Pathophysiology of selected clinical pictures and their main symptoms and clinical parameters. Recognition of alarm symptoms and distinction between pharmaceutical self-medication and the need for medical treatment. Detailed coverage of the pharmacotherapy of all fields of indication encountered in outpatient treatment. Outlining of therapeutic strategies and patterns with regard to suitable pharmaceutical compounds, active pharmaceutical ingredients and representative range of proprietary medicinal products. Discussion of the most important mechanisms of action, contraindications, side effects and interactions.

Hands-on course in pharmaceutical manufacturing in the pharmacy according to “GMP regulations for small quantities” defined in the pharmacopoeia: Design and practical approach in compounding of formulas using the most important dosage forms including their risks and quality assurance.

Objectives
Students are able to manufacture, to package, to quality-control and document pharmaceutical compounding on their own, “best practice” and according to GMP regulations, using the appropriate techniques. They know the most important properties of active ingredients and excipients frequently used. They achieve the necessary knowledge including the relevant literature and other sources of information, as well as the legal requirements regarding pharmaceutical manufacturing in small quantities.

Content
To impart knowledge about the principal techniques and processes in the manufacturing of pharmaceuticals in small quantities (formulas), focusing on the design, manufacturing, quality assurance and risk based self-appraisal including the patient specific dispensing. During the practical training periods: by means of pharmaceutical relevant examples the design, the planning, the manufacturing including the correct use of the equipment, the packaging and the quality assurance were practiced for various dosage forms and recipes. Quality assurance and control are mainly risk adapted considering as well hygiene regulations according to current pharmaceutical practice. The participants will thus improve their general GMP knowledge and skills.

Pharmaceutical Manufacturing in Small Quantities
P. Wiedemeier
J. Fröhlich, H. Hartenberg, G. Meier

Objectives

Institutional Pharmacy
Basics of Pharmaceutical Pharmacy

Institutional Pharmacy
P. Wiedemeier, J. Beney, M. Lutters, I. S. Vogel Kahmann

Objective
Students understand the concept of continuum of care and its practical implementation. They know the medication process within an institutional environment. They are able to find the necessary information and deal with problems in connection with pharmaceuticals, to evaluate them and to communicate and document their findings adequately. They know how a hospital is organised (procedures, possible problems), responsibilities of the different members of the staff and, most importantly, what the function of a hospital pharmacy is.

Content
Principals of the organisation of institutional environments (emergency hospitals), with special focus on medication processes and institutional pharmaceutical care (circulation of medication, continuum of care). Hygiene regulations, medical products, applications, drug formularies, patient files, SOAP notes, kardex study. Participation at interdisciplinary visits, internal trainings and doctors’ reports as well as visitation of the emergency room. Drug interaction, generic substitution, quality management and pharmacovigilance.

Basics of Practical Pharmacy
P. Wiedemeier, S. Enri, B. Falch, K. Fünfschilling, I. S. Vogel Kahmann

Objective
Students know the most important concepts and methods of pharmaceutical care of patients with regard to OTC and Rx-only drugs as well as the essential concepts and methods of public health, prevention and health care. They master the basic rules concerning the pharmaceutical triage and their implications. For the clinical pictures covered during the course, they are able to make therapeutic plans and accompany and optimize doctor’s orders. Students show an adequate understanding of the rights and duties of pharmacists as medical personnel regarding medical care and service within the framework of the Swiss health care system. They are capable of handling important medical products and instructing patients about their use. Students have the necessary basic skills and knowledge of first aid and emergency medicine. They know the essence, chances and limits with reference to additional assortments, therapeutic options like phytotherapy, complementary medicine, veterinary pharmacy and non-medicinal methods of healing. Students have the essential knowledge of legal aspects and regulations concerning pharmacists and know the basics of business administration.

Content
Pharmaceutical Care: possibilities of pharmaceutical care of patients regarding OTC and Rx-only drugs in the official pharmacy. Good pharmaceutical triage in practice, introduction to the pharmacutical validation of prescriptions, recognition of medicinal, patient related, therapeutic problems and the finding of solutions: Choice of therapy (OTC), accompanying and optimizing therapies (Rx), compliance, correct administration of drugs, cooperation with other medical professions in the field of outpatient treatment. Traditional and proactive pharmaceutical service, development of adequate means of documentations of intervention and consultation as well as pharmaceutical follow-up care. Public health: role and possibilities of official pharmacies as partners within the Swiss health care system: primary health care, prevention, campaigns, early detection, instruction and mediation, referral to doctors. Needs of customers, patients and employees, and social interaction. Significance of the medical profession (illness, suffering, promotion of health and well-being). Basic training in first aid, emergency medicine and wound care. Medical products: handling of important applications and instruction of patients. Important and additional forms of therapy and assortments: phytotherapy, complementary medicine, veterinary pharmacy, non-medicinal methods of healing. Economy and law in everyday pharmacy: overview of the Swiss legal system. Relevant legal framework, jurisdiction and regulations and their meaning with regard to quality assurance for practicing pharmacists. Basics of finance and accounting as well as personnel management and insurance matters.

Organisation and competencies of the various partners within the Swiss health care system, focusing on the intermediate position and the role of pharmacists as part of the medical community.

<td>gta-re-ve: Workshop on the occasion of the 50th jubilee of the Institute for the History and Theory of Architecture</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>The development of the material is conceived as a joint form-finding process. The basic idea is to create a revue-like series of various &quot;numbers&quot;: a dynamic mixture of book and lecture texts, historical documents and spontaneously emerging conversations. The final product will be performed by workshop contributors during the anniversary celebrations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The motivation behind the workshop is to focus on the beginnings of the gta on the occasion of its 50th anniversary. Among the founding fathers there were fascinating protagonists such as Adolf Max Vogt, Bernhard Hoesli, and Paul Hofer. Based on an understanding of their concepts, methods and ideas, a text collage will culminate in a script for a one-hour-long performance reading. In addition to the graphically significant gta publications produced at this time (<em>Rainbow</em>-books), contemporary image and film materials can be integrated as well as interviews with contemporary witnesses and the present gta chair. The result intends both contextualization as well as critical revision.</td>

<tr>
<td></td>
<td>Information technology plays an increasingly important role in research. To meet this challenging development, it is not only important to acquire respective skills, but also to consider and understand information technology in what sets it apart from other gustitals of technics (like mechanics, dynamics, or thermodynamics).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>The aim of this colloquium is to counter an observable tendency, that proportional to the degree in which students master practical skills in computing, they increasingly submit uncritically, in their understanding and framing of problems, to the dictation of schemata and templates implemented by technical systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The starting point for this colloquium is to comprehend computing not in terms of skills, but as a literacy which we can experience emerging today. Like in the case of writing as well, computing cannot exhaustively be reduced to either logics, grammar, arithmetics, oranalytics. Rather, computation, if comprehended as a literacy, relates to any of the established categories of learning and raises questions of an architectonic kind. This colloquium draws from the principal richness of cultural forms of knowing and learning and thematizes approaches to formulate a theoretical stance on information technology for architects which is driven by and resting on the actual reality of computability today. In this, it is complementary to those theory courses on technology offered by the historical disciplines at ETH.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>To benefit from this course, you should have a practical affinity to technics, as well as an abstract interest in information technology in its comprehensive cultural context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

</table>
The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. Led by Professor Dr. Marc Angélil and Professor Dr. Hubert Kämpfer as one full-day event in the academic semester. The programme comprises different formats, alternating with the responsible chair.

Participants in both cases are expected to submit single-page abstracts of their papers in advance and to make a presentation of app. 20 minutes at the colloquium. The discussion rounds will be moderated by the organizing professor and the invited guests.

Enrolment on agreement with the lecturer only.

### 151-0906-00L

**Frontiers in Energy Research**

This course is only for doctoral students.

**Abstract**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, their advisors and to the scientific community.

**Objective**

Knowledge of advanced research in the area of energy.

**Content**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min presentation of the results, 15 min discussion with the audience.

**Lecture notes**

Slides will be distributed.

**Course Catalogue of ETH Zurich**

**862-0002-16L**

**Research Colloquium History of Knowledge (HS 2016)**

Only for MAGPW students, D-GESS PhD and D-ARCH PhD students.

This colloquium is highly recommended for first and second semester MAGPW students.

**Abstract**

The colloquium of the ZGW focuses on present developments, debates and perspectives in the field of history of knowledge. On the second and fourth date there will be public events in the Cabaret Voltaire.

**Objective**

The colloquium deals with the general problems, questions and methods of the interdisciplinary research field "The History of Knowledge".

Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is getting more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production, circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only within science but also in relation to art, literature, technology, everyday life, and so on.

**Prerequisites / notice**

Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.

**051-0827-16L**

**Sand: an (in)finite Resource? - Engineering for Sustainable Development (E4D) Summer School**

Number of participants limited.

**Abstract**

The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. The course is for 30 master and doctoral students from ETH Zurich and other academic institutions (from different disciplines related to the topic), joined by faculty members and external experts from fields of expertise related to the winter school topic.

**Objective**

The E4D summer school 2016 aims to develop an integrated vision to a global challenge of today's construction industry. The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. Led by different experts from around the world, students will not only learn the thematic knowledge, but also gain experience in working with current and future technologies to transform sand and building waste. In the workshops the acquired knowledge will be tested and applied. The summer school presents three areas that could mobilise sand alternatives for construction and other applications: (i) I. Microbiologically Induced Calcite Precipitation (MICP), (ii) Chemical Crystallization Processes and (iii) 3D Printing.

**Content**

Sand is the most commonly used raw material for the production of goods on our planet. It is found in concrete, glass, computers, detergents and toothpaste. Sand is the megastar of the industrial and digital era - our culture is literally built upon this resource. But sand is not equal to sand: the construction industry requires grain sizes and rough shapes that are only found in river beds, lakes and the oceans. Mining of aquatic sand comes at high environmental and social costs; its growing demand cannot be met sustainably. Sand is mostly composed of quartz, a mineral form of silicon dioxide. Silicon is one of the most abundant materials on earth and also one of the strongest. These properties make it valuable to various industries. Since a few years demand for sand has risen exponentially. Alternatives for sand for construction have yet to be developed.

Sustainability is often referred to as an interaction of social, cultural, economic, and ecological aspects. In the construction industry sustainability has been perceived as the optimisation of existing material and energy uses, yet the fundamental energetic and material character of these base resources has not been questioned. The speed of consumption of these resources increases constantly due to demographic pressure and resulting construction, as seen around the world and in particular in developing and emerging countries. A fundamental understanding of metabolic processes is required to frame the question of material and energetic sustainability. At the same time the definition of resources expands to include previously undervalued materials and waste. Finally, advances in digital technology and science have opened new avenues for alternative materials and processes.

The summer school presents three areas that could mobilise sand alternatives for construction and other applications:

I. Microbiologically Induced Calcite Precipitation (MICP): Also known as bio-cementation it is a process utilised in self-healing concrete and soil stabilisation. The application to sand will produce naturally grown structural sand bricks. This workshop will compare MICP for various sand types, building wastes and bacterial cultures.

II. Chemical Crystallization Processes: Based on material computation experiments pioneered by architect and engineer Frei Otto, this workshop combines form finding properties of sand with structural and thinking and chemical crystallization processes.

III. 3D Printing: 3D Printing with sand and building waste, finally, explores the potential of sand as a substrate within a binding agent. In combination with a robotic arm, 3D printing of sand is an in situ digitally controlled construction process. It overcomes the need for traditional form-work and transportation of material, thereby reducing the grey energy.
The objective of the summer school is to support PhD researchers in their individual research and specific research stages by sharing their practical/laboratory courses and colloquiums.

Courses outside the curriculum

Compulsory

European Credit Transfer and Accumulation System (ECTS)

Eligible for credits

D. Eberle

Exercise

Suitable for doctorate

The objective of the summer school is to support PhD researchers in their individual research and specific research stages by sharing their practical/laboratory course and colloquium. Courses outside the curriculum are also mandatory.

</tbody>
</table>
Objective

Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.

Content

Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

Lecture notes

Material in the form of hand-outs will be distributed.

Literature

Lecture notes and references therein.

Seminar series on technical aspects of high-resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

W. Achermann

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear models.

G. Achermann

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Prerequisites / notice

Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

401-0649-00L

Applied Statistical Regression

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

551-1615-00L

NMR Methods for Studies of Biological Macromolecules

Prerequisites: Basic knowledge in biological NMR spectroscopy.

Objective

Seminar series on technical aspects of high resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

Content

Introduction and discussion of advanced methods for recording and analysis of NMR data with biological macromolecules.

551-1619-00L

Structural Biology

Objective

The goal of this course is to provide doctoral and postdoctoral students with a broad overview on the most recent developments in biochemistry, structural biology and biophysics.

851-0180-00L

Research Ethics

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Objective

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

Abstract
About 5 talks on applied statistics.

Objective
See how statistical methods are applied in practice.

**Content**

There will be about 5 talks on how statistical methods are applied in practice.

This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: [http://stat.ethz.ch/events/zukost](http://stat.ethz.ch/events/zukost)

Course language is English or German and may depend on the speaker.

**Abstract**

Seminars by invited speakers covering selected microbiology themes.

Discussion of selected microbiology themes presented by invited speakers.

**Objective**

Advice for analyzing data by statistical methods.

Advising students and researchers of ETH to organize and conduct empirical research by their own.

This is not a course, but a consulting service. There are no exams nor credits.

**Prerequisites / notice**

Students and researchers can get advice for analyzing scientific data, often for a thesis.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be made available after the seminars.

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

**Prerequisites / notice**

Number of participants limited to 8.

interaction seminar. Student-mediated presentations, guests and discussions on current themes in ecology, evolutionary and population biology.

Scientific talks and discussions on changing subjects.

For information and details: http://www.eco.ethz.ch/news/zis or contact: Lehre-eve@env.ethz.ch

This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects.

The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

**Abstract**

This seminar will feature invited lectures about recent advances and developments in systems biology, including topics from biology, bioengineering, and computational biology.

**Objective**

To provide an overview of current systems biology research.

**Content**

The final list of topics will be available at [http://www.bsse.ethz.ch/education/](http://www.bsse.ethz.ch/education/).

Abstract
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano-structuring. Several applications which are still in the research state, will be discussed together with industrial applications, such as micro lithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Objective
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano structuring. Several applications which are still in the research state, e.g. non-optical lithographies, will be discussed together with industrial applications, such as micro lithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Content
Introduction to lasers, Overview of micro- and nanotechnology, micro lithography, photoresists: classical types and new developments, laser cutting and welding, laser cleaning, laser ablation, polymer ablation: designed polymers, lasers and surfaces, laser spectroscopy, laser chemical vapor deposition, pulsed laser deposition (PLD), special materials by PLD, alternative structuring methods.

Lecture notes
The script (a copy of the slides) will be handed out during the first lecture.

Literature
FSRM, CD-ROM: An Introduction to the World of Microsystems, Neuchatel.

</tr>
<tr>
<td>Abstract</td>
<td>The lecture provides a journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfumery examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>After completion of this lecture module the students know all the major perfumery materials of the important odor families with their academic and industrial applications, their olfactory properties, their usage, their historic perspective, and today's economic importance. The students can explain the significance of important building blocks and industrial transformations, and can estimate how attractive chemical processes are on large scale. They can retrosynthetically plan academic and industrial syntheses of fragrant compounds and terpenoids, and the acquired knowledge on structure-odor relationships enables them to predict and design new odorants. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how olfactophore models are used. The students understand and can explain the molecular mechanism of smell, the biosynthesis of terpenes, and the basics of perfumery composition. The latter enables them to further their education in perfumery at specialized Universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general.</td>

**Abstracts and Content:**

- **Prerequisites / notice:**
  - Group meeting
  - Group seminar on electronic spectroscopy, photoelectron spectroscopy, vacuum ultraviolet spectroscopy.
  - Seminar on theoretical chemistry, molecular spectroscopy and dynamics.
  - Research seminar on current problems in nuclear magnetic resonance spectroscopy.
  - Prerequisites / notice for lecture on advanced high resolution molecular spectroscopy.
  - Prerequisites / notice for seminar in computational chemistry.
  - Prerequisites / notice for seminar on special problems in physical chemistry.
  - Prerequisites / notice for laser seminar.
  - Prerequisites / notice for seminar in advanced theoretical chemistry.
  - Prerequisites / notice for seminar on molecular quantum dynamics.

- **Faculty Members:**
  - P. H. Hünenberger, S. Riniker
  - F. Merkt
  - M. Quack, M. Reiher, R. Riek, S. Riniker, H. J. Wörner
  - B. H. Meier
  - H. P. Lüthi, P. H. Hünenberger, M. Reiher, S. Riniker
  - M. Quack
  - S. Albert
  - M. Reiher
  - R. Marquardt

- **Additional Information:**
  - Will be announced on www.reiher.ethz.ch/courses-and-seminars.html
  - A program and handouts can be downloaded from the indicated web site or will be delivered in the first session. Handouts are in English.

**Data:** 06.08.2021 13:03  Autumn Semester 2016  Page 419 of 1571
A program of the lecture as well as lecture notes in English containing a detailed literature list will be distributed before the 1st session. These documents contain a detailed list of specific publications. The short literature list given below is helpful in assisting the lecture. The website http://mctdh.uni-hd.de/ offers a view on a widely used computer program.

**Prerequisites / notice**

A solid knowledge in quantum mechanics is helpful, but not a condition to assist the lecture.

### Course Catalogue of ETH Zurich

**151-0906-00L Frontiers in Energy Research**

*This course is only for doctoral students.*

**Abstract**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community.

**Objective**

Knowledge of advanced research in the area of energy.

**Content**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min discussion with the audience. Additionally, they will learn how to communicate their own scientific results properly, using also additional measures that are reflected by alternative metrics. The following topics are covered:

1. The World of Scientific Publishing
2. Searching and Retrieving Scientific Information Using Search Engines and Using Literature Databases
3. Searching and Retrieving Scientific Information Using Subject-specific Databases in Chemistry
4. Searching and Retrieving Scientific Information Using Subject-Specific Databases in Life Sciences
5. Tools for Managing the Retrieved Scientific Information
7. Patents
8. Text(Literature) and Data Mining
9. Communicating & Analyzing the Impact of (Your) Science
10. Scientific Writing & Good Scientific Practice

**Lecture notes**

The slide deck and supplementary materials will be made available in the teaching document repository (ILIAS) after each lecture.

**Literature**

Additional literature and reference are provided in the course material.

<td>O. Bachmann, J. Leuthold</td>
</tr>
<tr>
<td></td>
<td>Abstract</td>
<td></td>
<td></td>
<td></td>
<td>Heat and mass transfers in the crust control many aspects of the differentiation of our planet, including (1) type of volcanic eruptions we should expect at the surface of our planet, (2) the volcanic/plutonic ratio in the crust, and (3) how volcanic degassing occurs, with important consequences on the climate response following volcanic eruptions.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>The goal of this class is to learn about the modern methods and ideas on heat and mass transfers in magmatology through recently published papers and computer softwares. The class will allow students to explore some of the most challenging concepts in this field, and become familiar with state-of-the-art techniques to model these processes.</td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>The class will focus mostly on reading recent literature on topics of interests, and will contain some computer exercises to allow students to work by themselves on some well-defined problems.</td>
</tr>

Abstract: Ph.D. students and members of staff report on their research.
Objective: Key problems of research projects will be discussed. Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.

| 851-0551-00L | Colloquium for Master and Ph.D. Students | W    | 2    | 1K    | G. Hürlimann       |

Abstract: Colloquium for master and doctoral students preparing a thesis in the history of technology.
Objective: Goals: to identify, discuss, and resolve methodological problems that emerge while elaborating a master or doctoral thesis.

| 851-0587-00L | CIS Colloquium                                               | E-   | 2    | 2K    | L.-E. Cederman, M. Steenbergen |

Abstract: In this seminar staff members of the Center for Comparative and International Studies (CIS) and external guests present and discuss their research.
Objective: In this seminar staff members of the Center for Comparative and International Studies (CIS) and external guests present and discuss their research.
Content: Presentation and discussion of current research.
Lecture notes: Distributed electronically.
Literature: Distributed electronically.

| 862-0088-00L | Research Colloquium Science Studies                         | E-   | 2    | 1K    | M. Hagner          |

Abstract: This colloquium is open for staff members based at the Center for Comparative and International Studies, CIS.
Objective: This colloquium is devoted to the introduction into the theory and practice of scientific work.
Prerequisites / notice: This colloquium is devoted to the introduction into the theory and practice of scientific work.

| 851-0587-01L | CIS Doctoral Colloquium                                      | W    | 2    | 1K    | P. Holtrup Mostert  |

Abstract: In this internal colloquium doctoral students present their work after about 12 months of research.
Objective: The aim of this colloquium is that the presenters receive feedback on their research at an important stage (a stage at which significant changes of direction, methodology, etc. may still be undertaken) in the PhD process.
Content: Presentation of doctoral research.
Lecture notes: Distributed electronically.
Literature: Distributed electronically.
Prerequisites / notice: Dates: See http://www.cis.ethz.ch/education/index

| 851-0549-00L | WebClass Introductory Course History of Technology           | W    | 3    | 2V    | G. Hürlimann       |

Number of participants limited to 100.
Objective: Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

| 851-0626-02L | PhD Colloquium in Development Economics                     | W    | 2    | 1K    | I. Günther         |

Abstract: PhD students interested in empirical development economics will present their ongoing work, with a particular focus on the methods (to be) used and challenges faced. Participants are expected to read the drafts/papers/presentations beforehand and give constructive feedback to the Phd student presenting.
Objective: PhD students learn how to present and discuss their own research questions, methods, results and problems. PhD students get familiar with the challenges of empirical research in developing countries.
Prerequisites / notice: The colloquium will take place about 8 times per semester. The schedule will be arranged together with the PhD students at the beginning of the semester.

Workshop & Lecture Series on the Law & Economics

851-0735-09L

This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding is applied to intellectual property, innovation, antitrust policy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

Literature
- Suzanne Scotchmer, Innovation and Incentives, 2004
- Bronwyn Hall / Nathan Rosenberg (eds.), Handbook of the Economics of Innovation, 2002
- Bronwyn Hall / Dietmar Harhoff, Recent Research on the Economics of Patents, 2011
- Paul Belleflamme / Martin Peitz, Industrial Organization: Markets and Strategies, Cambridge 2010
- Einer Elhauge / Damien Geradin, Global Competition Law and Economics, 2007
- Dennis Carlton / Jeffrey Perloff, Modern Industrial Organization, 4th edition, 2004

Self-Ownership - Philosophical and Juridical Perspectives

851-0125-18L

Rights in Objects are founded by an inalienable Self-Ownership. These Ideas ist central for personal rights. We speak of my body, my genes, my name, my portrait, my ideas oder ways of eypression.

Objective
- Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

Content
- Texts by Locke, Nozick, Christman, Otsuka, Rasmussen, Schneider, Stirner, Fichte and Forschner. Founding of property right in self-organization, emergence, (sudden) phase transitions at "tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Literature
- Text, Seminarplan und Literaturliste in ILIAS Lehrkumentenablage.
In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature. According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protokoll is to be written.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life. Topics covered during the lecture will include:

- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided. Case studies will also be included.

The course introduces students to the various methods of protection of technical inventions and the use of patent information.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ (851-0738-03) will be offered in the autumn semester.
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modeling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper.

Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk should contact course organizers (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students for oral presentations. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

**851-0252-01L** Human-Computer Interaction: Cognition and Usability  
Number of participants limited to 30.  
3 credits  
I. Barisic, C. Hölscher, S. Ognjanovic

**851-0252-02L** Introduction to Cognitive Science  
Number of participants limited to 70.  
3 credits  
V. Schinazi, L. Konieczny, T. Thrash

**851-0252-03L** Cognition in Architecture - Designing Orientation and Navigation for Building Users  
Number of participants limited to 40.  
3 credits  
V. Schinazi, B. Emo Nax, C. Hölscher

**851-0585-04L** Lecture with Computer Exercices: Modelling and Simulating Social Systems with MATLAB

A. Kilcher
Research and development play an important role in chemistry-related technology sectors such as inorganic and organic chemistry or...

**Research Colloquium Cognitive Science**

**Abstract**
The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to be involved in active research group.

**Objective**
Graduate student train and improve their presentation skills based on their own project ideas, all participants stay informed on current trends in the field and have the opportunity for networking with invited scholars.

**851-0252-05L**

**Research Colloquium Cognitive Science**

**Prerequisite:** Participants should be involved in research in the cognitive science group.

**Abstract**
The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

**Objective**
The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

**851-0738-03L**

**Protecting Inventions in Chemistry**

**Abstract**
The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.

**Objective**
Investments and development play an important role in chemistry-related technology sectors such as inorganic and organic chemistry or pharmacy.

**851-0585-41L**

**Computational Social Science**

**Abstract**
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

**Objective**
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

**851-0252-07L**

**Recent Debates in Social Networks Research**

**Abstract**
Social Networks research is a highly interdisciplinary fields. For example, scholars in Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics contribute to the development of theories and methods. This course aims at understanding, comparing and structuring recent debates in the field of Social Networks.

**Objective**
Social Networks research is a highly interdisciplinary fields. At the end of this seminar, students will understand and be able to compare different subject-specific approaches to social networks research (e.g., from Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics). They will be familiar with recent publications in the field of Social Networks and be able to critically participate in a number of recent debates. Amongst others, these debates touch upon the co-evolution of selection and influence mechanisms, appropriateness of statistical models, generic mechanisms and features of social networks, models for the analysis of dynamic networks.

**364-1062-00L**

**Experimental Methods**

**Abstract**
This course is complemented by a course on z-Tree

**Objective**
This course is complemented by a course on z-Tree

**Prerequisites / notice**
For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.

**Case studies**
The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

**The lecture is coordinated in particular to the needs of the following degree programs:** Agricultural science, biotechnology, chemical engineering, chemistry, food science, pharmaceutical sciences.

**For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.**

**Number of participants limited to 30**

**Computational Social Science and Global Systems Science**

**Abstract**
Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

**Objective**
The seminar comprises practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

**For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.**

**Number of participants limited to 30**

**Number of participants limited to 30**
Introduction to Epistemology

This course introduces PhD students into the principles of experimental methods and outlines how to prepare, conduct and evaluate an experiment.

Objective
- This course aims to prepare PhD students for conducting their own experiment.
- To learn how to relate texts to key critical theories as well as to the historical and social context.

Abstract
The course aims to introduce fundamental epistemological concepts of knowledge and perception. We will study the various forms and functions of repetition on the basis of texts by Plato (anamnesis), Freud (repetition compulsion), Nietzsche as eternal return, in Deleuze as repetition, and in Poétics as combination with difference as a positive mode of thinking change.

Content
1. Introduction: What are economic experiments and why to use them?
4. Conducting experiments: Instructions, testing, recruiting, sessions.
5. Measuring techniques: Eliciting beliefs, risk attitudes, social preferences.

Literature
Books:

Basic Articles:

A reading list with articles for each lecture has been published in Moodle.

Prerequisites / notice
- reading philosophical texts (including English texts)

851-0125-60L

Introduction to Epistemology

W 3 credits 2G N. El Kassar

Objective
- conceptions of fundamental epistemological concepts
- sensitivity to epistemological questions
- capacity to reflect epistemological theories
- capacity to discuss epistemological theories
- reading philosophical texts (including English texts)

Abstract
In this course we will examine fundamental questions of epistemology, e.g. What is knowledge? How are we to conceive of perception? Which beliefs are rational and justified? How do we acquire knowledge? By discussing a selection of seminal philosophical texts we will study fundamental epistemological theories.

Number of participants limited to 30.

Primary suited for Master and PhD level

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

Objective
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

Lecture notes
- Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Prerequisites / notice
- This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

851-0253-03L

The Sense of Time and Its Effects on Motivation, Cognition, and Emotion

W 2 credits 2S K. Stocker

Number of participants limited to 45.

Abstract
While time is studied prominently in physics, it is also an integral part of our mind. Some of the main parameters of our sense of time are time immersion, time specificity, time speed, time texture, time horizon, time motion, time embodiment, and lifetime localization. Our sense of time can (often unconsciously) have profound effects on our motivation, cognition, and emotion.

Objective
- To learn and understand how our sense of time influences our motivation, cognition, and emotion and to learn that our sense of time is malleable and can be influenced for the better. The course involves participating actively and regularly, reading articles, giving an oral presentation (in groups or individually), and writing a short paper.

851-0148-04L

Cyclical time

W 3 credits 2S T. Böhm

Abstract
The idea of cyclical time is found in ancient pieces of wisdom (Pythagoreans, Plato, Buddhism) as reincarnation or memory, but also in Nietzsche as eternal return, in Deleuze as repetition compulsion. We investigate the concept of repetition in combination with difference as a positive mode of thinking change.

Objective
- Understanding of the various forms and functions of repetition on the basis of texts by Plato (anamnesis), Freud (repitition compulsion), Kierkegaard (narration), Nietzsche (eternal return as cosmological and ethical principle), Deleuze (time synthesis and repetition of the future), Poincaré's theorem of recurrence.

851-0301-04L

Photography and Literature. Exchanging Practices

W 3 credits 2G F. Broggi-Wüthrich

Abstract
The course discusses writers from Henry James to Margaret Atwood whose interest for photography led them to elaborate new intriguing modes of representation. The aim is to identify how literature, photography and art meet to promote a photographic aesthetics while approaching the theories of Susan Sontag, Roland Barthes and Bourdieu as well as postmodern or posthuman criticism.

Objective
- Students know a wide variety of literary text (and their authors) that are related in content or form to the practice of photography. Students know how to relate texts to key critical theories as well as to the historical and social context.
## Philosophy of Time

**851-0144-20L**

**Philosophical Aspects of Quantum Physics**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>N. Sieroka, R. Renner</th>
</tr>
</thead>
</table>

**Abstract**

This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (there phenomenon will be highlighted).

**Objective**

By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

**851-0144-19L**

**Philosophy of Time**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
<th>N. Sieroka</th>
</tr>
</thead>
</table>

**Does not take place this semester.**

**Abstract**

This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

**Objective**

By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

- Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

## Literature and Technology - Simulations, Prototypes, Machines

**851-0301-05L**

**Beginnings**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>C. Jany</th>
</tr>
</thead>
</table>

**Abstract**

"All beginnings are difficult," goes the saying, "but without them there wouldn't be an end." However, what makes beginnings so difficult? What kind of action is that? Which knowledge does it presuppose? And what would a beginning say about the end? We will pursue these questions by reading sacred, philosophical, literary, and scientific texts that, each in its own way, make a beginning.

**Objective**

- thorough reading and critical analysis of the texts
- reflection upon the conditions and practice of beginnings in terms of their epistemology and rhetorical strategy (i.e. as an intellectual and literary operation)
- consider the cultural and historical function of fictions that tell of origins, such as cosmological myths, foundationalist philosophy, or poetic incantations

**Literature**

- Myths of Creation and First Origins (Genesis and Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wieland, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizierte Essays (Konstanz 2013).

**Prerequisites / notice**

Readings partly in English.

**851-0306-05L**

**Literature and Technology - Simulations, Prototypes, Machines**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>E. Edelmann-Ohler</th>
</tr>
</thead>
</table>

**Abstract**

Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature offers problem oriented insights into this sociotechnical process of translation.

**Objective**

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing.

**Content**

The seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will track topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

**Objective**

By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

- Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

## Values in Science

**851-0351-03L**

**Postal Knowledge and the History of Digital Societies**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>D. F. Zetti</th>
</tr>
</thead>
</table>

**Abstract**

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer based. The lecture offers problem oriented insights into this sociotechnical process of translation.

**Objective**

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

**Content**

**851-0157-66L**

**Who was Sigmund Freud?**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>M. Hagner</th>
</tr>
</thead>
</table>

**Abstract**

30 years ago it would have been bizarre to ask the question: Who was Sigmund Freud? The influence of psychoanalysis on twentieth century thinking was taken for granted even by those ones who rejected Freud's ideas. In contrast, the question today would be: What are Freud's central theories? We will tackle this question in the seminar and reconstruct Freud's thinking from his early medical writings to those writings, in which he developed a critical view of his time. The aim of the seminar is not only to understand Freud's thinking in historical context, but also to reflect, what it could mean to us in early twenty first century.

**Objective**

- consider the cultural and historical function of fictions that tell of origins, such as cosmological myths, foundationalist philosophy, or poetic incantations

**Literature**

- Myths of Creation and First Origins (Genesis and Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wieland, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizierte Essays (Konstanz 2013).

**Prerequisites / notice**

- Readings partly in English.

**851-0125-57L**

**Values in Science**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>K. Bschir</th>
</tr>
</thead>
</table>

**Number of participants limited to 25**

**Abstract**

Should science be free from moral, political or ideological influences? According to the so-called value-free ideal it should. Many scientists think of themselves as committed to truth and objectivity and nothing else. In this seminar, we will track topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

**Objective**

In the past decades, philosophers of science have begun to challenge the value-free ideal in science. With the help of recent literature from the philosophy of science, students will be introduced to the debate on values in science and the reasons for why the value-free ideal has come under attack. They will be familiarised with the distinction between epistemic (truth-conducive) values and so-called non-epistemic values. The course aims at enabling students to critically reflect the potential role of non-epistemic values in science.

**Content**

- thorough reading and critical analysis of the texts
- reflection upon the conditions and practice of beginnings in terms of their epistemology and rhetorical strategy (i.e. as an intellectual and literary operation)
- consider the cultural and historical function of fictions that tell of origins, such as cosmological myths, foundationalist philosophy, or poetic incantations

**Literature**

- Myths of Creation and First Origins (Genesis and Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wieland, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizierte Essays (Konstanz 2013).

**Prerequisites / notice**

- Readings partly in English.
"Bollywood and Beyond" - A Cultural History of Indian W Cinema in the 20th Century

Abstract
The Indian film industry has been around for 100 years and is one of the richest and most variegated of the world. The lecture reconstructs the historical development of Indian cinema and uses it as a lens through which cultural, social, and political change in the subcontinent can be explored.

Objective
The objective of this course is three-fold. For one, the participants shall learn to question aesthetic certainties and received modes of perception of cinematographic art. Secondly they will be acquainted with the huge potential of films as a historical source to grasp processes of social and cultural change. Besides, the reconstruction of the international career of a specific variety of art and entertainment will also raise important questions of cultural globalisation and consumerism. As a side-effect, a sit were, the students will also be provided with important insights into the chequered history of the Indian subcontinent in during the course of the 20th century.

Literature
Zur Einführung:

Prerequisites / notice
A detailed course description and session plan will be available from 15 Sept 2013 onwards at http://www.gmw.ethz.ch/education

Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones? W

Abstract
Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

Objective
The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge as contextually not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of european colonialism overseas. Secondly, students will become familiarized with how old collections can yield new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a platform to discuss ways of dialogue and possible collaboration between these different approaches.

Prerequisites / notice
A detailed course description and session plan will be available from 15 Sept 2013 onwards at http://www.gmw.ethz.ch/education
851-0157-69L  History of Astronomy

 Particularly suitable for students of D-ERDW, D-MATH, D-PHYS

Die Veranstaltung ist ausgebuht

Abstract
The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Objective
The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle’s system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man's place in the cosmos and the philosophical principles underpinning cosmology.

851-0144-21L  Philosophical Issues and Problems in Theoretical Computer Science

 Particularly suitable for students of D-INFK

Abstract
This course studies philosophical issues concerning computers and computing. Topics include: information (and information content), computational complexity, the Turing Test for computer thought; the "Chinese Room" argument against the possibility of strong AI; connectionist AI; consciousness; the Church-Turing thesis; computational and hypercomputational models of mind; and free will.

Objective
- Exhibit a general understanding of the philosophy and history of computing.
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.
- Communicate clearly in writing about topics in this field.

851-0331-05L  The Art of Conversation

 Abstract
This course will offer the occasion to reflect upon the art of conversation: its codes, its pleasures of improvisation, its worldly aspects and its importance in everyday life.

Objective
This will permit us to consider different figures of the writer and salon hostess, such as Mme de Lafayette, Mme du Deffand, Julie de Lespinasse, and Mme de Staël.

851-0331-06L  The Secretaries of the Baroque Age and the "Honest Dissimulation"

 Abstract
Torquato Accetto, secretary and poet, published the treatise “Della simulazione onesta” in 1641. It was a thin manual to survive political turmoils and moral instability of the time; it was also a guide to "secret" writing in a time of censorship. The course follows the reception of the treatise up to the 20th century and focuses on how it got shaped to meet various historical and political ideas.

Objective
The students know the author and his coeval context; the students can relate the writing modalities of the treatise to the socio-cultural context of various historical times; the students know how to identify and interpret the metaphorical potential of the texts, as well as its literary power.

862-0002-16L  Research Colloquium History of Knowledge (HS 2016)

 Only for MAGPW students, D-GESS PHD and D-ARCH PHD students.

Abstract
This colloquium is highly recommended for first and second semester MAGPW students.

Objective
The colloquium deals with the general problems, questions and methods of the interdisciplinary research field “The History of Knowledge”. Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is getting more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production, circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only within science but also in relation to art, literature, technology, everyday life, and so on.

Prerequisites / notice
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.

851-0125-63L  Images of Mathematics

 Particularly suitable for students of D-MATH

Abstract
The lecture series “Images of Mathematics” deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

Objective
The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics.
Content

How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century: Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years.

These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

The lecture series “Images of Mathematics” deals with a few moments in the history of the scientific discipline since the middle of the 19th century when the image of mathematics changed. In particular, it focuses on the consequences of the fact that in the 19th century mathematics started to not only reflect on their own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. Through Cantor’s set theory, the mathematical treatment of logic since Boole and especially through Frege and the formalization of its axioms in a wide ranging discussion involving Zermelo, Fraenkel and others, this self-reflexive stance came to the fore.

Yet, the deeper mathematicians dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundation of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundations of mathematics primarily as if so it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in deepened insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

Literature

851-0125-51L Man and Machine

Does not take place this semester.

Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL

Abstract

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective

On the one hand models of machines had a heuristical value in research on man, e.g. in Harvey’s discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

851-0300-85L The Knowledge of Literature. An Introduction

This lecture provides a general introduction to literary theory and presents the important theories dealing with knowledge and its role in and as literature.

Objective

Students are introduced to the various approaches and methods of literature studies and gain an overview of literary theory.

Content

This lecture has two aims: Firstly, it serves as a general introduction into the fiel of literary theory (thereby looking into “knowledge about literature”). Secondly, there will be a special emphasis on recent theoretical approaches that take seriously literature and knowledge as one of its components (thus investigating the “knowledge of literature”). Even though traditional criticism disagrees, a number of recent approaches, based on literature and culture studies, hold that literature is not to be conceived of as standing in opposition to the world and the discursive system of the academic disciplines, particularly the sciences (e.g. Copeland). Instead, these approaches understand literature in terms of its epistemological forms and functions. Thus, the main thesis is that literature actively participates in the constitution and formation of knowledge. Literature itself generates models of knowledge, sometimes with critical or even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.

851-0300-79L Theories of Joke

From Plato, Aristotle and Cicero, philosophers have tried to find the core principle of wit (or the joke, as both meanings are contained in the German term “Witz”). Even during the 20th century, the philosophy of life and psychoanalysis struggle with it. The seminar provides an overview of this history.

Objective

This seminar deals with the meaning and history of “Witz” (wit, joke) as a form of knowledge. It places “Witz” as a switch or transitional figure within the development of modern theories of knowledge in particular.

Content

Contrary to intuitive expectations, the German term “Witz” is not only an instance of the comical, but also a form of knowledge that plays on similarity and difference by juxtaposing the disparate. In this vein, especially during the 17th and 18th centuries, “Witz” becomes a central attribute of poetic and rhetorical types of expression (wit). Only during the 19th century “Witz” comes to denote a characteristic genre of the comic (joke). From now on “Witz” is theoretically associated with the comical and laughter. Around 1900 there are approaches based on the philosophy of life, sociology and psychology, elaborated by Bergson, Bakhtin and Freud, among others.

862-0078-02L Research Colloquium. Extra-European History and Global History (HS 2016)

For PhD students and postdoctoral. Masterstudents are welcome.

Abstract

The fortnightly colloquium provides a forum for PhD students and postdoctoral researchers to present and discuss their current work. Half of the slots are reserved for presentations by invited external scholars.

Objective

PhD students will have an opportunity to improve their presentation skills and obtain an important chance to receive feedback both from peers and more advanced scholars.

364-1078-00L z-Tree: Programming Experiments in Economics and the Social Sciences

This course is complemented by a course on experimental methods (364-1062-00L Experimental Methods). It is not
Cognitive neuroscience bridges two seemingly distinct but closely related disciplines. On one side, there is cognitive psychology and on the other side biology, or more specifically, neuroscience. In terms of research, this relatively young field aims to explain such diverse mental processes as thinking, perceiving, feeling, and reasoning by exploring their underlying biological or neural mechanisms.

The course explores selected topics of cognitive neuroscience. The course begins with a basic introduction to the field covering neural anatomy and brain physiology. Contemporary methods used in neuroscientific research (e.g., IMRI, EEG) will also be introduced and their benefits and limits critically reviewed. Using this knowledge, we will discuss some of the classic works in neuroscience in visual perception, memory and emotion. This will be accompanied by some famous cases of patients demonstrating problems in these domains (e.g., people with agnosia or amnesia). Further topics will include the cognitive and neural processes involved in pain processing, the placebo effect, as well as spatial representation and navigation.

This course targets students at the Bachelor level with no previous experience. The main requirement for this course is an open and critical mind. By the end of the course, the student will be able to identify the major brain structures and to explain the basic functioning of neurons as well as some of the fundamental principles of how our brain works. Students should be able to identify the phenomenon, give examples, and discuss one or two of the main theories explaining it.

**Prerequisites / notice**

The class is open to all Ph.D. (and Master students) who are interested in conducting (behavioral) economic experiments.

Abstract: This graduate seminar provides doctoral students in computer science a chance to discuss their research. Enrollment requires permission of the instructor. Credit units are granted only to active participants.

Objective: Learn how to formulate a research project, how to conduct research and how to improve presentation skills in an academic setting.

Content: The seminar will explore different topics from a research perspective. The seminar is open to assistants of the Department of Computer Science (Informatik), Computer Systems Institute. Others should contact the instructor.

Lecture notes: Supporting material will be distributed during the seminar.

Prerequisites / notice: Credit will be given only to those who present a paper/project. No credit for "attendance".

Abstract: An essential aspect of any research project is dissemination of the findings arising from the study. Here we focus on oral communication, which includes: appropriate selection of material, preparation of the visual aids (slides and/or posters), and presentation skills.

Objective: The seminar participants should learn how to prepare and deliver scientific talks as well as to deal with technical questions. Participants are also expected to actively contribute to discussions during presentations by others, thus learning and practicing critical thinking skills.

Content: Research papers, to be chosen in the seminar.

Prerequisites / notice: This doctoral seminar of the Machine Learning Laboratory of ETH is intended for PhD students who work on a machine learning project, i.e., for the PhD students of the ML lab.

Abstract: Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective: The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

Content: Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes: Yes

Prerequisites / notice: Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Abstract: This seminar is an opportunity to become familiar with current research in software engineering and more generally with the methods and challenges of scientific research.

Objective: Each student will be asked to study some papers from the recent software engineering literature and review them. This is an exercise in critical review and analysis. Active participation is required (a presentation of a paper as well as participation in discussions).
The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages. The publications to be presented will be announced on the seminar home page at least one week before the first session. Organizational note: the seminar will meet only when there is a scheduled presentation. Please consult the seminar's home page for information.

264-S810-00L

Programming Languages Seminar

This graduate seminar provides doctoral students in computer science a chance to read and discuss current research papers. Enrollment requires permission of the instructors. Credit units are granted only to active participants.

Objective

Learn about current research results in the area of programming languages, static program analysis, program verification, and related areas; practice of scientific presentations.

Content

The seminar will explore different topics from a research perspective.

Lecture notes

Supporting material will be distributed during the seminar.

Prerequisites / notice

The seminar is open to assistants of the Chair of Programming Methodology and the Software Reliability Lab (Department of Computer Science). Others should contact the instructors.

151-0906-00L

Frontiers in Energy Research

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community.

Objective

Knowledge of advanced research in the area of energy.

Content

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min presentation of the results, 15 min discussion with the audience.

Lecture notes

Slides will be distributed.

264-S812-00L

Writing for Publication in Computer Science (WPCS)

This course is designed to help junior researchers in Computer Science develop the skills needed to write their first research articles. The course deals with topics such as:

- understanding the needs of different target readings,
- managing the writing process efficiently,
- structuring texts effectively,
- producing logical flow in sentences and paragraphs,
- editing texts before submission, and
- revising texts in response to colleagues' feedback and reviewers' comments.

Objective

Writing for Publication in Computer Science is a short course (5 x 4-lesson workshops) designed to help doctoral students develop the skills needed to write their first research articles. The course deals with topics such as:

- understanding the needs of different target readings,
- managing the writing process efficiently,
- structuring texts effectively,
- producing logical flow in sentences and paragraphs,
- editing texts before submission, and
- revising texts in response to colleagues' feedback and reviewers' comments.

Content

Participants will be expected to produce a number of short texts (e.g., draft of a conference abstract) as homework assignments; they will receive individual feedback on these texts during the course. Wherever feasible, elements of participants' future conference/journal articles can be developed as assignments within the course, so it is likely to be particularly useful for those who have i) their data and are about to begin the writing process, or ii) an MSc thesis they would like to convert for publication.

</table>
| **Content** | - Rings, fields and linear spaces, normed linear spaces and inner product spaces.  
- Ordinary differential equations, existence and uniqueness of solutions.  
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.  
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.  
- Stability and stabilization, observers, state and output feedback, separation principle.  
- Realization theory. |
| **Lecture notes** | See above |
Prerequisites: Control Systems I (227-0103-00) or equivalent and sufficient mathematical maturity. |
| 227-0389-00L | Advanced Topics in Magnetic Resonance Imaging   | Z    | 0    | 1V    | K. P. Prüssmann |
| **Abstract** | This course is geared towards master and PhD students with a focus on bioimaging. It covers advanced topics in magnetic resonance imaging in biennial rotation, including the electrodynamics of MR signal detection, noise mechanisms, image reconstruction, radiofrequency pulse design, RF pulse trains, as well as advanced contrast mechanisms. |
| **Objective** | By the end of the class students should be comfortable with the fundamental results in linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology. |
| **Content** | - Learning linear and nonlinear functions and filters: kernel methods, neural networks.  
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case. |
| **Lecture notes** | See above |
| **Prerequisites / notice** | T.M. Cover and J. Thomas, Elements of Information Theory (second edition) |
| 227-0417-00L | Information Theory I                           | W    | 6    | 4G    | A. Lapidoth |
| **Abstract** | This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equipartition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity. |
| **Objective** | The fundamentals of Information Theory including Shannon's source coding and channel coding theorems |
| **Content** | The entropy rate of a source. Typical sequences, the asymptotic equipartition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity |
| **Literature** | T.M. Cover and J. Thomas, Elements of Information Theory (second edition) |
| 227-0427-00L | Signal and Information Processing: Modeling, Filtering, Learning | W | 6 | 4G | H.-A. Loeliger |
| **Abstract** | Fundamentals in signal processing, detection/estimation, and machine learning.  
I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.  
| **Objective** | The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning. |
| **Content** | Part I - Linear Signal Representation and Approximation: Hilbert spaces, least squares and LMMSE estimation, projection and estimation by linear filtering, learning linear functions and filters, L2 regularization, L1 regularization and sparsity, singular-value decomposition and pseudo-inverse, principal-components analysis.  
| **Lecture notes** | Lecture notes.  
Prerequisites:  
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)  
- others: solid basics in linear algebra and probability theory |
| 227-0455-00L | Terahertz: Technology & Applications           | W    | 3    | 2V    | K. Sankaran |
| **Abstract** | This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting. |
| **Objective** | This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting. |

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 437 of 1571
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic - Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Yes. This colloquium for MSc and PhD students at D-ITET discusses current research topics in Translational Neuromodeling, a new discipline concerned with the development of mathematical models for diagnostics of brain diseases. The range of topics is broad, incl. statistics and computational modeling, experimental paradigms (fMRI, EEG, behaviour), and clinical questions.

Selected topics of the current research activities at the IEF and closely related institutions are discussed.

Control systems (227-0216-00L) or equivalent.

System Identification
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

WARNING

Seminar in Electromagnetics, Photonics and Terahertz
Selected topics of the current research activities at the IEF and closely related institutions are discussed.

Have an overview on the research activities of the IEF institute.

TNU Colloquium on Terahertz Technology
This colloquium for MSc and PhD students at D-ITET discusses current research topics in Translational Neuromodeling, a new discipline concerned with the development of mathematical models for diagnostics of brain diseases. The range of topics is broad, incl. statistics and computational modeling, experimental paradigms (fMRI, EEG, behaviour), and clinical questions.

Randomized Algorithms and Probabilistic Methods
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Machine Learning
Machine learning algorithms to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond
Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.
Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

227-0559-00L Seminar in Distributed Computing
Does not take place this semester.

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Content
Different each year. For details see: www.disco.ethz.ch/courses.html

Lecture notes
Slides of presentations will be made available.

Literature
Papers.
The actual paper selection can be found on www.disco.ethz.ch/courses.html.

Seminar language: English

| 364-0531-00L | CER-ETH Research Seminar | E-  | 0    | 2S    | H. Gersbach, A. Bommier, L. Bretschger, W. Mimra |
| **Abstract** | Research Seminar of Center of Economic Research CER-ETH |
| **Objective** | Understanding cutting-edge results of current research in the fields of the CER-ETH Professors. |
| **Content** | Referate zu aktuellen Forschungsergebnissen aus den Bereichen Ressourcen- und Umweltökonomie, theoretische und angewandte Wachstums- und Aussenwirtschaftstheorie sowie Energie- und Innovationsökonomie von in- und ausländischen Gastreferierenden sowie von ETH-internen Referierenden. |
| **Prerequisites / notice** | Bitte spezielle Ankündigungen beachten. Studierende des GESS-Pflichtwahlfachs sollten sich vor Beginn mit der Seminarleitung in Verbindung setzen. |

| 364-0553-00L | Innovation in the Digital Space | W   | 1    | 1G    | G. von Krogh |
| **Abstract** | The purpose of this course is to review and discuss issues in current theory and research relevant to innovation in the digital space. |
| **Objective** | Through in-depth analysis of published work, doctoral candidates will identify and appraise theoretical and empirical studies, formulate research questions, and improve the positioning of their own research within the academic debate. |
| **Content** | The Internet has a twofold impact on the way individuals and firms innovate. First, firms increasingly draw on digital technology to access and capture innovation-relevant knowledge in their environment. Second, individuals, firms, and other organizations extensively utilize the Internet to create, diffuse, and commercialize new digital products and services. During the past decade, theory and research on innovation in the digital space has flourished and generated extensive insights of relevance to both academia and management practice. This has brought us better understanding of working models, and some fundamental reasons for innovation success or failure. A host of new models and research designs have been created to explore the innovation in the digital space, but these have also brought out many open research questions. We will review some of the existing streams of work, and in the process explore a new research agenda. |
| **Format** | The course is organized in one block of 2 days. The course is a combination of pre-readings, presentations by faculty and students, and discussions. The students prepare presentations of papers in order to facilitate analysis and discussion. |

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 440 of 1571
1. Introduction
Dynamic models and workhorses in macroeconomics

2. Doctoral Workshop: Astute Modelling
In this course, we will address three blocs of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models). Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.

### Literature

Innovation, openness and search:

Open source and innovation models:

Motivation to Innovate:

Leadership and Governance:

### 364-0559-00L Dynamic Macroeconomics (Doctoral Course)

**Objective**
Dynamic models and workhorses in macroeconomics

In this doctoral course, we learn dynamic general equilibrium theory and the basic workhorses in macroeconomics. After the course the participants will be able to speak the Arrow-Debreu and recursive language and apply the frameworks to interesting issues in Growth, Public Finance, Monetary Theory and Banking.

**Content**
1. Introduction
2. The Arrow-Debreu Approach and Sequential Markets
3. The Neoclassical Growth Model and the Representative Agent Model
4. Mathematical Background
5. Frictions and Banking
6. 5.1 Overview
7. 5.2 Banks in Macroeconomic Models
8. 5.3 Ramsey cum Banks: General Equilibrium with Banks and Outside Equity
9. 6. Overlapping Generations Models and Models with Heterogenous Agents
10. 7. Debates
11. 7.1 Theory of Piketty
12. 7.2 High Bank Equity Requirements

### 364-0556-00L Doctoral Workshop: Astute Modelling

**Abstract**
In this workshop, ongoing research is presented and the criteria and guidelines for astute modelling of economic, political, and social situations are discussed.

**Objective**
We will learn how to craft models, how to present our own research and improve our analytical skills.

**Prerequisites / notice**
Students are expected to attend the doctoral course "Macroeconomic Dynamics" before registering for this workshop.

### 364-0585-01L PhD Course: Applied Econometrics

**Abstract**
In this course, we will address three blocks of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models).

**Objective**
The main agenda of this course is to familiarize students with the estimation of econometric problems with three alternative types of problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models). Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.
For panel data analysis, I will rely on the book:

For sample selection and endogenous treatment effect analysis, I will rely on the book:

For spatial econometrics:
I will mostly use papers.

I will prepare a script (based on slides), covering all topics.

### 364-0517-00L Urban and Spatial Economics

**W** 3 credits  **R. H. van Nieuwkoop**

#### Abstract
This course explores the economic factors which influence location decisions of households and firms, and it explores theories of how these decisions induce the formation of cities. The course will cover the neoclassical models of land use, concepts from the new economic geography, zoning, and transportation and traffic congestion.

#### Objective
The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structure and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

#### Content
Outline of Lectures

- Topic 1: Why do cities exist?
- Topic 2: The Basic Muth-Mills model
- Topic 3: The New Economic Geography
- Topic 4: Business demand for land and Von Thünen’s model
- Topic 5: Urban spatial structure
- Topic 6: Land use control
- Topic 7: City size and city growth
- Topic 8: Traffic externalities and congestion
- Topic 9: Public transport

#### Lecture notes
- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.
- The new introduction to geographical economics, Steven Brakman, Harry Garretsen and Charles van Marrewijk, Cambridge.

### 364-0581-00L Microeconomics Seminar (ETH/UZH)

**E-** 0 credits  **H. Gersbach**

#### Abstract
Research Seminar research papers of leading researchers in Microeconomics are presented and discussed

#### Objective
Research Seminar research papers of leading researchers in Microeconomics are presented and discussed

#### Content
Invited Speakers present current research in Microeconomics

### 364-1013-00L Managerial Cognition

**W** 1 credit  **S. Brusoni**

#### Abstract
Does not take place this semester.

#### Objective
The module will seek to provide:
1) Exposure to key theoretical streams in the area.
2) Familiarity with the issues, methods, findings and gaps in the area.
3) Skills in finding insight in the literature.
4) Skills in critiquing the literature, defining research problems and proposing empirical research in this area.

#### Content
- Session 1 - Introduction to the field of managerial cognition
- Session 2 - Methods to study managerial cognition
- Session 3 - Sensemaking, Mindfulness and Attention
Session 1: Introduction
Perspectives on Organizational Knowledge

Session 2: Some methods to study managerial cognition

Session 3: Sensemaking, Mindfulness and Attention

Bonus: http://www.wired.com/wired/archive/4.04/weick_pr.html

Weick & Sutcliffe. 2006. Mindfulness and the Quality of Organizational Attention. Organization Science July/August 17:514-524 [Suggested but not required. Daniella will discuss it.]

Assignments: At the beginning of each session, students must distribute copies of their critique of the assigned reading (please see your names at the end of each reference). The critique should be brief, extending to a maximum of one printed page. The critique is meant to serve as a starting point for the student to lead the class in a discussion of the strengths and weaknesses of the paper. For each session, students should emphasize the following topics in their critique:

Session 1:
- summarize the research problem or question
- summarize the central framework/ theory that is proposed
- list the strengths of the paper (you can use bulletpoints)
- list the weaknesses of the paper (you can use bulletpoints)

Session 2:
- Same as for session 1 with particular emphasis on the pros and cons of the method used
- Propose at least one alternative methodology and explain why you think the alternative method(s) would have been better suited

Session 3:
- three bullet points summarizing the paper strengths
- three bullet points summarizing the paper weaknesses
- prepare a one-page research idea: what would be a new research question? how would you extend the paper? what could be counterintuitive results?

Please contact Dr Daniella Laureiro Martinez for more information on this course.
This module aims to introduce major theoretical perspectives on organizational knowledge and to improve the competence of doctoral students to publish in relevant research areas. How knowledge is conceptualized and what aspects of knowledge are being studied depends on the epistemological and ontological assumptions accepted by researchers.

Objective

- to provide a basic understanding of key theoretical perspectives on organizational knowledge.
- to provide insights on the research questions, methods, findings and implications of the selected papers.
- to build skills in critically analyzing the literature.
- to identify future directions in the area.

Content

Given its prominence in the history of organization science, an impressive variety of theories have evolved that deals with organizational epistemology, the way of knowing in the organization (e.g., Brown & Duguid, 1991; Grant, 1996; Kogut & Zander, 1992; Lave & Wenger, 1991; Nonaka, 1994; Spender, 1996; Tsoukas, 1996; von Krogh et al., 1994). In this module, students will learn about various seminal contributions in the area of organizational knowledge and make connections between theory and empirical research, and identify the ongoing trends and future research directions.

Session 1: Knowledge based view of the firm.
Session 2: Knowledge sharing and transfer
Session 3: Social practice view on knowledge and knowing

Literature

Remark: The list might change. Students will be informed about the changes before the first session.

Prerequisites / notice
In each session, students will have three assignments:
1) prepare for in-depth discussion of all papers. The students are supposed to read in advance all the papers that will be presented in the sessions.
2) critically review and discuss the assigned papers. Assignments will be done after participants confirm their presence.
3) submit in advance a short critique of the assigned papers - max 2 pages.

364-1013-01L Organizations and Technical Change W 1 credit 1G S. Brusoni

Abstract

This 1-credit module is designed to introduce students to selected topics focused on the relationship between technical change and organizational dynamics.

Objective

The objectives of this module are:
1) to provide students with a relatively detailed understanding of some of the major theoretical perspectives and their developments in the field of innovation and technical change
2) to illustrate how these perspectives have evolved
3) to discuss how they can be operationalized
4) and, on these bases, develop the ability of constructively criticising them in order to learn how to build upon and extend extant research in the field

Content

Session 1. Technology rules. Once upon a time, people believed that technology determines organization. What techniques we use explain how we organize around them. If there is no fit to the technique, then there is failure. Powerful, simple, predictive, engineer-friendly. Occasionally correct, too.

Session 2. Never Mind the Bollocks ... Once upon a time, people believed that technologies were fully malleable to social dynamics. Marxists, social constructivists and management gurus (still) share great optimism in the human ability of solving technical problems, once the right organizational processes are in place. Revolutionary, ambitious, path-breaking. Occasionally baffling, though.

Session 3. It takes two to tango: Technological and organizational dynamics. And last, the big compromise, or the balance finally found? It is not white. It is not black. But it is not grey either. Pragmatic, practical, progressive. Relevant? Actionable?
The course is taught by Florian Wangenheim (ETHZ).

Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, decision-making, and leadership. In this module an overview of major research streams and empirical paradigms in organizational behavior is provided.

Objectives:
- To provide an overview of OB research
- To discuss major research streams in OB

On each session, students will have two assignments: 1) prepare a summary and critique of at least one of the readings for the day; 2) come prepared to critically discuss all the readings for the day. For the critique, readings will be pre-assigned in advance of each sessions.

Further info on assignments will be circulated by email before the start of the course.

Organizational Behavior (1 credit)

Marketing Theory (1 credit)

Advanced Microeconomics (3 credits)

Risk Center Seminar Series (0 credits)

Literature

Session 1.

Session 2. Never Mind the Bollocks: organizations rule.

Session 3. It takes two to tango: technological and organizational dynamics

Prerequisites / notice

On each session, students will have two assignments: 1) prepare a summary and critique of at least one of the readings for the day; 2) come prepared to critically discuss all the readings for the day. For the critique, readings will be pre-assigned in advance of each sessions.

Further info on assignments will be circulated by email before the start of the course.

364-1013-05L Organizational Behavior W 1 credit 1S E. L. Paddock, G. Grote

Abstract
Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, decision-making, and leadership. In this module an overview of major research streams and empirical paradigms in organizational behavior is provided.

Objective
- The objectives of this course are:
  - to provide an overview of OB research
  - to discuss major research streams in OB
  - to enable students to relate their own research to concepts and methods used in OB

364-1013-06L Marketing Theory W 1 credit 1G F. von Wangenheim

Abstract
The course is taught by Florian Wangenheim (ETHZ).

Objective
It focuses on the theoretical foundations of marketing and marketing research.

Content
- The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for understanding and explaining buyer and customer behavior in response to marketing action.
- In the first class, current understanding of the marketing literature and marketing thought is discussed.
- In the following classes, various theories are discussed, particularly in light of their importance for marketing, Economic, psychological and sociological theory will be related to current marketing thought.

364-1025-00L Advanced Microeconomics E- 3 credits 2G A. Bommier

Abstract
The objective of the course is to provide students with advanced knowledge in some areas of micro economic theory. The course will focus on 1) Individual behavior 2) Collective behavior 3) Choice under uncertainty 4) Intertemporal choice.

Objective
- The aim is to give to the students the opportunity to review the key results in rational individual behavior, collective models, choice under uncertainty, intertemporal choice, as well as to get some insights on more recent advances in those areas.
- The course is therefore designed for students who have some interest for research in economics.

Content
- The following topics will be addressed:
  2) Collective models. Cooperative and non cooperative models of household behavior.
  3) Choice under uncertainty. The foundations of expected utility theory. Some insights on other approaches to choice under uncertainty.
  4) Intertemporal choice. Dynamic model. Life cycle theory.

Literature
- The course will be based on some chapters of the books "Advanced Microeconomic Theory" by Jelte and Reny (2011) and "Microeconomic Theory", by Mas-Colell, Whinston and Green (1995), as well as research articles for the most advanced parts.

364-1058-00L Risk Center Seminar Series Number of participants limited to 50.

Abstract
This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. Students and other guests are welcome.

Objective
- Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop novel mathematical models for open problems, to analyze them with computers, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to work scientifically on an internationally competitive level.

Content
- This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. For details of the program see the webpage of the colloquium. Students and other guests are welcome.
This course is geared towards first and second-year Ph.D. students of MTEC. It is held as in a workshop style. Students attending this seminar will benefit from interdisciplinary discussions and insights into current and future work in business and economics research.

Objective
The purpose of this course is to:
- introduce students to the world of economics, management and systems research at MTEC
- make students aware of silo-thinking in the specific subdisciplines and encourage them to go beyond those silos
- discuss current issues with regard to substantive, methodological and theoretical domains of research in the respective fields

Abstract
This course introduces PhD students into the principles of experimental methods and outlines how to prepare, conduct and evaluate an experiment.

Content
1. Introduction: What are economic experiments and why to use them?
4. Conducting experiments: Instructions, testing, recruiting, sessions.
5. Measuring techniques: Eliciting beliefs, risk attitudes, social preferences.

Literature
Books:

Basic Articles:

A reading list with articles for each lecture has been published in Moodle.

Prerequisites / notice
This course is complemented by a course on programming experiments with z-tree. It is not mandatory but recommended to take both courses.

Pre-registration upon invitation required.

| Content     | PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min presentation of the results, 15 min discussion with the audience. |      |       |       |                         |
| Lecture notes | Slides will be distributed.                                         |      |       |       |                         |

| 151-1049-00L | Seminar in Fundamentals of Process Engineering                       | W    | 1     | 1S    | P. Rudolf von Rohr     |
|             | Only for master and doctoral students of Process and Chemical Engineering. |      |       |       |                         |
| Abstract    | This seminar covers actual subjects from the specific research areas of the laboratory of transport processes and reactions. |      |       |       |                         |
| Objective   | Scientific discussion on actual research topics.                    |      |       |       |                         |
| Content     | The contents are announced through the group's webpage.             |      |       |       |                         |
| Lecture notes | No textbook                                                        |      |       |       |                         |

|             | Does not take place this semester.                                   |      |       |       |                         |
| Objective   | Current advanced research activities in the areas of thermo- and fluid dynamics are presented and discussed, mostly by external speakers. Knowledge of advanced research in the areas of thermo- and fluid dynamics |      |       |       |                         |
| Prerequisites / notice | Permission of the PhD advisor and/or instructor.                   |      |       |       |                         |

| 151-0104-00L | Uncertainty Quantification for Engineering & Life Sciences          | W    | 4     | 3G    | P. Koumoutsakos         |
|             | Does not take place this semester.                                   |      |       |       |                         |
| Abstract    | Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology. |      |       |       |                         |
| Objective   | The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures. |      |       |       |                         |
| Content     | Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis. |      |       |       |                         |
| Lecture notes | The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class. |      |       |       |                         |
| Literature  | 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia          |      |       |       |                         |
|             | 2. Probability Theory: The Logic of Science by E. T. Jaynes         |      |       |       |                         |
|             | 3. Class Notes                                                      |      |       |       |                         |
| Prerequisites / notice | Fundamentals of Probability, Fundamentals of Computational Modeling |      |       |       |                         |

| 151-0107-20L | High Performance Computing for Science and Engineering (HPCSE) I     | W    | 4     | 4G    | M. Troyer, P. Chatzidoukas |
|             | This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering. |      |       |       |                         |
| Objective   | Introduction to HPC for scientists and engineers                    |      |       |       |                         |
|             | Fundamental of:                                                    |      |       |       |                         |
|             | 1. Parallel Computing Architectures                                 |      |       |       |                         |
|             | 2. MultiCores                                                       |      |       |       |                         |
|             | 3. ManyCores                                                        |      |       |       |                         |
### 151-0123-00L Experimental Methods for Engineers

**W** 4 credits 2V+2U  T. Rösgen, R. S. Abhari, K. Boulouchos, D. J. Norris, H.-M. Prasser, A. Steinfeld

**Abstract**
The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics and process engineering) are attended by students in small groups.

**Objective**
Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic applications. Understanding of various sensing technologies and analysis procedures. Exposure to typical experiments, diagnostics hardware, data acquisition and processing. Study of applications in the laboratory.

**Content**
In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, process engineering) Student participation in 8-10 laboratory experiments (study groups of 3-5 students, dependent on the number of course participants and available experiments)

A final exam evaluates the acquired knowledge individually.

**Lecture notes**
Presentations, handouts and instructions are provided for each experiment.

**Literature**

**Prerequisites / notice**
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

### 151-0182-00L Fundamentals of CFD Methods

**W** 4 credits 3G  A. Haselbacher

**Abstract**
This course is focused on providing students with the knowledge and understanding required to develop simple computational fluid dynamics (CFD) codes to solve the incompressible Navier-Stokes equations and to critically assess the results produced by CFD codes. As part of the course, students will write their own codes and verify and validate them systematically.

**Objective**
1. Students know and understand basic numerical methods used in CFD in terms of accuracy and stability.
2. Students have a basic understanding of a typical simple CFD code.
3. Students understand how to assess the numerical and physical accuracy of CFD results.

**Content**
1. Governing and model equations. Brief review of equations and properties
2. Overview of basic concepts: Overview of discretization process and its consequences
3. Overview of numerical methods: Finite-difference and finite-volume methods
4. Analysis of spatially discrete equations: Consistency, accuracy, stability, convergence of semi-discrete methods
5. Time-integration methods: LMS and RK methods, consistency, accuracy, stability, convergence
6. Analysis of fully discrete equations: Consistency, accuracy, stability, convergence of fully discrete methods
7. Solution of one-dimensional advection equation: Motivation for and consequences of upwinding, Godunov’s theorem, TVD methods, DRP methods
8. Solution of two-dimensional advection equation: Dimension-by-dimension methods, dimensional splitting, multidimensional methods
9. Solution of one- and two-dimensional diffusion equations: Implicit methods, ADI methods
10. Solution of one-dimensional advection-diffusion equation: Numerical vs physical viscosity, boundary layers, non-uniform grids
11. Solution of incompressible Navier-Stokes equations: Incompressibility constraint and consequences, fractional-step and pressure-correction methods
12. Solution of incompressible Navier-Stokes equations on unstructured grids

**Lecture notes**
The course is based mostly on notes developed by the instructor.

**Literature**
Literature: There is no required textbook. Suggested references are:

**Prerequisites / notice**
Prior knowledge of fluid dynamics, applied mathematics, basic numerical methods, and programming in Fortran and/or C++ (knowledge of MATLAB is "not" sufficient).

### 151-0517-00L Scientific Visualization for Engineering Applications

**W** 4 credits 2V+2P  X. Tricoche

**Abstract**
The course offers an introduction to the basic principles and most prominent methods of scientific visualization in science and engineering applications. The presentation will cover mathematical models and algorithms that support the depiction of 2D, 3D, and time-dependent datasets comprised of scalar, vector, and tensor attributes.

**Objective**
The course offers a self-contained introduction scientific visualization with an emphasis on basic principles and techniques that are most relevant to scientific and engineering applications.

The specific learning objectives are the following:
1. Basics: elementary notions of computer graphics and visual perception
2. Data processing: Relevant spatial data structures and smooth data reconstruction
3. Colors: Proper usage of colors in visualization
4. Scalar visualization: Level sets, salient surfaces, volume rendering and transfer function design
5. Vector visualization: Integral curves and surfaces, dense representation
6. Tensor visualization: Glyphs and integral curves
7. Flow visualization: automatic feature extraction and structure characterization
8. Visual abstraction: topological skeleton
obtain an overview of various topics in Robotics, Systems, and Controls from leaders in the field. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems---controls--151-0623-0.html for a list of upcoming lectures.

The course "Leading and Coaching Focus Project Teams (Basic Course)" for Autumn Semester is examined together with the course "Leading and Coaching Focus Project Teams (Advanced Course)" for Spring Semester with 4 ECTS.
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

**Abstract**

Aim is enhancement of knowledge and competency regarding coaching skills. Participants should be coaches of focus projects. Topics: Overview of the role and mindset of a coach, introduction into coaching methodology, building competencies by doing and exchanging good practices from former focus projects.

**Objective**

Basic knowledge about role and mindset of a coach; Knowledge and reflection about the classical problems in coaching of a focus project; Development of personal coaching skills; Knowledge and know-how about coaching methods; Reflection and exchange of experiences about personal coaching situations; Inspiration and learning from good cases regarding organizational and team management aspects.

**Content**

Content of both basic and advanced course (2 semester):
- Basic knowledge about role and mindset of a coach
- Introduction into coaching: definition & models
- Introduction into the coaching process
- Role of coaches between examinator and “friend”
- Knowledge and reflection about the problems in coaching a focus project
- Knowledge about team development
- Reflection about critical phases in the innovation process for an innovation team
- Know-how about reference model for analysis critical situations
- Development of personal coaching competencies, e.g. active listening, asking questions, giving feedback
- Competencies in theoretical models
- Coaching competencies: exercises and reflection
- Knowledge and know-how about coaching methods
- Knowledge about basic coaching methods for technical projects/innovations projects
- Know-how about usage of methods in the coaching process
- Facilitating decisions
- Using and applying coaches opinions and knowledge
- Reflection and exchange of experiences about personal coaching situations
- Self-reflection
- Exchange of experiences in the lecture group
- Good practice on organizational and management aspects
- How to do system and concurrent engineering
- Project planning and replanning
- Facilitating conflict situations
- Discussing sample cases from former teams and actual cases of participants.

**Lecture notes**

Slides, script and other documents will be distributed via electronically (access only for participants registered to this course).

**Literature**

Please refer to lecture script.

**Prerequisites / notice**

Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.

The course "Leading and Coaching Focus Project Teams (Basic Course)" (HS) is examined together with "Leading and Coaching Focus Project Teams (Advanced Course)" (FS) in FS with 4 ECTS.

**151-0833-00L**

**Principles of Nonlinear Finite-Element-Methods**

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

**Objective**

The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:
- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex nonlinear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

**Content**

- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

**Lecture notes**

yes

**Literature**

**Prerequisites / notice**

If we will have a large number of students, two dates for the exercises will be offered.

**351-0778-00L**

**Discovering Management**

Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Excercises) 351-0778-01.

**Abstract**

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.
Discovering Management combines in an innovative format a set of lectures and an advanced business game. The learning model for
Discovering Management involves ‘learning by doing’. The objective is to introduce the students to the relevant topics of the management
literature and give them a good introduction in entrepreneurship topics too. The course is a series of lectures on the topics of strategy,
innovation, corporate finance, leadership, design thinking and corporate social responsibility. While the 14 different lectures provide the
theoretical and conceptual foundations, the experiential learning outcomes result from the interactive business game. The purpose of the
business game is to analyse the innovative needs of a large multinational company and develop a business case for the company to grow.
This business case is as relevant to someone exploring innovation within an organisation as it is if you are planning to start your own
business. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students’ understanding
of factors driving innovation, entrepreneurship, and company success.

This course is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD
students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard
curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

|             | https://moodle-app2.let.ethz.ch/course/view.php?id=2209 |
|             | All the materials uploaded on Moodle must be considered as required readings. |
| 363-0389-00L| Technology and Innovation Management | W     | 3 credits|                         |
|             | Abstract                      |       |         |                         |
|             | This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change. |
|             | Objective                     |       |         |                         |
|             | This course intends to enable all students to:  
|             | - understand the core concepts necessary to analyze how innovation happens  
|             | - master the most common methods and tools organizations deploy to innovate  
|             | - develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation |
|             | Content                       |       |         |                         |
|             | This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small.  
|             | How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work. |
|             | Lecture notes                 |       |         |                         |
|             | Slides will be available on the TIMGROUP website. |
|             | Literature                    |       |         |                         |
|             | Readings will be available on the TIMGROUP website. |
|             | Prerequisites / notice         |       |         |                         |
|             | No specific background in economics or management is required. |

**363-0403-00L**

Abstract

The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.
### Objective

After taking the lecture, students should have knowledge on

1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
   - Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

### Content

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry.

The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by two Teaching Assistants (Zhiying Cui and Jana Gross) and the professor (Prof. F. v. Wangenheim).

### Literature

- Weekly readings, distributed in class (via Moodle)

### 363-0503-00L Principles of Microeconomics

<table>

<th>2G</th>
<th>M. Filippini</th>
</tr>
</thead>
</table>
| Objective | The learning objectives of the course are:
| 1) Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can apply simple mathematical treatment of some basic concepts and can solve utility maximization and cost minimization problems. |
| Lecture notes | Lecture notes, exercises and reference material can be downloaded from Moodle. |
| Literature | N. Gregory Mankiw and Mark P. Taylor (2014), "Economics", 3rd edition, South-Western Cengage Learning. The book can also be used for the course 'Principles of Macroeconomics' (Sturmi) |
| Prerequisites / notice | For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book: N. Gregory Mankiw and Mark P. Taylor (2014), "Microeconomics", 3rd edition, South-Western Cengage Learning. |
| Complementary: |

<tr>
<td>Objective</td>
<td>The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffman focusing on related case-studies in management.</td>

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

### 363-0711-00L Accounting for Managers

| W | 3 credits | 2V | M. Passardi |

---

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 453 of 1571
Abstract
Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes

Objective
Understand the different procedures involved in the accounting system
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product

Content

Prerequisites / notice
This course is a prerequisite for the course Financial Management.

363-0790-00L Technology Entrepreneurship

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

Objective
This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Content
See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

Lecture notes
Lecture slides and case material

363-1021-00L Monetary Policy

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

Objective
This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Content
See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

Lecture notes
Lecture slides and case material

401-0625-01L Applied Analysis of Variance and Experimental Design

Abstract

Objective
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Content

Literature

Prerequisites / notice
Basic knowledge in international economics and a good background in macroeconomics. The course website can be found at: https://moodle-app2.let.ethz.ch/course/view.php?id=2467

535-0546-00L Patents

Abstract
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmacetics. Introduction into intellectual property; prosecution of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmaceutics and medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.

Content
1. Introduction into industrial property (patents, trademarks, industrial designs);
2. Prosecution of patent applications (patentability);
3. Patent information (patent publications, databases, searches);
4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement);
5. Peculiarities in pharmaceutics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication);
6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions);
7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharma-trademarks.

Literature

636-0507-00L Synthetic Biology II

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).
Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external,) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course

Prerequisites / notice
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

851-0180-00L Research Ethics 2G G. Achermann
Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective
The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

- European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
Fourier Analysis in Function Space Theory

In the most important part of the course, we will present the notion of Singular Integrals and Calderón-Zygmund theory as well as its application to the analysis of linear elliptic operators.

In the first lectures we will review the theory of tempered distributions and their Fourier transforms. We will go in particular through the notion of Fréchet spaces, Banach-Steinhaus for Fréchet spaces etc. We will then apply this theory to the Fourier characterization of Hilbert-Sobolev spaces.

In the second part of the course we will study fundamental properties of the Hardy-Littlewood Maximal Function in relation with L^p spaces. We will then make a digression through the notion of Marcinkiewicz weak L^p spaces and Lorentz spaces. At this occasion we shall give in particular a proof of Aoki-Roelwicz theorem on the metrisability of quasi-normed spaces. We will introduce the preduals to the weak L^p spaces, the Lorentz L^{p,r} spaces as well as the general L^{p,[q]} spaces and show some applications of these dualities such as the improved Sobolev embeddings.

In the third part of the course, the most important one, we will present the notion of Singular Integrals and Calderón-Zygmund theory as well as its application to the analysis of elliptic operators.

This theory will naturally bring us, via the so called Littlewood-Paley decomposition, to the Fourier characterization of classical Hilbert and non-Hilbert Function spaces which is one of the main goals of this course.

If time permits we shall present the notion of Paraproduct, Paracompositions and the use of Littlewood-Paley decomposition for estimating products and general non-linearities. We also hope to cover fundamental notions from integrability by compensation theory such as Coifman-Rochberg-Weiss commutator estimates and some of its applications to the analysis of PDE.

4) Loukas Grafakos, “Modern Fourier Analysis” GTM 250 Springer.
Projective Spaces: Abelian Varieties over Finite Fields

*Prerequisites / notice*

Notions from ETH courses in Measure Theory, Functional Analysis I and II (Fundamental results in Banach and Hilbert Space theory, Fourier transform of L^2 Functions)

**401-4145-66L**

**Reading Course: Abelian Varieties over Finite Fields**

**W** 2 credits 4A J. Fresán, P. S. Jossen

**Abstract**

In this course we will study projective spaces over finite fields, which are crucial in many areas of mathematics. We will cover topics such as algebraic varieties, finite fields, and projective geometry. This course is perfect for students interested in algebraic geometry and number theory.

**Content**

We will start by introducing the basics of algebraic geometry and finite fields. Then, we will delve into the theory of projective spaces, discussing their properties and applications. Throughout the course, we will emphasize the connections between projective spaces and other areas of mathematics.

**Literature**

**Prerequisites / notice**

Basic knowledge of algebra and geometry is recommended. Familiarity with finite fields and algebraic structures will be beneficial.

---

**401-4147-66L**

**Perfectoid Spaces**

**W** 0 credits 2V M. H. Hedayat Zadeh Razavi

**Abstract**

Perfectoid spaces are a recent development in arithmetic geometry, introduced by Peter Scholze. They provide a powerful tool for studying p-adic geometry and have applications in various areas of mathematics. The course will introduce the concept of perfectoid spaces and explore their properties and applications.

**Content**

We will begin by defining perfectoid spaces and discussing their basic properties. Then, we will explore their connections with other areas of mathematics, such as p-adic Hodge theory and Galois representations. Throughout the course, we will emphasize the geometric aspects of perfectoid spaces.

**Literature**

**Prerequisites / notice**

A basic understanding of algebraic geometry and number theory is recommended. Knowledge of p-adic Hodge theory and Galois representations will be beneficial.

---

**401-3225-00L**

**Introduction to Lie Groups**

**W** 8 credits 4G P. D. Nelson

**Abstract**

Lie groups are smooth manifolds that are also groups, with the group operations being smooth maps. They play a crucial role in many areas of mathematics, including geometry, topology, and analysis. This course will introduce the basic theory of Lie groups and their Lie algebras.

**Objective**

The goal of this course is to develop a foundational understanding of Lie groups and their Lie algebras. We will cover topics such as definitions, examples, and basic properties of Lie groups.

**Content**

We will start by defining Lie groups and discussing their basic properties. Then, we will explore their Lie algebras, discussing their structure and representation theory. Throughout the course, we will emphasize the geometric and algebraic aspects of Lie groups.

**Literature**

- V. S. Varadarajan: *Lie groups, Lie algebras, and their representations*. Springer-Verlag
- J. Frank Adams: *Lie groups and algebraic groups*. Cambridge University Press

**Prerequisites / notice**

A basic understanding of topology and linear algebra is recommended. Knowledge of group theory and basic differential geometry will be beneficial.

---

**401-4531-66L**

**Topics in Rigidity Theory**

**W** 6 credits 3G M. Burger

**Abstract**

This course will introduce the basic techniques of rigidity theory. We will cover topics such as rigidity of actions, rigidity of groups, and rigidity of geometric structures.

**Objective**

The aim of this course is to give detailed proofs of Margulis' normal subgroup theorem and his superrigidity theorem for lattices in higher rank Lie groups.

**Content**

We will start by introducing the basic concepts of rigidity theory. Then, we will explore the rigidity of actions, discussing theorems such as the Tits alternative and the Tits alternative for algebraic groups. We will also cover the rigidity of groups, discussing theorems such as the superrigidity theorem of Margulis.

**Literature**

- M. Burger: *Rigidity and Arithmeticity*, European School of Group Theory, 1996, handwritten notes, will be put online.
- Y. Benoist: *Five lectures on lattices in semisimple Lie groups*, available on his homepage.
- H. Samelson: *Notes on Lie algebras* (Springer, '90)
- E. Spanier, *Algebraic topology*, Springer-Verlag

**Prerequisites / notice**

For this course some knowledge of elementary Lie theory would be good. We will however treat Lie groups by examples and avoid structure theory since this is not the point of the course nor of the techniques.

---

**401-3001-66L**

**Algebraic Topology I**

**W** 8 credits 4G P. S. Jossen

**Abstract**

This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

**Literature**

3) E. Spanier, *Algebraic topology*, Springer-Verlag

**Prerequisites / notice**

Some knowledge of elementary geometry and differential topology is useful but not absolutely necessary.

---

**401-3536-11L**

**Geometric Aspects of Hamiltonian Dynamics**

**W** 6 credits 3V P. Biran

**Abstract**

The course will concentrate on the geometry of the group of Hamiltonian diffeomorphisms introduced by Hofer in the early 1990's and its relations to various topics in symplectic geometry such as capacities, Lagrangian submanifolds, holomorphic curves, as well as recent algebraic structures on the group of Hamiltonian diffeomorphisms such as quasi-morphisms.

**Literature**

Books:
- L. Polterovich: *The geometry of the group of symplectic diffeomorphisms* (Springer, '98)
- H. Hofer & E. Zehnder: *Symplectic invariants and Hamiltonian dynamics*

**Prerequisites / notice**

Prerequisites. Good knowledge of undergraduate mathematics (analysis, complex functions, topology, and differential geometry). Some knowledge of elementary algebraic topology would be useful.

Data: 06.08.2021 13:03  Autumn Semester 2016 Page 462 of 1571
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and A selection of the following topics will be covered:

- Elliptic boundary value problems
- Galerkin discretization of linear variational problems
- The primal finite element method
- Mixed finite element methods
- Discontinuous Galerkin Methods
- Boundary element methods
- Spectral methods
- Adaptive finite element schemes
- Singularly perturbed problems
- Sparse grids
- Galerkin discretization of elliptic eigenproblems
- Non-linear elliptic boundary value problems
- Discretization of parabolic initial boundary value problems

Lecture notes
Course slides will be made available to the audience.

Prerequisite / notice
Practical exercises based on MATLAB
Abstract
Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content
This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Lecture notes
Not available

Literature
A list of references will be distributed during the course.

Prerequisites / notice
Basic knowledge in probability and statistics

401-3627-00L
High-Dimensional Statistics
W
4 credits
2V
P. L. Bühlmann

Abstract
"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference

Content
Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Prerequisites / notice
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-4889-00L
Mathematical Finance
W
11 credits
4V+2U
M. Schweizer

Abstract
Advanced introduction to mathematical finance:
- absence of arbitrage and martingale measures
- option pricing and hedging
- optimal investment problems
- additional topics

Objective
Advanced level introduction to mathematical finance, presupposing knowledge in probability theory and stochastic processes

Content
This is an advanced level introduction to mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this in both discrete- and continuous-time models. Topics include absence of arbitrage and martingale measures, option pricing and hedging, optimal investment problems, and probably others. Prerequisites are probability theory and stochastic processes (for which lecture notes are available).

Literature
Details will be announced in the course.

Prerequisites / notice
Prerequisites are probability theory and stochastic processes (for which lecture notes are available).

402-0861-00L
Statistical Physics
W
10 credits
4V+2U
G. Blatter

Abstract
This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory and hydrodynamics. In a more advanced part degenerate Fermions, Bose-Einstein condensation, real Bose gases, magnetism, general mean field theory and critical phenomena will be addressed.

Objective
This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics education.

Content
- Basics of phenomenological thermodynamics, three laws of thermodynamics.
- Hydrodynamics.
- Classical statistical physics: microcanonical ensembles, canonical ensembles and grandcanonical ensembles, applications to simple systems.
- Quantum statistical physics: single particle, ideal quantum gases, fermions and bosons.
- Degenerate fermions: Fermi gas, electrons in magnetic field.
- Bosons: Bose-Einstein condensation, Bogoliubov theory, superfluidity.
- Critical phenomena: mean field, series expansions, scaling behavior, universality.
- Renormalization group: fixed points, simple models.

Literature
Lecture notes available in german.

401-3059-00L
Combinatorics II
W
4 credits
2G
N. Hungerbühler

Abstract
The course Combinatorics I and II is an introduction into the field of enumerative combinatorics.

Objective
Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

Content
Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

401-3640-66L
Monte Carlo and Quasi-Monte Carlo Methods: Mathematical and Numerical Analysis
W
4 credits
2S
C. Schwab

Abstract
Introduction and current research topics in the theory and implementation of Monte Carlo and quasi-Monte Carlo methods and applications.
Prerequisites / notice

Prerequisites:
Completed courses
Numerical Analysis of Elliptic/ Parabolic PDEs,
or Numerical Analysis of Hyperbolic PDEs,
or Numerical Analysis of Stochastic ODEs,
and FAI, Probability Theory I.

401-4600-66L Student Seminar in Probability
W 4 credits 2S A.-S. Sznitman, J. Bertoin, P. Nolin, W. Werner

Content

The seminar is centered around a topic in probability theory which changes each semester.
The student seminar in probability is held at times at the undergraduate level (typically during the spring term) and at times at the graduate level (typically during the autumn term). The themes vary each semester.

The number of participants to the seminar is limited. Registration to the seminar will only be effective once confirmed by email from the organizers.

Abstract

The Graduate Colloquium is an informal seminar aimed at graduate students and postdocs whose purpose is to provide a forum for communicating one's interests and thoughts in mathematics.

Research colloquium

Objective

Expose graduate students to ongoing research activities (including applications) in the domain of optimization.
This seminar is a forum for researchers interested in optimization theory and its applications. Speakers are expected to stimulate discussions on theoretical and applied aspects of optimization and related subjects. The focus is on efficient algorithms for continuous and discrete optimization problems, complexity analysis of algorithms and associated decision problems, approximation algorithms, mathematical modeling and solution procedures for real-world optimization problems in science, engineering, industries, public sectors etc.

Modern Aspects in Surface Science Research: Techniques and Applications

Number: 402-0317-00L
Type: 6 credits
ECTS: 2V+1U
Lecturers: S. Schön, W. Wegscheider

Abstract:
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective:
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

Content:
Fundamentals of Solid State Physics: Semiconductor materials, band structures, carrier statistics in intrinsic and doped semiconductors, p-n junctions, low-dimensional structures; Bulk Material growth of Semiconductors: Czochralski method, floating zone method, high pressure synthesis; Semiconductor Epitaxy: Fundamentals, MBE, MOCVD, LPE; In situ characterization: RHEED, LEED, AES, XPS, process control (temperature, thickness)

Course contents:
1) Division and reminder of bulk crystals (week 1):
   Reminder of the crystal structure, x-ray diffraction and determination of the crystal structure.
2) Crystal surfaces (weeks 2 and 3):
   Definitions, description of surfaces, and reconstructions; Moiré patterns; quasi-crystals.
3) Imaging surfaces with electrons (week 4):
   SEM, LEED, LEEM
4) Imaging surfaces with ions (week 5):
   LEIS, He-ion microscopy
5) Introduction to probe microscopy (week 6):
   General problems, field ion microscopy, topografiner
6) Scanning Tunnelling Microscopy (weeks 6, 7 and 8):
   Tunnelling problem (reminder), work function derivation and measurement with STM, imaging surfaces in real space, surface reconstructions, examples form metals and semiconductors and hybrid surface systems
7) Atomic force microscopy (week 9):
   Technique, basics, examples.
8) Electronic structure of the bulk (week 10):
   Reminders; density of states, band structure, low dimensional systems
9) Electronic structure of surfaces (week 11):
   Bulk derived states, image states, examples from STM research
10) Photoelectric emission (week 12):
    Basics of spectroscopy with x-rays and electrons.

11) STM and AFM derived spectroscopy techniques (weeks 13 and 14):
    Comparative studies of Scanning Tunnelling spectroscopy (STS) to other integral spectroscopic methods.
   6) Charles Kittel, Introduction to Solid State Physics (8th Ed.)
   7) Neil W. Ashcroft and N. David Mermin, Solid State Physics
   8) Harald Ibach and Hans Lüth, Solid-State Physics: An Introduction to Principles of Materials Science
   9) Further reading material will be supplied.

At least, 4 homework will be assigned.
Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

1. Experimental techniques, an overview
   1.1 First experiments on electron dynamics and lattice heating
   1.2 The finite lifetime of excited states
   1.3 Detection of lifetime effects
   1.4 Dynamical properties of reactions and adsorbents

2. Dynamics of the lattice
   2.1 Phonons
   2.2 Non-thermal melting

3. Dynamics of the electron gas
   3.1 Laser induced ultrafast demagnetization
   3.2 Ultrafast spin currents generated by lasers
   3.3 Landau-Lifschitz-Dynamics
   3.4 Laser induced switching

5. Correlated materials

This course presents a comprehensive discussion of optical processes in semiconductors. The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these material, enabled numerous applications (lasers, LEDs and solar cells) as well as the realization of new physical concepts. Systems that will be covered include quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

Electronic states in III-V materials and quantum structures, optical transitions, excitons and polaritons, novel two dimensional semiconductors, spin-orbit interaction and magneto-optics.

This lecture is complementary to the lecture on "ultrafast methods for solid state physics" of the spring semester. Both lectures can be attended independently. The focus of this lecture is on the optical processes whereas the focus of the "ultrafast methods for solid state physics" lecture is on the experimental techniques.

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e. quantum point contacts, Aharonov-Bohm rings and quantum dots.

1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots
5. Introduction and overview
6. Semiconductor crystals: Fabrication and band structures
7. k-p-theory, effective mass
8. Envelope functions and effective mass approximation, heterostructures and band engineering
9. Fabrication of semiconductor nanostructures
10. Electrostatics and quantum mechanics of semiconductor nanostructures
11. Heterostructures and two-dimensional electron gases
12. Drude Transport
13. Electron transport in quantum point contacts; Landauer-Büttiker description
14. Ballistic transport experiments
15. Interference effects in Aharonov-Bohm rings
16. Electron in a magnetic field, Shubnikov-de Haas effect
17. Integer quantum Hall effect
18. Coulomb blockade and quantum dots
This course reviews current research topics in Terahertz Science with a strong focus on scientific applications in physics, chemistry and materials science. The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons.

The course will focus predominantly on understanding research conducted over the last 4-5 years at the forefront of this developing field, with a strong emphasis on nonlinear THz science which has only recently become possible. This in particular has generated excitement as it offers potential new ways to control chemical reactions and/or phase transitions in materials.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. The former course title of this course is "Terahertz Technology and Applications".

The course is taught in English.

**Lecture notes**

In addition to the lecture notes, the following supplementary books can be recommended:

**Prerequisites / notice**
The lecture is suitable for all physics students beyond the bachelor of science degree. Basic knowledge of solid state physics is recommended. Very ambitioned students in the third year may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.

**Lecture notes**
Modern Topics in Terahertz Science

W  6 credits  2V+1U  S. Johnson

Abstract
This course reviews current research topics in Terahertz Science with a strong focus on scientific applications in physics, chemistry and biology, as well as the emerging field of nonlinear THz optics.

Objective
Terahertz frequency electromagnetic radiation lies at the border between electronics and optics, and as such has many unique properties that make it well-suited to study the electronic, magnetic and structural properties of many materials. The course objective is to give students the ability to identify problems of current interest in physics, chemistry, materials science and biology that can be potentially addressed using terahertz photonics and to design potential experimental solutions.

Content
The course will focus predominantly on understanding research conducted over the last 4-5 years at the forefront of this developing field, with a strong emphasis on nonlinear THz science which has only recently become possible. This in particular has generated excitement as it offers potential new ways to control chemical reactions and/or phase transitions in materials.

- Overview of THz & interactions with matter
- THz generation and detection
- Linear THz spectroscopies
- Imaging
- Nonlinear THz interactions

**Lecture notes**
Scripts will be distributed via moodle.

Literature
The readings for the course will draw mostly on current journal articles that will be distributed in class/via moodle. There is also a general textbook listed below available electronically via the ETH library system. You can also order a black-and-white paperback via an "on-demand" system for a pretty reasonable price.

- Principles of Terahertz Science and Technology, Yun-Shick Lee (Springer, 2008).
- Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"
- Byrne: "Neutrons, Nuclei and Matter"
- Carlile & Willis: "Experimental Neutron Scattering"
- Rauch & Werner: "Neutron Interferometry"
- Golub, Richardson & Lamoreaux: "Ultra-Cold Neutrons"
- Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"

**Prerequisites / notice**
The former course title of this course is "Terahertz Technology and Applications".

**Lecture notes**
In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons.

The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons.

Content
Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From piconic hydrogen to the strong interaction and effective field theories
- etc.

**Literature**
- Golub, Richardson & Lamoreaux: "Ultra-Cold Neutrons"
- Rauch & Werner: "Neutron Interferometry"
- Carlile & Willis: "Experimental Neutron Scattering"
- Byrne: "Neutrons, Nuclei and Matter"
- Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"

**Prerequisites / notice**
Einführung in die Kern- und Teilchenphysik / Introduction to Nuclear- and Particle-Physics
Literature
D.O. Caldwell, Current Aspects of Neutrino Physics, Springer.

402-0883-63L Symmetries in Physics
W 6 credits 2V+1U M. Gaberdiel
Abstract
The course gives an introduction to symmetry groups in physics. It explains the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrates their important role in modern physics.
Objective
The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

402-0898-00L The Physics of Electroweak Symmetry Breaking
W 6 credits 2V+1U not available
Abstract
Does not take place this semester.
The aim is to understand the need of physics beyond the Standard Model, the basic techniques of model building in theories BSM and the elements of collider physics required to analyze their phenomenological implications. After an introduction to the SM and alternative theories of electroweak symmetry breaking, we will investigate these issues in the context of models with warped extra dimensions.
Objective
After the course the student should have a good knowledge of some of the most relevant theories beyond the Standard Model and have the techniques to understand those theories that have not been surveyed in the course. He or she should be able to compute the constraints on any model of new physics, its successes explaining current experimental data and its main phenomenological implications at colliders.
Prerequisites / notice
The former title of this course unit was "The Physics Beyond the Standard Model". If you already got credits for "The Physics Beyond the Standard Model" (402-0898-00L), you cannot get credits for "The Physics of Electroweak Symmetry Breaking" (402-0898-00L).

402-0845-60L Quantum Field Theory III: EFT and SUSY
W 6 credits 2V+1U G. Isidori
Abstract
This course provides a comprehensive introduction to two advanced topics in Quantum Field Theory: Effective Field Theories (EFTs) and Supersymmetry (SUSY).
Content
In the first part we will discuss the basic concepts of EFTs, with particular attention to the concepts of decoupling of heavy degrees of freedom, matching and renormalization, chiral Lagrangians. The Standard Model viewed as an EFT will also be discussed as a specific application. The second part of the course is devoted to Supersymmetry, starting from the discussion of the SUSY algebra and its representations, to arrive, after the presentation of the superfield formalism, to the construction of the supersymmetric version of gauge field theories. A phenomenological discussion of the mechanisms of SUSY breaking and the construction of viable supersymmetric extensions of the Standard Model will also be presented.
Topics:
- Introduction to Effective Field Theories
- The Appelquist-Carrazone theorem
- The matching procedure
- Chiral Lagrangians
- The SM as an EFTs
- The SUSY algebra
- Superspace and superfields
- Supersymmetric field theories
- Supersymmetric gauge theories
- Supersymmetry breaking
- The Minimal supersymmetric Standard Model

Literature
J. Wess and J. Bagger, "Supersymmetry and supergravity".
Mueller-Kirsten & Wiedemann, "Introduction to supersymmetry".
Prerequisites / notice
QFT-I (mandatory) and QFT-II (highly recommended).

402-0899-65L Higgs Physics
W 6 credits 2V+1U M. Grazzini
Abstract
Does not take place this semester.
The course introduces the theory and phenomenology of the recently discovered Higgs boson. With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.
Objective
With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.
The course introduces analysis techniques, the basics of astronomical instruments, real-world observational tools, data reduction strategy and software packages used in astrophysics research. The course will also include discussions of current topics in astrophysics with a focus on active galaxies. The course will include the reduction and analysis of real data from a variety of observatories.

Major topics include:
- Scientific programming and analysis tools
- How to set up your computing environment, data management, catalog generation and the Virtual Observatory, collaborative tools
- Optical imaging and spectroscopy:
  - Basics of observatories (ground vs space), multi-wavelength data, detector types, reduction and analysis strategies for imaging and spectroscopic data, types of spectrographs, interpreting spectra including stellar and galaxy evolution models
  - X-ray, IR and radio astronomy
  - Basics of X-ray and high energy detectors and telescopes, spectral fitting, basics of radio astronomy, interferometric observations, aperture synthesis, source confusion and decomposition
- Planning of observations and proposal writing.
- Analysis of real-world data

various examples from across the spectrum (ground and space-based)

Astrophysics I is required and Astrophysics II is recommended. Some programming skills in Python or similar languages are necessary.

Statistical methods play a vital role in modern cosmology and astrophysics studies. This course will give an overview of the statistical principles and tools that are used in these fields. Topics covered will include basic probability theory, Bayesian inference, hypothesis testing, sampling and estimators.

Develop an understanding of basic probability and statistical theory. Gain practical knowledge of statistical methods commonly used in cosmology and astrophysics.

Credit or current enrollment in Astrophysics I is recommended but not required.

Knowledge of advanced research in the area of energy, and software packages used in astrophysics research. The course will also include discussions of current topics in astrophysics with a focus on active galaxies. The course will include the reduction and analysis of real data from a variety of observatories.

Advanced Course in Neurobiology I (Functional Neuroanatomy of the Rodent Brain) (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: SPV0Y009

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Objective

1) Human Neuroanatomy I&II
2) Comparative Neuroanatomy
3) Development I&II
4) Membran and Action Potential
5) Synaptic Transmission & Plasticity I&II
6) Glia and Blood-Brain-Barrier
7) Somatosensory and Motor System
8) Visual System
9) Auditory System
10) Circuits underlying Emotion
11) Modeling of Neural Circuits

Prerequisites / notice

For doctoral students of the Neuroscience Center Zurich (ZNZ).

Advanced Course in Neurobiology I (Functional Neuroanatomy of the Rodent Brain) (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: SPV0Y009

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Objective

This credit point course is designed for doctoral students who have successfully completed the Introductory Course in Neuroscience at the Neuroscience Center Zürich. The goal is to provide students with a broader and deeper knowledge in several important areas of neurobiology.

Prerequisites / notice

Current Topics in Accelerator Mass Spectrometry and E-Their Applications

The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

Prerequisites / notice

Follow-up of the block course "An Introduction to the Perturbative Pomeron and to the BFKL Equation in QCD and in N=4 SYM in the last decade.

The BFKL Equation Reloaded and the Multi-Regge Kinematics in QCD and in N=4 SYM

The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Objective

The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Content

- the BFKL Hamiltonian as an integrable model
- the analytic structure of the Mueller-Navelet jet cross sections in QCD
- the analytic properties of N=4 SYM amplitudes in multi-Regge kinematics

Prerequisites / notice

Follow-up of the block course "An Introduction to the Perturbative Pomeron and to the BFKL Equation in QCD and in N=4 SYM"

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 474 of 1571
The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

Prerequisites / notice

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017. Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis - inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593)).

551-0205-00L Challenges in Plant Sciences

Number of participants limited to 40.

Abstract

The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

Major objectives of the colloquium are:

- introduction of graduate students and Master students to the broad field of plant sciences
- promotion of an interdisciplinary and integrative teaching program
- promotion of active participation and independent work of students
- promotion of presentation and discussion skills
- increased interaction among students and professors

Objective

- How can microbes feed the world (American Academy of Microbiology) http://academy.asm.org/index.php/browse-all-reports/800-how-microbes-can-help-feed-the-world

- Can microbes feed the world? (Society for general microbiology) http://www.sgm.ac.uk/en/publications/microbiology-today/past-issues.cfm/publication/can-microbes-feed-the-world

Prerequisites / notice:
Physics I, II, Environmental Fluid Dynamics
1) Einführung in die Problematik  Motivation
Begriffe (UV-C, UV-B, UV-A,...)
Einfluss der UV Strahlung auf Biosphäre (Mensch, Tier, Pflanzen)
Positive und schädliche Effekte
Wirkungsspektrum, Konzept, Beispiele
UVIndex

2) Geschichtlicher Rückblick
Rayleigh - Himmelsblau
1907: Dorno, PMOD
1970: Bener, PMOD
1980: Berger, Erythemal sunburn meter
1990- : State of the Art

3) Extraterrestrische UV Strahlung
Spektrum
Energieverteilung
Variabilität (Spektral, zeitlich, relativ zu Totalstrahlung)
Satellitenmessungen, Übersicht

4) Einfluss der Atmosphäre auf die solare UV Strahlung
Atmosphärenaufbau
Beinflussende Parameter (Ozon, Wolken, ...)
Ozon, Stratosphärisches versus troposphärisches
Geschichte: Ozon-depletion, Polare Ozonlöcher und Einfluss auf die UV Strahlung
Wolken
Aerosole
Rayleighstreueung
Trends (Ozon, Wolken, Aerosole)
Radiation Amplification Factor (RAF)

5-6) Strahlungstransfer
Strahlungstransfegleichung
Modellierung, DISORT
libRadtran, TUV, FASTRT
Parameter
Sensitivitätsstudien
Vergleiche mit Messungen
3-D Modellierung (MYSTIC)
Beer-Lambert Gesetz

7) Strahlungsmessungen
Instrumente zur Strahlungsmessung
Messgrössen: Irradiance (global, direct, diffus), radiance, aktinischer Fluss
Horizontale und geneigte Flächen
Generelle Problematic: Freiluftmessungen...
Qualitätssicherung

8) Solare UV Strahlungsmessungen
Problematic: Dynamik, Spektrale Variabilität, Alterung
Stabilität
Spezifische Instrumente: Filtrerradiometer, Spektro radiometer, Dosimetrie
Übersicht Aufbau und Verwendung

9-10) Solare UV Strahlungsmessgeräte
Spektro radiometer, Filtrerradiometer (Breit und schmalbandig)
Charakterisierung
Kalibriermethoden (Im Labor, im Feld)
Qualitätssicherung, Messkampagnen

11-12) Auswerteverfahren
Atmosphärische Parameter aus Strahlungsmessungen
Ozon, SO2
Albedo (Effektiv versus Lokal)
Aerosol Parameter (AOD, SSA, g, Teilchenverteilungen)
Zusammenspiel Messungen - Modellierung
Aktinische UV-Strahlungsflüsse und Bestimmung von atmosphärischen Photolysefrequenzen

13) UV Klimatologie
Trends
UV Klimatologie durch Messnetze
UV Klimatologie durch Satellitenmessungen am Beispiel von TOMS
Modellierung am Beispiel Meteosat-JRC
UV Rekonstruktionen

14) Aktuelle Forschungen
Internationale Projekte, Stand der Forschung

---

**Abstract**

The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.
The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

Lecture notes

Documents are provided in the contact hours.

Literature

Prerequisites / notice

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1211-01L Master's Seminar: Atmosphere and Climate 1 W 3 credits 2S H. Joos, O. Stebler, F. Tummon, M. A. Wüst

Abstract

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective

Training scientific writing skills.

Content

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Attendance is mandatory.

651-4095-01L Colloquium Atmosphere and Climate 1 W 1 credit 1K H. Joos, C. Schär, D. N. Bresch, N. Gruber, R. Knutti, U. Lohmann, T. Peter, S. I. Seneviratne, H. Wernli, M. Wild

Abstract

The colloquium is a series of scientific talks by prominent invited speakers assembling interested students and researchers from around Zürich. Students take part of the scientific discussions.

Objective

The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

Objective

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

Prerequisites / notice

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent).

Ecological Assessment and Evaluation

Publications and class notes can be downloaded from a web page announced during the lecture.

Powerpoint slides are available on the webpage. Additional documents are handed out as copies.

Students will be able to:

- critically consider biological data books and local, regional, and national inventories;
- evaluate the validity of ecological criteria used in decision making processes;
- critically appraise the handling of ecological data and criteria used in the process of evaluation
- critically appraise the handling of ecological data and criteria used in the process of evaluation;

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequstration options and to evaluate their potential, their cost, and their consequences.

From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Carbon Mitigation

W 3 credits 2G N. Gruber

Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequstration options and to evaluate their potential, their cost, and their consequences.

None

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

Eco\-logy and Evolution

Seminar in Evolutionary Ecology of Infectious Diseases

W 3 credits 2G D. Croll, S. Bonhoeffer, R. R. Regös

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Papers will be assigned and downloaded from a web page announced during the lecture.

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Ecological Assessment and Evaluation

W 3 credits 3G F. Knaus, U. Bollens Hunziker

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

Students will be able to:

1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Powerpoint slides are available on the webpage. Additional documents are handed out as copies.

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Research Seminar: Ecological Genetics

W 2 credits 1S A. Widmer, S. Fior

In this research seminar we will critically discuss current topics in Ecological Genetics using publications from the leading scientific journals in this field.

It is our aim that participants gain insight into the current research topics and knowledge available in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

none

The minimum number of participants is 4.

Active participation in the discussions is a prerequisite for this course.

Genetic Diversity: Techniques

W 2 credits 2P A. M. Minder Pfyli

This course provides training for advanced students (master, doctoral or post-doctoral level) in how to measure and collect genetic diversity data from populations, experiments, field and laboratory. Different DNA/RNA extraction, genotyping and gene expression techniques will be addressed. Choice of topic by demand and/or availability of data.

To learn and improve on standard and modern methods of genetic data collection. Examples are: use of pyrosequencing, expression analysis, SNP-typing, next-generation sequencing, etc. A course for practitioners.

After an introduction (one afternoon), students will have 3 weeks to work independently or in groups through different protocols. At the end the whole group meets for another afternoon to present the techniques/results and to discuss the advantages and disadvantages of the different techniques.

Techniques addressed are: RNA/DNA extractions and quality control, SNP genotyping, pyrosequencing, real-time qPCR.

Autumn Semester 2016

Page 480 of 1571

Data: 06.08.2021 13:03
The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and theories. To analyze the evolution as well as the key elements of environmental governance.

Abstract

Interaction seminar. Student-mediated presentations, guests and discussions on current themes in ecology, evolutionary and population biology.

Objective

Getting familiar with scientific arguments and discussions. Overview of current research topics. Making contacts with fellow students in other groups.

Content

Scientific talks and discussions on changing subjects.

Literature

For information and details: http://www.eco.ethz.ch/news/zis or contact: Lehrereve@env.ethz.ch

Prerequisites / notice

None

Literature

Material will be handed out in the course.

Prerequisites

Good knowledge in population genetics and experience in using GIS is required.

Prerequisites / notice

Number of participants limited to 30.

Prerequisites / notice

Material will be handed out in the course.

Prerequisites / notice

Two afternoons are hold in the class. The lab work will be done from the students according to their timetable, but has to be finished after 3 weeks. Effort is roughly 1-2 days per week, depending on the skills of the student.

Number of participants limited to 14.

Prerequisites / notice

None

Prerequisites / notice

None

Prerequisites / notice

Material will be handed out in the course.

Prerequisites / notice

None

Prerequisites / notice

Material will be handed out in the course.

Prerequisites / notice

Prerequisites: students should have basic knowledge in population genetics, GIS and R.

Prerequisites / notice

Grading will be according to a short written report (4 pages) on one of the themes of the course (workload: about 8 hours) and according to student contributions during the course.

Prerequisites / notice

None

Prerequisites / notice

Good knowledge in population genetics and experience in using GIS is required.

Prerequisites / notice

Experience in using GIS is required.

Prerequisites / notice

Prerequisites: good knowledge in population genetics and experience in using GIS is required.

None

Prerequisites / notice

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

Content

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes

We will mostly work with readings from the following books:

Literature

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 481 of 1571
Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester.
We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

<table>

<tr>
<th>851-0589-00L</th>
<th>Technology and Innovation for Development</th>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
<th>P. Aerni</th>
</tr>
</thead>
</table>

Abstract
Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective
- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes
Reader with issue-specific articles. E-version is partly available under https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on an article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

Prerequisites / notice

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.
Objective

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content

The lecture is structured as follows:

- Overview of concepts and methods of inter/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes

Handouts are provided by the lecturers

Literature

Selected scientific articles and book-chapters

Prerequisites / notice

This course is recommended and helpful for students participating in the Transdisciplinary Case Study 2017.

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krüttl, C. E. Pohl

Abstract

The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

The course is seminar-like, interactive.

Objective

At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

Lecture notes

Handouts.

</tbody>
</table>

Abstract

In-depth understanding of concepts, insight into current research and experience with methods of Forest Pathology based on selected pathosystems.

Objective

To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.

To understand the dynamics of selected pathosystems and disturbance processes.

To be able to diagnose tree diseases and injuries.

To know forest protection strategies and to be able to comment on them.

Content

Stress and disease, virulence and resistance, disease diagnosis and damage assessment, tree disease epidemiology, disease management, ecosystem pathology.

Systems (examples): Air pollution and trees, endophytic fungi, mycorrhiza, wood decay, conifer- root rot, Phytophthora diseases, chestnut canker and its hypoviruses, urban trees, complex diseases, emerging diseases

Lecture notes

no script, the ppt-presentations and specific articles will be made available among others:

Prerequisites / notice

The course is composed of introductory lectures, practical work, discussions and reading. The participants should have basic knowledge in forest pathology (corresponding to the course 701-0563-00 "Wald- und Baumkrankheiten, see teaching book of H. Butin: Tree diseases and disorders, Oxford University Press 1995, 252 pp.").

701-1631-00L Foundations of Ecosystem Management W 5 credits 3G J. Ghazoul, C. Garcia

Abstract

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective

Students should be able to:

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.

b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.
Content

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasize the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resourcing, the course will address the complexity of multipurpose management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Environmental Governance

Number of participants limited to 30.

Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

Content

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes

Lecture slides and additional course material will be provided throughout the semester.

Literature

We will mostly work with readings from the following books:

Prerequisites / notice

A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

701-1671-00L

Sampling Techniques for Forest Inventories

Abstract

Introduction to design and model assisted sampling theory for finite populations as well as to the infinite population model for forest inventories. Two-phase two-stage forest inventories with simple or cluster sampling. Small area estimation. Presentation of the Swiss inventory. Two-phase two-stage forest inventories with simple or cluster sampling. Small area estimation. Presentation of the Swiss inventory.

Objective

To analyze the sampling designs and model assisted procedures for forest inventories. To introduce the framework for small area estimation. To discuss the Swiss National Forest Inventory.

Content

Sampling techniques for forest inventories. Daniel Mandallaz. Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants.

Literature

Sampling methods, remote sensing and GIS multisource forest inventory. M. Köhli, S. Magnusson, M. Marchetti, 2006, Springer.

Prerequisites / notice

A simulation software will be used throughout the lectures to illustrate the theoretical developments. Upon request a half day field demonstration can be organized at the WSL outside the lecture time. A repertorium for the exam is also offered.

<td>751-5125-00L</td>
<td>Stable Isotope Ecology of Terrestrial Ecosystems</td>
<td>W</td>
<td>2</td>
<td>R. A. Werner, A. Gessler</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions. Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, and how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.</td>
<td></td>

<td>A. Baltensweiler</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>The course communicates the basics of the programming language Python and gives a general introduction into the geoprocessing framework of ArcGIS. In addition various Python libraries (numpy, Scipy, GDAL, statsmodels, pandas) will be introduced which increase the functional range of the geoprocessing framework substantially.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The students learn the basics of geographic data processing based on the programming language Python and ArcGIS (arcpy). They get the ability to implement their own processing sequences and models for geoprocessing. The students are able to integrate open source libraries in their python scripts and know how the libraries are applied to spatial datasets.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The course communicates a deepened understanding of the geoprocessing frameworks arcpy and covers basic language concepts of Python such as datatypes, control structures and functions. In addition the application of popular Python libraries in combination with spatial datasets will be shown.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Lecture notes</strong></td>
<td>Lecture notes, exercises and worked out solutions to them will be provided.</td>
<td></td>

<td>Dendroecology</td>
<td>W</td>
<td>3</td>
<td>C. Bigler, A. Rigling, K. Treydte</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective

The students...
- understand, how wood is configured and how tree-ring structures are formed.
- are able to identify and describe different tree-ring structures.
- understand the theoretical and practical aspects of the dating of tree rings.
- know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- discover a tool for understanding and reconstructing global change processes.
- learn software to date, standardize and analyze tree rings.
- get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

Content

- Overview and history of dendrochronology
- Principles of dendrochronology
- Evolution of tree rings
- Formation and structure of wood and tree rings
- Intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring
- Crossdating methods (visual, skeleton plots, quantitative)
- Standardization of tree-ring series
- Development of tree-ring chronologies
- Dendrogeomorphology, dendrohydrology, dendroclimatology
- Stable isotopes
- Climate, climate-growth relationships, climate reconstructions
- Age and size structures, forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the lab (Swiss Federal Institute for Forest, Snow and Landscape Research WSL)

Lecture notes

Lecture notes (in English) will be handed out in the class.

Literature

Literature lists (in English) will be handed out in the class.

Prerequisites / notice

Time schedule (total of 90 hours): There will be 12 lectures with each two hours (total of 24 hours presence) as well as a field and lab day (8 hours presence). In addition, the students are expected to put 18 hours into the preparation of the lectures as well as 18 hours for the exercises. 4 hours are reserved for the lab work and 18 hours for the project.

The class language is German and English, on request English only.

Requirements:
- Basics of biology, ecology and forest ecology

701-1695-00L Soil Science Seminar
Z 0 credits 1S R. Schulin

Abstract

Invited external speakers present their research on current issues in the field of soil science and discuss their results with the participants. The program will be announced through various channels and also be made available through the teaching materials.

Objective

Master and PhD students are introduced to current areas of research in soil sciences and get first-hand experience in scientific discussion.

Inter- and Transdisciplinary Courses

<td>Seminar on Transdisciplinary Research for Sustainable Development</td>
<td>W</td>
<td>2 credits</td>
<td>2S</td>
<td>C. E. Pohl, M. Stauffacher</td>
</tr>
</tbody>
</table>

Abstract

The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective

The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

Content

The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Involving stakeholders
(4) Collaborating disciplines
(5) Exploration of tools and methods
(6) Analysing participants' projects to improve inter- and transdisciplinary elements

Literature

Literature will be made available to the participants

Prerequisites / notice

The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

701-1503-00L CCES Winter School "Science Meets Practice"
W 4 credits 9A C. Adler, P. Fry, P. Kröll, C. E. Pohl

Abstract

Increasingly, scientists need to interact more with people and institutions outside the scientific community. This requires the capability to understand and critically reflect about scientific activities and consequences for society and environment and to communicate with confidence. The CCES Winter School builds capacity to create and manage interactions between science and society.

Objective

1. To acquire knowledge of key aspects of the interplay between science and practice
2. To reflect on and understand the role and consequences of scientific activity in relation to society and environment
3. To acquire skills and learn about a systematic application of methods to create and manage interactions between science and society

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 487 of 1571
The CCES Winter School provides insights into theoretical and methodological foundations on the challenges of knowledge exchange and dialogue between science and practice. It offers media and knowledge management training for enhancing stakeholder involvement. Selected case examples support group work discussions and analysis. Real stakeholder meetings are organized for testing techniques in view of identifying diverse expectations and needs and working towards solutions. Together the Winter School participants and stakeholders experience and develop ways for better linking environmental science and practice.

The course is structured by an intimate interrogation between theoretical inputs, reflection and translation into own topics and projects. The course offers insights into a wide spectrum of crossing boundaries between science and practice (e.g. information, consultation, co-production of knowledge) and provides test fields for and room for reflection of own experiences.

The first block with inputs, individual and group work, and reflection is a preparation for the second block, which focuses on implementation of stakeholder interactions. Between the two blocks coached project work is offered.

The CCES Winter School takes place at Propstei Wislikofen in January and February 2017. Accommodation is provided. Course materials (e.g. slides, articles, toolboxes) are provided for preparatory reading and during the course (in Moodle). Collection of key literature in online reader in Moodle.

The CCES Winter School addresses PhD students and postdocs from environmental and natural sciences, engineering, and social sciences related to sustainable development. Participants are required to apply online providing key information about their interest and PhD project - details and application form can be found here: http://www.cces.ethz.ch/winterschool/

There is a participation fee of 400 CHF for the course, which is a contribution to the costs for the two blocks at the seminar venue Propstei Wislikofen, organizational support as well as material for the stakeholder meetings. Travel expenses to the venue are to be borne by the participants.

<td>Readings in Environmental Thinking</td>
<td>W</td>
<td>3</td>
<td>J. Ghazoul, G. Hirsch Hadorn, A. Patt</td>
</tr>
</tbody>
</table>

**Abstract**

This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

**Objective**

The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

**Content**

The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example: identifying the key points made within the text identifying issues of particular personal interest and resonance considering the impact of the text at the time of publication, and its importance now evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (6 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.

**Literature**

The specific texts selected for discussion will vary, but examples include:

- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

---

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 488 of 1571
Abstract
Purpose is to discuss and teach the professional skills that are needed in science (or future career in science). Course consists of lectures and practical sessions. Course is organized by Eawag scientists.

Objective
Purpose is to discuss and teach the professional skills that are needed in science (or future career in science). Course consists of lectures and practical sessions.

Content
Lectures and exercises in:
- Project management
- Application of research grants
- Scientific publishing
- Reviewing
- Writing papers
- Applying jobs
- Job interviews

EAWAG PhD Skills Seminar
Does not take place this semester.

W 2 credits 2S

Basic Concepts of Management

W 2 credits 2V
R. Schwarzenbach

Abstract
This course deals with fundamental and proven management concepts. The lecturers emphasize the practical applicability of concepts. The course was designed in close cooperation with practitioners; e.g. will Mr. S. Baldenweg, mechanical engineer ETH, MBA Insead, share his experience in several guest lectures.

Objective
Students:
will be familiar with basic general management concepts.
learn about the fundamental concepts of strategy development with practical examples.
get a rough overview on the concepts of financial management.
will learn about the strategic positioning of small departments within larger organisations.
will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.
will learn the basic principles of project management and of successful self-management.
will reflect on customer oriented information representation.

Content

Die finanzielle Abbildung von Organisationen und Projekten wird übersichtsweise dargestellt und die stufengerechte Darstellung von Informationen anhand von realen Beispielen besprochen.

Die Inhalte werden durchgängig mit Praxisbeispielen illustriert.

Lecture notes
Skripten werden elektronisch zur Verfügung gestellt.

Literature
Empfohlen werden folgende Titel für die Vertiefung einzelner Themen:

Research Ethics

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

W 2 credits 2G
G. Achermann

Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective
The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

Abstract
The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective
Primary educational objective is to learn programming with C++. When successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scences" when a program is translated and executed.

Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking of a computer scientist.

Content
The course covers fundamental data types, expressions and statements, (Limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientiation deals with classes, inheritance and polymorphy, simple dynamic data types are introduced as examples.

In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes
A script written in English will be provided during the semester. The script and slides will be made available for download on the course web page.

Literature
Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

Prerequisites / notice
From AS 2013, an admission to the exam does not any more formally require an attending of the recitation sessions. Handing in solutions to the weekly exercise sheets is thus not mandatory, but we strongly recommend it.

Examination is a one hour-long written test.

Abstract
Digital and analogue signals and their representation. Combinational and sequential circuits and systems, boolean algebra, K-maps. Finite state machines. Memory and computing building blocks in CMOS technology, programmable logic circuits.

Objective
Deepen and extend the knowledge from lecture and exercises, usage of design software Quartus II as well as an oscilloscope

Content
The contents of the digital circuits laboratory will deepen and extend the knowledge of the correspondent lecture and exercises. With the help of the logic device design software Quartus II different circuits will be designed and then tested on an evaluation board. You will build up the control for a 7-digit display as well as an adder and you will create different types of latches and flip-flops. At the end of the laboratory a small synthesizer will be programmed that is able to play self-created melodies. At the same time the usage of a modern oscilloscope will be taught in order to analyse the programmed circuits through the digital and analogue inputs.

Abstract
In this lecture we treat problems in applied analysis. The focus lies on the simplest cases of three fundamental types of partial differential equations of second order: the Laplace equation, the heat equation and the wave equation.

Content
1.) Klassifizierung von PDE's
   - linear, quasilinear, nicht-linear
   - elliptisch, parabolisch, hyperbolisch

2.) Quasilineare PDE
   - Methode der Charakteristiken (Beispiele)

3.) Elliptische PDE
   - Bsp: Laplace-Gleichung
   - Harmonische Funktionen, Maximumsprinzip, Mittelwerts-Formel.
   - Methode der Variablenseparation.

4.) Parabolische PDE
   - Bsp: Wärmeleitungsgleichung
   - Bsp: Inverse Wärmeleitungsgleichung
   - Methode der Variablenseparation

5.) Hyperbolische PDE
   - Bsp: Wellengleichung
   - Formel von d'Alembert in (1+1)-Dimensionen
   - Methode der Variablenseparation

6.) Green'sche Funktionen
   - Rechnen mit der Dirac-Deltafunktion
   - Idee der Green'schen Funktionen (Beispiele)

7.) Ausblick auf numerische Methoden
   - 5-Punkt-Diskretisierung des Laplace-Operators (Beispiele)

Die gegenwärtige Entwicklung der Ingenieurwissenschaften verlangen, dass auch Student:innen dieser Fächer die Grundlagen der Quantenmechanik und Festkörperphysik (mit den Bandstrukturen) beherrschen. Es ist das Ziel dieser Vorlesung das Gebiet der Quantenmechanik auf einem Weg einzuführen, der zwar elementar ist, es aber ermöglicht die quantenmechanische Begriffe auf die verschiedensten Situationen anzuwenden.

**Kap. 1-Teil 1 Die Grundlagen der elektromagnetischen Wellen und der Quantenphysik**

Heisenbergsche Unschärferelationen

### Kapitel 2: Quantenmechanik

**Wellenfunktion und Wahrscheinlichkeitsdichte, Schrödingergleichung, freies Teilchen, Dispersion der Materiewelle, Potentialstufe, Tunnelwirkung, Teilchen im Potentialkasten, harmonische Oszillatoren, zeitabhängige Schrödingergleichung, formale Theorie der Quantenmechanik (Operator, Observables, Eigenwert, Erwartungswert, Kommutator).**

### Kapitel 3: Atome mit einem Elektron

Wasserstoffatom, Quantisierung des Drehimpulses, Energieelektronen-Wellenfunktion in Zentralfeldern (Atomorbitale), Zeeman-Effekt, Elektronenspin, Spin-Bahn-Wechselwirkung

### Kapitel 4: Atome mit vielen Elektronen

Born-Oppenheimer Näherung, Heliumatom, Ausschliessungsprinzip von Pauli, Periodensystem, Elektronenstruktur der Atome, Röntgenspektren, Auswahlregeln

### Kapitel 5: Moleküle

Wasserstoffmolekül-Ion, Moleküllwellenfunktion zweiatomiger Moleküle, Kovalente Bindung, Hybrid-Oberflächen, Molekulare Rotation und Schwingung

### Kapitel 6 und 13: Festkörper und Quantentheorie

**Typen der Festkörper, Bändermodell der Festkörper, "Tight Binding Model" explizit hergeleitet, Modell der freien Elektronen, Elektronenbewegung in einer periodischen Struktur, "effective mass approximation", Leiter, Isolator und Halbleiter, Quantentheorie der elektrischen Leitfähigkeit, Fermienergie, Löcher, Strahlungsübergänge in Festkörpern, Fermi-Dirac Statistik, Zustandsdichte, Bose-Einstein Statistik, Herleitung Planckshire Schrödingergleichung, Elektronen in Metallen und Halbleiter (Anwendung der Fermi-Dirac Verteilung), Dotierungen in Halbleitern.**

**Prerequisites / notice**

Prerequisites: Physics I.
Objective
Modern, transistor-based electronics has transformed our lives and plays a crucial role in our economy since the 2nd half of last century. The main objective of this course in electronic circuits is to introduce the concept of active device, including operational amplifiers, and their use in amplification, signal conditioning, switching and filtering to students. In addition to gaining experience with typical electronic circuits that are found in common applications, including their own Gruppenarbeit and Fachpraktikum projects, students sharpen their understanding of linear circuits based on nonlinear devices, imperfections of electronic circuits and the concept of design (as opposed to analysis). The course is a prerequisite for higher semester subjects such as analog integrated circuits, RF circuits for wireless communications, A/D and D/A converters and optoelectronics.

Content

1. Discrete-time linear systems and filters:
   state-space realizations, z-transform and spectrum,
   decimation and interpolation, digital filter design,
   stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective:
   probability, random variables, discrete-time stochastic processes;
   detection and estimation: MAP, ML, Bayesian MMSE, LMMSE;
   Wiener filter, LMS adaptive filter, Viterbi algorithm.

Lecture notes

227-0102-00L Discrete Event Systems

W 6 credits 4G
L. Thiele, L. Vanbever,
R. Wattenhofer

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course
we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages,

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the
proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans.
The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a
keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study
processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new
modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event
systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete
event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and
queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems
from a worst-case perspective using the theory of online algorithms and adversarial queuing.

Content

Abstract

Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of
control systems for single input - single output and multivariable systems.

Objective

Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of
control systems for single input - single output and multivariable systems.

Content

Process automation, concept of control. Modelling of dynamical systems - examples, state space description, linearisation,
algebraical/numerical solution. Laplace transform, system response for first and second order systems - effect of additional poles and zeros.
Closed-loop control - idea of feedback. PID control, Ziegler - Nichols tuning. Stability, Routh-Hurwitz criterion, root locus, frequency
response, Bode diagram, Bode gain/phase relationship, controller design via "loop shaping", Nyquist criterion. Feedforward compensation,
cascade control. Multivariable systems (transfer matrix, state space representation), multi-loop control, problem of coupling, Relative Gain
Array, decoupling, sensitivity to model uncertainty. State space representation (modal description, controllability, control canonical form,
observer canonical form), state feedback, pole placement - choice of poles. Observer, observability, duality, separation principle. LQ
Regulator, optimal state estimation.
 Covered are the lower three layer of the OSI reference model: the physical, the data link, and the network layer. The basic terms of Description of generic time harmonic electromagnetic fields; the role of the material in Maxwell’s equations; energy transport and power 2V+2U Understanding of high-speed signal propagation in interconnects, microwave cables and integrated transmission lines such as microwave A skript including animated wave representations is provided in electronic form. **Abstract**

This course provides advanced knowledge of electromagnetic waves in linear materials including negative index and other non classical materials.

**Objective**

The behavior of electromagnetic waves both in free space and in selected environments including stratified media, material interfaces and wave guides is understood. Material models in the time harmonic regime including negative index and plasmonic materials are clarified.

**Content**

Description of generic time harmonic electromagnetic fields; the role of the material in Maxwell’s equations; energy transport and power loss mechanism; EM-waves in homogeneous space; ordinary and evanescent plane waves, cylindrical and spherical waves, “complex origin”-waves and beams; EM-waves in stratified media; generic guiding mechanism for EM waves; classical wave guides, dielectric wave guides.

**Lecture notes**

A skript including animated wave representations is provided in electronic form.

**Literature**

See literature list in the script.

**Prerequisites / notice**

The lecture is taught in German while both the script and the viewgraphs are in English.

### 227-0112-00L High-Speed Signal Propagation

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>2V+2U</th>
<th>C. Bolognesi</th>
</tr>
</thead>
</table>

**Abstract**

Understanding of high-speed signal propagation in microwave cables and printed circuit boards.

**Objective**

Understanding of high-speed signal propagation in interconnects, microwave cables and integrated transmission lines such as microwave integrated circuits and/or printed circuit boards.

**Content**

As system clock frequencies continuously rise in the GHz domain, a need urgently develops to understand high-speed signal propagation in order to maintain good signal integrity in the face of phenomena such as inter-symbol interference (ISI) and cross-talk.

**Lecture notes**

Butterworth-, Chebychev- and Bessel filter approximations: filter synthesis from low-pass filter prototypes.

**Prerequisites / notice**

Exercises will be held in German, but assistants also speak English.

### 227-0113-00L Power Electronics

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4G</th>
<th>J. W. Kolar</th>
</tr>
</thead>
</table>

**Abstract**

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

**Objective**

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

**Content**

**Lecture notes**

Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

**Prerequisites / notice**

Prerequisites: Signal and Systems Theory II.

### 227-0121-00L Communication Systems

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4G</th>
<th>A. Wittneben</th>
</tr>
</thead>
</table>

**Abstract**

Information Theory, Signal Space Analysis, Baseband Transmission, Passband Transmission, Example und Channel, Data Link Layer, MAC, Example Layer 2, Layer 3, Internet

**Objective**

Introduction into the fundamentals of digital communication systems. Selected examples on the application of the fundamental principles in existing and upcoming communication systems

**Content**

Covered are the lower three layer of the OSI reference model: the physical, the data link, and the network layer. The basic terms of information theory are introduced. After this, we focus on the methods for point-to-point communication, which may be addressed elegantly and coherently in the signal space. Methods for error detection and correction as well as protocols for the retransmission of perturbed data will be covered. Also the medium access for systems with shared medium will be discussed. Finally, algorithms for routing and flow control will be treated.

The application of the basic methods will be extensively explained using existing and future wireless and wired systems.

---

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 499 of 1571
Introduction to Electric Power Transmission: System & Technology

Objectives:
At the end of this course, the student will be able to:
- describe the structure of electric power systems,
- name the most important components and describe what they are needed for,
- apply models for transformers and lines,
- explain the technology of overhead power lines,
- calculate stationary power flows, current and voltage transients and other basic parameters in simple power systems.

Content:
Structure of electric power systems, transformer and power line models, analysis of and power flow calculation in basic systems, symmetrical and unsymmetrical three-phase systems, transient current and voltage processes, technology and principle of electric power systems.

Lecture notes:
Lecture script in English, exercises and sample solutions, translation of important vocabulary: english-german.

Solid State Electronics and Optics

Abstract:
Solid State Electronics is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magneto-resistance, and optical properties of solids.

Objective:
Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

Prerequisites / notice:
Recommended background:
Undergraduate physics, mathematics, semiconductor devices.

Analog Integrated Circuits

Abstract:
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective:
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content:
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc.; Amplifiers; differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Biomedical Imaging

Abstract:
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective:
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content:
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Bioelectronics and Biosensors

Abstract:
The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

Objective:
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field
Content
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
Supervised exercises solving real-world problems. Some Matlab based exercises in groups.

Electives
This is but a short selection. Other courses from the ETH course catalogue may be chosen. Please consult the “Richtlinien zu Projekten, Praktika, Seminaren” (German only), published on our website (http://www.ee.ethz.ch/pps-richtlinien).

Economics, Law and Management Electives
These subjects are particularly suitable for students planning to apply to the Master's Degree Program in Energy Science and Technology (MSc EST) or Management, Technology and Economics (MSc MTEC).

<table>

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Objective
Discovering Management combines in an innovate format a set of lectures and an advanced business game. The learning model for Discovering Management involves 'learning by doing'. The objective is to introduce the students to the relevant topics of the management literature and give them a good introduction in entrepreneurship topics too. The course is a series of lectures on the topics of strategy, innovation, corporate finance, leadership, design thinking and corporate social responsibility. While the 14 different lectures provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interactive business game. The purpose of the business game is to analyse the innovative needs of a large multinational company and develop a business case for the company to grow. This business case is as relevant to someone exploring innovation within an organisation as it is if you are planning to start your own business. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving innovation, entrepreneurship, and company success.
**Content**
Discovering Management aims to broaden the students' understanding of the principles of business management, emphasizing the interdependence of various topics in the development and management of a firm. The lectures introduce students not only to topics relevant for managing large corporations, but also touch upon the different aspects of starting up your own venture. The lectures will be presented by the respective area specialists at D-MTEC.

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures are designed to introduce students to topics related to strategy, corporate innovation, leadership, corporate and entrepreneurial finance, value chain analysis, corporate social responsibility, and business model innovation. Practical examples from industry experts will stimulate the students to critically assess these issues. Creative skills will be trained by the business game exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of Chief Innovation Officer of a large multinational company. As they learn more about the specific case and identify the challenge they are faced with, the students will have to develop an innovative business case for this multinational corporation. Doing so, this exercise will provide an insight into the context of managerial problem-solving and corporate innovation, and enhance the students' appreciation for the complex tasks companies and managers deal with. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

**Prerequisites / notice**
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

| **Abstract** | Evidence-based management requires valid empirical research. In this course, students will learn the basics of research design, fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

**Objective**
- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

**Content**
1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

**Prerequisites / notice**
Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned-in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

</table>
| **Abstract** | The course introduces basic principles, problems and approaches of microeconomics.

**Objective**
(1) Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can apply simple mathematical treatment of some basic concepts and can solve utility maximization and cost minimization problems.

**Lecture notes**
Lecture notes, exercises and reference material can be downloaded from Moodle.

**Literature**
The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

| **Abstract** | Managerial Economics applies economic theory and methods to business and economic decision-making. Economic ideas related to optimization, the theory of consumer demand, the theory of the firm, industrial organization and decision making under uncertainty are studied using methods of numerical analysis, statistical estimation, game theory and constrained optimization.

**Objective**
The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffmann focusing on related case-studies in management.

</table>
| **Abstract** | Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture " or " Introduction to Law" (851-0708-00), cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.
A comprehensive script will be made available online on the moodle platform. Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=2170).

Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystem devices by the combination of unit process steps (= process flow).

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Business Law
Particularly suitable for students of D-ITET, D-MAVT

The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

Objective
The students shall obtain the following competence:
- They shall have a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution
- They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

The lecture gives an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights).

Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective
The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thicket).

The Role of Intellectual Property in Daily Routine: A Practical Introduction
Particularly suitable for students of D-BAUG, D-ITET, D-MAVT

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective
In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, computational science and engineering, computer science, electrical engineering and information technology, environmental engineering, geometric engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ (851-0738-03) will be offered in the autumn semester.
The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group
performance; leadership behavior and leadership styles.

Content
- Tissue and Cellular Biomechanics, Molecular Biomechanics and Biopolymers, Computational Biomechanics, Biomaterials, Tissue
Engineering, Radiation and Radiographic Imaging, Diagnostic Ultrasound Imaging, Magnetic Resonance Imaging,
Biomedical Optics and Lasers.

Lecture notes
- Stored on ILIAS.

Literature

  - P. Wild
Abstract
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics. Since working on broad topics like aerodynamics, manufacturers, airport operation, business aviation, business models etc. the students gets a good overview in air Transportation.

Objective
Understand and explain basics, principles and contexts in the broader air transport industry. Lay the foundation of working in or with the air transport industry. Ideal foundation for Aviation II - Management of Air Transport

Content
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

Concept: This course will be taught as Aviation I. A subsequent course is under evaluation.

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Law Enforcement; Maintenance & Manufacturers; Airport Operations & Planning; Customs & Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Operations.

Technical visit: This course includes a guided tour at Zurich Airport (baggage sorting system, apron, ATC Tower).

Examination: written, 60 min, open books (Examination in German; Answers may be given in English)

Lecture notes
Slides are provided prior to each class

Literature
We will also use English papers

Literature will be provided by the lecturers respective there will be additional Information upon registration

Lecturers
Coping with Psychosocial Demands of Teaching (EW4

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

ECTS
Title
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

A. Deiglmayr

In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

- Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

- Zulassungsanforderungen richten sich im Umfang nach der Zahl zu erwerbender ECTS-Punkte, wobei 1 ECTS-Punkt einem Zeitaufwand von ca. 30 Arbeitsstunden entspricht. ETHZ-Studierende können im Rahmen dieser Veranstaltung 3 ECTS-Punkte erwerben.

Dazu sind folgende Leistungen zu erbringen: - Präsenz und aktive mündliche Mitarbeit in der Lehrveranstaltung (MA)

- Referat (RE)

- Weitere Angaben zu den Leistungsnachweisen werden im Rahmen der Startveranstaltung abgegeben und erläutert.

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 506 of 1571
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

851-0242-06L  
**Cognitively Activating Instructions in MINT Subjects**  
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Abstract**  
The focus will be on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Objective**  
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

**Prerequisites / notice**  
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L  
**Human Intelligence**  
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Abstract**  
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**  
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L  
**Research Methods in Educational Science**  
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Abstract**  
Literature from the learning sciences is critically discussed with a focus on research methods.

At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**  
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

**227-0853-00L**  
**Mentored Work Subject Didactics Electrical Engineering and Information Technology I**  
Only for students who enrolled before HS 2011 into TC.
Prerequisites: successful completion of FD I and FD II.

Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
- (M-)Leitprogramm
- Gelenktes Entdeckendes Lernen
- Puzzle
- Werkstatt
- Projektarbeit
Zu diesen Themen sind die vorhandenen Manuals aus den IfV zu verwenden, bzw. wo nötig zu adaptieren.

The teaching internship can only be visited if all other courses of TC have been completed.
Repetition of the teaching internship is no possible, also if the examination lessons have to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons in their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

<td>VLSI II: Design of Very Large Scale Integration Circuits</td>
<td>W</td>
<td>7</td>
<td>5G</td>
<td>H. Kaeslin, F. K. Gürkaynak, M. Korb</td>
</tr>
</tbody>
</table>

Abstract

This second course in our VLSI series is concerned with how to turn digital circuit netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects. Low-power circuit design is another important topic. Economic aspects and management issues of VLSI projects round off the course.

Objective

Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

Content

The second course begins with a thorough discussion of various technical aspects at the circuit and layout level before moving on to economic issues of VLSI. Topics include:

- How to make integrated circuit testable (design for test).
- Synchronous clocking disciplines compared, clock skew, clock distribution, input/output timing.
- Synchronization and metastability.
- CMOS transistor-level circuits of gates, flip-flops and random access memories.
- Sinks of energy in CMOS circuits.
- Power estimation and low-power design.
- Current research in low-energy computing.
- Layout parasitics, interconned delay, static timing analysis.
- Switching currents, ground bounce, IR-drop, power distribution.
- Floorplanning, chip assembly, packaging.
- Layout design at the mask level, physical design verification.
- Electromigration, electrostatic discharge, and latch-up.
- Models of industrial cooperation in microelectronics.
- The caveats of virtual components.
- The cost structures of ASIC development and manufacturing.
- Market requirements, decision criteria, and case studies.
- Yield models.
- Avenues to low-volume fabrication.
- Marketing considerations and case studies.
- Management of VLSI projects.

Exercises are concerned with back-end design (floorplanning, placement, routing, clock and power distribution, layout verification). Industrial CAD tools are being used.

Lecture notes

All written documents in English.

Literature

Highlight:

Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.

Prerequisites:

"VLSI I: from Architectures to Very Large Scale Integration Circuits and FPGAs" or equivalent knowledge.

Further details:

http://www.iis.ee.ethz.ch/stud_area/vorlesungen/vlsi2.en.html

227-0417-00L | Information Theory I | W    | 6    | 4G    | A. Loeliger                          |

Abstract

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective

The fundamentals of Information Theory including Shannon’s source coding and channel coding theorems.

Content

The entropy rate of a source. Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity.

Literature

T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0427-00L | Signal and Information Processing: Modeling, Filtering, Learning | W    | 6    | 4G    | H.-A. Loeliger                          |

Abstract

Fundamentals in signal processing, detection/estimation, and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.

Objective

The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Content

Lecture notes

Lecture notes.

Prerequisites:

- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory.

227-0439-00L | Wireless Access Systems | W    | 6    | 2V+2U | A. Wittneben                          |
Wireless access systems support locally constrained wireless connectivity and mobile access to a backbone network (typically the Internet). In this course, the student develops a comprehensive understanding of existing and upcoming wireless access technologies (including WiFi, Bluetooth, RFID, NFC, VANET) and related Physical Layer and Medium Access Control Layer problems and opportunities.

### Objective
The course consists of two tracks. The track "Technology & Systems" is structured as regular lecture. In the introduction we will discuss the challenges and potential of pervasive wireless access and study some fundamentals of short/medium range wireless communications. The main body of this track is devoted to existing and upcoming systems. A comprehensive survey of Ultrawide band (UWB) as the promising transmission technology for pervasive wireless access completes this track. In the track "Simulate & Practice" we form student teams that implement and analyze functional blocks of the physical layer of various advanced wireless access systems based on MATLAB simulations. The track includes combination tasks where different teams combine their functional blocks (e.g. transmitter, receiver) in order to simulate the complete physical layer.

### Content
1. Short range wireless communication: fundamental Physical Layer challenges and solutions
2. Wireless Local Area Network (WLAN)
3. Vehicular Networks (VANET)
4. Ultra-Wideband (UWB) technology: fundamental principles, promises and solutions
5. Wireless Body Area Networks (WBAN)
6. Wireless Personal Area Networks (Bluetooth, Zigbee)
7. Radio Frequency Identification (RFID) and Near Field Communication (NFC)

### Recommended Subjects
These courses are recommended, but you are free to choose courses from any other special field. Please consult your tutor.

### Abstract
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

### Objective
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

### Content
1. Introduction
2. Automata and Languages
3. Smarter Automata
4. Specification Models
5. Stochastic Discrete Event Systems
6. Worst-Case Event Systems
7. Network Calculus

MATLAB is used for system analysis and simulation.

227-0112-00L
High-Speed Signal Propagation
Understanding of high-speed signal propagation in microwave cables and printed circuit boards.

Objective
As clock frequencies rise in the GHz domain, there is a need grasp signal propagation to maintain good signal integrity in the face of symbol interference and cross-talk.

Content
The course is of high value to all interested in high-speed analog (RF, microwave) or digital systems.

Objective
Understanding of high-speed signal propagation in interconnects, microwave cables and integrated transmission lines such as microwave integrated circuits and/or printed circuit boards.

Content
As system clock frequencies continuously rise in the GHz domain, a need urgently develops to understand high-speed signal propagation in order to maintain good signal integrity in the face of phenomena such as inter-symbol interference (ISI) and cross-talk.

Concepts such as Scattering parameters (or S-parameters) are key to the characterization of networks over wide bandwidths. At high frequencies, all structures effectively become "transmission lines." Unless care is taken, it is highly probable that one ends-up with a bad transmission line that causes the designed system to malfunction.

Filters will also be considered because it turns out that some of the problems associated by lossy transmission channels (lines, cables, etc) can be corrected by adequate filtering in a process called "equalization."

Butterworth-, Chebychev- and Bessel filter approximations: filter synthesis from low-pass filter prototypes.

Lecture notes
Script: Leitungen und Filter (In German).
Exercises will be held in German, but assistants also speak English.

227-0166-00L
Analog Integrated Circuits
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Content
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurments.

Lecture notes
Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

227-0301-00L
Optical Communication Fundamentals
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is described. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Objective
An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Content
* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
* Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error rates and error estimations.
* Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techquines, Error correction coding.
* Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.
* Chapter 7: Optical Amplifiers : Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Abstract

This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting.

Objective

This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.

Content

INTRODUCTION

Chapter 1: Introduction to THz Physics

Chapter 2: Components of THz Technology

THz TECHNOLOGY MODULES

Chapter 3: THz Generation

Chapter 4: THz Detection

Chapter 5: THz Manipulation

APPLICATIONS

Chapter 6: THz Imaging

Chapter 7: THz Communication

Chapter 8: THz Energy Harvesting

Literature

- Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Whenever we deviate from the main material discussed in these books, softcopy of lectures notes will be provided.

Prerequisites / notice

Good foundation in electromagnetics & knowledge of microwave or optical communication is helpful.

W. 6 credits 2V+2U H. Schmid

Abstract

Suitable for Master Students as well as Doctoral Students.

Objective

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.
At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chipping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Prerequisites / notice

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.
The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over material for exercises, copies of transparencies. Designing systems with a low energy footprint is an increasingly important. There are many applications for low-power systems ranging from mobile devices powered from batteries such as today’s smart phones to energy efficient household appliances and datacenters. Key drivers are the more than tenfold increase of mobile devices and the growing integration density required to help such devices to work more efficiently. Knowledge of the state-of-the-art in low power system design, understanding recent research results and their implication on industrial products is essential.

The objective of this lecture is to present the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Sofware Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, System-on-Chip), (c) Application specific instruction sets, code generation and retargetable compilation, (d) Performance analysis and estimation techniques, (e) System design (hardware-software partitioning and design space exploration).

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

**Autumn Semester 2016**

Data: 06.08.2021 13:03
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TGG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

**Objective**

Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience.

**Content**

Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-domain crossing, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection. This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

Abstract
Context recognition in mobile communication systems like mobile phone, smart watches and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning.
Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

Objective
Using internal sensors and sensors in our environment including data from the wristwatch, bracelet or internet (crowd sourcing), our ‘smart phone’ detects our context continuously, e.g. where we are, what we are doing, with whom we are together, what is our constitution, what are our needs. Based on this information our ‘smart phone’ offers us the appropriate services like a personal assistant.
Context comprises user’s behavior, his activities, his local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone.
Context recognition as the crucial function of mobile systems is the main focus of the course. Using MATLAB the participants implement and verify the discussed methods also using a smart phone.

Content
Using internal sensors and sensors in our environment including data from the wristwatch, bracelet or internet (crowd sourcing), our ‘smart phone’ detects our context continuously, e.g. where we are, what we are doing, with whom we are together, what is our constitution, what are our needs. Based on this information our ‘smart phone’ offers us the appropriate services like a personal assistant.
Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.

The main topics of the course include:
- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarly measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, KNN-Methods, Support Vector Machine, AdaBoost, Deep Learning), clustering (k-means, dbscan, topic models), Recommender Systems, Collaborative Filtering, Crowdsourcing.
- Models of distributed computations, time space diagrams, virtual time, logical clocks and causality, wave algorithms, parallel and distributed graph traversal, consistent snapshots, mutual exclusion, election and symmetry breaking, distributed termination detection, garbage collection in distributed systems, monitoring distributed systems, global predicates.

Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis

227-0377-00L
Physics of Failure and Failure Analysis of Electronic Devices and Equipment

3 credits

2V

U. Sennhauser

Abstract
Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

Objective
Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis

Lecture notes
Comprehensive copy of transparencies

Distributed Algorithms

4 credits

3V

F. Mattern

Abstract
Models of distributed computations, time space diagrams, virtual time, logical clocks and causality, wave algorithms, parallel and distributed graph traversal, consistent snapshots, mutual exclusion, election and symmetry breaking, distributed termination detection, garbage collection in distributed systems, monitoring distributed systems, global predicates.

Objective
Become acquainted with models and algorithms for distributed systems.

Content
Verteilte Algorithmen sind Verfahren, die dadurch charakterisiert sind, dass mehrere autonome Prozesse gleichzeitig Teile eines gemeinsamen Problems in kooperativer Weise bearbeiten und der dabei erforderliche Informationsaustausch ausschliesslich über Nachrichten erfolgt. Derartige Algorithmen kommen im Rahmen verteilter Systeme zum Einsatz, bei denen kein gemeinsamer Speicher existiert und die Übertragungszeit von Nachrichten i.a. nicht vernachlässigt werden kann. Da dabei kein Prozess eine aktuelle konsistente Sicht des globalen Zustands besitzt, führt dies zu interessanten Problemen. Im einzelnen werden u.a. folgende Themen behandelt:
- Modelle verteilter Berechnungen; Raum-Zeit-Diagramme; Virtuelle Zeit; Logische Uhren und Kausalität; Wellenalgorithmen; Verteilte und parallele Graphtransversierung; Berechnung konsistenter Schnittmengen; Wechselseitiger Ausschluss; Elektion und Symmetriebrechung; Verteilte Terminierung; Garbage-Collection in verteilten Systemen; Beobachten verteilter Systeme; Berechnung globaler Prädikate.

227-0447-00L
Image Analysis and Computer Vision

6 credits

3V+1U

L. Van Gool, O. Göksel, E. Konukoglu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 517 of 1571
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Objective

In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Content

Seminar language: English

Lecture notes

Different each year. For details see: www.disco.ethz.ch/courses.html

Literature

Abstract

This second course in our VLSI series is concerned with how to turn digital circuit netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects. Low-power circuit design is another important topic. Economic aspects and management issues of VLSI projects round off the course.

Objective

Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

Content

The second course begins with a thorough discussion of various technical aspects at the circuit and layout level before moving on to economic issues of VLSI. Topics include:

- The difficulties of finding fabrication defects in large VLSI chips.
- How to make integrated circuit testable (design for test).
- Synchronous clocking disciplines compared, clock skew, clock distribution, input/output timing.
- Synchronization and metastability.
- CMOS transistor-level circuits of gates, flip-flops and random access memories.
- Sinks of energy in CMOS circuits.
- Power estimation and low-power design.
- Current research in low-energy computing.
- Layout parasitics, interconnected delay, static timing analysis.
- Switching currents, ground bounce, IR-drop, power distribution.
- Floorplanning, chip assembly, packaging.
- Layout design at the mask level, physical design verification.
- Electromigration, electrostatic discharge, and latch-up.
- Models of industrial cooperation in microelectronics.
- The caveats of virtual components.
- The cost structures of ASIC development and manufacturing.
- Market requirements, decision criteria, and case studies.
- Yield models.
- Avenues to low-volume fabrication.
- Marketing considerations and case studies.
- Management of VLSI projects.

Exercises are concerned with back-end design (floorplanning, placement, routing, clock and power distribution, layout verification). Industrial CAD tools are being used.

Wearable Systems

Objective

Context recognition in mobile communication systems like mobile phone, smart watches and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning.

Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smartphone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MatLab the participants implement and verify the discussed methods also using a smartphone.
Using internal sensors and sensors in our environment including data from the wristwatch, bracelet or internet (crowd sourcing), our ‘smart phone’ detects our context continuously, e.g. where we are, what we are doing, with whom we are together, what is our constitution, what are our needs. Based on this information our ‘smart phone’ offers us the appropriate services like a personal assistant. Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.

The main topics of the course include:
- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarity measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, KNN-Methods, Support Vector Machine, Adaboost, Deep Learning), clustering (k-means, dbscan, topic models), Recommender Systems, Collaborative Filtering, Crowdsourcing.

The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.

Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

Abstract

Optical Communication Fundamentals
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Nano-Optics
Nano-Optics is the study of optical phenomena and techniques on the nanometer scale. It is an emerging field of study motivated by the rapid advance of nanoscience and technology. It embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high-resolution imaging and spectroscopy.

Neuromorphic Engineering I
Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Objective

An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Content

* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
* Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.
* Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.
* Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.
* Chapter 7: Optical Amplifiers : Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Understanding the characteristics of neuromorphic circuit elements.

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Abstract

Content

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsics properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Communication Systems

Information Theory, Signal Space Analysis, Baseband Transmission, Passband Transmission, Example und Channel, Data Link Layer, MAC, Example Layer 2, Layer 3, Internet

Introduction into the fundamentals of digital communication systems. Selected examples on the application of the fundamental principles in existing and upcoming communication systems

Covered are the lower three layer of the OSI reference model: the physical, the data link, and the network layer. The basic terms of information theory are introduced. After this, we focus on the methods for the point to point communication, which may be addressed elegantly and coherently in the signal space. Methods for error detection and correction as well as protocols for the retransmission of perturbed data will be covered. Also the medium access for systems with shared medium will be discussed. Finally, algorithms for routing and flow control will be treated.

The application of the basic methods will be extensively explained using existing and future wireless and wired systems.

The course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modelling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

The course projects will focus on the theory and the basic understanding of the operation of special devices, such as single-electron transistor, resonant tunneling diode, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

227-0166-00L

Analog Integrated Circuits

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

227-0377-00L

Physics of Failure and Failure Analysis of Electronic Devices and Equipment

Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis

227-0455-00L

Terahertz: Technology & Applications

This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting.

Autumn Semester 2016

Page 521 of 1571
This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.

### Objective

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

### Content

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

### Literature

- Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Whenever we deviate from the main material discussed in these books, softcopy of lectures notes will be provided.

### Prerequisites / notice

Good foundation in electromagnetics & knowledge of microwave or optical communication is helpful.

**Abstract**

This lecture provides theoretical and experimental knowledge on the techniques for the characterization and numerical modeling of power semiconductors, as well on the related built-in reliability strategies.

**Objective**

The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.
This lecture consists of a theoretical part (50%) and of laboratory exercises and demonstrations (50%). The theoretical part covers the basic techniques and procedures for characterization, modeling and built-in reliability of modern power semiconductor devices with special attention to MOS and IGBT. The starting part on technology provides an overview on the main device families and includes a review of the most relevant application-oriented aspects of the device physics, thermal management, and packaging. The second section deals with the basic experimental characterization techniques for the definition of the semiconductor material properties, electrical characteristics, safe operating area, and junction temperature of the devices. The following section introduces the basic principles for electrical, thermal, and electro-thermal simulation of power semiconductors by Technology Computer Aided Design (TCAD) and compact modeling. Finally, procedures are methods are presented to implement efficient built-in reliability programs targeted on power semiconductors. They include failure physics, dedicated failure analysis techniques, accelerated testing, defect screening, and lifetime modeling.

During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the base of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.

227-0620-00L Characterization of the Electronic Properties of Materials for Semiconductor Devices

Abstract

This lecture provides theoretical and experimental knowledge on the techniques for the characterization of the main electronic properties of semiconductors and thin film materials used in microelectronics, with special focus on silicon.

Objective

The characterization of the electronic properties of semiconductor and related materials is fundamental to manufacture integrated devices, which fulfill the required specifications. By this lecture, the students shall get acquainted with the main electrical characterization techniques of the electronic properties of semiconductors and thin film materials used in microelectronics, as well as with their physical principles. This knowledge is intended to provide the future engineer with the theoretical background and experimental tools for process control in semiconductor manufacturing, parameter extraction in device simulation, and design of dependable devices.

Content

This lecture consists of a theoretical part (80%) and of laboratory exercises and demonstrations (20%). In the first section of the lecture, methods and procedures are presented for the experimental characterization of relevant electronic parameters in the bare semiconductor (mainly silicon), like resistivity, carrier and doping density, contact resistance, defect density, carrier lifetime, mobility. The second section deals with techniques involving basic structures and devices (contact chains, MIS capacitors, diodes, gated diodes, MOST, MOSFET) for the characterization of atomic transport, mechanical stress, dielectric thickness, impact ionization, channel mobility, instabilities, defects formation at interfaces and in thin film dielectrics, carrier transport and trapping in thin film dielectrics, quasi-static and dynamic device characteristics. The list of the covered methods includes among others probing, Kelvin measurements, VanderPauw technique, Hall spectroscopy, SIMS, Raman spectroscopy, spreading resistance, scanning probe techniques, static/high-speed I-V, static/high-frequency C-V, open circuit voltage decay, carrier recombination techniques, Zerbst techniques, deep level transient spectroscopy, split C-V, charge pumping, and inverse modeling techniques using TCAD. All methods are presented in conjunction with the proper test structures. During the laboratory activities, a selection of the experimental techniques discussed in the lecture are demonstrated on the base of realistic examples.

Handouts to the lecture (approx. 200 pp.)

Schroeder D.K., Semiconductor Material and Device Characterization, Wiley Ed.

227-0627-00L Applied Computer Architecture

Abstract

This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective

Understand the function, the design and the performance modeling of parallel computer systems.

Content

The lecture "Applied Computer Architecture" gives theoretical and corporate insights in innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data streams of about 30 TB/s, produced by a proton accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?

Script and exercises sheets.

Prerequisites:

Basics of computer architecture.

227-0659-00L Integrated Systems Seminar

In the "Fachseminar IIS" the students learn to communicate topics, ideas or problems of scientific research by listening to more experienced authors and by presenting scientific work in a conference-like situation for a specific audience.

The seminar aims at instructing graduate and PhD students in the basics of presentation techniques, i.e. "how to give a professional talk".

Attendees have the possibility to become acquainted with a current topic by a literature study, and to present the results thereof in a 20 minutes talk in English. The participation at the seminar also gives an overview on current problems in modern nano- and opto-electronics.

The seminar topics' are simulation of nanoelectronic processes and devices, and the optical as well as electronic simulation of optoelectronic devices as lasers, photodiodes, etc.

Presentation material

227-2037-00L Physical Modelling and Simulation

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics available.

Robots are often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

The document provides sufficient information for the participants to successfully participate in the course. The course will be taught in English.

151-0601-00L Theory of Robotics and Mechatronics

Objective
Robots is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Content
An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Prerequisites / notice
The course will be taught in English.

151-0605-00L Nanosystems

Objective
Familiarize students with basic science and engineering principles governing the nano domain.

Content
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately. Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:
(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

Prerequisites / notice
Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

151-0620-00L Embedded MEMS Lab

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes
A document containing theory, background and practical course content is distributed at the first meeting of the course.

Literature
The document provides sufficient information for the participants to successfully participate in the course.

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 524 of 1571
Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant methods will be available on the TIMGROUP website.

D. J. Norris

Class notes and handouts

This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

Title

Readings will be available on the TIMGROUP website.

Type

Introduction to Plasmonics

Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

S. Brusoni

This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

Energy and Power Electronics

Core Subjects

These core subjects are particularly recommended for the field of "Energy and Power Electronics".

Number

227-0247-00L

Title

Power Electronic Systems I

Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant DC/DC converters are analyzed in detail and high frequency loss mechanisms of magnetic components are explained. Space vector modulation of three-phase inverters is introduced and the main power components are designed for typical industry applications.

Content

The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand

Lecture notes

Lecture notes. Course is supported by WWW-teaching system.

Content:

Military knowledge of design and optimization of a power electronic system; furthermore, lecture and exercises thoroughly discuss key subjects of power electronics that are important with respect to a practical realization, e.g. how to select suitable power components, how to determine switching losses, calculation of high frequency losses, EMI filter design and realization, thermal considerations.

Complete design process: from given specifications to a complete power electronic system. Selection and / or design of suitable passive power components: specific properties, parasitic components, tolerances, high frequency losses, thermal considerations, reliability. Static and dynamic characteristics of power semiconductors. Optimized design of the EMI filter. Thermal characterization of the converter, optimized heat sink design. Additional circuitry: gate driver, measurement, control. Converter start up: typical sequence of events, circuitry required.

Overall system optimization: identifying couplings between different components of the considered power electronic system, optimization targets and issues.

Lecture notes

Lecture notes and complementary exercises including correct answers.

Prerequisites: Introductory course on power electronics.

227-0731-00L Power Market I - Portfolio and Risk Management W 6 credits 4G D. Reichelt, G. A. Koeppe

Abstract

Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model

Objective

Content
1. Pan-European power market and trading
2. Development of the European power markets
3. Energy economics
4. Spot and OTC trading
5. European energy exchange EEX

2. Market model
2.1. Market place and organisation
2.2. Balance groups / balancing energy
2.3. Ancillary services
2.4. Market for ancillary services
2.6. Capacity auctions

3. Portfolio and Risk management
3.1. Portfolio management 1 (introduction)
3.2. Forward and futures contracts
3.3. Risk management 1 (m2m, VaR, hpfC, volatility, cVaR)
3.4. Risk management 2 (PaR)
3.5. Contract valuation (HPFC)
3.6. Portfolio management 2
2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
4.1. Options 1 basics
4.2. Options 2 hedging with options
4.3. Introduction to derivatives (swaps, cap, floor, collar)
4.4. Financial modelling of physical assets
4.5. Trading and hydro power
4.6. Incentive regulation

Lecture notes Handouts of the lecture
Prerequisites / notice 1 excursion per semester, 2 case studies, guest speakers for specific topics.
Course Moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=2196

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust “inversion” of a linear filter.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>1. Discrete-time linear systems and filters: state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion. 2. The discrete Fourier transform and its use for digital filtering. 3. The statistical perspective: probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.</td>

Overview of the technical characteristics of railway systems

This lecture provides theoretical and experimental knowledge on the techniques for the characterization and numerical modeling of power electronics. The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.

### Content

- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

### Prerequisites

- Control Systems I (227-0103-00) or equivalent and sufficient mathematical maturity.

### Lecture notes

### Prerequisites / notice

Handouts to the lecture (approx. 250 pp.)

### Lecture notes

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparatur und Unterhalt, SBB Zürich Altstetten
- Fahrzeugfertigung, Stadler Bussnang
- Betrieb:
  - Vollbahnfahrzeuge:
    - 2.1 Geschichtliche Entwicklung des Bahnverkehrs
    - 2.2 Bremsen
    - 2.3 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
    - 2.4 Hilfssysteme und Komfortanlagen
    - 2.5 Steuerung und Regelung
  - 3.1 Fahrweg
  - 3.2 Bahnstromversorgung
  - 3.3 Sicherungsanlagen
  - 4.1 Interoperabilität, Normen und Zulassung
  - 4.2 RAMS, LCC
  - 4.3 Anwendungsbeispiele

### Lecture notes

Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

### Prerequisites / notice

Dozent:
- Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

Handouts to the lecture (approx. 250 pp.)
227-0697-00L  Industrial Process Control  W  4 credits  3G  G. Maier, A. Horch

Abstract
Introduction to process automation and its application in process industry and power generation

Objective
Knowledge of process automation and its application in industry and power generation

Content
Introduction to process automation: system architecture, data handling, communication (fieldbusses), process visualization, engineering, etc.

- Analysis and design of open loop control problems: discrete automata, decision tables, petri-nets, drive control and object oriented function group automation philosophy. RT-UML.
- Engineering: Application programming in IEC61131-3 (function blocks, sequence control, structured text); process visualization and operation; engineering integration from sensor, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis.
- Practical examples from process industry, power generation and newspaper production.

Lecture notes
Slides will be available as .PDF documents, see “Learning materials” (for registered students only)

Prerequisites / notice
Exercises: Tuesday 15-16

Prerequisites
Practical exercises will illustrate some topics, e.g. some control software coding using industry standard programming tools based on IEC61131-3.

227-0759-00L  International Business Management for Engineers  W  3 credits  2V  W. Hofbauer

Abstract
Globalization of markets increases global competition and requires enterprises to continuously improve their performance to sustainably survive. Engineers contribute substantially to the success of an enterprise provided they understand and follow fundamental international market forces, economic basics and operational business management.

Objective
The goal of the lecture is to get a basic understanding of international market mechanisms and their consequences for a successful enterprise. Students will learn by practical examples how to analyze international markets, competition as well as customer needs and how they convert to a successful portfolio an enterprise offers to the global market. They will understand the basics of international business management, why efficient organizations and effective business processes are crucial for the successful survival of an enterprise and how all this can be implemented.

Content
The first part of the course provides an overview about the development of international markets, the expected challenges and the players in the market. The second part is focusing on the economic aspects of an enterprise, their importance for the long term success and how to effectively manage an international business. Based on these fundamentals the third part of the course explains how an innovative product portfolio of a company can be derived from considering the most important external factors and which consequences in respect of product innovation, competitive product pricing, organization and business processes emerge. Each part of the course includes practical examples to demonstrate the procedure.

Lecture notes
A script is provided for this lecture.

Prerequisites / notice
The lecture will be held in three blocks each of them on a Saturday. Each block will focus on one of the three main topics of the course. Between the blocks the students will work on specific case studies to deepen the subject matter. About two weeks after the third block a written examination will be conducted.

151-0563-01L  Dynamic Programming and Optimal Control  W  4 credits  2V+1U  R. D'Andrea

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Cover the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Systems and Control

Core Subjects
These core subjects are particularly recommended for the field of "Systems and Control".

<td>Discrete Event Systems</td>
<td>W</td>
<td>6</td>
<td>4G</td>
<td>L. Thiele, L. Vanbever, R. Wattenhofer</td>
</tr>
</tbody>
</table>

**Abstract**
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

**Objective**
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

**Content**
1. Introduction  
2. Automata and Languages  
3. Smarter Automata  
4. Specification Models  
5. Stochastic Discrete Event Systems  
6. Worst-Case Event Systems  
7. Network Calculus

**227-0447-00L Image Analysis and Computer Vision**  
W 6 credits  3V+1U  L. Van Gool, O. Gökcel, E. Konukoglu

**Abstract**

**Objective**
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

227-0526-00L  Power System Analysis  W  6 credits  4G  G. Hug  
Abstract  The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Objective  The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Content  The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand oriented, operationally, economically), network planning and network operation, models of N-port network components (line, cables, shunts, transformers), the p.u. computation, computer oriented network models, linear networks (solution methods - direct, iterative), algorithms for the solution of non-linear sets of equations, derived from the electrical power system (Newton-Raphson), power flow computation (problem definition, solution methods), three phase short-circuit computation, application of power flow algorithms. Introduction to power system stability.

Prerequisites / notice  The course language is English.

Lecture notes  Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

227-0689-00L  System Identification  W  4 credits  2V+1U  R. Smith  
Abstract  Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective  To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content  Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models. Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Prerequisites / notice  Control systems (227-0216-00L) or equivalent.

Lecture notes  Lecture notes. Course is supported by WWW-teaching system.

227-0945-00L  Cell and Molecular Biology for Engineers I  W  3 credits  3G  C. Frei  
Abstract  This course is part I of a two-semester course.

Objective  The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Content  Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

151-0104-00L  Uncertainty Quantification for Engineering & Life Sciences  W  4 credits  3G  P. Koumoutsakos  
Abstract  Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective  The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content  Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes  The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.
### 151-0532-00L Nonlinear Dynamics and Chaos I

**Abstract**
Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

**Objective**
This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

**Content**
1. Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.
2. Near equilibrium dynamics: Linear and Lyapunov stability
3. Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations
4. Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.
5. Time-dependent dynamical systems: Floquet theory, Poincare maps, averaging methods, resonance

**Lecture notes**
The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

**Prerequisites / notice**
- Prerequisites: Analysis, linear algebra and a basic course in differential equations.
- Exam: two-hour written exam in English.
- Homework: A homework assignment will be due roughly every other week. Hints to solutions will be posted after the homework due dates.

### 151-0573-00L System Modeling

**Abstract**

**Objective**

**Content**
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, thermodynamic, chemistry, fluid dynamic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Estimation techniques (least-squares methods). Class case studies: Loud-speaker, Water-propelled rocket, geostationary satellites, etc. The exercises address practical examples. One larger case study is to be solved.

**Lecture notes**
The handouts in English will be sold in the first lecture.

**Prerequisites / notice**
A list of references is included in the handouts.

### 151-0601-00L Theory of Robotics and Mechatronics

**Abstract**
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Objective**
Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Content**
An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

**Lecture notes**
The course will be taught in English.

**Prerequisites / notice**
The handouts in English will be sold in the first lecture.

### 151-0583-01L Dynamic Programming and Optimal Control

**Abstract**
Introduction to Dynamic Programming and Optimal Control.

**Objective**
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

**Content**
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

**Literature**

**Prerequisites / notice**
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

### 376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

**Abstract**
Rehabilitation Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive functions. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
## Content

Introduction, problem definition, overview  
Rehabilitation of visual function  
- Anatomy and physiology of the visual sense  
- Technical aids (glasses, sensor substitution)  
- Retina and cortex implants  
Rehabilitation of hearing function  
- Anatomy and physiology of the auditory sense  
- Hearing aids  
- Cochlea Implants  
Rehabilitation and use of kinesthetic and tactile function  
- Anatomy and physiology of the kinesthetic and tactile sense  
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)  
- Role of displays in motor learning  
Rehabilitation of vestibular function  
- Anatomy and physiology of the vestibular sense  
- Rehabilitation strategies and devices (e.g. BrainPort)  
Rehabilitation of vegetative Functions  
- Cardiac Pacemaker  
- Phrenic stimulation, artificial breathing aids  
- Bladder stimulation, artificial sphincter  
- Deep brain stimulation for patients with Parkinson, epilepsy, depression  
- Brain-Computer Interfaces

## Literature

### Introductory Books:

### Selected Journal Articles and Web Links:

## Prerequisites / notice

### Target Group:

- Students of higher semesters and PhD students of  
  - D-MAVT, D-ITET, D-INFK, D-HEST  
- Biomedical Engineering, Robotics, Systems and Control  
- Medical Faculty, University of Zurich  
- Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Autumn Semester 2016  
Page 533 of 1571
Introduction to basic techniques and problems in mathematical optimization, and their applications to problems in engineering.

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

Subjects of General Interest

- Devices and Equipment
- Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.
- Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.
- Visualization, Simulation and Interaction - Virtual Reality II
- This course provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.
- Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems.

The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.
Content
Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes
The handout is available in German and English.

Prerequisites / notice
Prerequisites: "Visualization, Simulation and Interaction - Virtual Reality I" is recommended.

Didactical concept:
The course consists of lectures and exercises.

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

Objective
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content
* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the “in this paper” paragraph, the scientific part, the summary, Equations, Figures).
* Topic 2: Power Point Presentations.
* Topic 3: Citation Rules and Citation Software.
* Topic 4: Guidelines for Research Integrity.

Literature
ETH "Citation Etiquette", see www plagiate.ethz.ch.

ETH Guidelines on "Guidelines for Research Integrity", see www ee.ethz.ch > Education > > Contacts, links & documents > Forms and documents > Brochures / guides.

Prerequisites / notice
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 536 of 1571
Abstract
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

Objective
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

Content
1. Discrete-time linear systems and filters: state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.
2. The discrete Fourier transform and its use for digital filtering.
3. The statistical perspective: probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.

Prerequisites / notice
MATLAB is used for system analysis and simulation.

227-0166-AAL
Analog Integrated Circuits
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers; differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

Lecture notes
Handouts of slides. No script but an accompanying textbook is recommended.

Literature

227-0117-AAL
High Voltage Technology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Understanding of the fundamental phenomena and principles connected with the occurrence of extensive electric field strengths. This knowledge is applied to the dimensioning of high-voltage equipment. Methods of computer-modeling in use today are presented and applied within a workshop in the framework of the exercises.

Objective
The students know the fundamental phenomena and principles connected with the occurrence of extensive electric field strengths. They have the ability to identify of weak spots in insulation systems and to name possibilities for improvement. Further they know the different insulation systems and their dimensioning in practice.
Content
- discussion of the field equations relevant for high voltage engineering.
- analytical and numerical solutions/solving of this equations, as well as the derivation of the important equivalent circuits for the description of the fields and losses in insulations.
- introduction to kinetic theory of gases.
- mechanisms of the breakdown in gaseous, liquid and solid insulations, as well as insulation systems.
- methods for the mathematical determination of the electric withstand of gaseous, liquid and solid insulations.
- application of the expertise on high voltage components.
- excursions to manufacturers of high voltage components.
- excercise to learn on computer-modeling in high voltage engineering.

<td>This year the UN Conference in Paris will shape future world objectives to tackle climate change. This course provides an introduction to the notion of sustainable development when applied to our built environment</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Lecture notes
All important information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

**151-0123-00L** Experimental Methods for Engineers

<table>
<thead>
<tr>

**Lecture notes**

All important information will be online available before the lectures. For each lecture slides of the lecture will be provided.

**Literature**

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.
Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant

Introduction to current and future engine systems and their control systems

Introduction to methods of control and optimization of dynamic systems. Application to real engines. Understand the structure and behavior of drive train systems and their quantitative descriptions.

Physical description and mathematical models of components and subsystems (mixture formation, load control, supercharging, emissions, drive train components, etc.). Case studies of model-based optimal design and control of engine systems with the goal of minimizing fuel consumption and emissions.

Introduction to Modeling and Control of Internal Combustion Engine Systems

Overview of the technical characteristics of railway systems

Basic characteristis of railway vehicles and their interfaces with the railway infrastructure:

- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Traffic control and maintenance

Overview of the technical characteristics of railway systems

- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
Content
EST I (Frühjahsemester) - Begriffen, Grundlagen, Merkmale

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebssysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparatur und Unterhalt, SBB Zürich Altstetten
- Fahrzeugfertigung, Stadler Bussnang

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice
Dozent: Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.
Content

1. Pan-European power market and trading
2. Development of the European power markets
3. Energy economics
4. Spot and OTC trading
5. European energy exchange EEX
6. Market model
7. Market place and organisation
8. Balance groups / balancing energy
9. Ancillary services
10. Market for ancillary services
11. Cross-border trading
12. Capacity auctions
3. Portfolio and Risk management
13. Portfolio management 1 (introduction)
14. Forward and futures contracts
15. Risk management 1 (m2m, VaR, hplc, volatility, cVaR)
16. Risk management 2 (PaR)
17. Contract valuation (HPFC)
18. Portfolio management 2
2.8. Risk Management 3 (enterprise wide)
4. Energy & Finance I
1. Options 1 basics
2. Options 2 hedging with options
3. Introduction to derivatives (swaps, cap, floor, collar)
4. Financial modelling of physical assets
5. Trading and hydro power
6. Incentive regulation

Lecture notes
Handouts of the lecture

Prerequisites /
notice
1 excursion per semester, 2 case studies, guest speakers for specific topics.

227-0759-00L International Business Management for Engineers

W 3 credits
2V W. Hofbauer

Abstract
Globalization of markets increases global competition and requires enterprises to continuously improve their performance to sustainably survive. Engineers substantially contribute to the success of an enterprise provided they understand and follow fundamental international market forces, economic basics and operational business management.

Objective
The goal of the lecture is to get a basic understanding of international market mechanisms and their consequences for a successful enterprise. Students will learn by practical examples how to analyze international markets, competition as well as customer needs and how to effectively manage an international business. Based on these fundamentals the third part of the course explains how an innovative product portfolio of a company can be derived from considering the most important external factors and which consequences in respect of product innovation, competitive product pricing, organization and business processes emerge. Each part of the course includes practical examples to demonstrate the procedure.

Content
The first part of the course provides an overview about the development of international markets, the expected challenges and the players in the market. The second part is focusing on the economic aspects of an enterprise, their importance for the long term success and how to effectively manage an international business. Based on these fundamentals the third part of the course explains how an innovative product portfolio of a company can be derived from considering the most important external factors and which consequences in respect of product innovation, competitive product pricing, organization and business processes emerge. Each part of the course includes practical examples to demonstrate the procedure.

Lecture notes
A script is provided for this lecture.

529-0193-00L Renewable Energy Technologies I

W 4 credits
3G A. Wokaun, A. Steinfeld

Abstract
The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Objective
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

Content
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Lecture notes
Lecture notes will be distributed electronically during the course.

Literature

Prerequisites /
notice
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

A. E. Braunschweig

How to make sustainability operational - in industry, services and other organizations: You will learn how to put sustainability into practice

Advanced Environmental Assessment (Computer Lab)

We meet for five 3-hour-lectures, with discussions and case studies during course time.

Different tools and software used for environmental assessments, such as LCA are introduced. The students will have hands-on exercises

Technical systems are investigated in projects, based on the software and tools introduced in the course 102-0317-03 Advanced Env. Assessments

Course documentation as well as case study descriptions will be provided during the course via the "ilias" repository.

Literature will be made available on the lecture homepage.

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multiproduct processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes

No script. Lecture slides and literature will be made available on the lecture homepage.

S. Hellweg

S. Pfister

Become acquainted with utilizing various software programs for environmental assessment to perform a Life Cycle Assessment and learn

1G

This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications.

No script. Lecture slides and literature will be made available on the lecture homepage.

S. Pfister

- Communication of Sustainability Issues
- (Sustainable) Supply Chain Management
- Life Cycle Costing, Life Cycle Management
- Environmental Performance Measurement (Concepts, Standards, Methods)
- The concept of ‘Continuous Improvement’
- Organisational and implementation
- Sustainability Opportunities and Innovation
- Management Standards for Sustainability (ISO and others)
- Sustainable Development and its meaning for Management
- Allocation (multiproduct processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes

Course documentation as well as case study descriptions will be provided during the course via the "ilias" repository.

151-0360-00L

Procedures for the Analysis of Structures

W 4 credits 2V+1U G. Kress

Basic theories for structure integrity calculations are presented with focus on strength, stability, fatigue and elasto-plastic structural analysis.

Theories and models for one dimensional and planar structures are presented based on energy theorems.

Basic principles applied in structural mechanics. Introduction to the theories of planar structures. Development of an understanding of the relationship between material properties, structural theories and design criteria.

1. Basic problem of continuum mechanics and energy principles: structural theories, homogenization theories; finite elements; fracture mechanics.

3. Strength of material theories and material properties: ductile behaviour, plasticity, von Mises, Tresca, principal stress criterion; brittle behaviour, viscoplastic behaviour, creep resistance.

4. Structural design: fatigue and dynamic structural analysis.

Lecture notes
yes

151-0524-00L

Continuum Mechanics I

W 4 credits 2V+1U E. Mazza

The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Lecture notes
yes

151-0573-00L

System Modeling

W 4 credits 2V+2U G. Ducard, C. Onder

Introduction to generic system modeling approaches for control-oriented models based on first principles and experimental data. Examples: mechatronic, thermodynamic, chemistry, fluid dynamic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Estimation techniques (least-squares methods).

Class case studies: Loud-speaker, Water-propelled rocket, geostationary satellites, etc.

The exercises address practical examples. One larger case study is to be solved.

Lecture notes

151-0593-00L

Embedded Control Systems

This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Familiarize students with main architectural principles and concepts of embedded control systems.

An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:

- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Lecture notes
Lecture notes, lab instructions, supplemental material

Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: marischm@ethz.ch).

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

151-0927-00L

Rate-Controlled Separations in Fine Chemistry

W 4 credits 3G M. Mazzotti

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.
Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes
Handouts during the class

Literature
Recommendations for text books will be covered in the class

Prerequisites / notice
Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

Overview of process simulation and flowsheeting

Objective
This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modelling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able develop criteria to correctly use commercial software packages and critically evaluate their results.

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging

An exemplary literature list is provided below:

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
Content
- Vorstellung der Dozierenden mit Fallstudie aus der persönlichen Berufspraxis (CH, RK, WL, FS)
- Resourcen der Welt und Bedeutung für die Schweiz (RK)
- Metallische Erzlagerstätten - Einführung (CH)
- Metallische Erzlagerstätten - Magmatische Prozesse Test 1 (CH)
- Ozeanische Hydrothermalsysteme, Oberflächenprozesse und Atmosphärenentwicklung (CH)
- Metallische Erzlagerstätten - Magmatisch-hydrothermale Systeme Test 2 (CH)
- Energierohstoffe - Einführung; Bildungsprozesse Petroleum und Erdgas (WL)
- Energierohstoffe - Kohle und CO2-Entsorgung Test 3 (WL/RK)
- Nichtmetallische Rohstoffe - Baustoffe (RK)
- Nichtmetallische Rohstoffe - Erden (RK/FS)
- Nichtmetallische Rohstoffe - Industrieminen Test 4 (FS)

Lecture notes
Kursnotizen werden in den Stunden verteilt

Literature

Prerequisites / notice
Geologische und mineralogische Grundkenntnisse aus Dynamische Erde I und II einschliessliche Uebungen in Gesteinsbestimmung; Buch von Grotzinger, Press & Siever. Anwesenheit in den Stunden ist essentiell -- Uebungen und 4 Kurzprüfungen zur Leistungskontrolle.

701-0963-00L Energy and Mobility

Abstract
The lecture Energy and Mobility imparts profound knowledge on how to reduce energy in mobility systems. Both Engineering science and social science aspects are integrated, as technological potentials, policy tools, and human decision making behaviour are combined in order to assess how to reduce energy demand for transport.

Objective
The main objectives of this lecture are:
(i) Students gain profound knowledge on how to frame problems related to the reduction of energy demand (or greenhouse gas emissions) of mobility (sub-)systems.
(ii) Students have an overview on the most relevant technological potentials (fuel-based and vehicle-based).
(iii) Students can assess whether a given reduction goal is ambitious or not, and whether given policy tools are adequate to reach the defined reduction goal.

Content
The lecture Energy and Mobility deals with the intersection of energy and transportation with focus on motorized individual transport. The lecture deals with the question, how the energy demand, or greenhouse gas emissions, of mobility can be reduced. A five step approach provides a common framework:
a) Status quo and Scope: Definition of the system boundary (whole transport system, or only road transport) and of the status quo of that system (energy demand and energy carrier mix for this system, current technology mix, transportation services provided);
b) Trends and Targets: Analysis of trend development of the mobility system under consideration, establishment of a trend scenario (baseline scenario). Definition of the reduction targets (expressed in terms of energy demand or greenhouse gas emissions; base year and target year; absolute or relative reduction target)
c) Potential Analysis: Analysis of currently employed technologies and of upcoming technologies. Identification of the reduction potential of current, conventional technologies and of future, alternative technologies. Technologies cover both the fuel and the vehicle side.
d) Policy Measures: Possible policy measures, direct, indirect and macro-level effects of policies, psychological aspects of decision making, elements of behavioral economics and prospect theory, combination of policies into policy mixes.

Multi-disciplinary Courses
With the consent of the tutor, the students are free to choose individually from the entire course offer of ETH Zürich.

Course Catalogue of ETH Zurich

Semester Project

Number Title Type ECTS Hours Lecturers
227-1101-00L How to Write Scientific Texts in Engineering Sciences E- Strongly recommended for Semester Projects and Master Theses at D-ITET (MSc BME, MSc EEIT, MSc EST).

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

Objective
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content
* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the “in this paper” paragraph, the scientific part, the summary, Equations, Figures).
  * Topic 2: Power Point Presentations.
  * Topic 3: Citation Rules and Citation Software.
  * Topic 4: Guidelines for Research Integrity.

Literature
ETH “Citation Etiquette”, see www.plagiate.ethz.ch.

Prerequisites / notice
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

227-1671-00L Semester Project O 8 credits 20A Supervisors

Abstract
The semester project is designed to train the students in solving specific problems from the field of Energy Science & Technology. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor and must be approved in advance by the tutor.

Abstract
This practical course provides an introduction to elementary laboratory techniques.

Objective
This course is intended to provide an overview of experimental chemical methods.

Content
The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvation or precipitation processes) is studied.

The synthesis of simple inorganic complexes or organic molecules is practised.

Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

Lecture notes
The script will be published on the web. Details will be provided on the first day of the semester.

Literature
A thorough study of all script materials is requested before the course starts.

06.08.2021 13:03
Autumn Semester 2016
ECTS

Prerequisites / notice

The course builds on the contents of the natural science topics that are parts of the basics, the focus areas and the supplementary courses as required for the Swiss federal Matura (Guidelines for the Swiss Matura Exam, 2012). In order to be able to repeat some of these contents and to better prepare for the course before it starts, one can find links to preparatory material (videosclips) on the Course website on OLAT.

651-4271-00L Data Analysis and Visualisation with Matlab in Earth Sciences

Abstract

This lecture and the corresponding exercises provide the students with an introduction to the concepts and tools of scientific data analysis.

Objective

The following concepts are introduced in the course:

- Effective data analysis and visualisation in 2D and 3D
- Working with matrices and arrays
- Programming and development of algorithms
- Learning to effectively use animations
- Statistical description of a dataset
- Interactive data-mining
- Uncertainty, error propagation and bootstrapping
- Regression analysis
- Testing hypotheses

Fehlerrechnung, 9 ausgewählte Versuche zu folgenden Themen:

- Leitfähigkeit und Wärmeleitfähigkeit, Radioaktivität, Radioaktive Innenluft, Dichte und Leitfähigkeit, Fluss durch ein poröses Medium, Lärm.

Abstract

The central aim is to provide an individual experience of the physical phenomena and the basic principles of the experiment. By conducting simple physical experiments the student will learn how to properly use physical instruments and how to evaluate the results correctly.

Objective

This laboratory course aims to provide basic knowledge of:

- the setup of a physics experiment,
- the use of measurement instruments,
- various measuring techniques,
- the analysis or measurement errors,
- and the interpretation of the measured quantities.

Content

Fehlerrechnung, 9 ausgewählte Versuche zu folgenden Themen:

- Testing hypotheses
- Regression analysis
- Uncertainty, error propagation and bootstrapping
- Interactive data-mining
- Statistical description of a dataset
- Regression analysis
- Testing hypotheses

Die Auswahl der Versuche kann zwischen den verschiedenen Studiengängen variieren.

</tbody>
</table>

Abstract

To understand, qualitatively and semi-quantitatively, crystal and mineral formation, the interdependence between crystals structure, chemical composition and physical properties. This dependence is especially the case for the structural dependence of optical anisotropy and the elastic properties of the minerals as well as for the growth of crystals and their defect structures.

Objective

Qualitatives und teilweise quantitatives Verständnis für den Aufbau von Kristallen und Mineralien, für die Zusammenhänge zwischen chemischer Zusammensetzung, Kristallstruktur und physikalischen Eigenschaften, für das Wachstum von Kristallen sowie wichtiger identifikationsrelevanter makroskopischer Eigenschaften; selbständige Identifikation der rund 70 wichtigsten Mineralarten.

Content

- Symmetrien und Ordnung, Punktgruppen, Translationsgruppen, Raumgruppen,
- einfache Strukturtypen, dichte Kugelpackungen, Strukturbestimmende Faktoren
- Chemisch Bindungen, Beziehungen zwischen Struktur und Eigenschaften eine Kristalls.
- Grundlagen von Thermodynamik und Computersimulationen in der Kristallographie.
- Einführung in die Mineralogie und Mineralsystematik.
- Praktikum in Mineralbestimmen aufgrund makroskopischer Eigenschaften.

Interpretation of Geological Maps I

Only for Earth Sciences BSc (Programme Regulations)
Abstract

Introduction to reading and construction of simple geologic maps.
Construction of geological cross-sections.
Introduction to Lambert projection and Schmidt net (i.e., stereoplots).

This course is mainly a hands-on-training, where students solve exercises under supervision.

Objective

To improve the ability to understand geological structures in three dimensions and visualize them.

Learn how to read and interpret geological maps, as well as drawing geological cross-sections.

Content

strike lines, symbols
true and apparent thickness of geological units
true and apparent dip
V-rule
3-Point-Problems
unconformities
faults
introduction to the Lambert projection
folds
magmatic structures

Lecture notes
Exercises and instructions are handed out and are available online in Moodle.

Literature
Semester literature can be found in the ERDW-library.

Prerequisites / notice
This course is not a prerequisite, but nevertheless extremely helpful for the Terrainkurs II.

651-3323-00L Earth and Climate History W+ 3 credits 2G G. Haug

Course will no longer take place after HS16.

Abstract

The goal of the course is to give the students a perception of the major aspects of planetary history and to add to their curiosity about methods which can be applied in the investigations of more specific problems and to planetary features.

Objective

Content

Frühe Geschichte der Erde, der Litho-, Atmo- und Biosphäre; Phanerozoische Platten und Terranes; Entwicklung des Lebens im Phanerozoikum, Mesozoische Anoxia, Kreide-Tertiär-Grenze, Tertiäre Abkühlung, Messian-Salinitätskrise, Hominidenentwicklung, Quartäre Klimaschwankungen.

Lecture notes
Unterlagen werden abgegeben.

Examination Blocks

Examination Block 1

Number Title Type ECTS Hours Lecturers
402-0063-00L Physics II O 5 credits 3V+1U A. Vaterlaus

Abstract

Introduction to the "way of thinking" and the methodology in Physics, with the help of demonstration experiments. The Chapters treated are Electromagnetism, Refraction and Diffraction of Waves, Elements of Quantum Mechanics with applications to Spectroscopy, Thermodynamics, Phase Transitions, Transport Phenomena. Whenever possible, examples relevant to the students' main field of study are given.

Objective

Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

Content

Elektromagnetismus, Elektromagnetische Wellen, Wellenoptik, Strahlenoptik, Quantenoptik, Quantenmechanik, Thermische Eigenschaften, Transportphänomen, Wärmestrahlung

Lecture notes
Skript wird verteilt.

651-3341-00L Lithosphere O 3 credits 2V S. Wiemer, E. Kissling

Prerequisite: successful completion of Dynamic Earth I and II is mandatory.

Course will no longer take place after HS16.
Abstract
Comprehensive understanding of role and evolution of oceanic and continental lithosphere in global plate tectonics and evolution of earth. Understanding principles of theoretical and experimental geothermics and fundamentals of mantle and lithosphere rheologies.

Objective
Comprehensive understanding of role and evolution of oceanic and continental lithosphere in global plate tectonics and evolution of earth. Understanding principles of theoretical and experimental geothermics and fundamentals of mantle and lithosphere rheologies.

Content

Lecture notes
Detailed scriptum in digital form and additional learning modules (www.lead.ethz.ch) available on intranet.

see list in scriptum.

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between weather - climate - atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modeling of complex interrelations in the atmosphere.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes
Written information will be supplied.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Content
Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Abstract
Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

Objective
Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

Content
Topics of the course.
- Physical properties of water (i.e. density and equation of state)
- Exchange at boundaries
- Mixing and transport processes in open waters
- Groundwater and its dynamics
- Ground water as part of the terrestrial water cycle
- Ground water use
- Groundwater - climate
- Groundwater and tracer
- Case studies

Lecture notes
In addition to the suggested literature handouts are distributed.

Literature
Suggested literature.

5. Semester Majors

Major in Geology
Advisor of the major in Geology is Prof. Stefano Bernasconi

Major in Geology: Core Courses
From the offered core courses in autumn and spring semester, 27 credits have to be acquired.

</tr>
</tbody>
</table>

Abstract
The course focuses on the most important systems of radioactive and stable isotopes used in geochemistry and geology. Applications of isotope geochemistry for solving fundamental geological problems are discussed on the basis of case studies.

Objective
Development of a basic knowledge and understanding of the applications of the most important systems of stable and radiogenic isotopes.
The following methods will be discussed in detail: the radioactive-radiogenic systems Rb-Sr, Sm-Nd, U-Th-Pb and K-Ar, as well as the stable isotope systems of oxygen, carbon, nitrogen, sulfur and hydrogen.

We will discuss how these methods are used in the following research fields: geochemistry of the earth, age dating, paleotemperature reconstructions, evolution of the crust and mantle reservoirs, sediment diagenesis, fluid rock interactions, hydrothermal activity, paleoceanography, biogeochemical cycles.

Lecture notes
Available
- Dickin A. P., Radiogenic Isotope Geology, (2005), Cambridge University Press

Prerequisites / notice
Geochemie I: (Bachelor course)
### 651-3523-00L Hydrogeology and Quaternary Geology

**Objective**
- Become familiar with the processes that formed the landscapes during the last 2 Mio. years.
- Understand the types of landscape and the forming quaternary sediments.
- Get insight into the role of the quaternary aquifers and apply fundamental hydrogeological techniques.
- Learn about the risk exposure of aquifers and ways to protect them.
- Familiarize with the concepts for characterization of fractured and karst aquifers.

**Content**
- Erforschungsgeschichte und Gliederung des Quartärs, Klimaentwicklung.
- Prozesse während Kaltzeiten (Eisvorsätze, glaziale Erosion) und während Warmzeiten (Sedimentation, fluviatile Erosion) (mit Übungen).
- Quartäre Geomorphologie, quartäre Ablagerungen (mit Übungen).
- Entwicklungs geschichte der Täler in den Alpen und im Alpenvorland (mit Übungen).
- Altersbestimmungen, Quantarstratigraphische Methoden. Stratigraphie der Talfüllungen.
- Wiederholung Hydrogeologischer Grundlagen.
- Grundwasservorkommen der Schweiz (mit Übungen).
- Hydrogeologie quartärer Ablagerungen (namentlich fluviolglaziale Schotter).
- Nutzung und Bewirtschaftung der Grundwasservorkommen in quartären Ablagerungen (mit Übungen).
- Grundwassernutzung im Hauptsiedlungs raum der Schweiz.
- Gefährdung und Schutz der Grundwasservorkommen in quartären Locker gestein en (mit Übungen).
- Einführung in die Hydrogeologie von Karstgrundwasserleitern (mit Übung).

**Lecture notes**
Während der Vorlesung werden die wichtigsten Daten und Fakten auf Blättern abgegeben und im Internet zum Download bereitgestellt.

**Literature**
- Zahlreiche Publikationen des BAFU zur Hydrologie und Hydrogeologie der Schweiz.

**Prerequisites / notice**
Voraussetzung erfolgreicher Abschluss von 701-0401-00 Hydrospäre

### 651-3525-00L Introduction to Engineering Geology

**Objective**

**Content**

**Lecture notes**
Written course documentation available under "Kursunterlagen".

**Literature**

**Prerequisites / notice**
Requirement: Earth science mapping exercises I

### 651-3527-00L Earth Science Mapping Exercises II

**Objective**
Reading and interpretation of geological and climatological maps.

**Content**

**Lecture notes**
Exercises and instructions are handed out.

### 651-3541-00L Exploration and Environmental Geophysics

**Objective**
Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismics, Georadar. Discussion of survey design, sources and receivers and data processing.

**Content**

**Lecture notes**
Available through eDoz/ILIAS.

**Additional material**
Will be provided by the lecturers.
### Major in Geology: Compulsory Laboratory Courses

These practical courses are mandatory for the BSc-specializations "geology" and "geophysics".

### Major in Geology: Electives

From the offered elective courses in autumn and spring semester 8 credits must be acquired. Primarily courses from the core courses of BSc Earth Sciences have to be selected. Other elective courses from the ETH and University of Zurich are possible, however they must be granted by the advisor of geology (Professor Stefano Bernasconi). Courses of the paleontology of the University of Zurich (further offer under www.palinat.uzh.ch).

Zahlreiche Publikationen des BAFU zur Hydrosphäre und Hydrogeologie der Schweiz

Voraussetzung erfolgreicher Abschluss von 701-0401-00 Hydrosphäre

Primarily core courses of the BSc Earth Sciences majors should be chosen.

Lectures notes

- Cryosphere
  - 651-3561-00L
  - 3 credits
  - M. Funk, M. Huss, K. Steffen
  - W
  - This course introduces the different parts of the cryosphere: snow, glaciers, sea ice, permafrost and their role in the climate system. A significant physical aspect is the focus in each part. Those completing the course are able to describe the dynamics of cryosphere components both formally and using examples.

- Earth Science Mapping Exercises II
  - 651-3527-00L
  - 2 credits
  - M. Funk
  - W
  - Reading and interpretation of geological and climatological maps.
  - Reading and interpretation of geological and climatological maps.

- Introduction to Engineering Geology
  - 651-3525-00L
  - 3 credits
  - M. Funk
  - W
  - This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

- Exploration and Environmental Geophysics
  - 651-3541-00L
  - 4 credits
  - M. Funk
  - W
  - Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismics, Georadar. Discussion of survey design, sources and receivers and data processing.

Prerequisites / notice

- Exercises and instructions are handed out.

Tectonics
W+ 3 credits
2V
J.-P. Burg, E. Kissling

Abstract
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.
Overview of the geological formation processes and the global distribution of mineral resources (metals, energy resources, bulk materials)

**Objective**
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

**Content**
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longfidelity and growth of continents, supercontinents. Rheology of layered lithosphere and upper mantle. Oduction systems Collisions systems Extensional systems Basin evolution Passive and active continental margin evolution

Autumn Semester 2016

Page 562 of 1571
The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can reduce. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.

Students are able to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics. They can evaluate the significance of clouds and aerosol particles for climate and artificial weather modification.

Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate and weather modification, clouds and precipitation

Powerpoint slides and script will be made available.

We offer a lab tour, in which we demonstrate with some instruments how some of the processes, that are discussed in the lectures, are measured.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

We offer a lab tour, in which we demonstrate with some instruments how some of the processes, that are discussed in the lectures, are measured.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

This lecture introduces the theoretical principles and the observational and analytical methods of atmospheric dynamics. Based on these principles, the following aspects are discussed: the energetics of the global circulation, the basic synoptic- and meso-scale flow phenomena, in particular the dynamics of extratropical cyclones, and the influence of mountains on the atmospheric flow.

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Weather Systems

The students are able to explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics.

To discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena.

To explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features.

To explain how mountains influence the atmospheric flow on different scales.

Lecture notes

List of literature is provided.

Lecture notes and slides

Atmospheric Science, An Introductory Survey

John M. Wallace and Peter V. Hobbs, Academic Press

Seminar for Bachelor Students: Atmosphere and Climate

In this seminar all students in the realm of atmospheric and climate science convene to train presentation techniques (talks, posters) by means of classic and modern scientific articles.

In this seminar all students in the realm of atmospheric and climate science convene to train presentation techniques (talks, posters) by means of classic and modern scientific articles.

1st week: course organisation and presentation of the institute
2nd and 3rd week: introduction to oral presentation technique
Week 4 to 10: students talks
11th week: introduction to poster presentation technique
12th and 13th week: poster design
14th week: concluding poster presentation

Documents are offered via the course's web page.

Documents are offered via the course's web page.

This course can only be offered to a limited number of students, however, in any case for everybody having to attend it compulsorily. We beg you to sign in to this course early.

The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their in-plant on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

The students know the different techniques of air pollution control and their scientific basements. They are able to incorporate goals concerning the air quality into their engineering work.
Part 1 Emission, Immission, Transmission
- Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (pro cess-integrated measures) and by different
engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of
these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-cipitators, scrubbers) with their different
mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and
the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes
- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II

Literature
List of literature included in scrib

Prerequisites / notice
College lectures on basic physics, chemistry and mathematics

401-0649-00L Applied Statistical Regression W 5 credits 2V+1U M. Dettling

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical
background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily
work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear
modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual
analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable
transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model,
logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for
which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-
3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have
not registered for the examination of the other course unit.

401-6215-00L Using R for Data Analysis and Graphics (Part I) W 1 credit 1G A. Drewek, A. J. Papritz

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and
selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge
collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very
rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices,
arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding
elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be
taken independently from Part I.

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology W 3 credits 2G+2U D. Or
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior
- Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.
- Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Lab #1:  Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
- Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam
- Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
- Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.
- Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.
- Additional topics:
  - Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
  - Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.
  - Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
  - http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hilbel
Objective

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Content

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

Krusemann, de Ridder, Untersuchung und Anwendung von Pumpversuchen, Verl. R. Müller, Köln, 1970
G. de Marsily, Quantitative Hydrogeology, Academic Press, 1986

Abstract

This course introduces the different parts of the cryosphere - snow, glaciers, sea ice, permafrost - and their role in the climate system. A significant physical aspect is the focus in each part. Those completing the course are able to describe the dynamics of cryosphere components both formally and using examples.

Objective

Students are able
- to qualitatively describe the main components of the cryosphere and their role in the climate system
- to formally describe the relevant physical processes which determine the state of cryosphere components

Content

Introduction into the different components of the Cryosphere: Snow, glaciers, sea ice and permafrost, and their roles in the climate system. Each part is use to emphasized on one specific physical aspect: material qualities of ice, mass balance and dynamics of glaciers and energy balance of sea ice.

Lecture notes

handouts will be distributed during the teaching semester

Field Trips, Laboratory and Block Courses

Courses can be chosen from the complete offerings of the ETH Zurich and University of Zurich.

Number Title Type ECTS Hours Lecturers
701-0565-00L Fundamentals of Natural Hazards Management W 3 credits 3G H. R. Heinimann, B. Krummenacher, S. Löw

Abstract

Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.
Objective

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.

Risk assessment - What are the acceptable levels of risk?
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.

Risk management - What steps should be taken to manage risks?
- Explain the best alternative from a set of thinkable measures based on an evaluation scheme.

Content

Die Vorlesung besteht aus folgenden Blöcken:
1) Einführung ins Vorgehenskonzept (1W)
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Expositions- und Folgenanalyse
2) Risikoanalyse (6W + Exkursion) mit:
   - Systemabgrenzung

3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Choice of courses from the complete offerings of ETH and UZH.

| Objective | - Advanced knowledge in optical mineralogy  
- Application of methods to determine minerals in thin sections  
- Identification and characterisation of metamorphic minerals  
- Description of rocks. Derive correct petrographic rock name, based on modal abundance and microstructure/texture  
- Interpretation of rock fabric/microstructure, parageneses and mineral reactions |
| Content | - Repetition of principal optical properties and of microscopic methods to identify minerals. Emphasis on interpretation of interference figures.  
- Study typical metamorphic rocks in thin sections  
- Description and interpretation of parageneses and texture/microstructures. Study the age relationship of crystallisation and deformation.  
- Estimation of metamorphic grade  
- Quantitative determination: To determine volume percentage of rock components  
- Scientific documentation: Descriptions, drawings, photomicrography using different kinds of illumination and using plane- or circular-polarised light. |
| Lecture notes | handouts with additional information on theory and for exercises, in English.  
To brush up knowledge in optical mineralogy read the relevant chapters in the book of W.D. Nesse (2004);  
Nesse, W.D.: Introduction to optical mineralogy, 3. Ed. (2004). Figures from this book will be used in lectures. Besides the theory, this book describes all optical properties of important minerals. Petrographers working on varying types of silicate rocks should have a look at this book.  
| Literature | - Nesse, W.D.: Introduction to optical mineralogy, 3. Ed. (2004). Figures from this book will be used in lectures. Besides the theory, this book describes all optical properties of important minerals. Petrographers working on varying types of silicate rocks should have a look at this book.  
| Prerequisites / notice | Participants should have basic knowledge in crystallography, mineralogy and petrology, and have taken practical courses in microscopy of thin sections, as well as lectures in metamorphic petrology and structural geology! Other microscopy courses at department D-ERDW are on:  
- magmatic rocks, following this course in second half of semester (P. Ulmer, IGP; Inst. for Geochemistry and Petrology)  
- sedimentary rocks (Geol. Institute)  
- ore minerals (reflected light microscopy, Th. Driesner, IGP)  
- microstructures, deformed rocks (Geol. Institute) |

| 651-4047-00L | Microscopy of Magmatic Rocks          | W+   | 2 credits | 2G   | P. Ulmer   |
| Abstract | This course provides basic knowledge in microscopy of igneous rocks. Apart from the identification of common igneous minerals in thin sections, mineral assemblages, textures and structures will be investigated and the results of microscopy will be combined with igneous phase equilibria to understand generation, differentiation and emplacement of igneous rocks. |
| Objective | The principal goal of this course is to acquire expertise in:  
(1) optical determination of minerals in igneous rocks using the polarizing microscope  
(2) Identification of igneous rocks basing on modal mineralogy, structure and texture;  
(3) interpretation of textures and structures and associated igneous processes;  
(4) Application of igneous phase diagrams to natural rocks. |
| Content | This practical course bases on the course 'Microscopy of metamorphic rocks' (P. Nievergelt), that is taught immediately before this course, where basic knowledge in optical mineralogy and the use of the polarizing microscope is acquired. In this course, the most important (common) igneous minerals and rocks are studied in thin sections under the polarizing microscope. Mineral assemblages, structures, textures and crystalization sequences are determined and utilized to understand the generation, differentiation and emplacement of igneous rocks. In addition, we will apply igneous phase equilibria that have been introduced in other lectures (such as magmatism and volcanism at ETH/Uni Zurich or an equivalent igneous petrology course) to natural rock samples in order to constrain qualitatively parental magma compositions and crystallization conditions. The range of investigated rocks encompasses mantle rocks, tholeiitic, calc-alkaline and alkaline plutonic and volcanic rocks that contain the most common igneous minerals. |
| Lecture notes | Basis of the optical determinations of (igneous) minerals using the polarizing microscope are the tables of Tröger (‘Optische Bestimmung der gesteinsbildenden Minerale’, Optical determination of rock-forming minerals, 1982) that are available in sufficient volumes in the class room. Some loose sheets will be distributed during the lecture providing additional information and templates for thin section descriptions.  
Additionally, I recommend the lecture notes of H.-G. Stosch (University of Karlsruhe, in German) that can be provided in printed form upon request. |
| Literature | There are several good textbooks on the subject of ‘mineralogy in thin sections’ that I can suggest upon request. |
| Prerequisites / notice | This course does not include an introduction in optical mineralogy and the use of a polarizing microscope and, therefore, bases on the course ‘Microscopy of metamorphic rocks’ taught by P. Nievergelt immediately before this course where these basic principles are provided. Alternatively, e.g. for external students, an equivalent course is required to follow this practical course. Other microscopy courses taught at ETH Zurich at the D-ERDW are:  
Microscopy of metamorphic rocks (P. Nievergelt, required for this course)  
Microscopy of sedimentary rocks (W. Winkler & Blaesi)  
Reflected light microscopy and ore deposits practical (T. Driesner)  
Microstructures (deformation structures, B. Cordnonnier) |

Abstract
- Introduction to reflected light microscopy. Use of the microscope. Identification of opaque minerals through the used of tables. Description of textures and paragenetic sequences.

Objective
- Recognition of the most important ore minerals in polished section, interpretation of mineral textures in geological context

Content
- Introduction to reflected light microscopy as a petrographic technique. Leaning main diagnostic criteria. Study of small selection of important and characteristic minerals. Interpreting polished (thin) sections as exercise

Lecture notes
- To be handed out in class

Prerequisites / notice
- Credits and mark based on independent description of selected sample(s) towards the end of the course

Further readings:
- and various journal papers

For the various analytical methods English texts are available from text books and scientific publications.

- Practical work in analytical chemistry for Earth science students.
- Knowledge of some analytical methods used in Earth sciences.
- Introduction to analytical chemistry and atom physics.
- X-ray diffraction (XRD), X-ray fluorescence analysis (XRF), Electron Probe Microanalysis (EPMA), Laser ablation inductively coupled plasma mass spectroscopy (LA-ICP-MS), Mass spectroscopy for light isotopes.

- Aims, usefulness and theoretical background of methods for sediment analysis.
- Practical work in analytical chemistry for Earth science students.
- Knowledge of some analytical methods used in Earth sciences.
- X-ray diffraction (XRD), X-ray fluorescence analysis (XRF), Electron Probe Microanalysis (EPMA), Laser ablation inductively coupled plasma mass spectroscopy (LA-ICP-MS), Mass spectroscopy for light isotopes.

The earlier attendance of other MSc microscopy courses (e.g. magmatic and metamorphic rocks) is not required if during the BSc a general course on microscopy of rocks was completed.

Autumn Semester 2016
Prerequisites / notice
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data.

Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential.

The lecture course is limited to 12 participants.

### Restricted Choice Modules Geology

A minimum of two restricted choice modules must be completed for the major Geology.

**Abstract**
The course "Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimatological research.

**Objective**
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics - through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary palaeoclimatic archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

**Content**
- Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.
- Geological time, stratigraphy, geological archives, climate archives, palaeoclimatic proxies

Climate through geological time: "lessons from the past"

- Cretaceous greenhouse climate
- The Late Paleocene Thermal Maximum (PETM)
- Cenozoic Cooling
- Onset and Intensification of Southern Hemisphere Glaciation
- Onset and Intensification of Northern Hemisphere Glaciation
- Pliocene warmth
- Glacial and Interglacials
- Millennial-scale climate variability during glaciations
- The last deglaciation(s)
- The Younger Dryas
- Holocene climate - climate and societies

**Prerequisite:** Successful completion of the MSc-course

- "Sedimentology I" (651-4041-00L).

**Abstract**
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

**Objective**
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

**Content**
- carbonates, chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg : CO2 sources and sink
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

**Literature**
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"
The grading of students is based on in-class exercises and end-semester examination.

</table>

**Abstract**
Sediments preserved a record of past landscapes. This course focuses on understanding the processes that modify sedimentary landscapes with time and how we can read these changes in the sedimentary record.

**Objective**
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

**Content**
Details on the program will be handed out during the first lecture.

We will attribute the papers for presentation on the 26th, so please be here on that day!

**Literature**
The sedimentary record of sea-level change
Angela Coe, the Open University.
Cambridge University Press

**Prerequisites / notice**
The grading of students is based on in-class exercises and end-semester examination.

**Abstract**
Reconstruction of time scales is critical for all Quaternary studies in both Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture we focus on the six methods that are most frequently used for dating Quaternary sediments and landforms.

**Objective**
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

**Content**
1. Introduction: Time scales for the Quaternary, Isotopes and decay
2. Radiocarbon dating: principles and applications
3. Cosmogenic nuclides: 3He,10Be, 14C, 21Ne, 26Cl, 36Cl
4. U-series disequilibrium dating
5. Luminescence dating
6. K/Ar and Ar/Ar dating of lava flows and ash layers
7. Summary and comparison of results from several dating methods at specific sites

**Prerequisites / notice**
Visit to radiocarbon lab, cosmogenic nuclide lab, noble gas lab, accelerator (AMS) facility.

**Required attending the lecture, visiting laboratories, handing back solutions for problem sets (Exercises)**

</table>

**Number of participants limited to 12.**

**Abstract**
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

### Content
Fundamental principles of X-ray diffraction
Setup and operation of X-ray diffractometers
Interpretation of powder diffraction data
Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

### Lecture notes
Selected handouts will be made available in the lecture

### Literature

The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data.

Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. The lecture course is limited to 12 participants.

### Structural Geology

#### Structural Geology: Compulsory Courses

Introduction to the programming software Matlab.
Learning and understanding the continuum mechanics equations describing rock deformation.
Mathematical equations describing rock rheology: elasticity + viscosity.
Introduction to the finite-element method for modeling rock deformation in 2D.
A small applied project-work at the end of the semester will be tailored to the student's interest.

In addition, innovative methods will be applied to mark the performance in the course, which includes self-evaluation and peer-evaluation among the students. Therefore, some soft-skills will be required and trained as well, such as
- honest self-evaluation and self-grading
- providing honest feedback to a colleague in a tone that is acceptable
- receiving feedback from a colleague without taking criticism personal
- learning the procedure of scientific peer-evaluation

### Literature

A good knowledge of linear algebra is expected.

The used software is Matlab. So, knowledge of Matlab is advantageous. Students may bring their own laptop with a pre-installed copy of Matlab.
The course will consist of regular classes, with a small number of laboratory demonstrations made on an ad-hoc basis (depending on equipment and research project schedules at the Rock Deformation Laboratory). The course will cover measurements of physical properties of rock such as density, porosity, permeability and elastic wave velocity, and will include the concept of seismic anisotropy etc. Later we will cover rock deformation in the brittle field, earthquake physics and triggering. Finally we will discuss scale effects as we move from small scale laboratory environment to the scale of the geophysical investigation.

**Prerequisites / notice**

Undergraduate courses in the following subjects are highly recommended in order to get the most out of this specialist course:

- Basic structural Geology
- Geophysics

### Labo8tory course: Tectonics

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: BIO280

**Abstract**

The course "Basics in Palaeobotany" gives an overview on the evolution and palaeobiology of plants and their relevance for the reconstruction of past environments.

**Objective**

On successful completion of the module, the students should be able to explain how plants are preserved in the fossil record, to describe the morphology of plant megafauna, and of spores and pollen. They can describe how plant fossils can be used for reconstructing palaeoenvironments. Students should be able to explain the interactions between evolution of plants, climate and physical environment and they will be able to integrate the dimension of geological time into their understanding of biological events.

**Content**

- Preservation of plants in the fossil record.
- First evidence for plants on Earth.
- The conquest of the continents by plants.
- Major adaptation and innovations leading to the present plant diversity.
- The evolution and morphology of the major plant groups.
- Plant associations through geological time and their palaeogeographic and stratigraphic relevance.
- Mass extinctions and the fossil plant record.
- Interaction between past vegetation and climate.
- The relevance of plant microfossils for reconstruction of palaeoclimate and palaeooecology.

651-4057-00L Climate History and Palaeoclimatology W 3 credits 2G S. Bernasconi, B. Ausin Gonzalez, A. Fernandez Bremer, A. Gilli

Abstract
The course "Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in palaeoclimate research.

Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary palaeoclimatic archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Geological system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.

Geological time, stratigraphy, geological archives, climate archives, palaeoclimate proxies

Climate through geological time: "lessons from the past"

Cretaceous greenhouse climate

The Late Paleocene Thermal Maximum (PETM)

Cenozoic Cooling

Onset and Intensification of Southern Hemisphere Glaciation

Onset and Intensification of Northern Hemisphere Glaciation

Pliocene warmth

Glacial and Interglacials

Millennial-scale climate variability during glaciations

The last deglaciation(s)

The Younger Dryas

Holocene climate - climate and societies

</tr>
</thead>
<tbody>
<tr>
<td>651-4231-00L</td>
<td>Basin Analysis</td>
<td>W+</td>
<td>3 credits</td>
<td>2G</td>
<td>S. Willett, T. I. Eglinton, M. Lupker</td>
</tr>
</tbody>
</table>

Abstract
The course discusses the formation and development of different basin types as part of lithosphere geodynamics. It introduces conceptual models and governing physics, with practical application to the study of basin evolution. Techniques for the analysis of subsidence and thermal history are demonstrated. Organic matter, petroleum play, and their biogeochemical investigation are examined.

Objective
Based on the introductory education and practical training during this course, each participant should be able to choose and apply approaches and techniques to own problems of basin analysis, and should be versed to expand their knowledge independently.

In particular, each participant should:
- Develop an intuitive understanding for origin, dynamics, and temporal evolution of basins in a geological / geodynamic context;
- Acquire the necessary theoretical foundation to describe basin evolution quantitatively;
- Be familiar with geological and geophysical methods that are applied to obtain information about rock properties, structural geometry, and thermal and subsidence history of basins;
- Understand the burial and maturation of organic matter in basins, the development of petroleum play, and be acquainted with geochemical methods to study the evolution of biogenic carbon.
The following topics are covered:

- Introduction; classification schemes and types of basins; heat conduction; geotherms;

- The lithosphere; isostasy; rifts and basins due to lithospheric stretching; uniform extension model; modifications to the uniform stretching model; dynamics of rifting.

- Elasticity of the lithosphere; flexural compensation; geometry and analytical description of loads and the resulting deflection; foreland basins; their anatomy;

- Reconstruction of basin evolution; borehole data; porosity loss and decompaction; backstripping; subsidence curves; thermal history and its reconstruction;

- Petroleum play concept; organic production; source rock prediction and depositional environment; petroleum generation, expulsion, migration, alteration; reservoir and traps;

- Carbon cycle; maturation of organic matter; geochemistry of biogenic carbon; biomarkers; analytical techniques

- Overview of other basin types: effects of mantle dynamics, strike-slip basins.

Each week of the course is split in lectures and corresponding practicals, in which the concepts are applied to simplified problems.

Grading of the semester performance is based on submitted practicals (50%) and a final exam (50%). The exam will take place in the time slot of the last practical (18.12.).

Lecture notes
Lecture notes are provided online during the course. They summarize the current subjects week by week, and provide the essential theoretical background.

Literature
Main reference:

Recommended, but not required (available in library).

Supplementary:

Prerequisites / notice
Familiarity with MATLAB is advantageous, but not required.

Abstract
Introduction into seismic interpretation for solving geological and environmental problems. A special focus is given to the seismic facies analysis and seismic sequence stratigraphy. In addition, the seismic attributes are explained, which are important for the analysis of paleo-geomorphology and structural deformation.

Objective
1. Acquire techniques for a comprehensive interpretation of seismic sections for solving geologic, tectonic, stratigraphic and environmental problems

2. Correlation of seismic facies to lithologic facies in different sedimentary systems

3. Recognition of structural elements and faults on seismic sections.

4. Learning the techniques of 3D seismic data interpretation

5. Reconstruction of sedimentary history using seismic stratigraphy and facies analysis and core information.
The four day course consists of lectures that are accompanied by a variety of exercises.

Day 1:
Introduction seismic facies analysis with exercise
Seismic resolution
Factors controlling sedimentation
Exercise: Seismic section in Straits of Florida

Day 2:
Seismic attributes and seismic geomorphology
Siliciclastic deltas, shelves and turbidite systems, 2D-3D
Exercise: Seismic section Tarragon Basin
Seismic facies carbonates
Exercise: Seismic section platform margin Great Bahama Bank
Deepwater environments, including cold-water coral habitats

Day 3:
Seismic facies of mixed systems with exercises
Faults and structures on seismic sections
Exercise: Seismic section Golf von Mexiko

Day 4:
Telling ages on seismic section
Seismic stratigraphy and sequence stratigraphy
Exercise: Sequence analysis Straits of Andros
Final discussion

Lecture notes
An original script (110 pages) designed for the class will be distributed at the beginning of the course.

Data: 06.08.2021 13:03  Autumn Semester 2016
This course is a general introduction to the methods of seismic hazard analysis. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties.

Objective

This course is a general introduction to the methods of seismic hazard analysis.

Content

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.

651-4016-00L Geophysical Geodesy W+ 3 credits 2G N. Houlié
Abstract

The course is an introduction to the concepts of geodesy applied to the seismic cycle and to the monitoring of ground deformation.

Objective

This course is a general introduction to the methods of seismic hazard analysis.

Content

1. Plate Tectonics before Space Geodesy
2. Space geodetic techniques (VBLI, gravity, etc.)
4. The seismic cycle monitoring (Moment release, seismology, Stress transfer)
5. Presentation of GPS and Applications 1 (positioning, rigid plate motions)
6. GPS networks in the world. Development of tectonic geodesy and Applications 2 (Practical on inter-seismic deformation)
7. Presentation of InSAR, pSAR, etc. Applications to earthquake. Post-seismic deformation.
8. GPS and deformation related to volcanoes (Practical on Mogi source)
9. GPS, Strain, Stress and Plate motion.
10. InSAR applied to subsidence and small deformation.
11. Troposphere sounding. Accuracies of GPS and InSAR.
12. GPS and geodynamics
13. Future of GPS. Future of InSAR.
14. GPS and normal modes?

Lecture notes

Literature

Geology and Geophysics equivalent to Bachelor program at ETH
Math of Bachelor program at ETH

Pre-requisites / notice

Of advantage:
Higher Geodesy Basics; Physical Geodesy and Geodynamics I; Seismotectonics

The grading is based on participation, homework sets, and a final oral presentation. There is no final exam.

651-4103-00L Earthquakes Source Physics W+ 3 credits 2G S. Wiemer
Abstract

Does not take place this semester.

The course unit will be offered again in the autumn semester 2017.

Objective

This course teaches the fundamental principles to understand physical processes leading to and governing earthquake source ruptures. To obtain that understanding we cover topics ranging from friction and fault mechanics up to earthquake source descriptions. The acquired understanding will be applied to a topic of choice to practice research skills.

Content

We will cover a range of topics, including:
- Earthquake basics: definitions, faults, elastic rebound theory, and source parameters.
- Introduction to elastodynamics: strain, stress, equation of motion.
- Mathematical description of the source:
  - Representation theorem, point and extended sources, source spectra.
  - Energy partitioning
- Source dynamics: Linear Elastic Fracture Mechanics
- Fault mechanics and friction
- Seismic cycle: inter- , co-, and post-seismic processes
- Aseismic creep and slow slip transients
- Earthquake source inversion and data assimilation
- Recurrence models
- Modeling of dynamic ruptures and seismic cycles

After a theoretical understanding has been acquired, we invite students to apply this knowledge to their topic of preference by presenting a group of state-of-the-art and/or classical papers as a final project. This will require them to understand and evaluate current challenges and state-of-the-art practices in earthquake physics. Additionally, this stimulates participants to improve their skills to:
- critically analyze (to be) published papers
- disseminate knowledge within their own and neighboring research fields
- formulate their opinion, new ideas and broader implications
- present their findings to an audience
- ask questions and actively participate in discussions on new scientific ideas

Lecture notes

Course notes will be made available on a designated course web site. An overview of the discussed principles are available in the three books mentioned below.

Literature

Prerequisites / notice

This concerns a bi-yearly course that will be taught again in Fall 2017.

The course will be evaluated in 2 parts:
- a two hours final exam at the end of the course,
- a presentation discussing a topic of chose based on a group of suggested papers

The course is worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS. The final writing exam has a weight of 70% and the presentation weighs for 30%.

The course will be given in English.

Physics of Glaciers

Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).

Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes

**Abstract**

Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, ice rheology, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of Greenland and Antarctica.

After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Good high school mathematics and physics knowledge required.

**Abstract**

Seismic tomography is the science of interpreting seismic measurements (seismograms) to derive information about the structure of the Earth. The subject of this course is the formal relationship existing between a seismic measurement and the nature of the Earth, or of certain regions of the Earth, and the ways to use it, to gain information about the Earth.

Seismic tomography is the science of interpreting seismic measurements (seismograms) to derive information about the structure of the Earth. The subject of this course is the formal relationship existing between a seismic measurement and the nature of the Earth, or of certain regions of the Earth, and the ways to use it, to gain information about the Earth.

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.

Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Quaternary Geology and Geomorphology

Quaternary Dating Methods

Abstract
Reconstruction of time scales is critical for all Quaternary studies in both Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture we focus on the six methods that are most frequently used for dating Quaternary sediments and landforms.

Objective
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

Content
1. Introduction: Time scales for the Quaternary, Isotopes and decay
2. Radiocarbon dating: principles and applications
3. Cosmogenic nuclides: 3He,10Be, 14C, 21Ne, 26Cl, 36Cl
4. U-series disequilibrium dating
5. Luminescence dating
6. K/Ar and Ar/Ar dating of lava flows and ash layers
7. Summary and comparison of results from several dating methods at specific sites

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, noble gas lab, accelerator (AMS) facility.

Quantiﬁcation and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)

Abstract
Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

Objective
Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

Content
Erosion and sedimentation by glaciers as a function of topogrophy, englacial temperature, sediment balance, sliding and melt water runoff. Processes and landforms in regions of seasonal and perenial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).
Lecture notes

Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

Literature references in skript

Prerequisites / notice

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes

Remote Sensing

Abstract

The course will introduce students to the general principles of Geothermics and is suitable for students who have a basic knowledge of Geoscience or Environmental Science (equivalent of a Bachelor degree).

Objective

To provide students with a broad understanding of the systems used to exploit geothermal energy in diverse settings.

Content

The course will begin with an overview of heat generation and the thermal structure of the Earth. The basic theory describing the flow of heat in the shallow crust will be covered, as will be the methods used to measure it. Petrophysical parameters of relevance to Geothermics, such as thermal conductivity, heat capacity and radiogenic heat productivity, are described together with the laboratory and borehole measurement techniques used to estimate their values. The focus will then shift towards the exploitation of geothermal heat at various depths and temperatures, ranging from electricity and heat production in various types of deep geothermal systems (including high and medium temperature hydrothermal systems, and Engineered Geothermal Systems at depths of 5 km or more), to ground-source heat pumps installed in boreholes at depths of a few tens to hundreds of meters for heating domestic houses. The subjects covered are as follows:

Week 1: Introduction. Earth's thermal structure. Conductive heat flow
Week 3: Temperature measurement. Hydrothermal reservoirs & well productivity
Week 4: Hydrological characterisation of reservoirs. Drilling. Optimized systems
Week 5: Petrothermal or Engineered Geothermal Systems
Week 6: Low-enthalpy systems 1
Week 7: Low-enthalpy systems 2

Lecture notes

The script for each class will be available for download from the Ilias website no later than 1 day before the class.

**Abstract**

This course focuses on the principles (fundamentals) and basic concepts of rock mechanics and rock engineering (e.g., tunnelling, rock slope stability).

**Objective**

The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e., the conditions under which the rock formed) will be clearly established.

The student shall understand basic principles of rock mechanics and rock engineering. In addition, the student shall learn how to carry out laboratory tests, to interpret these tests and to apply the results from lab and field investigations to simple engineering problems. This knowledge is required for subsequent integration courses (Landslide Analysis and Hazard Mitigation; Engineering Geology of Underground Excavations).

**Content**

This course focuses on the principles (fundamentals) and basic concepts of rock mechanics and generic rock engineering. The behavior of different rock types is studied with laboratory investigations which are linked to the theoretical aspects discussed in lectures and applied in exercises. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses.

**Lecture notes**

**Abstract**

The course provides an introduction into quantitative analysis of groundwater flow and solute/heat transport. It is focussed on understanding, formulating, and solving groundwater flow and solute/heat transport problems.

**Objective**

a) Students understand the basic concepts of groundwater flow and solute/heat transport processes and boundary conditions.

b) Students are able to formulate simple, practical groundwater flow and solute/heat transport problems.

c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute/heat transport problems.
1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.

2. Flow equation. The generalised Darcy law.

3. The water balance equation.

5. Analytical solutions to flow problems I

6. Analytical solutions to flow problems II

7. Finite difference solution to flow problems.

12. Analytical solutions to transport problems I.

13. Analytical solutions to transport problems II

Abstract
This course introduces students to the methods used in characterising, developing or monitoring geotechnical engineering project sites. Measurements, tools and analyses are described that are relevant to determining the geologic conditions at a site as well as deformations that occur under natural or construction conditions.

Objective
This course aims to introduce the general procedures taken during a engineering geological site investigation. Students who complete the course should be able to design a site investigation program of measurements based on information from initial desk studies, and to analyse, integrate and interpret data from the measurement program.

Content
The methods that are routinely employed in site investigations will be described focusing on their applicability in different geologic environments. The limitations of the data in constraining the parameters of interest will be addressed together with problems of interpretation and cost-versus-information value. Specific topics addressed include drilling, coring, sampling, borehole testing, geophysical methods used in engineering geology, satellite, air- and ground-based surface and displacement monitoring (photogrammetry, LIDAR and Radar), and in-situ deformation measurement methods.

Lecture notes
Lecture notes will be available for download 1-2 days before each class.

Literature

Online (ETH): http://www.icevirtuallibrary.com/content/book/100017

Supplemental literature will be suggested and made available during the course.

Engineering Geology: Integration
Courses for this Module take place in spring semester.

Prerequisites: successful participation in all 3 compulsory modules of the Major in Engineering Geology (Fundamentals, Methods and Integration).

The Industrial Internship of the Eng Geol Major should take place in the second MSc year after consultation with Dr. Ernst Kreuzer. Detailed regulations of this practical are published on the Eng Geol Website.
The goal of the course is to provide an understanding of the principles of digital signal processing and filter theory. Form: two hours lecture per week over 7 weeks.

The class follows no single book. A list of relevant texts will be given in class.

T. Gerya
Title
Geophysical Data Processing

Objective
The goal of the course is to provide an understanding of the principles of digital signal processing and filter theory. Form: two hours lecture per week over 7 weeks.

Content
Analog-digital conversion: dynamic range and resolution; Dirac-impulse, step function; Laplace transformation; Z-transformation; Differential equations of linear time-invariant systems; Examples: seismometer and RC-filter; Impulse response and transfer function; Frequency selective filters: example Butterworth filters; Digital filters: impulse invariance and bilinear transformation; Inverse filters; Response spectra.

Lecture notes
Lecture notes will be made available for download from the website of the course.

Literature
The class follows no single book. A list of relevant texts will be given in class.

Prerequisites / notice
Students must bring their own laptop in class for Matlab exercises.

651-4241-00L
Geophysical Fluid Dynamics

Objective
The goal of this course is to develop familiarity with basic fluid dynamical concepts relevant to geophysical and astrophysical problems. The course is a combination of lectures, exercises and demo experiments to present the same concepts in various forms.

Content
(i) Basic concepts.
(ii) Conservation Laws.
(iii) Dynamic similarity and scale analysis.
(iv) The inviscid approximation.
(v) Streamlines-Streamfunctions.
(vi) Elements of boundary layer theory - Application to viscous boundary layer.
(vii) Vorticity-Concept and Examples.
(viii) Introduction to rotating fluid.
(ix) Viscous boundary layer in rotating fluid.
(x) Non-rotating thermal convection.
(xi) Introduction to rotating thermal convection.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

Taras Gerya, Introduction to Numerical Geodynamic Modelling, Cambridge University Press 2010
Abstract

In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth's mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

Objective

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth's mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.

Content

A provisional week-by-week schedule (subject to change) is as follows:

Week 1: The continuity equation

- Theory: Definition of a geological media as a continuum. Field variables used for the representation of a continuum. Methods for definition of the field variables. Eulerian and Lagrangian points of view. Continuity equation in Eulerian and Lagrangian forms and their derivation.
- Exercise: Computing the divergence of velocity field.

Week 2: Density and gravity

- Exercise: Computing density, thermal expansion and compressibility from an equation of state.

Week 3: Stress and strain

- Exercise: Analysing strain rate tensor for solid body rotation.

Week 4: The momentum equation

- Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Week 5: Viscous rheology of rocks

- Theory: Solid-state creep of minerals and rocks as themajor mechanism of deformation of the Earths interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.
- Exercise: Computing effective viscosity from empirical flow laws.

Week 6: The heat conservation equation

- Exercise: steady temperature profile in case of channel flow.

Week 7: Elasticity and plasticity

GRADING will be based on homeworks (30%) and oral exams (70%).
The course explains the principles and assumptions used in seismology. It provides the tools to solve basic seismological problems. The course includes the theorems in dynamic elasticity, the formulation with potentials, Greens function, elastic waves from point dislocations sources, moment tensors, 1D, 2D, and 3D wave propagation problems, reflection and transmission at plane boundaries, and surface waves in a vertically heterogeneous medium.

**651-4015-00L Seismotectonics**

**Abstract**
If you're interested in knowing more about the relationship between seismology and plate tectonics, this is the course for you. If you're not that interested, but your program of study requires that you complete this course, this is also the course for you.

**Objective**
By the conclusion of this course, we hope that you:

- have a solid understanding of stress and strain and tensor representations;
- have a feeling for what rheology is and why it is important;
- have a more sophisticated understanding of the relationship between plate tectonics and earthquakes;
- understand earthquake source representations of varying complexity;
- understand earthquake settings in the context of different tectonic settings;
- understand why we can't predict earthquakes;
- understand that "modern science is... a set of research directions rather than a collection of nuggets of established truth."

**Content**
To begin our series of 14 meetings, we will review fundamentals of continuum mechanics and tensor analysis; our goal is to help you understand deformation from the scale of crustal deformation in the classroom to the scale of plate tectonics. We will tell you about several ways to approximately represent an earthquake source; we'll present these in order of increasing sophistication. We'll discuss a currently-popular theory to explain earthquake triggering. We'll talk about the conceptual connections between earthquakes and tectonic deformation. You will enjoy (at least) two computer exercises.

Discussed: stress and deformation in the Earth; stress and strain tensors; rheology and failure criteria; fault stresses, friction and effects of fluids; stable and unstable sliding; earthquake focal mechanisms; relationship between stress fields and focal mechanisms; seismic moment and moment tensors; relationship between moment- and deformation tensors; crustal deformation from seismic, geologic, and geodetic observations; earthquake stress drop, scaling, and source parameters; earthquake induced stress changes; global earthquake distribution; current global earthquake activity; different seismotectonic regions; examples of earthquake activity in different tectonic settings, such as in subduction zones, California, the Mediterranean, and in Switzerland.

**Literature**

**Prerequisites / notice**
You should have at least a foggy recollection of calculus.

**651-4021-00L Engineering Seismology**

**Abstract**
This course is a general introduction to the methods of seismic hazard analysis. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties.

**Objective**
This course is a general introduction to the methods of seismic hazard analysis.

**Content**
In the course it is explained how the disciplines of seismology, geology, strong-motion geophysics, and earthquake engineering contribute to the evaluation of seismic hazard. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties. The course includes the discussion related to intensity and macroseismic scales, historical seismicity and earthquake catalogues, ground motion parameters used in earthquake engineering, definitions of the seismic source, ground motion attenuation, site effects and microzonation, and the use of numerical tools to estimate ground motion parameters, both in a deterministic and probabilistic sense.

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.

### Applied Geophysics

#### Applied Geophysics: Compulsory Courses

---

Data: 06.08.2021 13:03    Autumn Semester 2016    Page 586 of 1571
The compulsory courses take place in spring semester.

►►► Applied Geophysics: Courses of Choice
The compulsory Courses for the Module Applied Geophysics take place in Spring Semester. One additional elective course of at least 3KP has to be completed for this Module according to prior agreement with the Subject Advisor of the Geophysics Major (Autumn or Spring Semester).

► Major in Mineralogy and Geochemistry
►► Compulsory Module in Analytical Methods in Earth Sciences
Students have to complete 6 credits in part A (microscopy courses), and 6 credits in part B (methods).

►► Microscopy Courses
Compulsory Module in Analytical Methods in Earth Sciences: Microscopy Courses

►►► Analytical Methods Courses
Compulsory Module in Analytical Methods in Earth Sciences: Analytical Methods Courses

►► Restricted Choice Modules Mineralogy and Geochemistry
A minimum of two restricted choice modules must be completed in the major Mineralogy and Geochemistry.

►►► Mineralogy and Petrology

Content

The course will give an introduction to phase petrology and its application to magmatic and metamorphic systems. Further, the course will give an introduction to thermobarometry of mineral assemblages. The origin and interpretation of microstructures and chemical zonation in rocks will be discussed. We will also touch kinetics of rock forming processes and the role of fluids during the lectures.

The specific topics will involve:

- Mineral reactions and chemical equilibria in metamorphic and magmatic rocks, recalculations of rock and mineral analyses, mineral modes, P-T-X relations.

Literature

1) the blue book by F Spear 1993 Metamorphic phase equilibria and pressure-temperature-time paths. MSA Mongraph

2) Principles of Metamorphic Petrology; Ron H. Vernon, Geoffrey Clarke

651-4233-00L Geotectonic Environments and Deep Global Cycles

Abstract

This course addresses master students interested in an integral view of processes operating in various tectonic environments, most specifically divergent and convergent plate margins.

651-4097-00L Applied Mineralogy and Non-Metallic Resources I

Abstract

Geological and mineralogical aspects to important non-metallic mineral resources. Industrial use of specific mineral resources as well as economic, strategic and environmental aspects are discussed. Examples from all over the world with a specific focus on the non-mineral mineral resources potential in Switzerland.

Objective

Students will learn to understand the use of non-metallic mineral resources from a geological and mineralogical point of view as well as from industrial, technical and strategic (political) point of view. Environmental aspects on the worldwide use of non-metallic mineral resources are discussed. A special focus will be given on the situation in Switzerland.

Content

Teaching, case-studies and excursions (e.g. raw-material industry).

Course "Applied mineralogy and non-metallic resources I" (autumn/winter semester):
- Non-metallic resources. Occurrences, geology, extraction, properties, fabrication and use. Industrial aspects, (new) technologies, market, stock, situation, reserves & resources, trends and development, environmental aspects, law.

Chapters:
- e.g. coal/carbon (coal, graphite, diamond, fullerene); oil/gas (oil- and tarsands, oil-shists); phosphates/nitrates; aluminum (bauxite, corundum); salt; carbonates; titanium; clay and clay minerals; sulphur; gypsum/anhydrite; fluors; asbestos; talc; micas; rare earth elements.

Course "Applied mineralogy and non-metallic resources II" (fall/summer semester):

Chapters:
- e.g. Stone industry - technical aspects of building stones, properties, weathering, treatment, quarries, products. Crushed stones - quarries, products, planning, environment. Gravel an sand - resources/reserves, environment (protection/law), alternative products (substitution). Cement and concrete (geological resources, prospection, fabrication, environment).

Lecture notes

Will be given according to the lessons. Partially integration of e-learning tools.

Petrology and Volcanology

Petrology and Volcanology: Compulsory Courses

The compulsory courses take place in spring semester.

**Abstract**

Principles of hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of geological, chemical and physical factors from global scale to sample scale. Introduction to orthomagmatic ore formation (mostly Cr, Ni, PGE).

**Objective**

Understanding the fundamental processes of hydrothermal and magmatic ore formation, recognising and interpreting mineralised rocks in geological context.

**Content**

- (a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types.
- Mineral solubility and ore deposition, principles & thermodynamic prediction using activity diagrams. Stable isotopes in ore-forming hydrothermal systems (O, H, C, S) Driving forces and structural focussing of hydrothermal fluid flow
- (b) Introduction to orthomagmatic ore formation. Chromite, Ni-Cu sulphides and PGE in layered mafic intrusions. Distribution coefficients between silicate and sulphide melts. Carbonatites and pegmatite deposits.

**Lecture notes**

Notes handed out during lectures

**Literature**

Extensive literature list distributed in course

**Prerequisites / notice**

2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h written exam in the last lecture of the semester (50%).

Mineral Resources: Courses of Choice
Introduction to computer tools for the simulation of hydrothermal processes: HYDROTHERM for fluid flow simulations, HCH for thermodynamic modeling. While learning the respective computer programs is an essential part of the course, the emphasis will be on using these tools to learn how the physics and chemistry of hydrothermal system actually work.

Lecture notes
Computer programs and course material will be distributed during the course.

Literature

651-4034-00L Resource Economics and Mineral Exploration

W 3 credits 3P C. A. Heinrich

Does not take place this semester.
The course unit will be offered again in the autumn semester 2017.

Abstract
Global mineral economics and the strategies of mineral exploration -- including geological, geochemical and geophysical methods, but also non-geological factors such as organisational, political and environmental aspects. Changing external lecturers.

Objective
Practical understanding of the procedure of exploring a mineral prospect, based on geological analysis, exploration by drilling, resource calculation of tonnage and grade as a basis for economic evaluation for reporting to investors.

Content
This block course in will comprise 4 half-day lectures and a series of practical exercises from selection of a mineral property to discovery of mineral resources and their valuation. Teams are formed as Limited Partnership companies that have to select and bid for a mineral property offered during an auction. Each company has the same nominal budget. The highest bidder purchases the selected property, others need to purchase the remaining properties during an auction. Justification for selecting the property is justified in a report. The companies must interpret the geology of their mineral property to prepare a diamond drill program to discover and, eventually, delineate the mineral resources. This drill program is presented in a report prior to drilling. Drilling in the tri-dimensional matrix of the property is simulated using the software FOREUR, until budget lapse. The companies must select drill intervals for chemical analysis to document the extent and composition of the discovered mineralization. Portions of the mineral rights can be traded for capital between the companies. An estimate of the tonnage and grade of the discovered resource is prepared using geometric methods and GIS software (ex. Arc GIS). The ground value of the resource is estimated by a computation of the Net Smelter Return at current metal prices. The results of the exploration program are presented in a comprehensive report.

Lecture notes
Handouts for background information and a computer simulation program for the case-study exercise will be provided. Participants must bring a Windows-based laptop computer.

Prerequisites / notice
Prerequisites: Knowledge of mineral deposit-type characteristics is useful (orogenic gold, Cu-Zn VMS, Ni-Cu-PGE); at least "Ressourcen der Erde", or adequate knowledge of mineral deposits acquired by preparatory reading. Basic knowledge of ArcGIS software is important to produce maps and sections required in reports. Training exercises and tutorials will be provided in advance to prepare for the course. Taught biennially in collaboration with University of Geneva.

This course is co-organised by ETH Zurich (Prof. C. Heinrich) and University of Geneva (Prof. L. Fontbote)

Abstract
This course will introduce some of the main quantitative methods available for the quantitative treatment of geochemical data, as well as the main modelling tools. Emphasis will both be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

Objective
Development of a basic knowledge and understanding of the main tools available for the quantitative analysis of geochemical data.

Content
The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and one-dimensional modelling of ocean chemistry; modelling speciation in aqueous (hydrothermal, fresh water sea water) fluids.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography.

A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Lecture notes
Slides of lectures will be available.

Prerequisites / notice
Pre-requisite: Geochemistry (651-3400-00L), Isotope Geochemistry and Geochronology (651-3501-00L).

Abstract
Formation and evolution of the solar system with a geochemical perspective

Objective
To understand the formation and evolution of the solar system from a geochemical perspective

Content
The sun and solid objects in the solar system (planets, comets, asteroids, meteorites, interplanetary dust) are discussed with a geochemical perspective. What does their present-day composition tell us about the origin and evolution of the solar system? The lecture first introduces the basic facts of the terrestrial and giant planets, as well as comets and asteroids, mainly gained from modern planetary missions. The chemical and isotopic composition of meteorites, being the most primitive material available for study, is a further major topic.

Abstract
The course “Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimatic research.
Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics-through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.

Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies

Climate through geological time: "lessons from the past"

Cretaceous greenhouse climate
The Late Paleocene Thermal Maximum (PETM)

Cenozoic Cooling
Onset and Intensification of Southern Hemisphere Glaciation
Onset and Intensification of Northern Hemisphere Glaciation
Pliocene warmth
Glacial and Interglacials
Millennial-scale climate variability during glaciations
The last deglaciation(s)
The Younger Dryas

Holocene climate - climate and societies

651-4225-00L  Topics in Geochemistry  W  3 credits  2G  S. Bernasconi, G. Bernasconi-Green, D. L. Cook

Abstract
This course aims to present and discuss advanced topics in geochemistry based on the critical reading of research papers. Themes will vary from year to year and suggestions from students are welcome. The format of the course will be: one or more lectures introducing a theme, followed by a presentation of one or more papers by a student or group of students.

Objective
The goal of the course is discuss topics in advanced geochemistry which were not covered in other general and specialized geochemistry courses. In addition, we aim at training the student's ability to critically evaluate research papers and to summarize the findings concisely in an oral presentation.

Content
Themes will vary from year to year and suggestions from students are welcome.
Some possible topics are:
Organic geochemistry.
Isotope geochemistry of organic matter: carbon, hydrogen and nitrogen.
Multiply-substituted isotopologues.
Mass-independent fractionations.
Mass transfer and isotopes in modern and ancient ocean-floor hydrothermal systems and subduction zone environments.
Noble gas geochemistry: terrestrial and extraterrestrial applications

Lecture notes
None

Literature
Will be identified based on the chosen topic.

651-4010-00L  Planetary Physics and Chemistry  W  3 credits  2G  P. Tackley

Abstract
This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective
The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

651-4235-00L  Marine Geology and Geochemistry  Does not take place this semester.

W  3 credits  2G  G. Bernasconi-Green
Abstract

Introduction to oceanographic methods and international research programs in marine geology and an overview of physical, chemical and biological processes in modern marine environments.

Objective

This course aims at giving an overview of oceanographic methods and an understanding of physical, chemical and biological processes in modern marine environments. This course will combine lectures and student participation. Student presentations are based on critical reading of research papers and integration of data and results from international oceanographic programs and ocean drilling.

Content

Specific topics will be chosen to examine processes of crustal formation, alteration, mass transfer and biological activity in mid-ocean ridge, continental margin and subduction zone settings, with consideration of data and new results obtained from international oceanographic programs and from DSDP, ODP and IODP drilling.

Student participation and discussions are based on critical reading of research papers, use of internet-based data, and web-based cruise results. Requirements to obtain credit points are oral or poster presentations and a short written summary of selected themes.

Lecture notes

No formal script will be distributed. Handouts will be given, where necessary. These will consist of the most important diagrams presented in the lectures. The students are expected to take their own notes and consult the literature for more details.

Literature

Lists of literature relevant to the selected topics will be handed out in the course.

Prerequisites / notice

This course is offered every 2 years.
Abstract
This colloquium comprises geophysical research presentations by invited leading scientists from Europe and overseas, advanced ETH Ph.D. students, new and established ETH scientists with specific new work to be shared with the institute. Topics cover the field of geophysics and related disciplines, to be delivered at the level of a well-informed M.Sc. graduate/early Ph.D. student.

Objective
Attendees of this colloquium obtain a broad overview over active and frontier research areas in geophysics as well as opened questions. Invited speakers typically present recent work: Attendees following this colloquium for multiple terms will thus be able to trace new research directions, trends, potentially diminishing research areas, controversies and resolutions thereof, and thus build a solid overview of state and direction of geophysical research. Moreover, the diverse content and delivery style shall help attendants in gaining experience in how to successfully present research results.

651-1851-00L Introduction to Scanning Electron Microscopy
W 1 credit 2G K. Kunze, L. Martin

Objectives
Introduction in scanning electron microscopy and microanalysis. Obtain practical experience in operating a SEM.

Content
Functional principles and operation modes of a scanning electron microscope. Methods and application fields for
- imaging (SE, BSE, FSE, A, CL),
- X-ray spectroscopy (EDX),
- Electron diffraction (EBSD, Channeling, Orientation Imaging),
Methods for sample preparation
Practical exercises.

Lecture notes
Scripts and operation manuals are provided during the course.

Literature

Prerequisites / notice
Full day block course after the end of HS

651-0048-00L Electron Microprobe Course
W 3 credits 4G E. Reusser

Objectives

Content
Physical principles of electron optics, interaction of electrons with matter, production of X-rays, interaction of X-rays with matter. Detection of X-rays. Laboratory work in the field of Earth sciences.

Lecture notes
Kursunterlagen

Literature

Prerequisites / notice
7 full days.

Prerequisite: Analytical methods in Petrology and Geology (651-4055-00L).

Max. 8 participants (incl. PhD students and external participants).

-> Restricted attendance. Register with E. Reusser.

327-0703-00L Electron Microscopy in Material Science
W 4 credits 2V+2U K. Kunze, R. Erni, S. Gerstl, F. Gramm, F. Krumeich

Abstract
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective
A comprehensive understanding of the interaction of electrons with condensed matter and details on the structural and chemical analysis of various materials.

Content
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

Lecture notes
Englisch

Literature

651-3541-00L Exploration and Environmental Geophysics
W 4 credits 3V F. Broggni, J. Doetsch

Abstract
Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seisms, Georadar. Discussion of survey design, sources and receivers and data processing.

Objective
Overview and understanding of the most important geophysical methods. Proposed solutions to assess and observe problems relevant to exploration and environmental geophysics in soil, ice and lithosphere at different scales. Getting familiar with measuring- and interpretation procedures. Pointing out the possibilities and limitations of geophysical methods.

Content

Lecture notes
Available through eDoz/LIAS.

Additional material will be provided by the lecturers.

Literature

651-4086-00L Experimental Methods in Petrology
W 3 credits 2P C. Liesbke

Abstract
Overview of the most common experimental methods employed in petrology to determine thermodynamic and physical properties and phase equilibria of minerals, mineral assemblages, magmas and fluids. The basic principals of low, moderate, high and ultrahigh pressure devices are discussed combined with an introduction into the synthesis of starting materials and the evaluation of run products.
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Objective
This course shall provide the basics of experimental petrology. The principal goals are the acquisition of basic knowledge about experimental equipment employed in petrology and the design and setup of an experimental study targeted to obtain quantitative data on phase relations, thermodynamic, kinetic and rheologic properties of earth materials as well as the examination, analysis and evaluation of experiments. At the end of the course, the participants should be able to evaluate experimental data independently and design appropriate experiments on their own.

Content
The course 'Experimental methods in petrology' covers the following subjects:

1. Introduction and historical summary of experimental petrology
2. Experimental methods at ambient pressure (1 bar) with practical exercise to determine the free energy of formation of wustite (FeO)
3. Experimental buffering techniques (phase rule, buffering of partial pressures of gases and supercritical fluids, buffering of mixed volatile phases at elevated pressures, buffering of activities and solid-solids solutions in solid phases
4. Experimental methods at moderate pressures: externally (cold seal) and internally (HIPV) heated gas-pressure apparatus with practical demonstration/exercise
5. High-pressure solid-media experimental techniques (piston cylinders)
6. Ultrahigh-pressure experimental techniques (multi-anvil apparatus, diamond-anvil-cells (DAC)
7. Evaluation of petrologic experiments (preparation of run products, analytical and spectroscopic methods of examination and quantification)

The practical work in the laboratories are conducted (with the exception of exercise #1) on a small research project where the various techniques and equipment are demonstrated and the practical use is trained.

Lecture notes
A summary of the material presented in the lectures are distributed weekly.

Literature
Currently, there is no comprehensive book available that summarizes the most important aspects of experimental petrology; publications relating to individual subjects are referred during the lectures.

Prerequisites / notice
This course addresses to a public (master and PhD students) that is interested in an introduction to experimental research in petrology, but does not require basic knowledge in experimental methods. However, basic knowledge in petrology and physical chemistry (thermodynamics) is required to follow the course.

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

Objective
Provide a deeper understanding in the selected research fields on hydrothermal processes and ore deposit formation. This is achieved by literature work as well as discussions of current BSc, MSc and PhD projects at the institute.

Content
Themen zur Hydrothermalgeochemie, Modellierung von Fluidprozessen, Mikroananlytik, Isotopen-Tracing von hydrothermalen Transportprozessen und der Bildung von Erzlagertätten

Prerequisites / notice
Register in MyStudies and send mail to szandra.ferkete@erdw.ethz.ch, to be placed on distributor for the evolving program.

651-4114-00L Illustrations in Natural History (University of Zürich) W 1 credit 1V University lecturers

Abstract
Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Objective
-the most important drawing techniques commonl applied in science
-accurate observation
-basic knowledge in image processing with PhotoShop

Content
In this course, both classic and computer-based drawing and illustration-techniques are presented. We begin with sketches with the pencil and continue with Indian ink which we use for drawings using hatchings and dots. Finally, one drawing is carried out in detail with a pencil. This drawing will then be scanned and processed in PhotoShop. The emphasis is on practicing the methods.

Lecture notes
-

Literature
not mandatory!

Recommended:

Prerequisites / notice
Please bring pencils (HB and 2H) as well as Indian ink-pens or fine black markers. In the second half of the semester, the students may bring their own laptops with PhotoShop because usually, we do not have enough computers in the lecture hall for all.

651-4273-00L Numerical Modelling in Fortran W 3 credits 2V P. Tackley

Abstract
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes
See http://jupiter.ethz.ch/~pj/FORTRAN/FortranClass.html

651-4273-01L Numerical Modelling in Fortran (Project) W 1 credit 1U P. Tackley

Prerequisite: 651-4273-00L Numerical Modelling in Fortran

Abstract
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Content
The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student’s Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.
### Empfehlungen

Seminar series with external and occasional internal speakers addressing current research topics. Changing programs announced via D-Erdw homepage (Veranstaltungskalender)

#### 651-1392-00L Palaeontological Colloquium (University of Zurich)

**Abstract**
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, ice rheology, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of Greenland and Antarctica.

**Objective**
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the current literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

**Content**
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

**Lecture notes**
http://people.ee.ethz.ch/~luethim/teaching.html

**Literature**
A list of relevant literature is available on the class web site.

**Prerequisites / notice**
Good high school mathematics and physics knowledge required.

**651-4249-00L Semester Paper in Paleontology (University of Zürich)**

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**Objective**
Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

**Content**
Wöchentliches Seminar mit Fachvorträgen eingeladener oder interner Wissenschafter, vornehmlich zu Themen der Geologie, Paläontologie (Paläobotanik, Paläozoologie und Mikropaläontologie) mit anschliessender Diskussion.

**Lecture notes**
http://www.uzh.ch/studies/application/mobilitaet_en.html

**Prerequisites / notice**
A list of relevant literature is available on the class web site.

**651-0254-00L Seminar Geochemistry and Petrology**

**Abstract**
Presentations on isotope geochemistry, cosmochemistry, fluid processes, economic geology, petrology, mineralogy and experimental studies. Mostly international speakers provide students, department members and interested guests with insight into current research topics in these fields.

**Objective**
Wöchentliches Seminar mit Fachvorträgen eingeladener oder interner Wissenschafter, vornehmlich Themen der Geochemie, Isotopengeologie, Hydrothermalgeochemie, Lagerstättenbildung, Petrologie, Mineralogie und experimentelle Studien.

**Content**

**651-1692-00L Seminar in Applied and Environmental Geophysics**

**Abstract**
A seminar series with both invited speakers from both inside and outside the ETH.

**Objective**
The seminar series provides an opportunity to convey the latest research results to students and staff. Informal seminars with both internal and external speakers on current topics in Structural Geology, Tectonics and Rock Physics. The current program is available at: http://www.geology.ethz.ch/sgt/seminar/sgt_seminar.htm

**Content**

**651-1180-00L Research Seminar Structural Geology and Tectonics**

**Abstract**
A seminar series with both invited speakers from both inside and outside the ETH.

**Objective**
The seminar series provides an opportunity to convey the latest research results to students and staff. Informal seminars with both internal and external speakers on current topics in Structural Geology, Tectonics and Rock Physics. The current program is available at: http://www.geology.ethz.ch/sgt/seminar/sgt_seminar.htm

**Content**

**651-4101-00L Physics of Glaciers**

**Objective**
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, ice rheology, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of Greenland and Antarctica.

**Content**
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the current literature on the topic. 651-2613-00L Humangeography III (Geographies of Difference) (Universität Zürich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
UZH Module Code: GEO232

Prerequisite: Human Geography II (UZH Module Code: GEO122)

Abstract
Teil GEO232.1: Das Seminar verfolgt das Ziel, ein tieferes Verständnis für sozialwissenschaftliche Grundlagen der Humangeographie zu gewinnen.

Objective
- Sie vertiefen ihre theoretischen, empirischen und methodischen Fähigkeiten in folgenden Themenbereichen:
  - Gesellschaft und Raum
  - Gesellschaft und Entwicklung
  - Gesellschaft und natürliche Umwelt/Ressourcen
  - Offenheit und Geschlossenheit in Wirtschaft und Gesellschaft
  - Chancen und Herausforderungen einer globalisierten Weltwirtschaft
- Sie sind in der Lage, Verknüpfungen zwischen grundlegenden sozial- und wirtschaftswissenschaftlichen Theorien und deren Konkretisierung in der Geographie herzustellen.
- Sie können die erwähnten Themen mit ausgewähltem Faktenwissen verknüpfen und diskutieren
- Sie schulen Ihre analytischen und theoretischen Fähigkeiten und können diese in Diskussionen einbringen
- Sie können die Relevanz von weiterführenden wissenschaftlichen Texten diskutieren und mit einem Ausgangstext verknüpfen
- Sie sind in der Lage, eine Diskussion über wissenschaftliche Themen zu strukturieren und - mit einfachen Moderationstechniken - zu moderieren

Prerequisites / notice
Besuch von GEO122.

651-2601-00L Human Geography I: One Earth - Many Worlds (University of Zurich)

Abstract
Imparting of research questions and basic principles in Human Geography

Objective
To get an overview about basic research questions and principles of Human Geography

Content
(1) Society and space (2) Society and development (structure and dynamic of population, urbanisation, disparities (3) Society and natural environment (natural resources; food security, sustainability)

Lecture notes
PowerPoint-slides (German)

The MSc Project Proposal is only offered in autumn semester. A registration in spring semester is subject to special approval by the study director.

The introductory lecture for all majors on "Conduct as a Scientist" will be taught at the beginning of spring semester 2017 on Tuesday February 21, 2017 at 16:15 during the Engineering Geology Seminar.

The main purpose of the Master Project Proposal is to help students organize ideas, material and objectives for their Master Thesis, and to begin development of communication skills.

The main objectives of the Master Project Proposal are to demonstrate the following abilities:
- to formulate a scientific question
- to present scientific approach to solve the problem
- to interpret, discuss and communicate scientific results in written form
- to gain experience in writing a scientific proposal

**Abstract**

General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

**Objective**

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

**Lecture notes**

Nivaldo J. Tro
Chemistry - A molecular Approach (Pearson), Chapter 1-18

**Literature**

Housecroft and Constable, CHEMISTRY
Octoby, Gillis, Nachtrieb, MODERN CHEMISTRY

**406-0603-AAL Stochastics (Probability and Statistics)**

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R."
Introduction to Engineering Geology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Objective
Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

</tbody>
</table>
Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module comprises the parts:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (3.5 weeks)

Lecture notes
Unterlagen für den Unterricht werden online mit Hilfe der e-learning Platform OLAT abgegeben.

Literature
Literatur und Literaturhinweise werden mit der e-learning Platform OLAT abgegeben.

Prerequisites / notice
This Course lasts for two semesters. It can be started in autumn or in spring. Booking is only required once.

Performance Assessment:
Performance is assessed during the course of the entire modul, with a final test. Active participation in the colloquia and group seminars is required. The thesis report and an oral presentation have to be completed.

The Specialized Biology Course with an Educational Focus (12 CP) can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects (each 15 CP). In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority for registration.

This course is organized jointly with the University of Zurich (Fachbereich Biologie) and is held at the Life Science Zurich Learning Center of the ETH Zurich and the University of Zurich.

**Abstract**

Specialized aspects of biology are dealt with under the viewpoint of their presentation, their historical development, their significance for the field, the individual and society.

**Objective**

The goal is to promote the ability to understand biological concepts, principles and their interrelationships and to communicate specialist knowledge to various groups of recipients in an understandable manner.

**Content**

Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (3.5 weeks)

**Lecture notes**

None.

**Literature**

Specific references will be made available for the individual projects.

**Prerequisites / notice**

The program of this course represents one half (6 CP) of that of the Specialized Biology Course with an Educational Focus (551-0963-00, 12 CP).

**Professional Exercises in Biology**

Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area.

**Abstract**

Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons.

**Objective**

Students can perform, off the cuff, 12 school experiments (which they have tested themselves), from the different subject areas, and conduct these correctly in technical terms. They can incorporate these experiments in their tuition in a didactically meaningful manner.

**Comments:**

By contrast to the Subject Specialisation 1 and 2 course units, these are "basic tests" and do not involve the implementation of current research topics. The students' compilations are available in a data archive.

**Content**

2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

**Lecture notes**

Hand out of course material.

**Subject Didactics Biology I**

Simultaneous enrolment in Introductory Internship Biology
- course 551-0963-00L - is compulsory.

**Abstract**

Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
- Application of teaching methods and techniques from educational science in biology classes.
- Planning and preparation of lessons.

**Objective**

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.
- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
- The students can use different forms of examination for monitoring performance.
- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

Announced Work with an Educational Focus Chemistry B for Teaching Diploma.

Students enrolled at UZH must register for this course and the corresponding exam at ETH.

Abstract
Selected topics in general chemistry:
1) The language of chemistry
2) Chirality and stereochemistry
3) Oxidation of water
4) Chemistry of the atmosphere

Objective
In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically assess pupils’ prior knowledge, clarify it in greater detail and take it into account for planning lessons.

Content
Content of the four modules:
1) The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
2) Chirality and stereochemistry: Selected aspects, origin of biomolecular chirality, inorganic chemistry
3) Cosmochemistry
4) Chemistry of the atmosphere

Lecture notes
Folien und ausgewählte Literatur werden zur Verfügung gestellt.

Literature
Ausgewählte Artikel aus der Primärliteratur werden vorgestellt, kommentiert und zur Lektüre empfohlen.

Prerequisites / notice
FV A (gelesen im Frühjahrsemester) and FV B (gelesen im Herbstsemester) bauen nicht aufeinander. Die Reihenfolge der Belegung ist somit indifferent

Simultaneous enrolment in Introductory Internship Chemistry - course 529-0966-00L - is compulsory.

Abstract
Implementing findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialties.

Objective
Among other things, students are put in a position where they can
- divide up the subject matter into contents that can be learned by heart or accessed intellectually, and communicate these contents;
- break down technically complex contents to the right level for a class and still present these in a stringent, error-free manner in their simplified form;
- establish which subject matter can be presented with which teaching techniques and methods that have been recognised as efficient in teaching terms, and adapt these tools to the learning content in question;
- plan school experiments, incorporate them in lessons, perform them in accordance with all the rules of the art, and also evaluate them in a beneficial manner;
- assess pupils’ prior knowledge, clarify it in greater detail and take it into account for planning lessons;
- design a sequential curriculum suitable for the levels in question and put it into practice;
- reliably identify stumbling blocks in the contents and get round these.

Content
Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:
- Auswahl gymnasiumsrelevanter Lerninhalte
- Modellbegriff in den Naturwissenschaften, insbesondere der Chemie
- Sprache und Fachsprache im Chemieunterricht
- Wechselwirkungen zwischen Beobachtungen in der realen Welt und Deutungsversuchen auf der Modell-Ebine
- Interdisziplinarität im Unterricht, Erkenntnisse und praktische Auseinandersetzung mit Biologie, Mathematik und Physik
- Leistungserhebung und -beurteilung im Theorie- und Laborunterricht
- Schule der Schüler und Schüler der Schule
- Atome und molekulare chemische Bindung
- Mathematische Beschreibung chemischer Systeme (z.B. Stöchiometrie und Gleichgewichtssysteme)
- Auswahl, Konzeption, Einbettung, Vorbereitung, Durchführung, Nachbereitung und Auswertung von Demonstrations- und Schüler-Experimenten

Lecture notes
Literature

Prerequisites / notice
Der Chemieunterricht am Gymnasium soll einerseits dem zukünftigen Nichtnaturwissenschaftler ein grundlegendes Rüstzeug an chemischen Kenntnissen und Fähigkeiten für den Alltag an die Hand geben, andererseits aber auch auf ein naturwissenschaftlich orientiertes Hochschulstudium vorbereiten können. Diese beiden Anforderungen sind im Unterricht gleichermaßen zu berücksichtigen.

Da viele Lerninhalte zudem zwingend sequentiell und einander benützend strukturiert sind, ist dem logischen und aus Schülersicht nachvollziehbaren Aufbau des Unterrichtes besonderes Augenmerk zu schenken. Dies bedingt eine besonders feine Abstimmung von fachlichen Inhalten unterschiedlichen Niveaus und der für ihre Vermittlung eingesetzten didaktischen Methoden und Techniken auf die kognitive Leistungsfähigkeit der Lernenden.

Anhand der Diskussion ausgearbeiteter und bewährter Beispiele, aber auch durch selbständiges Probehandeln und mit Hilfe selbst zu erstellender kleiner Unterrichtsbausteine soll die zukünftige Lehrkraft befähigt werden, einen den spezifischen Rahmenbedingungen angepassten eigenen Unterricht zu konzipieren und durchzuführen, der diesem hohen Qualitätsanspruch genügen kann.

Science promised us truth, or at least a knowledge of such relations as our intelligence can seize: it never promised us peace or happiness.
Gustave Le Bon

Physicists learned to realize that whether they like a theory or they don’t like a theory is not the essential question. Rather, it’s whether or not the theory gives predictions that agree with experiment.
Richard Feynman, 1985

Simultaneous enrolment in Introductory Internship Physics - course 402-0920-00L - is compulsory for Teaching Diploma Physic

**Information for UZH students:**
Enrolment to this course unit only possible at ETH. No enrolment to module 090Phy1 at UZH. Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

**Objective**

Die Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.

Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

**Content**

Thematische Schwerpunkte

Fachspezifisches: Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbezüge, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grundlagen- und Schwerpunktunterrichts

Einsatz verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation

Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum

Lernformen

Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studentischer Einzel- und Kleingruppenarbeit, kurzen Präsentationen der Studierenden, Verleihung der Inhalte durch Bearbeitung von Aufträgen ausserhalb der Kontakttunden

**Lecture notes**

Folien und weitere Unterlagen werden zur Verfügung gestellt

**Abstract**
Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

**Objective**
- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing content- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

**Content**
Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

**Subjects:**
- History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivism)
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

**Literature**

- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

**Abstract**
The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

**Objective**
- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

**Content**
The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century.

Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

<td>Strategic Studies I</td>
<td>Z</td>
<td>3 credits</td>
<td>2V</td>
<td>M. Mantovani</td>
</tr>
</tbody>
</table>

**Abstract**
The lecture series treats basic strategic studies from antiquity to the present.

**Objective**
The participants know in what ways the understanding of strategy has evolved over time. They understand the balance of strategy's basic components: ends, ways and means. They know the most important classics of strategy and war theory, especially against their specific background. Based on the analysis of historical and contemporary examples, they are aware the ambiguity of declaration and implementation of strategies. They are capable of analyzing critically original texts and modern scholarly works in the field of strategic studies.

**Content**
The two-term lecture series treats basic strategic studies from antiquity to the present. Term 1 covers the theories up until roughly 1900, term 2 the theories ever since. Theories are deemed classic, if they were prominent in their respective times and if they had a strong reception after, be it in literature, in academic debates or as guidelines for action. Each out of some 50 theories is discussed in three steps: historical context, core messages and reception.

**Lecture notes**
Slides as well as a textbook with primary sources and a list of further reading are accessible electronically. The textbook is also available in hard copy.

**Literature**
- Peter Paret, Makers of Modern Strategy, From Machiavelli to the Nuclear Age, Princeton 1986

**Prerequisites / notice**
The lecture is held in German. Passive knowledge of English and French are required.

<td>Military Business Administration II - Case Examples</td>
<td>Z</td>
<td>3 credits</td>
<td>2V</td>
<td>M. M. Keupp</td>
</tr>
</tbody>
</table>

**Abstract**
The elective course Military Business Administration II builds on the mandatory course Military Business Administration I and adds to it. It deals with in-depth case studies from international security and economic policy with a special emphasis on the economic and practical relevance of these issues for the Swiss Armed Forces.

**Objective**
Students who are intrinsically interested in business-related issues will be provided with a big picture that transcends the micro view of business administration. Students learn how to integrate security and resource-related issues into a global economic analysis and how to derive relevant consequences, particularly economic ones, for Switzerland.
The program of the course is organized into 14 units of 90 minutes each. The units combine the elements of lecture (where analytical concepts are taught) and application (where these concepts are applied). Additionally, guest lecturers will hold talks on selected issues.

- Swiss economic autarchy - madness or option?
- Global resource positions and world trade: Implications for the Swiss Armed Forces I
- Global resource positions and world trade: Implications for the Swiss Armed Forces II
- Economic causes of military instability
- Aggressive emerging economies: Economic growth and rearmament
- The process of an arms deal
- Costs and financing of a military conflict
- Economic analysis of terrorism
- Economic analysis of cyberwar
- Economic analysis of the present GSOA initiative: Compulsory military service vs. voluntary militia
- Global arms production and international arms trade
- The privatization of military security
- Standardisation and interoperability: Does NATO membership increase Swiss military efficiency
- Written exam

As this course has been completely redesigned and is being offered for the first time in the fall semester of 2013, a script is not yet available. However, the lecturer will distribute all necessary course material in time and directly to the students, either in the classroom or by uploading files to a public server.

The Lecturer will distribute all necessary literature directly to the students by disseminating pdf files or citing links to online references.

Exam "Military Business Administration I" passed successfully or profound basic knowledge of business administration and economics. The course is open to external participants.

853-0064-00L Military Sociology I

Z 3 credits 2V T. Szvircsev Tresch

Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

A reader with a set of texts will be handed out.

Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Objective

Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Content

WebClass Einführungskurs Technikgeschichte is a web-based introduction to technology history. The students are challenged to discover how technological innovations take place within complex economic, political and cultural contexts. They get introduced into basic theories and practices of the field.

Prerequisites / notice

Online course combined with two obligatory presentations. Einführungssitzung: 26.9.2016, two presentations: 14.11.2016. Active participation and successful completion of online assignments are mandatory. The number of participants is limited to 100. Registration: In the introduction session on 26.9.2016, as well as written materials. Late registrations cannot be accepted. Further information at https://www.tg.ethz.ch/de/programme/.
Development Cooperation from a Biographical Point of View

Abstract
The Archives of Contemporary History provide 75 video interviews with contemporary witnesses who report on their missions abroad for Swiss humanitarian aid and development cooperation. Based on selected interviews the motives of their commitment and the experience in a foreign country are examined.

Objective
The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims for a critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

Literature

Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones?

Abstract
Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

Objective
The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of European colonialism overseas. Secondly, students will become familiarised with how old collections can yield new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a platform to discuss ways of dialogue and possible collaboration between these different approaches.

Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

Regional Politics of the Arabian Peninsula

Abstract
The course explores the complex nature of politics and history of the Arabian Peninsula. It takes a closer look at the political systems of several countries of the Arabian Peninsula, especially Yemen, Saudi Arabia and Oman and Bahrain.

Objective
To highlight how the politics of the Arabian Peninsula is a product of two spheres: politics within states and politics between states.

Introduce the Arabian Peninsula as a political unit, but not a homogeneous one
An overview of the type of political systems prevalent in the region, religious Denominations, sectarian rivalry, and how this shape its regional relations

The neighbouring states of the Arabian Peninsula - especially Saudi Arabia, Oman and Yemen - make for strange bedfellows. They are governed by different systems with different results, calling into question how their internal policies affect regional relations and vice versa. Saudi Arabia is a monarchy, a prosperous, religious and restrictive state increasingly facing problems of social/political unrest. Oman is a small, thriving, stable Sultate, modernised and moderate but tightly controlled; and the republic of Yemen, which has the region's poorest economy, has still not shrugged off the legacy of its turbulent modern history. Each state adheres to a different Islamic sect, moreover, and though their populations are overwhelmingly Arab, differing tribal structures result in widely variant effects on the political process in their respective systems. Each state has also had extensive historical relationships with the Ottoman and British empires, the US and Russia, and these too have coloured regional relations. Recent events like the terrorist attacks of 11 September 2001, the American-led invasion of Iraq and the Arab uprisings of 2011 have also influenced these states internal policy decisions, further affecting their dealings with one another and at with the world at large. This course examines each country in detail, from state formation to current affairs and from local to international government.

History of Art and Architecture III

Abstract
The two-semester course offers an introduction to the history and theory of architecture from the industrial revolution up to now. Based on current questions a variety of case studies will be discussed.

Objective
The aim is to give an overview on crucial events, works of art, buildings and theories since the beginning of the 19th century up to today. The course should enhance the comprehension of historical and theoretical issues, and allow the students to localize their own practice within a broader historical context.

Content
The subject of this lecture course is the history and theory of architecture since the beginning of the 19th century up to now. It examines the architectural answers to the changing technical inventions and social practices. Consequently, the focus will be less on individual architects or buildings than on various themes that determined the architecture of the period.

History of Urban Design I

Abstract
This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.
Content

In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.

01. Introduction to the discipline and method: The history of urban design as a historical project
02. Athens and Rome in the ancient world: Myth, selfportrayal and speculation
03. From the spirit of equality to the colonial module: Greek and Roman City foundings
04. From the urban ideal to new cities in the Middle Ages and the Renaissance
05. Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg
06. The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon
07. Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850
08. Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830
09. The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century
10. Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht
11. Neoabsolute power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and Ildefonso Cerdas Ensanche for Barcelona
12. Neoabsolute power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and Ildefonso Cerdas Ensanche for Barcelona

Objective

Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

Abstract

Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Literature

Uekötter, Frank (Ed.) 2010. The turning points of environmental history, Pittsburgh: University of Pittsburgh Press.

Further recommended literature to consult is listet within the script.

Number of participants limited to 100.

Lecture notes

The lectures are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 30.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

History of Urban Design from antiquity to the 19th century

Prerequisites / notice

History of Urban Design from antiquity to the 19th century

701-0791-00L

Environmental History - Introduction and Overview

W 2 credits 2V

D. Speich Chassé

Number of participants limited to 100.

Objective

Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

Abstract

Improved ability to assess current problems from a historical perspective and to critically interrogate one’s own standpoint.

Prerequisites / notice

Students are asked to write an exam during the second last session (11.12.2015).

701-0366-00L

The Architecture of the City from Modernity to Today

W 2 credits 2V

V. Magnago Lampugnani

Objective

This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

Content

The lecture which will be hold only in one semester includes the developments of the 20th century

1. Le Corbusier: theories, visions and clearcuts in the name of the autorité
2. The United States in the Jazz Age: Between Metropolis of Tomorrow and Broadacre City
3. Italy in the Fascist Era: Monumental ensembles and new town between assiduousness of modernization and obsession of representation
4. Urban design under totalitarian regimes: The architects of the “Tausendjährige Reich” and the "engineers of luck" of the Soviet Union of Stalin
5. Coming to terms with the past and the Cold War: Reconstruction in the two German states
6. The myth of the human scale: the 1950s in Spain, Great Britain, Scandinavia and Italy
7. Postwar Experiments: Rationalistic classicism in France
8. Two new towns in the 20th century: Chandigarh and Brasilia
9. Fictions and visions: The international utopia of the city
10. The second conquest of the North American territorium: The automobile and the city in the USA
11. Analysis, analogy and renewal: The adventure of the typological city

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 611 of 1571
Bekenntnisse des Hochstaplers Felix Krull" was published in 1954, one year before Thomas Mann's death. This humorous autobiography Myths of Creation and First Origins (Genesis und Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and
e. Edelmann-Ohler

To each lecture an overview is listed within a script, that can be purchased at the chair for the history of urban design (HIL D 75.2) at the name and dates of the buildings and its builders along with a short introductory note. Aside this script the chair offers the Quellentextbände (source texts) which help to extend the knowledge of theoretical discourses in the field of urban design. For the master program the institute offers one volume of texts at the price of CHF 5.-. The script is in German, the Quellentextbände are reprinted in their original languages.

Literature

Further recommended literature to consult is listed within the script.

<tr>
<td>Abstract</td>
<td>Students are introduced to the various approaches and methods of literature studies and gain an overview of literary theory.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This lecture has two aims: Firstly, it serves as a general introduction into the field of literary theory (thereby looking into &quot;knowledge about literature&quot;). Secondly, there will be a special emphasis on recent theoretical approaches that take seriously literature and knowledge as one of its components (thus investigating the &quot;knowledge of literature&quot;). Even though traditional criticism disagrees, a number of recent approaches, based on literature and culture studies, hold that literature is not to be conceived of as standing in opposition to the world and the classificatory system of the academic disciplines, particularly the sciences (e.g. Foucauldian discource analysis and New Historicism), instead, these approaches understand literature in terms of its epistemological forms and functions. Thus, the main thesis is that literature actively participates in the constitution and formation of knowledge. Literature itself generates models of knowledge, sometimes with critical or even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.</td>

<td>3</td>
<td>2S</td>
<td>A. Kilcher</td>
</tr>
<tr>
<td>Abstract</td>
<td>From Plato, Aristotle and Cicero, philosophers have tried to find the core principle of wit (or the joke, as both meanings are contained in the German term &quot;Witz&quot;). Even during the 20th century, the philosophy of life and psychoanalysis struggle with it. The seminar provides an overview of this history.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This seminar deals with the meaning and history of &quot;Witz&quot; (wit, joke) as a form of knowledge. It places &quot;Witz&quot; as a switch or transitional figure within the development of modern theories of knowledge in particular.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Contrary to intuitive expectations, the German term &quot;Witz&quot; is not only an instance of the comical, but also a form of knowledge that plays on similarity and difference by juxtaposing the disparate. In this vein, especially during the 17th and 18th centuries, &quot;Witz&quot; becomes a central attribute of poetic and rhetorical types of expression (wit). Only during the 19th century &quot;Witz&quot; comes to denote a characteristic genre of the comical (joke). From now on &quot;Witz&quot; is theoretically associated with the comical and laughter. Around 1900 there are approaches based on the philosophy of life, sociology and psychology, elaborated by Bergson, Bakhtin and Freud, among others.</td>

</tbody>
</table>
When we write a literary text we enter into a set-up for experiments and explore the possibilities ensuing from the specific structure and overall consistency of such a text. Literary writing allows us to go over to another kind of knowledge. Thus, the question: what is it that I want to write about? is replaced by: what do I write?

Objective
In this course we shall analyze and apply conditions and criteria for literary writing on the basis of our own texts. The course is intended for persons who are interested in literary approaches to exactitude. Any attempt to write literature is confronted with an unforeseeable linguistic dynamism whose feasibility is determined by laws and rules quite different from those of science and technology. For the science-oriented writer, experiencing the self-evidence produced by literary approaches in his or her own writing project opens up a field of language with new content and new methods.

Content
In the natural sciences as well as in engineering we set up experiments, analyze equation systems, and formulate theories. In order to complement these practices, the course «Writing» shall pursue precision in literary writing, its choice of word and its self-evidence.

Prerequisites / notice
Voraussetzungen: Die Bereitschaft, sich auf ein Projekt mit experimentellem Charakter einzulassen. GUTE BEHERRSCHUNG DER DEUTSCHEN SPRACHE.

Die Teilnehmerzahl ist begrenzt. SCHRIFTLICHE ANMELDUNG erforderlich (bis 31. August): uwe.justus.wenzel@nzz.ch

851-0315-01L Writing: Precision of Language as a Field of Research W 1 credit 1G F. Kretzen

851-0331-05L The Art of Conversation W 3 credits 2V C. Thomas

851-0331-06L The Secretaries of the Baroque Age and the "Honest Dissimulation" W 3 credits 2V S. Nigro

Objective
Students know and can apply autonomously up-to-date investigation methods and techniques in the behavioral sciences. They achieve the ability to develop their own ideas in the field and to communicate their ideas in oral presentations and in written papers. The credits will be obtained by a written report of approximately 10 pages.
Content
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modeling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper.

Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk on their own should contact the course organizers (Rutsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students for oral presentations. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

851-0626-01L International Aid and Development

Does not take place this semester.
Prerequisites: Basic knowledge of economics

Abstract
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Objective
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

Content
Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support, Fair-Trade.

Literature
Articles and book abstracts will be uploaded to a course website.

851-0609-06L Governing the Energy Transition

Number of participants limited to 30.

Abstract
This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

Objective
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form one part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

Lecture notes
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Literature
A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

Prerequisites / notice
This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

151-0757-00L Environmental Management

W 2 credits 2G R. Züst

Abstract
An environmental management system has the objective to continuously improve the environmental performance of the activities, products and services of a company. The company has to introduce different management procedures. The goal of this lecture is to provide basics and specific procedure to implement the environmental dimension in the planning and decision making processes of an organisation.

Objective
Introduction to environmental management / environmental management systems, energy and material flows, economical and ecological problems in industry; charakterisation of an enterprise (incl. management handbook); structur and contents of an environmental management system; overview on the ISO 14001 ff. series; methods for environmental evaluation and assessment; integrated management systems; planning methodology and life-cycle-design design; planning example.

Lecture notes
Information about environmental management and environmental management systems will be provided by a CD or mail.

Literature
A list with literatures and links will be provided

Prerequisites / notice
Delivery of a case study, worked out in groups. Language: Teaching in English on request.

860-0006-00L Applied Statistics and Policy Evaluation

W 3 credits 3G I. Günther, K. Harttgen

Number of participants limited to 20.

Science, Technology, and Policy MSc and MAS in Development and Cooperation have priority.

Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Objective
Students
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis
Overview of the key concepts of corporate sustainability and topics related to Water, Energy, Mobility, and Food

Financial Market Risks
3 credits
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation? What significance do international economic relations have for Switzerland?

Objective
Develop critical thinking skills (argumentation, communication, evaluative judgment) that are useful in the context of corporate sustainability using an innovative writing and peer review method.

Content
Business implications of sustainable development, in particular for the assessment of sustainability performance, strategic change towards sustainability, technological innovations and sustainability, and finance and corporate sustainability.

Principles of Macroeconomics
W 3 credits 2V J.-E. Sturm
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation? What significance do international economic relations have for Switzerland?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes
The course webpage (to be found at https://moodle-app21.let.ethz.ch/course/view.php?id=2467) contains announcements, course information and lecture slides.

Literature

We advise you to also buy access to Apilia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Apilia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.
Objective
The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.
- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

Content
1- The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.
2- Risks in financial markets
   - What is risk?
   - Measuring risks of financial assets
   - Introduction to three different concepts of probability
   - History of financial markets, diversification, market risks
3- Introduction to financial risks and its management.
   - Relationship between risk and return
   - Portfolio theory: the concept of diversification and optimal allocation
   - How to price assets: the Capital Asset Pricing Model
   - How to price assets: the Arbitrage Pricing Theory, the factor models and beyond
4- Financial markets: role and efficiency
   - What is an efficient market?
   - Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
   - Deviations from efficiency, puzzles and anomalies in the financial markets
   - Financial bubbles, crashes, systemic instabilities
5- An introduction to Options and derivatives
   - Calls, Puts and Shares and other derivatives
   - Financial alchemy with options (options are building blocs of any possible cash flow)
   - Determination of option value; concept of risk hedging
6- Valuation and using options
   - A first simple option valuation model
   - The Binomial method for valuing options
   - The Black-scholes model and formula
   - Practical examples and implementation
   - Realized prices deviate from these theories; volatility smile and real option trading
   - How to imperfectly hedge with real markets?
7- Real options
   - The value of follow-on investment opportunities
   - The timing option
   - The abandonment option
   - Flexible production
   - Conceptual aspects and extensions
8- Government bonds and their valuation
   - Relationship between bonds and interest rates
   - Real and nominal rates of interest
   - Term structure and Yields to maturity
   - Explaining the term structure
   - Different models of the term structure
9- Managing international risks
   - The foreign exchange market
   - Relations between exchanges rates and interest rates, inflation, and other economic variables
   - Hedging currency risks
   - Currency speculation
   - Exchange risk and international investment decisions

Lecture notes
Lecture slides will be available on the site of the lecture

Literature
Corporate finance
Brealey / Myers / Allen
Eight edition
+ additional paper reading provided during the lectures

Prerequisites / notice
none

363-1050-00L Conference of Disarmament: Simulation of Negotiations
W 3 credits 2S M. Ambühl

Does not take place this semester.

Abstract
The Global Studies Institute (University of Geneva) is organizing a simulation seminar on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

Objective
The simulation is conducted with experts and students during a two days seminar at the University of Geneva.

Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.
The simulation project is intended for Master's or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keepers of the minutes or of observers and analysts. Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the "Capitals" to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: https://chamilo.unige.ch/home/courses/M165/?id_session=0

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

Dates/Time/Location (GE = University of Geneva)
22 Sept. | ETH HG D 22 | 10:15-12:00 | Introduction
29 Sept. | GE Uni Mail Salle 1170 | 10:15-12:00 | Introduction to Negotiation Techniques (Dr. Vidalj Butenko and Dr. Sibylle Zürcher, ETH)
6 Oct. | ETH HG D 16.2 | 10:15-12:00 | Distribution of the roles, composition of the negotiation tables, preparation of mandates for the HA (humanitarian approach)
13 Oct. | ETH HG D 22 | 10:15-12:00 | Preparation of the mandates for the FMCT (Fissile Material Cut-off Treaty)
20 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | No session; Students deepen and summarize their mandates on one page (A4)
27 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates I (FMCT)
10 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates II (HA)
17 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Preparation Meeting
26 & 27 Nov. | GE Salles 407 et 408 | 10:00-18:00 | Simulation at Uni Dufour
1 Dec. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the results

Note:
The participation in the simulation on 26. and 27. November in Geneva is necessary.
The two hours lectures on the 22. September, 6. and 13. October have to be attended in Zürich via conference call (ETH HG D 16.2). The other lectures during the semester can be attended via Skype.
To get the 3 ECTS, students have to participate at the 2 days simulation in Geneva, attend the 3 mandatory lecture parts via conference call an Zürich and write a report of 5 pages at the end of the course.

(technical note for registration: At this stage all registered students are on the waiting list)

351-0555-00L
Open- and User Innovation
W 3 credits 2G S. Häfliger, S. Spaeth

Abstract
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

Objective
The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Grading is based on the final exam, the class presentations (including the slides) as well as class participation.

Content
This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Lecture notes
The slides of the lectures are made available and updated continuously through the SMI website:

Literature
Relevant literature for the exam includes the slides and the reading assignments. The corresponding papers are either available from the author online or distributed during class.

Reading assignments: please consult the SMI website:

351-0778-00L
Discovering Management

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Objective
Discovering Management combines in an innovate format a set of lectures and an advanced business game. The learning model for Discovering Management involves "learning by doing". The objective is to introduce the students to the relevant topics of the management literature and give them a good introduction in entrepreneurship topics too. The course is a series of lectures on the topics of strategy, innovation, corporate finance, leadership, design thinking and corporate social responsibility. While the 14 different lectures provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interactive business game. The purpose of the business game is to analyse the innovative needs of a large multinational company and develop a business case for the company to grow.

This business case is as relevant to someone exploring innovation within an organisation as it is if you are planning to start your own business. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving innovation, entrepreneurship, and company success.
Discovering Management aims to broaden the students' understanding of the principles of business management, emphasizing the interdependence of various topics in the development and management of a firm. The lectures introduce students not only to topics relevant for managing large corporations, but also touch upon the different aspects of starting up your own venture. The lectures will be presented by the respective area specialists at D-MTEC.

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures are designed to introduce students to topics related to strategy, corporate innovation, leadership, corporate and entrepreneurial finance, value chain analysis, corporate social responsibility, and business model innovation. Practical examples from industry experts will stimulate the students to critically assess these issues. Creative skills will be trained by the business game exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of Chief Innovation Officer of a large multinational company. As they learn more about the specific case and identify the challenge they are faced with, the students will have to develop an innovative business case for this multinational corporation. Doing so, this exercise will provide an insight into the context of managerial problem-solving and corporate innovation, and enhance the students' appreciation for the complex tasks companies and managers deal with. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zürich. No prior knowledge of business or economics is required to successfully complete this course.

<tr>
<th>Prerequisites / notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>The detailed semester program (syllabus) is made available to the students at the beginning of the semester.</td>
</tr>
</tbody>
</table>
After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries’ realities
- Analyze the forces, components and processes, which influence the design, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations
- Analyze politics and design approaches to influence them, looking among others at governance, social organization, legal issues and institutions

Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formality. This ranges from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biodiversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008

Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle).

The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

On the Relation Between Nature and Social Culture in Self-Ownership - Philosophical and Juridical Perspectives

Rights in Objects are founded by an inalienable Self-Ownership. These ideas are central for personal rights. We speak of my body, my genes, my name, my portrait, my ideas or ways of expression.

Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

Participants will have the opportunity to gain access to unfamiliar texts from the philosophical tradition and to see their relevance today. They experience the consequences of a certain use of concepts and orient themselves in current bioethical, juridical and political discussions.

Texts by Locke, Nozick, Chrestman, Otsuka, Schneider, Stirmer, Fichte and Forschner. Founding of property right in self-ownership (Locke), revival of this concept in Nozick and his egalitarian critics. Critique of the concept of self-ownership related to property in one's body. Looking back to the personal self-relatedness that comes up again in Intellectual Property and in modern personal rights.

Man and Machine

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

What is the Value of Truth?

It is useful to know which fellowships are available or to know the causes of frequent occurrence of extreme weather. These truths are of instrumental value. Is it also intrinsically good to know the truth, e.g., to know that there are gravitational waves? And which is the role of truth in our lives? The course will deal with such philosophical questions.

3. Esbenso soll ein besseres Urteil gebildet werden darüber, welche existenzielle Rolle die Suche nach Wahrheiten in unserem persönlichen Leben hat.

On the Relation Between Nature and Social Culture in Human Cognition and Action

How should we human beings understand ourselves according to our best knowledge about us, the social world, human history and nature? What are the relationships between biological and socio-cultural determinants of our thinking and doing? Michael Tomasello, psychologist, and social philosopher, has answered these questions in a thought-provoking way. His answers will be studied and examined.

Images of Mathematics

The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics.

L. Wingert
Images of Mathematics

What is the Value of Truth?

3. Esbenso soll ein besseres Urteil gebildet werden darüber, welche existenzielle Rolle die Suche nach Wahrheiten in unserem persönlichen Leben hat.

Man and Machine

Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATH

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

L. Wingert
On the Relation Between Nature and Social Culture in Human Cognition and Action

M. Hampe, A. Schubbach
Images of Mathematics

Particularly suitable for students of D-MATH

The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics.
How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century. Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years.

These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

The lecture series “Images of Mathematics” deals with a few moments in the history of the scientific discipline since the middle of the 19th century when the image of mathematics changed. In particular, it focuses on the consequences of the fact that in the 19th century mathematics started to not only reflect on their own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. Through Cantor’s set theory, the mathematical treatment of logic since Boole and especially through Frege and the formalization of its axioms in a wide ranging discussion involving Zermelo, Fraenkel and others, this self-reflexive stance came to the fore.

Yet, the deeper mathematics dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundation of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundation of mathematics primarily insofar as it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in detailed insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

I. Ethics & the Process of Ethical Inquiry
---------------------------------------
Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------
Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

851-0145-05L Narratives of Health and Illness ■ W 3 credits 2S S. Baier
Number of participants limited to 30

Particularly suitable for students of D-HEST

Abstract
Das Seminar gibt einen Einblick in den Forschungsbereich der Narrativen Medizin als Teilbereich der Medizinischen Geisteswissenschaften. Erzählungen spielen eine vielfältige Rolle, wenn es um Gesundheit und Krankheit geht
Ziel der Veranstaltung ist es, eine eigenständige kritische Perspektive auf Erzählungen von Gesundheit und Krankheit zu ermöglichen. Im Seminar werden daher unterschiedliche Arten von aktuellen Texten und Materialien zur Rolle von medizinischen Narrativen kritisch miteinander diskutiert.

851-0148-04L  
**Objective**  
This course studies philosophical issues concerning computers and computing. 

**Abstract**  
The idea of cyclical time is found in ancient pieces of wisdom (Pythagoreans, Plato, Buddhism) as reincarnation or memory, but also in Nietzsche as eternal return, in Deleuze as repetition, in Freud as repetition compulsion. We investigate the concept of repetition in combination with different forms of thinking change.

**Objective**  
Understanding the various forms and functions of repetition on the basis of texts by Plato (anamnesis), Freud (repetition compulsion), Kierkegaard (narration), Nietzsche (eternal return as cosmological and ethical principle), Deleuze (time synthesis and repetition of the future), Poincaré's theorem of recurrence.

851-0144-20L  
**Philosophical Aspects of Quantum Physics**  
Particularly suitable for students of D-CHAB, D-PHYS  

**Abstract**  
This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

**Objective**  
By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

851-0144-19L  
**Philosophy of Time**  
Does not take place this semester. Particularly suitable for students of D-BIOL, D-INFK, D-MATH, D-PHYS  

**Abstract**  
This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

**Objective**  
By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

851-0144-21L  
**Philosophical Issues and Problems in Theoretical Computer Science**  
Particularly suitable for students of D-INFK  

**Abstract**  
This course studies philosophical issues concerning computers and computing. Topics include: information (and information content), computational complexity, the Turing Test for computer thought; the "Chinese Room" argument against the possibility of strong AI; connectionist AI; consciousness; the Church-Turing thesis; computational and hypercomputational models of mind; and free will.

**Objective**  
- Exhibit a general understanding of the philosophy and history of computing.  
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.  
- Communicate clearly in writing about topics in this field.

851-0144-22L  
**Developments in Logic after Gödel: Applications to Theoretical Computer Science**  
Particularly suitable for students of D-INFK  

**Abstract**  
The course will start by presenting a modern logic, namely (propositional) modal logic, which has turned out to be extremely fruitful and to have numerous interesting applications in computer science, mathematics and philosophy. Subsequently, two of these applications to computer science, tense logic and dynamic logic, and one application to mathematics, provability logic, will be introduced.

**Objective**  
- Learn the fundamental concepts of a range of propositional logics  
- Learn how to construct proofs in these logics  
- Study the interface between mathematical logic and computer science, and mathematical logic and mathematics

851-0127-28L  
**Death - The Secret Problem of Life**  
W 3 credits 2S  H. Wiedebach  

**Abstract**  
No detective novel without a corpse, no religion without knowledge about death and life, no large transplantation of an organ without certificate for the donor's death. Is a dead person always a corpse? - Death is part of life and yet stands simultaneously in opposition to it. We cling to life and nonetheless wish to have the option to commit suicide. Do we know what we really want in that case?

**Objective**  
Discussion of 1) several conceptions of death in history, 2) determination of death in a medical sense (brain-death, etc.). 3) The search for a personal view about life and death. 4) The practice of a precise manner of speaking based on reflection.

**Literature**  
Texte als Diskussionsgrundlage werden zu Beginn des Semesters genannt bzw. als PDF unter "Lernmaterialien" veröffentlicht.

**Prerequisites / notice**  
Leistungsnachweise der Studenten:  
- Es besteht Anwesenheitspflicht. Einmaliges Fehlen ist möglich mit Entschuldigung. Als Ersatz die Sitzung wird eine 4-seitige Darstellung des diskutierten Textes geliefert.  
- Ab dem 2. Seminartermin erfolgt im Voraus pro Sitzung (d.h. insgesamt 6mal) eine 2-seitige Darstellung bzw. Stellungnahme zu einem vorgegebenen Text.  
- Die 2-seitigen Darstellungen müssen bis Dienstag Abend in der Woche vor der nächsten Sitzung vorliegen, damit wir Zeit haben, sie zu lesen.  
- Statt einer der 6 Kurzdarstellungen kann ein einführendes Referat (15 min, max. 2 Personen) gehalten werden.  
- MA-Studenten Philosophie und Geschichte des Wissens schreiben zusätzlich einen 5-seitigen Essay zu Michael Theunissen: "Die Gegenwart des Todes im Leben".  
- Ihre Texte schicken Sie bitte an die eigens eingerichtete Email-Adresse: grundproblem-tod@ethz.ch

**Formalism (Minimalanforderungen):**  
- Schriftbild: Zeilenabstand 1.5, Schriftgrösse 12, Seitenabstand 2.5cm, Schriftart: Arial, Times New Roman.  
- Vor- und Nachname, Matrikelnummer, Veranstaltungsname, Dozent, E-Mail-Adr., Studiengang.  
- organisatorische Rückfragen bitte an den Assistenten Raphael Salvi: raphael.salvi@phil.gess.ethz.ch

701-0701-00L  
**Philosophy of Science**  
W 3 credits 2V  G. Hirsch Hadorn, C. J. Baumberger
Students can engage with problems in the philosophy of science and to relate them to natural and environmental sciences. They learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Lecturers
M. Huppenbauer

Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list. The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Lecture notes
A reader will be available for students.

Prerequisites / notice
A list of introductory literature and handbooks will be distributed to the students.

701-0701-01L Philosophy of Science: Exercises

Abstract
The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially with regards to environmental research. It addresses the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

Content
1. Core differences between classical Greek and modern conceptions of science.
2. Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
3. Objections to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
4. Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

Lecture notes
A reader will be available for students.

Literature
A list of introductory literature and handbooks will be distributed to the students.

Prerequisites / notice
Further optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader.

Students receive an additional credit point. They have to sign up separately for the exercises for the course 701-0701-01 U.

701-0701-01L Philosophy of Science: Exercises

W 1 credit
1U
G. Hirsch Hadorn
C. J. Baumberger

701-0703-00L Environmental Ethics

Abstract
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective
On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

Lecture notes
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfundierung. Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O’Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

- Marcus Düwell et. al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. Acht et. al (Hrsg.), Grundkurs Ethik 1, Grundlagen, Paderborn (mentis) 2008

Generell introductions:

Prerequisites / notice
Students that want to subscribe for this course also have to subscribe for the lecture 701-0701-00 V "Wissenschaftsphilosophie". Credit points are given for preparing a structure and a summary of one of the texts.

851-0121-32L Introduction to Ethics of Science

Abstract
This course covers both, issues of research ethics and of the social responsibility of scientists. Thereby the relevant theories for the determination of science and its tasks are introduced, as well as the main ethical theories.

Objective
Students learn to identify, analyse and evaluate problems concerning research ethics as well as the political and social role of science. They form their abilities to reason as well as to interpret and write texts.

Political Science

Number
851-0594-00L International Environmental Politics

Title
Particularly suitable for students of D-ITET, D-USYS

Abstract
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Lecture notes
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Literature
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>).

Prerequisites / notice
None

851-0589-00L Technology and Innovation for Development

Abstract
Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective
- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes
Reader with issue-specific articles. E-version is partly available under https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html
Prerequisites / notice

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

Abstract

This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current issues such as the Syria crisis, the migration challenge, terrorism, and Swiss-EU relations.

Objective

Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Auf dieser Basis werden wir die derzeitigen weltzeitlichen Entwicklungsliinien und deren Bedeutung für die Schweiz analysieren. Zu den ausserenpolitischen Herausforderungen und Themen, die wir diskutieren, gehören die Syrienkrise und andere Konflikte im Nahen und Mittleren Osten, die Ukrainekrise und das Engagement in der OSZE, die Friedensförderungspolitik der Schweiz generell, die Entwicklungszusammenarbeit, die ausserenpolitischen Beiträge zur Bewältigung der Migrationskrise, das Engagement der Schweiz gegen den Terrorismus, die Europapolitik und die Politik in der UNO.

### 853-0047-01L World Politics Since 1945: The History of International Relations (Without Exercises)

**Abstract**

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

**Objective**

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

**Content**

cf. "Diploma Supplement"

**Literature**

Reading:

### 853-0060-00L Current Issues in Security Policy

**Abstract**

This course provides an overview of the security implications of so-called "dual-use" technologies, i.e. technologies that can be used for both peaceful and military aims. The course will also cover various policies - in particular arms control - that are discussed and applied by the international community in dealing with such dual-use technologies.

**Objective**

Participants should gain a solid understanding of security challenges stemming from the use and control of dual-use technologies. In addition, the students should become aware of how researchers can deal with sensitive knowledge regarding research transparency and control.

**Content**

The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. Thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

### 853-0003-00L Leadership I

**Abstract**

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

**Objective**

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organization, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

### 853-0015-01L Conflict Research I: Causes of War in Historical Context (without exercises)

**Abstract**

This course offers an introduction to research on causes of wars. War as a social phenomenon is covered from the pre-state world to today's state system after the end of the Cold War. Topics include state formation and collapse, nationalism, decolonization, democracy, and ethnic conflict.

**Objective**

Developing an understanding for causes of war and their development over the last 500 years. Knowledge of fundamental concepts in research on causes of war.

### 853-0302-01L European Integration (Seminar without Tutorial)

**Abstract**

The lecture course covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

**Objective**

The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.
Content

1. Introduction
2. Theories of European integration
3. The development of European integration
4. Internal market and monetary union
5. Internal and external security policies
6. Constitutionalization
7. Widening and differentiation
8. Switzerland, the EEA, and EU neighbourhood policies
9. Identity, trust, and solidarity
10. Public spheres, parties, and elections
11. Decision-making and policy development in the EU
12. Statehood and democracy in the EU
13. European integration in crisis

Lecture notes
The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Literature

Prerequisites / notice
The grade is based on a written exam.

860-0001-00L Public Institutions and Policy-Making Processes W 3 credits 3G T. Bernauer, S. Bechtold, F. Schimmelfennig
Number of participants limited to 25.
Priority for Science, Technology, and Policy MSc students.

Abstract
Students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard.

Objective
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g. interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.

Content
Schedule (for up-to-date information, see the syllabus that will be distributed to participants electronically):
W1: Bechtold, Bernauer: Introduction
How are laws created and interpreted? How are they enforced?
W2: Bechtold: Why do we need laws and why do people and firms usually obey the law? What are possible goals of legal systems? What is the relationship between laws, social norms, and moral values?
W3: Bechtold: What role does scientific evidence play in the creation and enforcement of the law? How does the law deal with non-quantifiable factors or incommensurable values?
W4: no class
W5: Bernauer: How are parliaments (legislatures) elected, how do they work, and how do their characteristics and processes affect policy-making?
W6: Bernauer: Why do forms of government differ and how does this affect policy-making? Why and in what respect are public administrations efficient/effective, and why sometimes not?
W7: Bernauer: How do interest groups and social movements affect policy-making.
W8: Study week
W9: Schimmelfennig: Governance beyond the state: why and how states create international institutions.
W10: Schimmelfennig: International organizations and regimes: case studies of global governance.
W11: Schimmelfennig: Institutions and policy-making in the European Union.
W12: Schimmelfennig: International organizations and policy diffusion.
W13: End-of-semester exam

An add-on module to this course (3 ECTS) involves an essay. This part of the course is accessible only to ISTP MSc students and requires enrollment in the main course (3 ECTS). ISTP MSc students must enrol in both parts. Other students can only enrol in the main course.

3rd week of January: deadline for review essay

Lecture notes
Reading materials will be distributed electronically to the students when the semester starts.
This course offers a comprehensive examination of the role of international organizations (IOs) in world politics. Besides teaching the basic theories and methods that are necessary for studying IOs, this course considers the application of those theories and methods to a range of special institutions.

The first part of this course offers an introduction and will seek to explain how, if at all, IOs obtain some measure of authority in international affairs, i.e., why states delegate certain tasks to IOs instead of dealing unilaterally or multilaterally outside of an institutional context. The second part of the course focuses on the impact and effectiveness of international institutions. We assess whether and how IOs influence state compliance with agreements, and whether IOs socialize states to behave in certain ways. The third and final part of the course examines a special set of IOs: international alliances and international regimes, i.e., explicit principles, norms, rules, and decision-making procedures that define expected behavior in a specific problem field.

The requirements for the course include participation in class discussions (10%), one class presentation (30%), and a final exam (60%).

- **a)** Participation: The quality of students' experience in this course depends on the participation of students. Regular attendance and active class participation constitute a significant portion of the course grade. Students will be expected to read the required readings, think critically about them, and discuss them in class.

- **b)** Class Presentation: First, you will submit one short (maximum 2 pages) paper summarizing the readings for a particular week. This short paper should be distributed to the class ahead of the meeting time (email, at least 24 hours in advance). Each student writing such a paper must also prepare a short class presentation. The goal of this exercise is not simply to summarize the assigned readings, as others in the class will already be familiar with the assignment. Rather, a good summary discusses the broader issues, themes, and questions underlying the readings or identifies problems with research design or potential flaws in the particular articles. The paper(s) and presentation(s) serve as a starting point for a more focused in-class discussion.

- **c)** Final exam: The final examination will take place at the last week of the course. It lasts 1.5 hours, during which you will be required to answer 3 questions out of 9 questions.

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Thematische Schwerpunkte:
- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzentwicklung unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will take the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about experimental methods of investigating and understanding human cognitive processes and various application domains. A focus will be on matters of knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition. Architecture students can obtain course credit in “Vertiefungsfach” or “Wahlfach”.

This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their research ideas in relation to behavioral science. The colloquium also features invited research talks. Students know and can apply autonomously up-to-date investigation methods and techniques in the behavioral sciences. They achieve the ability to develop their own ideas in the field and to communicate their ideas in oral presentations and in written papers. The credits can be obtained by a written report of approximately 10 pages.

The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially perception, learning, memory and reasoning. This includes a comparison of cognitive processes in humans and technical systems, especially with respect to knowledge acquisition, knowledge representation and usage in information processing tasks.

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects. This seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their research ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modeling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper. Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the colloquium. Students interested in giving a talk in the colloquium (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students for oral presentations. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

**Abstract**
The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group performance; leadership behavior and leadership styles.

**Objective**
The aim of the lecture is to impart a well-founded scientific understanding of social influence processes in individuals, groups, organizations, and social settings. The participants should develop competencies in the structuring of communication, interaction, and management processes.

**Content**
Im Einzelnen sollen die Teilnehmerinnen und Teilnehmer lernen:

- an den Beispielen von Kaufverhalten oder ökologischem Verhalten zu beschreiben, wie Normen und Einstellungen Einfluss auf das Verhalten nehmen.
- Die Subjektivität und die Fehlerquellen sozialer Wahrnehmung verstehen,
- Prinzipien der Psychologie der Kommunikation zu nutzen für eine Verbesserung der Kommunikation in Studium und Beruf,
- Merkmale und Strukturen von Gruppen zu identifizieren und mit geeigneten Methoden zu analysieren,
- Die Grundlagen von Konformität und Gehorsam gegenüber Autoritäten zu erkennen,
- Gruppenphänomene wie soziales Faulenzen, Risiko- und Konservatismus-Schub und Gruppendenken entgegenzuwirken,
- Gruppenleistungen und -entscheidungen zu optimieren,
- Führungsstile zu unterscheiden lernen,
- Techniken zur Moderation von interagierenden Gruppen kennen zu lernen.

**Lecture notes**
kein Skript

**Literature**

**Prerequisites / notice**
Es werden für D-ITET-Studierende Gruppenarbeiten (6 Kreditpunkte) in Form eines 3-tägigen computer-unterstützten Assessments fachübergreifender Kompetenzen angeboten (Teilnehmerzahl beschränkt auf 12 Studierende). Die Teilnehmenden verfassen Berichte, die benotet werden.

| **Objective**| - understand basic components of risk management in organizations  
- know and apply methods for risk identification/evaluation, risk mitigation, risk communication  
- know psychological foundations of risk perception, decision-making under risk, and risk communication  
- know organizational principles for managing uncertainty  
- apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g. transport systems, IT, insurance) |
| **Content**| The syllabus includes the following topics:  
Elements of risk management  
- risk identification and evaluation  
- risk mitigation  
- risk communication  
Psychological and organizational concepts relevant in risk management  
- decision-making under uncertainty  
- risk perception  
- resilient organizational processes for managing uncertainty  
Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)  
Group projects related to company case studies |

**Abstract**

In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

**Objective**

The main goals are:

1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2. You have a basic understanding about psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students misconceptions.

**Prerequisites / notice**

Für eine reibungsfreie Semesterplanung wird um persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

**Abstract**

This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

**Objective**

The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

**Content**

At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

**Lecture notes**

**Data:** 06.08.2021 13:03  
**Autumn Semester 2016**  
**Page 632 of 1571**
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Objective
Enseignement des principes du droit, en particulier du droit privé. Introduktion au droit.

Content
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Literature
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des bibliothèques.

Sont indispensables:
- Le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Bolod, J.-P.: Manuel de droit, éd Statkine, Genève

Prerequisites / notice
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours “Recht I” et “Recht II” en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

851-0727-02L E-Business-Law
Particularly suitable for students of D-INFK, D-ITET
W 2 credits 2V D. Rosenthal

Abstract
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and engaging information technology activities.

Objective
The objective is knowing and understanding key legal concepts relevant for doing e-business, in particular understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

Content
Vorgesehen Strukturierung der Vorlesung:
1) Welches Recht gilt im E-Business?
   Internationalität des Internets
   Regulierte Branchen
2) Gestaltung und Vermarktung von E-Business-Angeboten
   Verwendung fremder und Schutz der eigenen Inhalte
   Haftung im E-Business (und wie sie beschränkt werden kann)
   Domain-Namen
3) Beziehung zu E-Business-Kunden
   Verträge im E-Business, Konsumentenschutz
   Elektronische Signaturen
   Datenschutz
   Spam
4) Verträge mit E-Business-Providern

Lecture notes

Literature
Die Semesterendprüfung ist in Form eines schriftlichen Kurztests (normalerweise MC) in voraussichtlich der letzten Doppelstunde geplant. Der Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Prerequisites / notice
Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

Ferner bietet Ursula Widmer eine Vorlesung zum Thema Informationssicherheit an, welche die rechtlichen Aspekte der Sicherheit von ICT-Infrastrukturen und Netzen und der transportierten und verarbeiteten Informationen.

851-0733-00L Traffic Law / Traffic Commercial Law
W 2 credits 2G S. Scherer

Abstract
Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.).

Objective
Participants are acquiring a comprehensive summary about the system Traffic Law/Traffic Commercial Law in Switzerland. With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Content
Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews the role of the law in the practical implementation and operation of e-business applications.

Lecture notes
Script will be distributed during the lecture.

851-0735-10L Business Law
Particularly suitable for students of D-ITET, D-MAVT
W 2 credits 2V P. Peyrot

Abstract
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Objective
Enseignement des principes du droit, en particulier du droit privé. Introduktion au droit.

Content
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Literature
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des bibliothèques.

Sont indispensables:
- Le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Bolod, J.-P.: Manuel de droit, éd Statkine, Genève

Prerequisites / notice
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

851-0733-00L Traffic Law / Traffic Commercial Law
W 2 credits 2G S. Scherer

Abstract
Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.).

Objective
Participants are acquiring a comprehensive summary about the system Traffic Law/Traffic Commercial Law in Switzerland. With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Content
Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews the role of the law in the practical implementation and operation of e-business applications.

Lecture notes
Script will be distributed during the lecture.

851-0735-10L Business Law
Particularly suitable for students of D-ITET, D-MAVT
W 2 credits 2V P. Peyrot

Abstract
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**

The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution.
- They shall be familiar with the issues of corporate compliance, i.e., the system of ensuring that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Content**

Participants discuss current law & finance issues with guests scholars from Europe and the U.S. In addition, participants write a comment on one of the discussed papers.

**Literature**

- Viral Acharya et al., Regulating Wall Street (Wiley 2011)

**Course Code**

851-0735-04L Workshop and Lecture Series in Law and Finance

**Abstract**

The Workshop and Lectures Series in Law & Finance is a joint seminar of ETH Zurich, the University of Zurich and the University of St. Gallen. Each semester, several guest speakers from law, finance and related fields give a lecture and/or discuss their ongoing research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

**Content**

Participants discuss current financial regulation and corporate governance issues with leading academics.

**Literature**

- Viral Acharya et al., Regulating Wall Street (Wiley 2011)

**Objective**

The Lecture and Workshop Series in Law & Finance aims at allowing participants to discuss current financial regulation and corporate governance issues with leading academics.

**Content**

Participants discuss current financial regulation and corporate governance issues with leading academics.

**Literature**

- Viral Acharya et al., Regulating Wall Street (Wiley 2011)

**Course Code**

851-0735-09L Workshop & Lecture Series on the Law & Economics of Innovation

**Abstract**

This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust and technology policy. Scholars from law, economics, management and related fields give a lecture and/or present their current research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

**Objective**

After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

**Content**

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust policy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

**Literature**

- Dennis Carlton / Jeffrey Perloff, Modern Industrial Organization, 4th edition, 2004

**Objective**

The aim of the course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

**Abstract**

Environmental Regulation: Law and Policy

*Does not take place this semester. The course will be offered again in the spring semester 2017.*

*Number of participants limited to 15.*

**Objective**

The aim of the course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.
The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights).

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.

Prerequisites / notice

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

Literature

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

Content

Topics covered in lectures:

(1) Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools
(2) Law: International, European and national laws
   a. International law
   b. European law
   c. National law
(3) Policy: Case studies

Assessment:

(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

Lecture notes

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English.

Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

Prerequisites / notice

The course is (inter)related to materials discussed in Politikwissenscaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

851-0738-00L Intellectual Property: Introduction

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Abstract

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyright) and patent law (software patents, patent trolls, patent thickets).

851-0738-01L The Role of Intellectual Property in Daily Routine: A Practical Introduction

Particularly suitable for students of D-BAUG, D-ITET, D-MAVT

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, geomatic engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

For students of chemistry-related degree programs, the lecture 'Protecting inventions in chemistry' (851-0738-03) will be offered in the autumn semester.

851-0738-03L Protecting Inventions in Chemistry

Particularly suitable for students of D-CHAB

Abstract

The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.
Die Studierenden werden eingeführt in die für die Nutzung natürlicher Ressourcen und die Gestaltung der Landschaft massgeblichen Law and Natural Resources 2 credits

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an ECTS Den Studierenden werden Unterlagen wie eine Übersicht über den behandelten Stoff auf PP-Folien, typische Gerichtsentscheide, D. Helbing

This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding Prerequisites /notice 701-0743-01L Law and Natural Resources W 2 credits 2V Unterrichtssprache: Deutsch

The learning concept is based on the co-ordinated implementation of the relevant legislations. The complexity of the legal situation will be discussed by analysing virtual and real law cases focused on spatial projects and planning. The students know the opportunities and restrictions which are given by the law when using natural resources. They have insights into the complex environmental legal system and their application in concrete cases. The students are able to formulate typical legal questions, to understand the argumentation of courts and to solve simple legal problems with respect to environmental problems.

</tr>
</tbody>
</table>
This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at "tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Prerequisites / notice
Mathematical skills can be helpful.

851-0252-04L Behavioral Studies Colloquium

<table>
<thead>
<tr>
<th>Number of participants limited to: 30</th>
</tr>
</thead>
</table>

Abstract
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their research ideas in relation to behavioral science. The colloquium also features invited research talks.

Objective
Students know and can apply autonomously up-to-date investigation methods and techniques in the behavioral sciences. They achieve the ability to develop their own ideas in the field and to communicate their ideas in oral presentations and in written papers. The credits will be obtained by a written report of approximately 10 pages.

Content
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include as well as theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modeling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have to start work on their thesis or on any other term paper.

Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk should contact the course organizers (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

851-0252-07L Recent Debates in Social Networks Research

Number of participants limited to 30

Abstract
Social Networks research is a highly interdisciplinary fields. For example, scholars in Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics contribute to the development of theories and methods. This course aims at understanding, comparing and structuring recent debates in the field of Social Networks.

Objective
Social Networks research is a highly interdisciplinary fields. At the end of this seminar, students will understand and be able to compare different subject-specific approaches to social networks research (e.g., from Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics). They will be familiar with recent publications in the field of Social Networks and be able to critically participate in a number of recent debates. Amongst others, these debates touch upon the co-evolution of selection and influence mechanisms, appropriateness of statistical models, generic mechanisms and features of social networks, models for the analysis of dynamic networks.

851-0585-04L Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB

Number of participants limited to 70.

Content
This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

Literature

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

851-0591-00L Digital Sustainability in the Knowledge Society

Number of participants limited to 30

Abstract
How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces »digital sustainability« as an alternative vision for society.

Objective
At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitalization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/"free" models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff. After the lecture, you should (hopefully) be able to:
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 637 of 1571
Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?» The problem is that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency provides to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparable to the environmentalism of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch. More on teach.digisus.info starting from September. Stay tuned.

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Literature

Content of the following books is covered (PDFs freely available online):

Other recommended books are:
1 (general) Chris DiBona et al., Open Sources: Voices from the Open Source Revolution, O'Reilly, 1999.

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45. Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the course.

851-0588-00L Introduction to Game Theory. Models and Experimental Studies

W 2 credits 2V A. Diekmann

Particularly suitable for students of D-MAVT, D-MATL

Abstract

This course introduces the foundations of game theory. It focuses on models of social interaction, conflict and cooperation, the emergence of cooperation and concepts of strategic decision-making behaviour. Examples, applications and the contrast between theory and empirical results are particularly emphasized.

Objective

Learn the fundamentals, models, and logic of thinking about game theory.

Apply game theory models to strategic interaction situations and critically assess game theory's capabilities through a wide array of experimental results.

Content

In der Vorlesung wird Wert darauf gelegt, Modelle an Beispielen zu demonstrieren und empirische Untersuchungen ("experimentelle Spieltheorie") vorzustellen.

Lecture notes

Die folgenden Einführungen unterscheiden sich nach Anwendungen und Grad der Formalisierung. Zur Einführung kann man sich eines der folgenden Bücher ansehen, die ab Januar im Handapparat der D-GESS-Bibliothek stehen werden:

Weitere Literatur und Übungsaufgaben zum Download unter: http://www.socio.ethz.ch/publications/spieltorie

Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)

**851-0585-43L** Experimental Game Theory  
Number of participants limited to 60  
W 2 credits 2S  
A. Diekmann

**Abstract**  
The course addresses principles and methods of experimental game theory. It focuses on experiments about social interaction, conflict and cooperation, emergence of cooperation and experimental validity of concepts for strategic behaviour in decision-making situations.

**Objective**  
Learn the fundamentals and logic of thinking about experimental methods and experimental game theory. Learn to read critically the scientific literature on experimental game theory. Apply experimental game theory methods to strategic interaction situations.

**Content**  

**Lecture notes**  
Foliens der Spieltheorie-Vorlesung und Literatur (Fachartikel, Kapitel aus Lehrbüchern) können auf der Webseite des Seminars eingesesehen und heruntergeladen werden.

**Literature**  
(Ein Handapparat dieser und weiterer Literatur wird in der D-GESS-Bibliothek bereitgestellt.)  
Literatur zum Download befindet sich auch auf der Webseite: http://www.socio.ethz.ch/publications/spieltorie

**227-0802-02L** Sociology  
W 2 credits 2V  
A. Diekmann

**Abstract**  
Various studies are used to introduce basic sociological concepts, theories and empirical research methods, along with selected sociological topics. The goal of the course is to provide participants with an understanding of working practice in empirical sociology and the central findings of sociological studies.

**Objective**  
To learn about methods of empirical social research and key results of classic and modern sociological studies.

**Content**  
Sociologie befasst sich mit den Regelmäßigkeiten sozialer Handlungen und ihrer gesellschaftlichen Folgen. Sie richtet ihren Blick auf die Beschreibung und Erklärung neuer gesellschaftlicher Entwicklungen und erfasst diese mit empirischen Forschungsmethoden. Die Vorlesung wird u.a. anhand von Beispielstudien - klassische Untersuchungen ebenso wie moderne Forschungsarbeiten - in die Grundbegriffe, Theorien, Forschungsmethoden und Themenbereiche der Soziologie einführen.

Folgende Themen werden behandelt:

3. Der Beitrag der Sozialtheorie. Vorstellung und Diskussion ausgewählter Studien zu einzelnen Themenbereichen, z.B.: (1) Die Entstehung sozialer Kooperation, (2) Reputation und Märkte, (3) Soziale Netzwerke u.a.m.

**Lecture notes**  
Foliens der Vorlesung und weitere Materialien (Fachartikel, Kopien aus Büchern) werden auf der Webseite der Vorlesung zum Download zur Verfügung gestellt.

**Literature**  
Foliens der Vorlesung und weitere Materialien (Fachartikel, Kopien aus Büchern) werden auf der Webseite der Vorlesung zum Download zur Verfügung gestellt.

Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)

**051-0811-00L** Sociology I  
W 1 credit 2V  
C. Schmid

Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)
Abstract Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and present-day forms of urbanization, and typical examples of models of urbanization.

Objective This series of lectures should enable students to comprehend architecture in its social context. It approaches the architectural profession from two different angles: macro-sociological and micro-sociological.

Content Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part some central aspects of social change are examined in particular the transition from Fordism to Postfordism and from Modernism to Postmodernism, and the interlinked processes of globalization and regionalization. The second part deals with historical and present-day forms of urbanization. Among other aspects treated here are the changed significance of urban-rural contrasts, the processes of suburbanization and periurbanization, the formation of global cities and metropolitan regions, the growth of new urban configurations in centres (gentrification) and on urban peripheries (edge city, exopolis). In the third part these general processes are illustrated by typical models of urbanization.

701-1541-00L Multivariate Methods
W 3 credits 2V+1U R. Hansmann
One of the lectures 701-1541-00 (autumn semester) OR 752-2110-00 (spring semester) are highly recommended for students in Environmental Sciences with the Major Environmental systems and Policy.

Abstract The course teaches multivariate statistical methods such as linear regression, analysis of variance, cluster analysis, factor analysis and logistic regression.

Objective Upon completion of this course, the student should have acquired:

1. Knowledge on the foundations of several methods of multivariate data analysis, along with the conditions under which their use is appropriate
2. Skill in the estimation, specification and diagnostics of the various models
3. Hands-on experience with those methods through the use of appropriate software and actual data sets in the PC lab

Content The course will begin with an introduction to multivariate methods such as analysis of variance and multiple linear regression, where a metric dependent variable is "explained" by two or more independent variables. Then two methods for structuring complex data, cluster analysis and factor analysis will be covered. In the last part, procedures for the analysis of relationships involving dichotomous or polytomous dependent variables (e.g., the choice of a mode of transportation) will be discussed.

Literature Will be announced at the beginning of the course.

701-0731-00L Environmental Behavior in Social Context
W 2 credits 2S H. Bruderer Enzler

Abstract This introductory class in the environmental social sciences covers topics such as environmental behavior, environmental concern, social dilemmas and social norms.

Objective Basic knowledge of the environmental social sciences
Overview on current fields of research and their relevance for practical application

Fragen, die uns während des Semesters beschäftigen:
- Wie kommt es zu Umweltschädigungen, obwohl niemand diese beabsichtigt?
- Warum verhält sich besonders umweltschonend? Wie wird dies gemessen?
- Welche Rolle spielt das Umweltbewusstsein?
- Welche Rolle spielen äussere Faktoren (Möglichkeiten, Kosten etc.)?
- Wie sehr lassen wir uns dadurch beeinflussen, was andere machen?
- Kooperieren wir nur, wenn auch andere dies tun?

051-0813-16L Sociology: Urban Quality of Life - Ethnological Field
Research in District 5 and in Zurich North
W 2 credits 2S C. Schmid, H. Nigg

Abstract In this ethnographic field research we examine the question, how people are perceiving and creating their environment, and how an urban quality of life is forming. We investigate four neighborhoods in the Zurich Region: upper District 5, Zurich West, Seebach and Glattpark.

Objective This elective course highlights the sociological perspective on architectural practice and provides an introduction to sociological research. It focuses on two main procedures: on the one hand, a systematic reading and discussion of theoretical texts, and on the other, empirical case studies of social aspects of the production of the built environment. In this course, a wide set of qualitative research methods is used (including various forms of interview, participant observation, image and text analyses). This approach enables students to gain their own experience by dealing with the various participants and constellations in the social field of architecture and building construction, and to familiarize themselves with the approaches and perceptions of various different participants.

Content An introduction into ethnographic field research.

Urban ethnology concentrates on the urban space, on urban actors, on the cityscape and compares cities of different continents and cultures with each other. Urban ethnography investigates symbols and practices representing and participating in the normal course of city life. Urban ethnology understands urban space not only as built environment, but also as a lived cultural and social context. With ethnographic field research the perception of actors in local milieu is investigated. How do they see and experience urban contexts? How do they move in the city area? How do they recognize houses, roads and places? How do they hear the city? The perception of local milieu, their obstinacy, creativity and their special way of life is considered significant for better understanding the city as central point of current social development. For ethnographic surveys of the built environment architects nowadays use a number of methods and techniques: participating in observation, interviews, photo and video site inspections in urban rooms, mindmapping etc.

Dr. Heinz Nigg ist Ethnologue und Kulturschaffender

851-0252-09L Special Topics in Cognitive Neuroscience
W 3 credits 2V C. Ghisleni, V. Schinazi

Abstract Cognitive neuroscience bridges two seemingly distinct but closely related disciplines. On one side, there is cognitive psychology and on the other side biology, or more specifically, neuroscience. In terms of research, this relatively young field aims to explain such diverse mental processes as thinking, perceiving, feeling, and reasoning by exploring their underlying biological or neural mechanisms.
We will deal with historical and contemporary theories of inventive imagination, fantasy, and creativity. Looking at artistic, psychological, history of astronomy, and comparative cultural sciences.

**Evolutionary Foundations of Social Behavior**

- **Objective**: This course explores selected topics of cognitive neuroscience. The course begins with a basic introduction to the field covering neural anatomy and brain physiology. Contemporary methods used in neuroscientists (e.g., fMRI, EEG) will also be introduced and discussed. Using this knowledge, we will discuss some of the classic works in neuroscience in visual perception, memory and emotion. This will be accompanied by some famous cases of patients demonstrating problems in these domains (e.g., people with agnosia or amnesia). Further topics will include the cognitive and neural processes involved in pain processing, the placebo effect, as well as spatial representation and navigation.

- **Abstract**: This lecture will deal with the manifestations of the "selfish gene" principle in human social behavior. Cooperation and competition, selfishness and altruism, gender relations and parent-child conflicts are issues, the evolutionary backgrounds of which will be discussed. Special attention will be paid to the costly signaling theory.

- **Objective**: You will receive an in-depth overview of the application of Darwinian theory on behavioral phenomena. This will enable you to approach the heuristic perspective of the so-called adaptationist program of social phenomena. Finally, you will be able to discern the benefits and the problems of the evolutionary perspective within various scientific disciplines, especially anthropology, psychology, empirical social research and comparative cultural sciences.

- **Prerequisites**: Particularly suitable for students of D-ERDW, D-MATH, D-PHYS

**Who was Sigmund Freud?**

- **Objective**: This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.

- **Abstract**: In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature.

- **Content**: According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.

- **Prerequisites**: Not limited to 20.

- **Objective**: This seminar targets students at the Bachelor level with no previous experience. The main requirement for this course is an open and critical mind. By the end of the course, the student will be able to identify the major brain structures and to explain the basic functioning of neurons as well as some of the fundamental principles of how our brain works. Students should have an understanding of the methods used to generate the various findings reported in the literature and the media. The course aims to enable and encourage the students to critically evaluate these findings, and what can and cannot be answered with neuroscience techniques. For each of the topics, students should be able to identify the phenomenon, give examples, and discuss one or two of the main theories explaining it.

- **Abstract**: This lecture will deal with the manifestations of the "selfish gene" principle in human social behavior. Cooperation and competition, selfishness and altruism, gender relations and parent-child conflicts are issues, the evolutionary backgrounds of which will be discussed. Special attention will be paid to the costly signaling theory.

- **Content**: By the end of this lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.

- **Prerequisites**: Not limited to 20.

**Science Research**

Die Veranstaltung ist ausgebucht

Abstract
The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Objective
The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle’s system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man’s place in the cosmos and the philosophical principles underpinning cosmology.

851-0157-70L

The Mathematics of Scientific Racism

W
2 credits
1S
A. Teicher

Abstract
How did racial scientists determine racial affiliation? In the seminar we will examine the practical challenges and eventual works of physical anthropologists from 1850 to the present. By scrutinizing the scientific toolbox of racial scientists, we will reveal how national affiliation, anti-Semitic perceptions and gender identity shaped scholars’ choices of graphical and computational methods.

Objective
The aim of the course is to analyze the mutual relations between scientific theories and social perceptions, and to follow the formation of the “scientific mind”. The course focuses on racial scientists and on the way their practices of computation and statistical analysis influenced their world-views - and vice versa. The students will be instructed on the way historians of science analyze scientific sources. They will gain a better understanding of the complexities of disciplinary dynamics, social biases and institutional pressures shaping scientific ideas, and learn on the influences such scientific ideas may have on the society as a whole.

Prerequisites / notice
Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

701-0771-00L

Environmental Consciousness and Public Relations

W
2 credits
2G
R. Locher

Abstract
"Environmental Consciousness and Public Relations" shows how to communicate about environment and sustainability successfully. We look at campaigns, exhibitions and other public relations measures to learn, how to design and realize good communication.

Objective
You learn how to handle tools and concepts in environmental communication. And you can evaluate communication projects. We also discuss the evolution of consciousness.

Content
- Methods and tools in environmental communication.
- Marketing mix
- Examples of campaigns, events, print products, media relations.
- Integral sustainability

Lecture notes
Handouts

Literature
- Integral Vision; Ken Wilber, 2005

Prerequisites / notice
We will discuss new trends in environmental communication with the focus on integral solutions.

851-0158-07L

Worldviews in Conflict

W
3 credits
2V
W. A. Stahel, H. von Sass, C. aus der Au Heymann

Abstract
Worldviews guide our thoughts and our actions even though we may not be aware of it. They often are realized only when they are confronted with each other. By means of lectures, discussions and contributions of participants, we will examine those worldviews as to the underlying philosophical concepts and their relations to the sciences, philosophy and religion.

Objective
Students of all disciplines shall obtain a basis for their own exploration of worldviews. Prior knowledge of philosophical concepts and history is not required.

Type B: Reflection About Subject-Specific Methods and Contents

Subject-specific courses: Recommended for doctoral, master and bachelor students (after first-year examination only).

Students who already took a course within their main study program are NOT allowed to take the course again.

These course units are also listed under “Type A”, which basically means all students can enroll

D-ARCH

Property Law for Geometers: Land Registry and Geoinformation Law
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Objective
Overview of the legal norms of land registry and surveying law.

Content
Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal problems of surveying, the reform of official surveying, liability of the geometer. The lecture unit is carried out within a frame of 8 sessions (2 hours): the first hour of each is given in the form of a lecture, the second in the form of a case-study.

Lecture notes
Abgegebene Unterlagen: Skript in digitaler Form

851-0705-02L Environmental Law: Topics and Case Studies W 2 credits 2S C. Jäger

Does not take place this semester.
Number of participants limited to 20.

Prerequisites: Environmental Law: Conceptions and Fields (851-0705-01L) offered in spring semester.

Abstract
This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

Objective
The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content
At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes
Den Studierenden werden Unterlagen zur juristischen Methoden- und Quellenlehre sowie im Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature
Rechtsgrundlagen, Literatur und Gerichtsentscheide werden themenspezifisch selber recherchiert, unter Mithilfe und Beratung des Dozenten.

Prerequisites / notice
Die Veranstaltung erfordert die Bereitschaft, sich aktiv und selbständig mit einer selbstgewählten Fragestellung oder einem eigenen Fallbeispiel aus dem Gebiet des Umweltrechts und allenfalls aus Schnittstellengebieten auseinanderzusetzen. Damit die Interaktivität und die Begleitung der Teams gewährleistet werden kann, ist die Teilnehmerzahl auf maximal 16 Personen beschränkt. Es handelt sich um eine Vertiefungsveranstaltung. Der Besuch der Vorlesung "Umweltrecht: Konzepte und Rechtsgebiete" (851-0705-01) ist Voraussetzung.

851-0707-00L Space Planning Law and Environment W 2 credits 2G O. Bucher

Abstract
System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective

Lecture notes
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Hänni, Peter, Planungs-, Bau- und besonderes Umweltschutzrecht, 6.A., Bern 2016

851-0252-01L Human-Computer Interaction: Cognition and Usability W 3 credits 2S I. Barisic, C. Hölscher, S. Ognjanovic

Number of participants limited to 30.

Abstract
This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

851-0252-03L Cognition in Architecture - Designing Orientation and Navigation for Building Users W 3 credits 2S V. Schinazi, B. Emo Nax, C. Hölscher

Number of participants limited to 40.

Abstract
How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

Objective
Tackling the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world experiments, virtual reality experiments, eye-tracking, and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture/planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition.

Architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach"
Postal Knowledge and the History of Digital Societies

**Abstract**

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture offers problem-oriented insights into this sociotechnical process of translation.

**Objective**

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

**Content**

---

**D-BAUG**

### 851-0738-01L

**Title:** The Role of Intellectual Property in Daily Routine: A Practical Introduction

**Abstract**

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**

In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

**Topics covered during the lecture will include:**

- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

**Prerequisites / notice**

The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, computational science and engineering, computer science, electrical engineering and information technology, environmental engineering, geomatic engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ (851-0738-03) will be offered in the autumn semester.

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

**Content**

### 051-0363-00L History of Urban Design I

**Abstract**
The lecture covers the time from the beginning of urban culture until the mid 19th century. With selected examples it emphasizes on the historical plannings and methods of European cities. Each specific urban development will be presented within a broader context.

**Objective**
This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

**Content**
In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.

1. 01. Introduction to the discipline and method: The history of urban design as a historical project
2. 02. Athens and Rome in the ancient world: Myth, selfportrayal and speculation
3. 03. From the spirit of equality to the colonial module: Greek and Roman City foundings
4. 04. From the urban ideal to new cities in the Middle Ages and the Renaissance
5. 05. Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg
6. 06. The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon
7. 07. Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850
8. 08. Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830
9. 09. The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century
10. 10. Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht
11. 11. Neoaoluslute power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and ldefonso Cerdas Enсанche for Barcelona

**Lecture notes**
The lectures are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 30.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

**Literature**
Further recommended literature to consult is listet within the script.

### 701-0703-00L Environmental Ethics

**Abstract**
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

**Objective**
You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

**Content**
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Current topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

**Lecture notes**
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

**Literature**
In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfundung, Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

**Prerequisites / notice**
The procedure for accumulating CP will be explained at the start of term.

**Generel introductions:**
- Andrew Light/Holmes Rolston III, Environmental Ethics, An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008
Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical software Stata.

Objective
- Students will have a sound understanding of linear and logit regression
- Students will know strategies to test causal hypotheses using regression analysis and/or experimental methods
- Students will be able to formulate and implement a regression model for a particular policy question and a particular type of data
- Students will be able to critically interpret results of applied statistics, in particular, regarding causal inference
- Students will be able to critically read and assess published studies on policy evaluation
- Students will be able to use the statistical software STATA for data analysis

Content
The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology, and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective
The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional, and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work, and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R’s (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

851-0144-19L Philosophy of Time 3 credits 2V 3N. Sieroka

Does not take place this semester.
Particularly suitable for students of D-BIOL, D-INFK, D-MATH, D-PHYS

Abstract
This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

Data: 06.08.2021 13:03   Autumn Semester 2016   Page 649 of 1571
Objective

Research and development play an important role in chemistry-related technology sectors such as inorganic and organic chemistry or pharmacy.

Investments in the development of new substances and active components in these sectors are traditionally secured by patents because publicly known inventions, generally chemical substances, may easily be reproduced by others.

In the last years, the know-how about intellectual property has become increasingly important for chemists and engineers. Both in the production process and in the distribution sector, chemists and engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information. As more than three-quarters of all publicly available technical information are available only in patents, it is more and more important for researchers and engineers to be capable of extracting relevant information from the flood of patents.

Patents are not only a powerful measure to protect investments and inventions in chemistry-related sectors but also an important source of information about competitors and potential cooperation partners and about the development of markets. Accordingly, the know-how about patents and patent information has become a key qualification on the strategic level in companies and in the research sector.

The seminar is customised to the needs of chemists and students of related degree programs. Participants will become familiar with practice-oriented aspects of intellectual property and will be enabled to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups
- Special aspects of protecting inventions in chemistry-related sectors, e.g. polymorphs and inventions in the field of nanotechnology.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The lecture is coordinated in particular to the needs of the following degree programs: Agricultural science, biotechnology, chemical engineering, food science, pharmaceutical sciences.

For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.

This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

**Objective**

- Students will have a sound understanding of linear and logit regression.
- Students will know strategies to test causal hypotheses using regression analysis and/or experimental methods.
- Students will be able to formulate and implement a regression model for a particular policy question and a particular type of data.
- Students will be able to critically interpret results of applied statistics, in particular, regarding causal inference.
- Students will be able to critically read and assess published studies on policy evaluation.
- Students will be able to use the statistical software STATA for data Analysis.

**Content**

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

Prerequisites / notice  
I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

860-0006-00L Applied Statistics and Policy Evaluation  
W 3 credits 3G  I. Günter, K. Harttgen

Number of participants limited to 20.

Science, Technology, and Policy MSc and MAS in Development and Cooperation have priority.

Abstract  
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Objective  
Students
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

Content  
The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs.

Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. 851-0125-51L Man and Machine  
Does not take place this semester. Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL

Abstract  
The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective  
On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man. Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

851-0180-00L Research Ethics  
Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract  
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective  
The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.

Postal Knowledge and the History of Digital Societies
851-0551-03L
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Particularly suitable for students of D-ARCH, D-BAUG, D-HEST, D-INFK, D-ITET, D-MAVT

Abstract
In the second half of the 20th century, postal services have dramatically changed. Communication today is computerbased. The lecture offers problem oriented insights into this sociotechnical process of translation.

Objective
Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

**Objective**

- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

---

**E-Business-Law**

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be observed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.
Vorgesehene Strukturierung der Vorlesung:

How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

2) Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling data: 06.08.2021 13:03

Lecture notes

Es wird mit Folien gearbeitet, die als PDF über die elektronische Dokumentenablage (ILIAS) auf dem System der ETHZ vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzesextenzen und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Prerequisites / notice

T2 Semesterendprüfung ist in Form eines schriftlichen Kurztests (normalerweise MC) in voraussichtlich der letzten Doppelstunde geplant. Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

Ferner bietet Ursula Widmer eine Vorlesung zum Thema Informationssicherheit an, welche die rechtlichen Aspekte der Sicherheit von ICT-Infrastrukturen und Netzen und der transportierten und verarbeiteten Informationen.

Fernster 851-0591-00L Digital Sustainability in the Knowledge Society

Particularly suitable for students of D-INFK, D-ITET, D-MATL, D-MAVT, D-MTEC, D-USYS.

How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g., Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open:"free" models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff. After the lecture, you should (hopefully) be able to:

- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetics», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can ductrict the technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge. Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with GNU/Linux as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)... As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch. More on teach.digisus.info starting from September. Stay tuned.
WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field. Particularly suitable for students of D-ARCH, D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.

Particularly suitable for students of D-ARCH, D-BAUG, D-INFK, D-ITET, D-MAVT.

Content

This course offers an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of time, its fundamental character, and our experience of it. The core theme will be time as an interval in the duration of events. The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

Lecture notes

The lecture slides will be presented on the course web page after each lecture.

Literature

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

WebClass Introductory Course History of Technology

W 3 credits 2V G. Hürlimann

Number of participants limited to 100.

Content

WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Objective

Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

Content

WebClass Einführungskurs Technikgeschichte ist eine webgestützte Einführung in die Technikgeschichte. Technikgeschichte untersucht Angebote technischer Entwicklungen, die in bestimmten historischen Kontexten entstanden und von sozialen Gruppen oder ganzen Gesellschaften als Möglichkeit sozialen Wandels wahrgenommen, ausgehandelt und schliesslich genutzt oder vergessen wurden.

Philosophy of Time

W 3 credits 2V N. Sieroka

Does not take place this semester.

Particularly suitable for students of D-ARCH, D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.

Content

This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.
851-0144-21L Philosophical Issues and Problems in Theoretical Computer Science

**Abstract**
This course studies philosophical issues concerning computers and computing. Topics include: information (and information content), computational complexity, the Turing Test for computer thought; the "Chinese Room" argument against the possibility of strong AI; connectionist AI; consciousness; the Church-Turing thesis; computational and hypercomputational models of mind; and free will.

**Objective**
- Exhibit a general understanding of the philosophy and history of computing.
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.
- Communicate clearly in writing about topics in this field.

851-0144-22L Developments in Logic after Gödel: Applications to Theoretical Computer Science

**Abstract**
The course will start by presenting a modern logic, namely (propositional) modal logic, which has turned out to be extremely fruitful and to have numerous interesting applications in computer science, mathematics and philosophy. Subsequently, two of these applications to computer science, tense logic and dynamic logic, and one application to mathematics, provability logic, will be introduced.

**Objective**
- Learn the fundamental concepts of a range of propositional logics
- Learn how to construct proofs in these logics
- Study the interface between mathematical logic and computer science, and mathematical logic and mathematics

860-0006-00L Applied Statistics and Policy Evaluation

**Abstract**
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

**Objective**
Students
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

**Content**
The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods:

- are able to use the statistical Software Stata for data Analysis

Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercise session.
Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner. Sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge. Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «leaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch. More on teach.digisus.info starting from September. Stay tuned.

Abstract
Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to a autonomous philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's philosophy).

Objective
The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protokoll is to be written.

Content
- Welches Recht gilt im E-Business?
  - Vertragsrecht, Gleichheit, Solidarität
- Rechtsstreitigkeiten und Rechtsänderungen
  - Rechtliche Grundlagen
- Präsentationen und Prüfungsaufgaben

Lecture notes
Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Literature
Content of the following books is covered (PDFs freely available online):

Other recommended books are:
1 (generally) Chris DiBona et al., Open Sources: Voices from the Open Source Revolution, O'Reilly, 1999.

851-0125-41L Introduction into Philosophy of Technology W 3 credits 2V O. Müller
Particularly suitable for students of D-ITET, D-MATL, D-MAVT

851-0727-02L E-Business-Law W 2 credits 2V D. Rosenthal
Particularly suitable for students of D-INFK, D-ITET

Prerequisites / notice
For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45. Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the lecture.

851-0125-41L Introduction into Philosophy of Technology

W 3 credits 2V O. Müller
Particularly suitable for students of D-ITET, D-MATL, D-MAVT

Abstract
Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to a autonomous philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's philosophy).

Objective
The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protokoll is to be written.

Content
Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business?
   - Internationalität des Internets
   - Regulierte Branchen
2) Gestaltung und Vermarktung von E-Business-Angeboten
   - Verwendung fremder und Schutz der eigenen Inhalte
   - Haftung im E-Business (und wie sie beschränkt werden kann)
   - Domain-Namen
3) Beziehung zu E-Business-Kunden
   - Verträge im E-Business, Konsumentenschutz
   - Elektronische Signaturen
   - Datenschutz
   - Spam
4) Verträge mit E-Business-Providern

Lecture notes
Es wird mit Folien gearbeitet, die als PDF über die elektronische Dokumentenablage (IIAS) auf dem System der ETHZ vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzeszitaten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Literature
WebClass Introductory Course History of Technology  

**Prerequisites / notice**  
Number of participants limited to 100. Particularly suitable for students of D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.

**Abstract**  
WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

**Objective**  
Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

**Content**  
WebClass Einführungskurs Technikgeschichte is a web-based introduction to the History of Technology. Technology history investigates the historical context in which technological innovations emerged. The students will learn about the social, economic, and political factors that influenced technological developments. They will explore how technological advancements have shaped societies and cultures. The seminar will include discussions on key technological innovations and their impacts on society and the environment. Students will engage in critical thinking about the ethical implications of technology and its role in modern society.

**Literature**  

**Prerequisites / notice**  

**Data: 06.08.2021 13:03 | Autumn Semester 2016 | Page 660 of 1571**
The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially with respect to knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are presented and students will learn about experimental methods of investigating and understanding human cognitive processes and their implications for applications in many fields, especially with respect to knowledge acquisition, knowledge representation and usage in information processing tasks.

Particularly suitable for students of D-ITET, D-USYS

Introduction to Cognitive Science

Number of participants limited to 70.

The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially perception, learning, memory and reasoning. This includes a comparison of cognitive processes in humans and technical systems, especially with respect to knowledge acquisition, knowledge representation and usage in information processing tasks.

Prerequisites / notice

Particularly suitable for students of D-ITET

The seminars will be held at the Swiss Federal Institute of Technology (ETH-Zürich). The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ (851-0738-03) will be offered in the autumn semester.

Number of participants limited to 70.

The seminars will be held at the Swiss Federal Institute of Technology (ETH-Zürich). The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Particularly suitable for students of D-ITET

The role of intellectual property in daily routine is compulsory.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

851-0594-00L

International Environmental Politics

W 3 credits 2V T. Bernauer

Course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Particularly suitable for students of D-ITET, D-USYS

Assigning reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggstr 4, B-floor, or in the library of D-USYS.

Literature

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>).
Abstract
The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective
The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

<tr>
<td>Abstract</td>
<td>This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at &quot;tiping points&quot;, multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or &quot;tragedies of the commons&quot; such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.</td>

The lecture series “Images of Mathematics” deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century: Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years.

These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

The lecture series “Images of Mathematics” deals with a few moments in the history of the scientific discipline since the middle of the 19th century when the image of mathematics changed. In particular, it focuses on the consequences of the fact that in the 19th century mathematics started to not only reflect on their own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. Through Cantor's set theory, the mathematical treatment of logic since Boole and especially through Frege and the formalization of its axioms in a wide ranging discussion involving Zermelo, Fraenkel and others, this self-reflexive stance came to the fore.

Yet, the deeper mathematics dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundations of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundation of mathematics primarily insofar as it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in detailed insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel's theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

Die Spieltheorie stellt Modelle zur Beschreibung und Analyse sozialer Interaktionen zur Verfügung. Klassische Probleme wie die
Hobbessche Frage nach den Bedingungen sozialer Ordnung, die Frage nach der Entstehung und Geltung sozialer Normen oder den
Auswirkungen gesetzlicher Regelungen und sozialer und ökonomischer Institutionen werden heute auch mit spieltheoretischen Methoden
untersucht. Dabei werden nicht nur Fragestellungen und Lösungsvorschläge präzisiert, sondern oftmals überraschende neue Einsichten
gewonnen. Spieltheorie wird überdies auch auf Probleme der Verkehrsplanung, Informatik (z.B. Rechnernetze) und insbesondere in der
Biologie (durch Evolution herausgebildete Strategien von Organismen) angewandt.

Nach einer Einführung in die Grundbegriffe (Strategien, Nash-Gleichgewicht, Teilspielperfektheit etc.) stehen auch Erweiterungen
(Einführung in wiederholte Spiele, unvollständige Information, evolutionäre Spieltheorie, Signalepiele) auf dem Programm. Ein
Schwerpunkt sind Anwendungen der Theorie in verschiedenen Bereichen. Dazu zählen sozialtheoretische Analysen von Kooperation, des
sozialen Austauschs, von Institutionen und Normen, sozialen Dilemmata und Reziprozität ebenso wie Anwendungen auf strategisches
Verhalten in Politik und zwischen Staaten und Firmen, den Auswirkungen von Reziprozitätsnormen auf den Arbeitsmarkt und einige
Anwendungen aus der Biologie. Es wird sich allerdings zeigen, dass experimentelle und andere empirische Studien häufig den strikten
Rationalitätsanforderungen der "Standardtheorie" nicht genügen. Unter dem Stichwort "Behavioural Game Theory" werden in der
Vorlesung Theorievarianten diskutiert, die mit den experimentellen Beobachtungen von Entscheidungen "begrenzt rationaler" Akteure
besser im Einklang stehen.

In der Vorlesung wird Wert darauf gelegt, Modelle an Beispielen zu demonstrieren und empirische Untersuchungen ("experimentelle
Spieltheorie") vorzustellen.

Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAYT)

Prerequisites / notice
Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAYT)

- Introduction to Game Theory. Models and
- particular experimental studies
- Particularly suitable for students of D-MATL, D-MAYT
- Abstract
- This course introduces the foundations of game theory. It focuses on models of social interaction, conflict and cooperation, the emergence
- of cooperation and concepts of strategic decision-making behaviour. Examples, applications and the contrast between theory and empirical
- results are particularly emphasized.
- Objective
- Learn the fundamentals, models, and logic of thinking about game theory.
- Apply game theory models to strategic interaction situations and critically assess game theory’s capabilities through a wide array of
- experimental results.
- Content

- D-MATL, D-MAVT, D-MTEC, D-USYS.
| Content | Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?» The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is not a new invention but digital reality in an adequate mix, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.
Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.
Comparative to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2020.ethz.ch.

Data: 06.08.2021 13:03 | Autumn Semester 2016 | Page 665 of 1571 | 2 credits | Lecture notes

| Literature | Content of the following books is covered (PDFs freely available online):
Other recommended books are:
1 (general) Chris DiBona et al., Open Sources. Voices from the Open Source Revolution, O'Reilly, 1999.

Prerequisites / notice
For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.
Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the lecture.

| Lecture notes | Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.
More on teach.digisis.info starting from September. Stay tuned.

| Literature | Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=2170).

| 851-0703-00L | Introduction to Law | W | 2 credits | 2V | O. Streiff Gnöpff
Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00), cannot register for this course unit.
Particularly suitable for students of D-MAVT, D-MATL
Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.
Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.
Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.
Lecture notes | Jaap Hage, Bram Ackermans (Eds.), Introduction to Law, Cham 2014 (Online Resource ETH Library)

| 851-0306-05L | Literature and Technology - Simulations, Prototypes, Machines | W | 3 credits | 2S | E. Edelmann-Ohler
Particularly suitable for students of D-ITET, D-MAVT, D-MATL
Abstract
Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature converts not only technology into fiction, but it also creates new cultural and social conceptualisations, which reveal alternative readings of configurations of knowledge.
Objective
Students are familiar with different relations between literature and technology. They can verbalise and analyse central contentions.
Content | Im Seminar lesen wir unter anderem Texte von E.T.A. Hoffmann, Franz Kafka, Georg Kaiser und Max Frisch.

| 851-0738-00L | Intellectual Property: Introduction | W | 2 credits | 2V | M. Schweizer
Particularly suitable for students of D-ITET, D-MAVT, D-MATL
Abstract
The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights).
Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.
Objective
The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights.
This knowledge is imparted based on current rulings and cases.
Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

| 851-0125-51L | Man and Machine | W | 3 credits | 2G | M. Hampe
Does not take place this semester.
Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL
Abstract
The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.
Objective: On the one hand, models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand, these models were always criticized, sometimes polemically, because they are supposedly not adequate for man. Students should learn about the connections between the history of anthropology and technology and be able to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

853-0060-00L

Course: Current Issues in Security Policy

W 3 credits 2V A. Wenger, O. Thränert

Abstract: This course provides an overview of the security implications of so-called “dual-use” technologies, i.e. technologies that can be used for both peaceful and military aims. The course will also cover various policies - in particular arms control - that are discussed and applied by the international community in dealing with dual-use technologies.

Objective: Participants should gain a solid understanding of security challenges stemming from the use and control of dual-use technologies. In addition, the students should become aware of how researchers can deal with sensitive knowledge regarding research transparency and control.

Content: The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. Thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

Lecture notes

Literature:

Prerequisites / notice: Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle. A reading list will be distributed at the beginning of the semester.

853-0047-01L

Course: World Politics Since 1945: The History of International Relations (Without Exercises)

W 3 credits 2V A. Wenger

Abstract: This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Objective: By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Content:

Literature:

Reading:

Prerequisites / notice: The lecture is being supported by a website on Moodle. If you have any questions, please contact Lukas Meyer, lukas.meyer@sipos.gess.ethz.ch.

701-0703-00L

Course: Environmental Ethics

W 2 credits 2V M. Huppenbauer

Abstract: The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective: On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

Content:

Lecture notes:

Literature:

Prerequisites / notice: The procedure for accumulating CP will be explained at the start of term. I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

701-0791-00L

Course: Environmental History - Introduction and Overview

W 2 credits 2V D. Speich Chassé

Abstract: Number of participants limited to 100. Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Objective: Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems. Improved ability to assess current problems from a historical perspective and to critically interrogate one's own standpoint.

Lecture notes:

Literature:

Prerequisites / notice: I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

701-0985-00L

Course: Social Intercourse with Current Environmental Risks

W 1 credit 1V B. Nowack, C. M. Som-Koller

Abstract: The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.
Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video).

- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- prospects for future developments

Lecture notes Copies of slides and selected documents will be distributed

Prerequisites / notice The lecture is held biweekly (for 2 hours). The dates are 26.9., 3.10. (out of schedule), 24.10, 7.11, 21.11, 5.12, 19.12

Objective - Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)

Content Knowledge about possibilities for sustainable innovation

- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- prospects for future developments

Lecture notes Copies of slides and selected documents will be distributed

Prerequisites / notice The lecture is held biweekly (for 2 hours). The dates are 26.9., 3.10. (out of schedule), 24.10, 7.11, 21.11, 5.12, 19.12
### Philosophy of the Environmental Sciences: An Introduction

**Particularly suitable for students of D-ARCH, D-BSSE, D-CHAB, D-MTEC, D-USYS**

**Abstract**

Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construe what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches.

**Objective**

The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine the central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to probe the different uses of those concepts, their semantic range in terms of historical depth and semantic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue of how values and norms can be embedded in technological objects. This leads us to the third and last complex of topics that focus on current deliberations about possible new ways of existence in the age of the Anthropocene and as a consequence the formation of adequate life styles in our societies. This refers to issues in philosophical and social anthropology and the challenge of climate change.

**Literature**

**Prerequisites / notice**

The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

---

### Conference of Disarmament: Simulation of Negotiations

Does not take place this semester.

**Abstract**

The Global Studies Institute (University of Geneva) is organizing a simulation seminar on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

**Objective**

The simulation is conducted in collaboration with experts and students during a two days seminar at the University of Geneva.

Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.

**Content**

The simulation project is intended for Master's or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSBP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keeper of the minutes or of observers and analysts.

Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the "Capitals" to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: [https://chamilo.unige.ch/home/courses/M165/?id_session=0](https://chamilo.unige.ch/home/courses/M165/?id_session=0)

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

**Note:**

The participation in the simulation on 26. and 27. November in Geneva is necessary. The two hours lectures on the 22. September, 6. and 13. October have to be attended in Zürich via conference call (ETH HG D 16.2). The other lectures during the semester can be attended via Skype.

To get the 3 ECTS, students have to participate at the 2 days simulation in Geneva, attend the 3 mandatory lecture parts via conference call an Zürich and write a report of 5 pages at the end of the course.

(For technical notice for registration: At this stage all registered students are on the waiting list)

---

### Principles of Macroeconomics

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

**Objective**

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meager in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

The course webpage (to be found at https://moodle-app2.let.ethz.ch/course/view.php?id=2467) contains announcements, course information and lecture slides.

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Students - have a sound understanding of linear and logit regression - know strategies to test causal hypotheses using regression analysis and/or experimental methods - are able to formulate and implement a regression model for a particular policy question and a particular type of data - are able to critically interpret results of applied statistics, in particular, regarding causal inference - are able to critically read and assess published studies on policy evaluation - are able to use the statistical software STATA for data Analysis
WebClass Introductory Course History of Technology

Abstract
WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced to basic theories and practices of the field.

Objective
Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

https://www.tg.ethz.ch/de/programme/

Prerequisites / notice
Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)

Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB

Abstract
This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

Literature

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

The Role of Intellectual Property in Daily Routine: A Practical Introduction

Abstract
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.
In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling this problem in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to:
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the legal/economic differences between proprietary and open approaches to the production and use of digital goods
- explain an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the open source software model to other digital goods (e.g., content, open access)
- transfer the ideas of the free/open source software model to other digital goods (e.g., content, open access)

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. "Digitalization plus Internet" allows for the first time in human kind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparative to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2000.ethz.ch.

More on teach.digisus.info starting from September. Stay tuned.

Objective
851-0591-00L Digital Sustainability in the Knowledge Society W 2 credits 2V M. M. Dapp
Particularly suitable for students of D-INFK, D-ITET, D-MATL, D-MAVT, D-MTEC, D-USYS.

Abstract
How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.

Objective
At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

Content
Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitalization plus Internet» allows for the first time in human kind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

851-0703-00L Introduction to Law W 2 credits 2V O. Streiff Gnonff
Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00), cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL.

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

<td>environmental ethics and will have practised these in small case studies.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

**Lecture notes**

Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfindung. Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

**Literature**

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

**Generel introductions:**

- Marcus Düwell etc. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. Ach et al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

**Prerequisites / notice**

The procedure for accumulating CP will be explained at the start of term.

I expect participants to be motivated and to contribute to discussions, keeping the course interesting and lively.

---

**Course Material**

- Social Intercourse with Current Environmental Risks
  - Marcus Düwell et al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
  - Johann S. Ach et al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

- History Part One: Europe (The Cradle of Modernity, Britain ca. 1789-1939)
  - Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
  - Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

- Business Law
  - Particularly suitable for students of D-ITET, D-MAVT
  - Practical experiences of newly acquired knowledge in case studies (protection of species, climate change, etc.)

- Current Issues in Security Policy
  - Practical experiences of newly acquired knowledge in case studies (protection of species, climate change, etc.)
The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. Thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

Lecture notes
Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle.

Prerequisites / Literature
A reading list will be distributed at the beginning of the semester.

Lecture notes
An online learning platform serves as a supplement to the course.

851-0585-15L Complexity and Global Systems Science

Content
The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

851-0144-20L Philosophical Aspects of Quantum Physics

Content
This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

Abstract
This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.

Objective
Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

Number
851-0144-20L

Title
Philosophical Aspects of Quantum Physics

Abstract
This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

Objective
By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

851-0144-19L Philosophy of Time

Content
This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Abstract
This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at " tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Objective
Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle.

Prerequisites / Literature
An online learning platform serves as a supplement to the course.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

851-0057-69L History of Astronomy

Content
This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at " tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Abstract
Die Veranstaltung ist ausgebucht

Objective
The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle's system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man's place in the cosmos and the philosophical principles underpinning cosmology.

Prerequisites / Literature
A reading list will be distributed at the beginning of the semester.

Lecture notes
An online learning platform serves as a supplement to the course.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

851-0585-04L Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB

Content
This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 674 of 1571
Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further use and unrestricted use.

<td><strong>Abstract</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construe what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Objective</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to probe the different uses of those concepts, their semantic range in terms of historical depth and semantic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue of how values and norms can be embedded in technological objects. This leads us to the third and last complex of topics that focus on current deliberations about possible new ways of existence in the age of the Anthropocene and as a consequence the formation of adequate life styles in our societies. This refers to issues in philosophical and social anthropology and the challenge of climate change.</td>

<td><strong>Abstract</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Objective</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge and culture in a way, which directly contrasts with the traditional understanding of “intellectual property” and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/“free” models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff. After the lecture, you should (hopefully) be able to</td>

<td>Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?» The real problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the use of the PC. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Comparably to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement focuses against treating software code as private property but as a cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)… As a “teaser” to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from <a href="http://www.essays2030.ethz.ch">www.essays2030.ethz.ch</a>. More on teach.digosius.info starting from September. Stay tuned.</td>

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 675 of 1571
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Lecture notes

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Applied reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link 'Registered students, please click here for course materials' at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Milke Hudecheck (Mike Hudecheck <michaelau@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Prerequisites / notice

None

851-0705-02L Environmental Law: Topics and Case Studies

Does not take place this semester.

Number of participants limited to 20.

Prerequisites: Environmental Law: Conceptions and Fields (851-0705-01L) offered in spring semester.

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract

This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

Objective

The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content

At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes

Den Studierenden werden Unterlagen zur juristischen Methoden- und Quellenlehre sowie zum Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature

Rechtsgrundlagen, Literatur und Gerichtsentscheide werden themenspezifisch selber recheckeit, unter Mithilfe und Beratung des Dozenten.

Prerequisites / notice

Die Veranstaltung erfordert die Bereitschaft, sich aktiv und selbständig mit einer selbstgewählten Fragestellung oder einem eigenen Fallbeispiel aus dem Gebiet des Umweltrechts und allenfalls aus Schnittstellengebieten auseinanderzureifen. Damit die Interaktivität und die Begleitung der Teams gewährleistet werden kann, ist die Teilnehmerzahl auf maximal 16 Personen beschränkt. Es handelt sich um eine Vertiefungsveranstaltung. Der Besuch der Vorlesung "Umweltrecht: Konzepte und Rechtsgebiete" (851-0705-01) ist Voraussetzung.

851-0707-00L Space Planning Law and Environment

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract

System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Content

Lecture notes

Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Hänni, Peter, Planungs-, Bau- und besonderes Umweltschutzrecht, 6.A., Bern 2006

851-0724-00L Property Law for Geometers: Land Registry and Geoinformation Law

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract

This workshop presents the legal aspects of land registry law and geoinformation law for geometers. It aims to familiarize students with the legal framework governing land registry and geoinformation in Switzerland. Key topics include the functions, powers, and responsibilities of the land registry office, the principles of registration, and the legal implications of geoinformation.

Objective

The course will provide students with a comprehensive understanding of the legal aspects of land registry and geoinformation, equipping them with the necessary legal knowledge to practice as geometers in Switzerland. Students will learn about the principles of registration, the role of the land registry office, and the legal implications of geoinformation.

Content

The course will cover the legal framework governing land registry and geoinformation in Switzerland, including the functions, powers, and responsibilities of the land registry office. Students will also learn about the principles of registration and the legal implications of geoinformation.

Lecture notes

Material will be provided during the lectures, including slides and reading assignments. Students will also have access to the library resources and online databases related to land registry and geoinformation law.
Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the overview of the legal norms of land registry and surveying law.

Abgegebene Unterlagen: Skript in digitaler Form

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped

Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones? Particularly suitable for students of D-BIOL, D-BSSE, D-USYS

Abstract

Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

Objective

The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of European colonialism overseas. Secondly, students will become familiarized with how old collections can yeald new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a platform to discuss ways of dialogue and possible collaboration between these different approaches.

Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

Environmental Regulation: Law and Policy Does not take place this semester. The course will be offered again in the spring semester 2017.

Number of participants limited to 15.

Abstract

The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

Objective

The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

Content

Topics covered in lectures:

(1) Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools

(2) Law: International, European and national laws
   a. International law
   b. European law
   c. National law

(3) Policy: Case studies

Assessment:

(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

Lecture notes

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English.

Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgestaltung (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).
Developing Countries

Abstract
The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes and actors in environmental politics at the example of specific environmental challenges of global importance.

Objective
After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries' realities
- Analyze the forces, components and processes, which influence the design, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations
- Analyze politics and design approaches to influence them, looking among others at governance, social organization, legal issues and institutions

Content
Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem based management (UBA): Adaptation and mitigation possibilities
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation opportunities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biofuels and food security: Did politics misfire?
- Food security: Policies, causes for insecurity, the role of land grabbing
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Strategy development at global level: IAASTD and World Development Report 2008

Prerequisites / notice
The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

Literature
Griffel, A.; Raumplanungs- und Baurecht in a nutshell, Dike Verlag, Zürich/St. Gallen 2012
Seitz/Zimmermann; Bundesgerichtliche Rechtsprechung zur Waldgesetzgebung. In URP 2009/3
Rausch, H.; Panorama des Umweltrechts - Kompendium der Umweltschutzvorschriften des Bundes, BUWAL-Schriftenreihe Umwelt Nr. 226, 4. A., Bern 2005
Keel/Zimmermann; Bundesgesetzliche Rechtsprechung zur Waldgesetzgebung. In URP 2009/3
Weitere Literaturangaben in den ersten Veranstaltung.

Prerequisites / notice
The course begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Lecture notes
Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle).

Prerequisites / notice
The course begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.
On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

**Content**
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

**Lecture notes**
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenerbau: Ethische Entscheidungsfindung. Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

**Literature**
- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

**Prerequisites / notice**
I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

**701-0731-00L Environmental Behavior in Social Context**

**Abstract**
This introductory class in the environmental social sciences covers topics such as environmental behavior, environmental concern, social dilemmas and social norms.

**Objective**
Basic knowledge of the environmental social sciences

**Content**

Fragen, die uns während des Semesters beschäftigen:
- Wie können es zu Umweltschädiigungen, obwohl niemand diese beabsichtigt?
- Wer verhält sich besonders umweltschonend? Wie wird dies gemessen?
- Welche Rolle spielt das Umweltbewusstsein?
- Welche Rolle spielen äussere Faktoren (Möglichkeiten, Kosten etc.)?
- Wie sehr lassen wir uns dadurch beeinflussen, was andere machen?
- Kooperieren wir nur, wenn auch andere dies tun?

**Literature**

**701-0747-00L Environmental Policy of Switzerland**

**Abstract**
This course presents the basics of policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors and processes are addressed both theoretically as well as by means of current Swiss environmental policy examples.

**Objective**
Beyond acquiring basic knowledge about policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

**Content**
The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. A key aspect is the distinction between politics and political science and specifically environmental policy.

**Lecture notes**
Instead of lecture notes different texts on policy analysis and Swiss environmental policy are made available to the students.

**Literature**
The lecture is based on the following book to be published in the summer of 2016:
B. Nowack W. E. Lieberherr

Number of participants limited to 100.

**701-0791-00L Environmental History - Introduction and Overview**

**Abstract**
Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

**Objective**
Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

**Lecture notes**

**Literature**
Uekötter, Frank (Ed.) 2010. The turning points of environmental history, Pittsburgh: University of Pittsburgh Press.

**Prerequisites / notice**

Students are asked to write an exam during the second last session (11.12.2015).

**701-0985-00L Social Intercourse with Current Environmental Risks**

**Abstract**
The lecture treaties the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.
3 credits
French: Literature (B2-C1)
A.

- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)

Content
- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost-benefit analysis etc.)
- The role of the media
- prospects for future developments

Lecture notes
Copies of slides and selected documents will be distributed

Prerequisites / notice
The lecture is held biweekly (for 2 hours). The dates are 26.9., 3.10. (out of schedule), 24.10, 7.11, 21.11, 5.12, 19.12

Number of participants limited to 20.

Science, Technology, and Policy MSc and MAS in Development and Cooperation have priority.

Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical software Stata.

Objective
Students
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software StATA for data Analysis

Content
The topics covered in the first part of the course are a revision of basic statistics and linear logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

| 851-0816-13L | Practising French in Context ■ | W    | 1 credit | 1G | J.-P. Coen |
| Abstract | This course targets B2/C1 French learners. It is not open to French native speakers. |
| Objective | The main objective of this course is to practice and improve the four language skills of participants (listening, speaking, reading and writing). Students will have to make a presentation in French on a complex subject, interact in a group, defend a point of view and answer to objections. |

| 851-0816-15L | French: Advanced (B2) ■ | W    | 1 credit | 1U | A.-F. Ritter |
| Abstract | This course is intended for students who have reached level B2. Participants will train their skills so that they may perform simple contributions during general debates. |
| Objective | The main emphasis is on spoken skills, with the aim of enabling students to develop their own voice in expressing their views and developing arguments efficiently. The course also nurtures the ability to understand a general meaning in documents concerning aspects of society at large. |

| 851-0816-05L | French: Grammar (B2-C1) ■ | W    | 1 credit | 1U | J.-P. Coen |
| Abstract | With a textual approach this course focuses on some complex topics such as the past tense, indirect speech and the subjunctive. The course does not aim at a systematic revision of grammar. |
| Objective | This course focuses on some complex topics such as the past tense, indirect speech and the subjunctive. The course does not aim at a systematic revision of grammar. |
Le cours a pour objectif principal d'améliorer la maîtrise du français écrit par l'appropriation de règles grammaticales et de règles d'usage qui, sur le plan textuel, assurent au moins en partie la correction des énoncés, et ceci pour quelques chapitres difficiles du français. Il propose une approche descriptive de moyens linguistiques qui permettent d'améliorer la rédaction de textes académiques (compte rendu, synthèse) ou d'écrits administratifs en général (lettre de motivation), ainsi que des exercices ciblés.

Les points étudiés sont notamment les temps du passé, l'ordre des mots dans la phrase, la cohésion textuelle, ainsi que le discours rapporté. Ils sont abordés à l'aide de matériel authentique et sans recours systématique à des exercices de drill.

Le cours présente des activités de repérage des difficultés, de mise en commun des résultats, ainsi que des exercices d'écriture.

**851-0823-00L**

**English Language and Literature Part I (C1-C2)**

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.unizh.ch).

**Abstract**

Bachelor and master students at C1-C2 level. The course enhances students appreciation and understanding of literature in English. Through the analysis and interpretation of literary texts, students improve their analytical and English language skills; their grammar skills through writing; and their range of vocabulary through reading, discussions, and writing.

**Objective**

The aims of the course are to:

* Introduce students to a variety of literary texts in English
* Help students to develop critical, creative, and personal approaches to analyzing literary texts and by extension become more astute readers in general
* Provide students with an opportunity to enhance and practice their argumentation skills in discussions and in writing
* Improve the ways in which students organize their ideas and arguments in a sustained, coherent, and logical manner
* Improve students grammatical and lexical repertoire through reading and discussion
* Impart a life-long interest in literature written in English

**Content**

A variety of texts, including classical and modern poetry, short stories, and one short novel, are analyzed. Classwork is interactive, with pair, small group, and plenary discussions. Writing tasks are designed to help students produce coherent and well-structured texts. Lexical work helps students to increase their range of vocabulary and allow them to apply freshly acquired vocabulary in speaking and writing.

**Lecture notes**

No script

**Literature**

Materials: Texts are available online (Moodle) and as handouts.

**Prerequisites / notice**

Other requirements:

All participants are expected to

* Attend regularly throughout the semester
* Participate actively in discussions, group work, and pair work
* Do at least 3 hours' work a week outside the classroom, including reading and writing
* Complete written assignments during the semester

NB: This is Part I of a two-part course. Part 2 runs in the spring semester. Each part can be taken on its own. However, a separate enrolment is required for each part.

Important note:

The course is only open to students who register on-line via the Sprachenzentrum website during the registration period (review the SZ website) and who receive on-line confirmation that they have been accepted on this course.

**851-0832-11L**

**Advanced English for Academic Purposes (C1-C2)**

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.unizh.ch).

**Abstract**

This course is designed for Bachelor and Master students from all disciplines, who wish to improve their English from C1 towards C2 level and train their language skills at Mastery level. Selected Academic English features are included to add value to the course to meet standard entrance requirements by leading universities and colleges worldwide.

**Objective**

Participants should already have reached a level of C1 (advanced), as defined in the Council of Europe Global Scale. The course is also open to participants whose level is above C1.

The course aims to train and develop linguistic skills at Mastery level, with a focus on formal and informal lexis, on listening and oral communication skills, increasing fluency, accuracy and complexity of spoken language; writing well-structured descriptive texts and argumentative essays, with the aim to fulfill the language requirements for study at an English speaking university or follow University Masters Courses held in English.

**Content**

The course covers: a review of vocabulary building and extension, including the Academic Word List and formulaic language; input on academic reading, writing and listening comprehension; and improvement of grammatical accuracy. Special emphasis is placed on individual speaking, argumentative discourse and group discussions, to enhance fluency and confidence. Where possible, students will be asked to reflect on how the course content relates to their own academic disciplines.

**Lecture notes**

No script. Handouts will be delivered weekly and published on Moodle.

**Literature**

Participants will be expected to make a contribution of CHF 5.00 at the beginning of the course to cover the costs of photocopying.

**Prerequisites / notice**

Participants will be expected to:

* Attend regularly throughout the semester;
* Take part actively in class discussions, group work and pair work;
* Do at least 2 hours' work per week outside class, including reading and writing;
* Use the electronic tools provided;
* Complete a portfolio report of four key tasks, aiming to practice the skills focussed on during the semester.

A language certificate from the Language Center is issued on successful completion of the course; Bachelor and Master students of the ETH will receive D-Gess credits and a mark, awarded electronically at the end of the semester. Details will follow at the beginning of the semester.

The course is only open to students who register on-line via the Sprachenzentrum website (in February 2015, please review the SZ webpage) and who receive on-line confirmation that they have been accepted on this course.

**851-0886-00L**

**New Zealand Through Literature and Film (C1-C2)**

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.unizh.ch).

**Abstract**

The course is designed for Bachelor and Master students from all disciplines who wish to gain an insight into New Zealand culture, history, society, and politics through New Zealand's rich tradition in literature and film while improving their English language skills further towards C2.
The main activity of the course is the visioning of films in Spanish (Spain and Latin America), giving an emphasis on a specific thematic.

Students will learn the discourse used, and issues under consideration, in the analysis and discussion of poetry, prose, and film. They will become aware of various ways of "reading" texts and film, and will improve their skills in planning and writing cohesive essays in which they marshal their views in a convincing and formal manner. Overall, the aims are that students become more discerning readers, improve their skills in expressing their views in written and spoken form clearly and concisely, and gain an understanding of the importance of literature and film to the development of a uniquely New Zealand identity.

The course gives a roughly chronological view of New Zealand's literary heritage, from Maori settlement to the present day, using selected poems, a short novel, short stories, articles, and films. A key focus is the way New Zealanders' notion of their own identity has shifted over the years, as expressed by the country's film-makers and writers working in English, and to a limited degree, in Maori (English translations are provided).

The teacher will provide the script. A fee of CHF 4.00 for photocopies be collected.

The chosen films can be seen / borrowed from the Selbstlernzentrum (http://www.sprachenzentrum.uzh.ch/slz/index.php).

The certificate and ETCS points are granted to the students who have complied with the following requirements:

* Participation in the fortnightly lessons (maximum 1 absence)
* Preparation (glossary and thematics) of one of the chosen films
* Entries in the blog and forum of the course

The certificate and ETCS points are granted to the students who have complied with the following requirements:

* Participation in the weekly lessons (maximum 3 absences)
* A minimum of 2 hours of self study (reading and grammar exercises)
* Presentation of one of the chosen texts
* Passing of a final exam

Other requirements:

* Attend class regularly throughout the semester
* Participate actively in discussions, group work, and pair work
* Do at least 3 hours' work a week outside the classroom, including reading, writing, and watching films
* Work consistently on their portfolio throughout the semester

Important note:
The course is only open to students who register on-line via the Sprachenzentrum website during the registration period (review the SZ website) and who receive on-line confirmation that they have been accepted on this course.

The course aims to approach the Italian language through literature. While reading short stories the participants will deepen their linguistic and syntactic competence as well as their understanding of the Italian culture by means of written exercises and class discussions.

The chosen films can be seen / borrowed from the Selbstlernzentrum (http://www.sprachenzentrum.uzh.ch/siz/index.php).

Important information for ETH students: The enrollment in this course at the Sprachenzentrum does not enrol the student automatically for the granting of the D-GESS points. Please inform yourself.

The course aims to explore the following questions through texts and film to introduce students to New Zealand and, in a broader sense, to raise their awareness of some of the key issues affecting former colonies from early settlement to the present day: What did New Zealand mean to its early settlers? Where did the settlers come from? How did they live? What is the Treaty of Waitangi, and what is its status today? What does it mean to live in multi-cultural New Zealand today?

The most important grammatical topic will be the imperfecto and pluscuamperfecto of subjunctive in subordinate structures. Free and directed discussion will be enhanced. We will read diverse text forms from Spanish and Latin American Authors.

Important information for ETH students: The enrollment in this course at the Sprachenzentrum does not enrol the student automatically for the granting of the D-GESS points. Please inform yourself.

The course deals with everyday topics. Participants practice simple forms of communication as these occur in daily life. Lexical and linguistic structures are taught within these contexts. Intercultural and socio-cultural issues relating to Brazil are also taken into consideration.

Objective
Participants can talk and write about themselves and everyday topics using simple sentences. They can take part in simple daily conversations, understand and write simple messages, describe an event in a time sequence, and express wishes, assumptions, and recommendations.

851-0849-01L Basic Course A2 (Brazilian-Portuguese) W 2 credits 2U P. de Avila Goulart Ribeiro W.

Abstract
This course is designed for participants with a basic knowledge of Portuguese (level A1).

Objective
The students should be able to translate a Greek text on a higher level. They should have a sound knowledge of the Homeric Epos and the Platonic philosophy.

851-0885-09L Modern Greek Language I (A1.1) W 2 credits 2U A. Rassidakis Kastrinidis

Abstract
This course is the first part of a language course which runs over four semesters, covering levels A1 and A2 of the Global European Framework. Modern Greek Language I is designed for students who have no or very little command of Modern Greek and covers level A1.1.

Objective
Practice of oral communication and study of basic vocabulary and grammar; focus on noun and adjective structures, personal and possessive pronouns, active verbs (Present Tense) and the use of adverbs. Initiation to web-based activities in Greek and enhancement of interest and activities in Greek language and culture.

Content
- The course book by D. Dimitra & M. Papacheimona, Ellinika tora 1+1 (Greek now 1+1, including 2 audio-CD), units 1-5, Athens 2002, and workbook one. Tetradio Askiosein 1, have been ordered for the course members and are available at "Bücherladen der Stiftung Zentralstelle der Studentenschaft", Schönberggasse 2.
- Web-based activities to support and enhance classroom teaching will be accessible via Moodle, an electronic platform offered by LET of Zentralstelle der Studentenschaft, Schönberggasse 2.
- Additional course materials and handouts will be distributed in class.
- A set of 1400 vocabulary cards for the entire coursebook (Ellinika tora 1+1) is available and can be ordered at the beginning of the semester.

This is Part III of the Modern Greek language course, running over four semesters. Modern Greek III covers level A2.1 of the Global European Framework and is designed for students who have already attended courses I and II at the Sprachenzentrum UNI/ETHZ, or whose language proficiency is equivalent to level A1.2.

Objective
Extensive vocabulary work (approx. 400 new words); reading of elementary texts; additional practice through speaking only Greek in class; improving listening comprehension; writing short essays (about the past and the future, describing events and personal experience).

Grammar work will focus on verbs (simple past, simple future, subjunctive and imperative; active and passive voice).

Content
Challenging everyday situations; discussion of specific topics (eg. describing pictures and photographs, talking about daily chores); elementary listening comprehension practice (dialogues, talking about events, advertisements); reading comprehension (advertisements, cooking recipes, poems).

Literature
- Audio-visual materials and handouts (photocopies) will be used. Photocopies will be distributed during the semester.
- Web-based activities can be accessed via Moodle platform, supported by LET of ETHZ (http://moodle.let.ethz.ch).

Prerequisites
All course participants are expected to attend regularly and participate actively in class do at least 3 hours' work at home take part actively in online-activities in the Moodle-LET online-classroom submit their written work for correction (Semester-Portfolio) pass the semester-test

All participants who fulfill the course requirements will receive a language certificate, issued by the Language Center, awarding 2 ECTS credits.

D-GESS students will receive on-line credit points and marks, in addition to the LC-certificate.

The course is only open to students who register on-line via the Sprachenzentrum-website and who receive online-confirmation that they have been accepted on this course. Please note the limited online-registration period! More Information concerning the courses on http://www.sprachenzentrum.uzh.ch/index.php

851-0889-00L Swedish I (A1) W 2 credits 2U F. Kreis

Abstract
This is the first of a two part Swedish-course, run over two semesters. The aim of the course is to achieve basic language skills in speaking, listening, reading and writing (Level A1). The focus is based on oral skills.

Objective
The participants learn how to express themselves adequately in different everyday situations. The course provides knowledge on characteristics of Swedish culture and society.

Literature

A printed wordlist and additional material is distributed during the lessons. You will be asked to pay CHF 9.00 to cover the cost of the material.

Prerequisites
Regular attendance (max 3 absences), active participation in class and a minimum of 3 hours work outside class is expected per week.

The course is only open to students who registered online via the Language Center website and who received an e-mail confirmation that they have been accepted in this course.

851-0889-02L Swedish II (A2.1) W 2 credits 2U F. Kreis

Abstract
This course is a direct continuation of the first part of the Swedish-course. Participants should already have reached level A1. The course aims to work on grammar skills, vocabulary and oral as well as writing skills. Furthermore, Swedish pronunciation should be improved (level A2.1).

Objective
The participants learn how to express themselves in a variety of everyday-situations. The course provides knowledge on characteristics of Swedish culture and society.

Literature
We are working with A1+2 Textbok (ISBN 978-91-27-43420-2) and Rivstart A1+2 Övningsbok (ISBN 978-91-27-43421-9); publisher: Natur och Kultur, Stockholm 2014. A printed wordlist and additional material is distributed during the lessons. You will be asked to pay CHF 9.00 to cover the cost of the material.

Prerequisites
Regular attendance (max 3 absences), active participation in class and a minimum of 3 hours work outside class is expected per week.

The course is only open to students who registered online via the Language Center website and who received an e-mail confirmation that they have been accepted in this course.

851-0889-01L Polish I (A 1.1) W 2 credits 2U S. Schaffner

Abstract
This course is the first of a two part Swedish-course, run over two semesters. The aim of the course is to achieve basic language skills in speaking, listening, reading and writing (Level A1). The focus is based on oral skills.

Objective
The participants learn how to express themselves adequately in different everyday situations. The course provides knowledge on characteristics of Swedish culture and society.

Literature

Polish krok po kroku I (Iwona Stempek, Anna Steimach, Sylwia Dawidek, Aneta Szymkiewicz), ISBN 978-83-930731-0-8. mp3 with audio materials, free access to interactive Polish course e.polish.eu
The coursebook will be available at:
Bücherladen und Studentenladen Zentrum, Schönberggasse 2, 8001 Zürich, tel: 044 634 45 23, email: ladenz@zsuz.uzh.ch

The use of of the open-source Learning Management System OLAT will be part of the course.

- a final test assessing the different skills trained.

Requirements for the award of 2 ECTS credits and:
- achievement assessed and documented as successful
- no more than 3 absences

851-0851-00L Russian I (A1.1) W 2 credits 2U D. Henseler

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

This course is an introduction to Russian language (and culture) for beginners (Level A1.1). The course treats both the Cyrillic alphabet and phonetics and develops a basic vocabulary. In two terms the students acquire a basic knowledge of the most important aspects of Russian grammar.

Registration for the course at sprachenzentrum.uzh.ch is obligatory!

The course focuses on grammar, vocabulary, oral communication in easy everyday life situation, and cultural differences.

Working forms: Single, pair, and group work, and plenum.

These are the contents of the course: writing and reading the Russian script; welcoming somebody; saying goodbye; presenting oneself; something; making sales talk; naming dishes and cutlery; making invitations; asking for an explanation of an unknown term; uttering congratulations and wishes; describing one's day; naming activities in the present, the past and the future; talking about one's way to the working place. The course is supported by OLAT.

851-0853-00L Russian III (A2.1) W 2 credits 2U D. Henseler

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

This course is a sequel to the one-year basic course. Students' level should come up to the level of the basic course (two terms, with two lessons per week). In case of doubt please contact the teacher prior to the beginning of the term.

Registration for the course at sprachenzentrum.uzh.ch is obligatory!

The course focuses on speaking, reading comprehension and auding as well as on cultural competence.

Working forms: Single, pair, and group work, and plenum.

These are the contents of the course: talking about food and meals; indicating quantity; saying that one needs something or has to buy something; making sales talk; naming dishes and cutlery; making invitations; asking for an explanation of an unknown term; uttering congratulations and wishes; describing one's day; naming activities in the present, the past and the future; talking about one's way to the working place. The course is supported by the learning platform OLAT.

851-0855-00L Russian V (A2.2+) W 2 credits 2U D. Henseler

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

The course Russian V requires a knowledge which should come up to the level of the four preceding courses (four terms, with two lessons per week). This corresponds to the level A2 of the "European Framework". In case of doubt please contact the teacher prior to the beginning of the term.

Registration for the course at sprachenzentrum.uzh.ch is obligatory!

The course focuses on speaking, reading comprehension and auditing as well as on cultural competences on a A2.2+ level according to the "European Framework".

Working forms: Single, pair, and group work, and plenum.
These are the contents of the course: talking about the weather; naming seasons and months; understanding touristic offers; uttering approval, refusal and indifference; making appointments; talking about holiday plans and arrangements; uttering prohibitions; drawing comparisons; talking about learning; indicating year and date; talking about interests; saying what one is busy with; talking about one's biography; saying what one would like to do; making and asking for recommendations; passing on information; saying how to get to a place; making suggestions. The course is supported by the learning platform OLAT.

851-0861-00L Arabic I (A1.1) ■ 
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course forms the first part (level A1) of a five semesters' Arabic course. Its aim is to acquire a basic competence on the level of speaking, hearing skills, and also reading and writing of the Arabic script.

Objective
The participants are able to show a culturally and linguistically appropriate behavior in common situations of everyday life. They acquire a cultural identity, occupation, place of living, etc.), simple telephone calls, to ask for information, to book a room. We will pay special attention to cultural aspects.

Content
Embedded into communicative situations we will work on the following contents: to greet, to present oneself, to talk about oneself (personal identity, occupation, place of living, etc.), simple telephone calls, to ask for information, to book a room. We will pay special attention to cultural aspects.

Literature

851-0861-03L Following Arabic Massmedia (B1) ■ 
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
Arabic authentic texts or programs from audiovisual media. Introduction into the Arabic media landscape with its peculiarities.

Objective
Participants are able to understand easy authentic texts (reports, news, interviews) of Arabic mass media and discuss them in Arabic. Strategies of textual interpretation, vocabulary building or the use of a grammar will enable students further to develop their own, autonomous approach to Arabic media.

851-0877-00L Chinese I (A1.1) ■ 
Your course registration is only valid with a simultaneous online registration at the language center

W 3 credits 4U A.-L. Achermann
This course is designed for students with a general interest in learning the modern Chinese language or students who are planning to study in China.

The course aims at promoting various everyday communication skills without neglecting their cultural context.

Building on course Chinese II the students will learn to actively master a vocabulary of 300 words. In addition, the course will teach some of the basic grammatical patterns. Exercises in spoken Chinese covering a number of topics are also part of the course-work. The course aims to bring the participants up to level 2 of the new HSK (standardized international Chinese proficiency test).

The course has the following aims: the participants shall acquire an advanced competence in the field of speaking, listening, reading and writing. They will build up a number of key characters, so that 300 words should be actively mastered by the end of the semester.

Exercises in basic grammatical forms shall give a first understanding of modern Chinese syntax. All the lessons will contain a fair share of conversational practice.

Neue erworbene Sprachkompetenzen:
1. Die Fähigkeit, Zahlen und Mengen in der korrekten grammatikalischen Form anzuwenden.
2. Eine eigene Meinung richtig äußern (z.B. Gefühle bewerten können).
3. Nach der Meinung der anderen fragen können.
4. Einen Vorschlag machen können.
5. Zwei Dinge miteinander vergleichen können.
7. Gegenwart, Vergangenheit und Zukunft ausdrücken können.

Vorausgesetzt wird der Besuch der Chinesisch I und II Kurse oder eine äquivalente Sprachkompetenz. Teilnehmende, welche die beiden ersten Kurse nicht besucht haben, werden gebeten, sich mit der Kursleiterin in Verbindung zu setzen.

This course aims to bring the participants up to level 2 of the new HSK (standardized international Chinese proficiency test).

The course has the following aims: the participants shall acquire an advanced competence in the field of speaking, listening, reading and writing. They will build up a number of key characters, so that 300 words should be actively mastered by the end of the semester.

Exercises in basic grammatical forms shall give a first understanding of modern Chinese syntax. All the lessons will contain a fair share of conversational practice.

Neue erworbene Sprachkompetenzen:
1. Die Fähigkeit, Zahlen und Mengen in der korrekten grammatikalischen Form anzuwenden.
2. Eine eigene Meinung richtig äußern (z.B. Gefühle bewerten können).
3. Nach der Meinung der anderen fragen können.
4. Einen Vorschlag machen können.
5. Zwei Dinge miteinander vergleichen können.
7. Gegenwart, Vergangenheit und Zukunft ausdrücken können.

Abstract
The third part of the Norwegian-course aims at a further development of your active and passive language competence. You will finish the textbook and round it off by an individual assignment on a Norwegian theme.
European Global Scale grading: B2 (independent user)

Objective
You will be reading Norwegian literature with ease and discussing various themes both in speech and in writing.

851-0900-02L Norwegian II W 3 credits 2U E. Berg
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
UZH Module Code: 360260

Number of participants limited to 20.
No simultaneous online registration at the language center necessary.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
This course is a continuation of the introductory course and is suited for students with elementary knowledge of Norwegian. By means of various media like articles, music and films, you will also get to know more about Norway.
European Global Scale grading: B1 (independent user)

Objective
The aim of this course is to expand your knowledge of the Norwegian grammar and vocabulary and train your oral and written skills.

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Objective</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning &amp; Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Learning goals include:</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can design and conduct a study that is relevant for answering their research question.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.</td>
<td></td>
<td></td>
<td></td>
<td></td>

Limited number of participants. Please write an email for registration no later than September 1 to: barbara.vettiger@ife.uzh.ch

Simultaneous enrolment in Introductory Internship Geography (651-4219-01L), Practice Lessons for Didactics I an II (651-4219-02L) is compulsory.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
Fundamentals (theory and practice) of specialist subject teaching for high-school geography lessons.

Objective
The course introduces students to the practical side of geography teaching. Participants look into the understanding of this school subject over the course of time and learn:
- how to plan their teaching in the context of the valid curricula, including on an interdisciplinary basis,
- how geographical contents can be implemented in didactic and methodological terms so as to ensure that fundamental competences can be imparted to pupils (knowledge, skills, attitudes), with a view to university studies as well.
- how to foster pupils in such a way that they can think independently in terms of spatial competence and can act in a responsible manner.

Content
Thematic Schwerpunkte
- Einführung in die Theorie der Geografiedidaktik.
- Bildungsauftrag der Geografie an Mittelschulen.
- Interesse der Lernenden am Geografieunterricht.
- Unterrichtsgestaltung und -vorbereitung: Sachanalyse, lernzielorientierte Unterrichtsplanung; Didaktische Analyse; Einführung in die Gestaltung von Lernarrangements.
- Mediendidaktik (Arbeiten mit Bildern und Karten).
- Planung einer Unterrichtseinheit (Struktur - Prozess - Verlauf).

Lernformen
Theoretische Konzepte werden präsentiert und an Beispielen diskutiert. Die Studierenden setzen sich mit Methoden aktiv auseinander (z.B. Lernpuzzle, Fallstudie sowie Sozial-und Aktionsformen) und reflektieren dabei ihre eigenen Schulerfahrungen im Fach.

Lecture notes
Unterlagen werden abgegeben.

Literature
Weitere Literaturangaben auf Liste.

Prerequisites / notice

651-4124-00L Examination Didactics
Prerequisites: Successful completion of Geography Didactics of Geography Teaching I, II, III, IV as well as FV i, ii, III, Introductory Internship and Internship.

Content
Geprüft werden:
Fähigkeit, Geografie-Unterricht mit Bezug zur eigenen Praxis kritisch und unter verschiedenen Blickwinkeln (inhaltlich, methodisch-didaktisch) zu betrachten. Lernarrangements mit Bezug zum heutigen Bildungs- und Schulfachverständnis zu gestalten und kritisch zu hinterfragen sowie deren möglichen/erzielten Wirkungen zu diskutieren und zu begründen; Unterrichtssituationen zu reflektieren und zu evaluieren.

Lecture notes
Unterlagen aus der Fachdidaktischen Ausbildung

Literature
Literaturlisten aus den Fachdidaktiken Geographie I-III

Prerequisites / notice
Die Fachdidaktik-Prüfung ist eine 15 minütige mündliche Prüfung. Sie findet am selben Tag wie die praktische Prüfung (2 Prüfungslektionen plus Kolloquium) statt.

651-4120-00L Geography Didactics IV: Mentored Project
Prerequisites: successful participation in Geography Didactics of Geography Teaching I+II+III (651-4239-00L, 651-2500-00L and 651-4118-00L).

Abstract
Mentorierte Arbeit mit Bezug zur Fachdidaktik

Objective
selbständige, theoriegestützte Auseinandersetzung mit konkreter, praxisbezogener Fragestellung zum Geografieunterricht.

Content
selbständige, mentorierte Arbeit zu einem Thema aus der Fachdidaktik mit direktem Bezug zur Lehrpraxis im Fach Geografie (z.B. zu eigenen Übungslektionen oder Praktikum oder zur Unterrichtsforschung). Das Thema wird zu Beginn mit der Mentorin/ dem Mentor festgelegt.

Prerequisites / notice
Frühestens parallel zum Fachdidaktik- Modul III zu belegen (Pflicht für ETH-Studierende)

651-4118-00L Geography Didactics of Geography Teaching III (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
UZH Module Code: 090GG3

Limited number of participants.
Prerequisites: successful participation in Geography Didactics of Geography Teaching I+II (651-4239-00L and 651-2500-00L).
**Abstract**

The Subject Didactics III course unit comprises two blocks: one "Specialisation" block with key subjects from courses I and II and a block on "Information technology in geography teaching" with specific applications.

**Objective**

In Subject Didactics III, students take a more in-depth, application-oriented look at geography. Students - learn about the options for using ICT to design their geography teaching and also the integral furtherance of pupils' IT competence. They plan an IT lesson, hold it and then evaluate it. - identify the opportunities and limits of illustrating their geography teaching with films, models and experiments. - look into the significance of the subjective theories for learning success and failure and discuss tuition options for a concept change (geographical case studies).

**Content**

- Fachdidaktik III Block "Vertiefung" (1/2 Semester)
  - Planung von Unterrichtseinheiten.

- Fachdidaktik III Block "ICT im Geografieunterricht" (1/2 Semester)
  - Fachspezifische Einsatzmöglichkeiten, Unterrichtshilfen, konkrete Anwendungen und Resultate an Beispielen kritisch reflektieren. (Leistungsnachweis).

**Lecture notes**

Theoretical concepts are presented and illustrated by typical examples from practice. Examples in the IT area are created by students themselves ("Workshop"), presented and discussed.

**Literature**

Weitere Literaturangaben.

**Prerequisites / notice**

Fachdidaktik III kann im Frühlingsemester parallel zu Fachdidaktik II besucht werden, aber erst nach Fachdidaktik I.

</table>
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel 14 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie spätestens 2 Tage vor der Prüfung (bis 18 Uhr) den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriterienbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines Kolloquiums (15 min).

Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Bitte bei der Prüfungsanmeldung den schriftlichen Nachweis erbringen, dass die ganze Ausbildung abgeschlossen ist.

**651-4137-00L**  
**Semester Paper within the Teaching Internship Geography (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code**: 090BPPJ

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Only for Geography Teaching Diploma.

Simultaneous enrolment in "Teaching Internship Geography" (651-2517-00L) is compulsory.

**Abstract**  
In the context of their teaching practice, students compile a portfolio in which they analyse and document selected aspects of their teaching experience.

**Objective**  
The provision of insight into their personal, selected and also theoretically-founded:
- study of tuition elements and the compilation of a personal method profile based on subject-didactics assignments.
- processing of key events/happenings experienced during their teaching or teaching practice period (e.g. specialist content; didactic planning; conducting teaching; interaction with the class or individual pupils; communication with the teacher responsible for the teaching practice) in line with the instructions and the advice given in the guide for practical professional training (IGB UZH).

**Content**  
- Erstellen eines Portfolios zum Praktikumsjournal (6-8 Seiten) und den dazu gehörenden Dokumenten (z.B. einem Beobachtungsprotokoll; einer Unterrichtsplandokumentation; Lernaufgaben; einer Prüfung)
- Vorgängige Überlegungen (Problemstellung bzw. Vorbereitung einzelner Lektionen) werden schriftlich dokumentiert sowie die Erfahrungen reflektiert, die bei der Umsetzung und Durchführung des Unterrichts gemacht wurden.
- Im Praktikumsjournal sollen fachwissenschaftliche Aspekte, allgemein- und fachdidaktische Überlegungen, fachlich-pädagogische und didaktische Aspekte sowie konkrete Erfahrungen aus dem Praktikum einbezogen und angemessen miteinander in Verbindung gebracht werden.
- Die Art der Darstellung des Portfolios wird durch die Studierenden bestimmt.
- Der Hauptteil des Praktikumsjournals umfasst ca. sechs bis acht Seiten.
- Formal muss die Praktikumsjournal der Struktur einer wissenschaftlichen Arbeit entsprechen (Titelblatt, Inhaltsverzeichnis, Hauptteil, Schlusswort, Literatur- und Materialienangaben).

**Lecture notes**  
Erledigung für das Unterrichtspraktikum und die unterrichtspraktischen Übungen:
- Merkblatt Praktikumsjournal IEE LLBM
- Aufgabenstellungen für die berufspraktische Ausbildung der Fachdidaktik Geografie.

**Literature**  

**Literaturlisten aus der Fachdidaktik und den Erziehungswissenschaften**: je nach den bearbeiteten Problem- oder Fragestellungen.

**Prerequisites / notice**  
Das Journal muss bei der Schlussbesprechung des Praktikums vorliegen. Es wird von der Praktikumslehrperson kontrolliert, visiert und geprüft.

Das Portfolios kann auch Gegenstand der fachdidaktischen Prüfung sein.

Autumn Semester 2016  
Page 693 of 1571
Current approaches to research which are of relevance to society are presented on the basis of examples and critically examined in respect of their significance for a high-school education in the subject of geography.

**Objective**

Students

- look at the subject knowledge in its full breadth, on the basis of current approaches to research and with the consideration of specific examples, thereby creating a specialised basis on which to critically examine specialist contents for the school subject of geography, as part of a general education, over the course of time.

- see whether and where current topics from the specialist subject (research) can be incorporated in secondary-school tuition.
- familiarise themselves with questions and forms of cognition-oriented, moderately constructivist tuition.
- can reflect on geography teaching in an aware and theory-based manner.

**Content**

Vorlesung:

In jeweils in sich geschlossenen Vorlesungen beleuchten Dozierende die gesellschaftliche Relevanz ihrer aktuellen Forschungsansätze an konkreten Beispielen aus der Physischen Geografie und den Erdwissenschaften, der Humangeografie sowie der Methodischen Geografie. Sie thematisieren dabei die Bedeutung der Ansätze für die Gesellschaft zur Auseinandersetzung mit räumlichen Fragestellungen und Problemlösungen und diskutieren die aus ihrem Forschungsansatz und den Ergebnissen resultierenden ethischen Fragen. Sie beleuchten damit die Breite des Fachverständnisses und legen das Fundament für die kritische Auseinandersetzung mit den allgemein bildenden Fachinhalten (Kompetenzen, Fachwissen, Einstellungen), die insbesondere in der gymnasialen Ausbildung im Fach Geographie vermittelt werden sollen.

**Lecture notes**

Zu jeder Vorlesung werden Folien/ Unterlagen abgegeben.

**Literature**

Wird von den jeweils verantwortlichen Dozierenden zusammengestellt.

**Prerequisites / notice**

Es wird sehr empfohlen, dieses Modul parallel zum Unterrichtspraktikum zu besuchen.
Participants conduct a critical examination of regional geography in terms of the understanding of the subject and teaching in schools, and its potential for substantiated tuition is established.

Regional geography observes delimited partial areas, mapped to different scales, considering thematic and exemplary aspects. Regional geography features in this form on a large number of geography syllabuses. Against this background, the module comprises two parts. A specialist lecture on the subject takes a specific regional example to highlight current, interdisciplinary topics and case studies. The aim here is to compile specialist contextual knowledge about a region. In an accompanying seminar, this contextual knowledge is then put in the correct practical form for teaching in a school, thus ensuring that the teachers are in a position to configure regional geography teaching that has been duly reflected on from the specialist-subject, didactic and pedagogical angle.

Fachwissenschaftliche Aspekte werden in der Form einer Vorlesung präsentiert. Die Studierenden vertiefen nach jeder Stunde die Inhalte und setzen diese im Hinblick auf die Schulpraxis um. Dabei wird ein elektronisches Lerntagebuch geführt und über eine Lernplattform über die schulpraktische Umsetzung reflektiert. Es werden auch Materialien zusammengestellt.

Lernformen

Abstract
Participants conduct a critical examination of regional geography in terms of the understanding of the subject and teaching in schools, and its potential for substantiated tuition is established.

Objective
Regional geography observes delimited partial areas, mapped to different scales, considering thematic and exemplary aspects. Regional geography features in this form on a large number of geography syllabuses. Against this background, the module comprises two parts. A specialist lecture on the subject takes a specific regional example to highlight current, interdisciplinary topics and case studies. The aim here is to compile specialist contextual knowledge about a region. In an accompanying seminar, this contextual knowledge is then put in the correct practical form for teaching in a school, thus ensuring that the teachers are in a position to configure regional geography teaching that has been duly reflected on from the specialist-subject, didactic and pedagogical angle.

Content
Vorlesung
- Übersicht über Themen, die für eine Region typisch sind oder sich in einer Region abspielen (z. B. Arabische Halbinsel, Afrika südlich der Sahara, Asien)
- Regionale Fallstudien mit interdisziplinärem Charakter
- Differenzierte Auseinandersetzung mit kulturellen und politischen Fragen und Entwicklungen in einer Region
- Erarbeiten von bedeutenden fachwissenschaftlichen Debatten zu einer Region

Seminar
- Regional-thematische Geografie versus traditionelle Länderkunde
- Geografisches Orientierungswissen: Stellenwert
- Werteerziehung und Interdisziplinarität im regionalgeogra-fischen Kontext
- Didaktische Analyse und Planung regionalgeografischen Unterrichts: Von der Sachanalyse über den Einstieg bis zur Bewertung
- Methoden und Recherche in der Regionalgeografie

Lernformen
Fachwissenschaftliche Aspekte werden in der Form einer Vorlesung präsentiert. Die Studierenden vertiefen nach jeder Stunde die Inhalte und setzen diese im Hinblick auf die Schulpraxis um. Objective
- Sie vertiefen ihre theoretischen, empirischen und methodischen Fähigkeiten in folgenden Themebereichen:  
  - Gesellschaft und Raum  
  - Gesellschaft und Entwicklung  
  - Gesellschaft und natürliche Umwelt/Ressourcen  
  - Offenheit und Geschlossenheit in Wirtschaft und Gesellschaft  
  - Chancen und Herausforderungen einer globalisierten Weltwirtschaft  
- Sie sind in der Lage, Verknüpfungen zwischen grundlegenden sozial- und wirtschaftswissenschaftlichen Theorien und deren Konkretisierung in der Geographie herzustellen.  
- Sie können die erwähnten Themen mit ausgewählte M Faktenwissen  
  - Gesellschaft und Raum  
  - Gesellschaft und Entwicklung  
  - Gesellschaft und natürliche Umwelt/Ressourcen  
  - Offenheit und Geschlossenheit in Wirtschaft und Gesellschaft  
- Sie sind in der Lage, eine Diskussion über wissenschaftliche Themen zu strukturieren und - mit einfachen Moderationstechniken - zu moderieren

Prerequisites / notice
Besuch von GEO122.

Physical Geography III (Geomorphology and Glaciology) (University of Zürich)  
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.  
UZH Module Code: GEO231

Mind the enrolment deadlines at UZH:  
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
Das Modul bietet eine kurze Einführung in einige Komponenten und Prozesse des hydrologischen Kreislaufes. Dabei werden einzelne Wasserspeicher (Schnee-, Boden und Grundwasser) und Flüsse zwischen den Speichern (Verdunstung, Niederschlag und Abfluss) betrachtet. Übungen ergänzen die Vorlesung.

Geography. Matters. (University of Zurich)  
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.  
UZH Module Code: GEO410

Mind the enrolment deadlines at UZH:  
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
The course demonstrates geography's interdisciplinary approach to contribute solving urgent challenges ahead of society. Students are encouraged to reflect on the value of interdisciplinary research at discipline level and on their individual interdisciplinary curricula. The course creates awareness of ways that concepts structure our thinking, and how they figure in research and practice.

Remote Sensing and Geographic Information Science III (University of Zürich)  
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.  
UZH Module Code: GEO233

Mind the enrolment deadlines at UZH:

| 252-0845-00L | Computer Science I | O | 5 credits | 2V+2U | M. Hirt |
| **Abstract** | The course covers the basic concepts of computer programming. |
| **Objective** | Basic understanding of programming concepts. Students will be able to write and read simple programs and to modify existing programs. |
| **Content** | Variablen, Typen, Kontrollanweisungen, Prozeduren und Funktionen, Scoping, Rekursion, dynamische Programmierung, vektorisierte Programmierung, Effizienz. Als Lernsprachen werden Pascal und Matlab verwendet. |

| 101-0031-00L | Systems Engineering | O | 4 credits | 3G | B. T. Adey, C. Richmond |
| **Abstract** | An introduction to system development, analysis and optimization, and decision making, with focus on linear programming, networks, formal decision methods and economic analysis. |
| **Objective** | - to gain competency in methods used to plan and analyse systems - to gain the ability to formulate, analyse and solve complex problems - to gain competency in the methods used for the evaluation of multiple solutions |
| **Content** | - Introduction - System development - System analysis - Networks - Decision theory - Economic analysis - Cost-benefit analysis |
| **Lecture notes** | Script and transparencies as well as additional material via Moodle. The transparencies will be provided via Moodle two days before the respective class. |

| 101-0031-02L | Business Administration | O | 2 credits | 2V | M. Passardi |
| **Abstract** | Remark: Students BSc Civil Engineering (StF2014) are not allowed to assign to 101-0031-02, but have to assign 101-0031-04 in spring semester (2. Sem.). |
| **Objective** | Prepare and analyze the financial statements of organizations Establish budget and determine profitability of investment Understand the major costing systems Perform some product calculations |

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 699 of 1571
Content
Overview in business administration
- Financial Accounting
  - Balance sheet, income statement
  - Accounts, double-entry bookkeeping
  - Year-end closing and financial statements
- Financial Management
  - Financial statement analysis
  - Financial planning
  - Investment decisions
- Management Accounting
  - Full costing and marginal costing
  - Product costing
  - Management decisions

651-0032-00L Geology and Petrography

Abstract
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust.

Objective
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts.

Content

Übungen zum Gesteinsbestimmen und Lesen von geologischen, tektonischen und geotechnischen Karten, einfache Konstruktionen.

Lecture notes
The course is based on the book Dynamic Earth from Press & Siever

Literature
Press, F.; Siever, R.: Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg

701-0243-01L Biology III: Essentials of Ecology

Abstract
This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

Objective
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level.

Content
- Übersicht der aquatischen und terrestrischen Lebensräume mit ihren Bewohnern
- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koeexistenz, Prädatation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflusse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

Lecture notes
Unterlagen, Vorlesungsfolien und relevante Literatur sind in der Lehrdokumentenablage abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

Literature
Generelle Ökologie:

GIS I

Will be distributed module by module
The students acquire enhanced knowledge regarding the operating mode, the application and the limitations of modern geodetic standard
Parameterestimation and Adjustment
To follow shortly; please note the German description.
Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and
Planning I
The lecture introduce into the main-features of spatial planning. Attended will be the themes planning as a national responsibility,
- Earthworks: Area and cubature
- Route planing and transition curves
- Precision leveling
- Trigonometric leveling
- Transformations and Centering
- Trigonometric leveling
- Precision leveling
- Route planing and transition curves
- Earthworks: Area and cubature
The slides and documents for enhanced study and further reading will be provided online.
Introduction to Law for Civil Engineering

Only for Civil Engineering BSc, Environmental Engineering BSc and Spatial Development and Infrastructure Systems MSc

Students who have attended or will attend the lecture *Introduction to Law for Architecture * (851-0703-01L) cannot register for this course unit.

Abstract
This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered.

Objective
Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.

Content
1. Public Law
   - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.

   2. Private law

Lecture notes
There are ‘Lecture Notes’ (in German) for this course.

Literature
Further information is available at http://www.hertig.ethz.ch/education/grundzuege-des-rechts-fuer-baug-und-arch.html

Introduction to Civil Law

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Objective

Content
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Literature
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies.

Sont indispensables:
- le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Bolliod, J.-P.: Manuel de droit, éd Slatkine, Genève

Prerequisites / notice
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

5. Semester

Compulsory Courses 5. Semester

Geodetic Reference Systems
Fundamentals and theory of geodetic reference systems and frames. Introduction to current international systems as well as to systems for the Swiss national geodetic survey.

Content
Various coordinate systems and transformations;
- reference systems and frames (inertial, Earth-fixed, topocentric) and associated transformations between the systems;
- introduction to Earth rotation theory;
- time systems;
- Swiss national geodetic survey

Lecture notes
Script will be provided electronically as pdf file.

Prerequisites / notice
If possible, a field trip to the geodetic fundamental station Zimmerwald (Bern) will be offered.

Higher Geodesy

Content
Advanced topics in geodesy, such as satellite geodesy, GPS, and synthetic aperture radar (SAR) techniques.

Lecture notes
If possible, a field trip to the geodetic fundamental station Zimmerwald (Bern) will be offered.

Geodetic Reference Systems

Abstract
Fundamentals of geoinformation technologies: spatial data modeling, metrics & topology, vector and raster data, thematic data, spatial queries and analysis, spatial databases; labs with GIS software

Objective
Knowing the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

Content
Einführung GIS & GIScience
Konzeptionelles Modell & Datenschema
Vektorgeometrie & Topologie
Rastergeometrie und -algebra
Thematische Daten
Räumliche Abfragen & Analysen
Geodatenbanken

Lecture notes
Vorlesungspräsentationen werden digital zur Verfügung gestellt.

Literature

Examination Block 3

In place of the German course 851-0703-03L Introduction to Law for Civil Engineering students can take the French course 851-0709-00L Droit civil.

Examination Block 4

Introduction to Law for Civil Engineering

Only for Civil Engineering BSc, Environmental Engineering BSc and Spatial Development and Infrastructure Systems MSc

Students who have attended or will attend the lecture "Introduction to Law for Architecture " (851-0703-01L) cannot register for this course unit.

Introduction to Civil Law

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Objective

Content
1. Public Law
   - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.

   2. Private law

Geodetic Reference Systems

Abstract
Fundamentals and theory of geodetic reference systems and frames. Introduction to current international systems as well as to systems for the Swiss national geodetic survey.

Objective
 Provision of fundamental knowledge and theory to get familiar with the applications of geodetic reference systems. Special emphasis will be placed on international global systems as well as on the systems of the Swiss national geodetic survey.

Content
Various coordinate systems and transformations;
- reference systems and frames (inertial, Earth-fixed, topocentric) and associated transformations between the systems;
- introduction to Earth rotation theory;
- time systems;
- Swiss national geodetic survey

Lecture notes
Script will be provided electronically as pdf file.

Prerequisites / notice
If possible, a field trip to the geodetic fundamental station Zimmerwald (Bern) will be offered.

Higher Geodesy

Abstract
Advanced topics in geodesy, such as satellite geodesy, GPS, and synthetic aperture radar (SAR) techniques.

Objective
Knowledge of the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

Content
Einführung GIS & GIScience
Konzeptionelles Modell & Datenschema
Vektorgeometrie & Topologie
Rastergeometrie und -algebra
Thematische Daten
Räumliche Abfragen & Analysen
Geodatenbanken

Lecture notes
Vorlesungspräsentationen werden digital zur Verfügung gestellt.

Literature

Abstract

Objective
Overview over the entire spectrum of Higher Geodesy

Content
Actual methods of Higher Geodesy. Basics of Shape of the Earth: Geoid determination and deflection of the vertical. Introduction into the most important topics: Satellite Geodesy (GPS) and Navigation; Physical Geodesy and gravity field of the Earth; Astronomical Geodesy and Positioning; Mathematical Geodesy and basics of Geodynamics. Reference systems and applications in National and Global Geomatics.

Abstract
First part: Spatial planning on the Commune level with focus on the special land use management
Second part: land re-allocation as an instrument of spatial planning; specific explanations for land re-allocations in rural regions and in construction zones.
Third part: land marketing; the view of investors.

Objective
Getting knowledge in spatial planning and land re-allocation as an interactive process.

Content
PART 1: Spatial Planning and Special Land Use Management
- Overview about Spatial Planning on the commune level
- workflows and planning methods on the commune level
- comprehension of the public
- getting knowledge of the special land use management

PART 2: Methods of Land Re-Allocation
- Intensions and principles of land re-allocation
- implementation of the land re-allocation
- land re-allocation in construction zones
- amelioration

PART 3: Agricultural Planning

Abstract
General introduction to the development, the life cycle and the characteristics of projects. Introduction to, and experience with, the methods and tools to help with the preparation, evaluation, organisation, planning, controlling and completion of projects.

Objective
To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

Content
- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Risk and Quality Management
- Project completion

Lecture notes
Yes

The transparencies will be available for download from the website at least one week before each class.

Copies of all necessary documents will be distributed at appropriate times.

101-0415-01L  Railway Infrastructures (Transportation II) | O | 3 credits | 2G | U. A. Weidmann

Abstract
Fundamentals of railroad technology and interactions between track and vehicles, network development and infrastructure planning, planning of rail infrastructure, planning and design of railway stations, construction and dimensioning of tracks, approval and beginning service on complex infrastructure facilities, special issues of maintenance.

Objective
Teaches the basic principles of public transport network and topology design, geometrical design, dimensioning and construction as well as the maintenance of rail infrastructures. Teaches students to recognize the interactions between the infrastructure design and the production processes. Provides the background for Masters degree study.

Content
(1) Fundamentals: Infrastructures of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks; railway standards and norms. (2) Infrastructure planning: Planning processes and decision levels in network development and infrastructure planning, planning of railway tracks and railway topologies; planning of the passenger parts of stations. (3) Infrastructure design: Fundamentals of the layout of a line; track geometry; switches and crossings; design of station platforms. (4) Construction of railway infrastructures: Assembly and evolution of the railway track; elements of the railway track; dimensioning of the track; track stability. (5) Approval and beginning service on complex infrastructure facilities: Definitions and limitations; fundamentals of the legal situation; test and approval processes; processes of putting railway systems into operation. (6) Maintenance of railway infrastructures: Fundamentals of infrastructure maintenance; kinds of deprecations; supervision methods; steps of infrastructure maintenance; estimation of maintenance need; methods to minimize maintenance costs.

Lecture notes
Course notes will be provided in German. Slides are made available some days before each lecture.

Literature
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

103-0245-01L  Thematic Cartography | W | 2 credits | 2G | L. Hurni

Abstract
Thematic map types (focus on quantitative information), analysis of themes and application, base maps, generalisation

Objective
Knowing of most important thematic map types.

Ability to design adequate thematic maps from statistical data.

The students know different GIS-based techniques and methods for analysis of landscape and urban areas as well as GIS-based process models and can implement these for quantifying urban qualities in planning processes.

The students are able to plan, pre-analyse and perform analysis of geodetic networks for practical problems. They are able to understand and develop geodetic software.

The students are able to plan, pre-analyse and perform analysis of geodetic networks for practical problems. They are able to understand and develop geodetic software.

GIS-skills would be advantageous.

Elective Block: Transport
The learning objectives of the course are:

(1) Students must be able to discuss basic principles, problems and approaches in microeconomics. 
(2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. 
(3) Students can contrast different market structures and describe firm and consumer behaviour. 
(4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. 
(5) Students can apply simple mathematical treatment of some basic concepts and can solve utility maximization and cost minimization problems.

The course introduces basic principles, problems and approaches of microeconomics. The learning objectives of the course are: 

The book can also be used for the course 'Principles of Macroeconomics' (Sturm) 
For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book: 

The course introduces basic principles, problems and approaches of microeconomics. The learning objectives of the course are: 

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection. 

Prerequisites / notice 
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

Abstract
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

Objective
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

Content
The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Abstract
Introduction to interactive, semi-automatic and automatic methods for image interpretation; methodological aspects of computer-assisted remote sensing, including semantic image classification and segmentation; detection and extraction of individual objects; estimation of physical parameters.

Objective
Understanding the tasks, problems, and applications of image interpretation; basic introduction of computational methods for image-based classification and parameter estimation (clustering, classification, regression), with focus on remote sensing.

Content
Image (and point-cloud) interpretation tasks: semantic classification (e.g. land-cover mapping), physical parameter estimation (e.g. forest biomass), object extraction (e.g. roads, buildings), visual assistance; Image coding and features; probabilistic inference, generative and discriminative models; clustering and segmentation; continuous parameter estimation, regression; classification and labeling; atmospheric influences in satellite remote sensing;

Literature
G. Bishop: Pattern Recognition and Machine Learning

Prerequisites / notice
basics of probability theory and statistics; basics of image processing; elementary programming skills (Matlab);

103-0137-00L | Engineering Geodesy | O    | 4 credits | 3G    | A. Wieser, E. Serantoni

Abstract
Introduction to Engineering Geodesy: methods, instruments, and applications.

Objective
The students will be introduced to the methods, instruments and applications in Engineering Geodesy with a focus on end-to-end quality assessment, sensor and multi-sensor-systems, setting out, and monitoring of engineering objects. They will be able to acquire enhanced knowledge and fundamental competences in high-precision angle, distance and height measurements. They will be introduced to aspects of interdisciplinary work in particular related to construction processes and civil engineering.

Content
- Introduction: Definition, methods, and tasks
- Planning and realizing geodetic networks
- High precision distance, angle and height measurements
- Sensors and multi-sensor-systems
- Calibration and testing
- Engineering Geodesy in construction above and below ground
- Tunnel surveying
- Building Information Modeling (BIM)
- Deformation monitoring: Models, methods, and applications

Lecture notes
The slides and additional documents will be provided in electronic form.

Literature

Prerequisites / notice
Fundamental knowledge in geodetic metrology (applied geodesy), physical geodesy, reference systems, GNSS and parameter estimation is required for this course. This knowledge can for instance been acquired within the appropriate courses of the bachelor studies in Geomatics and Planning.

103-0267-01L | Photogrammetry and 3D Vision Lab | W    | 3 credits | 2P    | J. D. Wegner

Abstract
The course deals with selected topics of close-range photogrammetry and geometric computer vision, including wide-baseline image matching and reconstruction, dense surface reconstruction, image search and indexing; emphasis is put on reading and self-study and on practical project work, typically in groups.

Objective
The aim of the course is to get to know the methods and practice of close-range photogrammetric reconstruction, and an in-depth understanding of selected topics in modern close-range photogrammetry and computer vision.

Content
This course builds in part on the courses "Photogrammetrie", "Bildverarbeitung" and "Photogrammetrie II" from the Bachelor program. It focusses on the particular challenges of automated close-range photogrammetry.

Lecture notes
Presentation slides, necessary publications and complementary learning materials will be provided through a dedicated course web-site.

Literature
Recommended textbooks:
- T. Luhmann. Nahbereichsphotogrammetrie (also available in English)
- R. Hartley and A. Zisserman. Multi-view geometry in computer vision
- R. Szeliski. Computer Vision

Prerequisites / notice
A recommended prerequisite for taking this course are the Bachelor courses "Photogrammetrie", "Bildverarbeitung" and "Photogrammetrie II". If you have not passed them, please contact the main lecturer of the course before enrolling. The course will include both practical work with commercial software, and programming in Matlab.

103-0767-00L | Engineering Geodesy Lab | W    | 4 credits | 3P    | A. Wieser, R. Mautz

Abstract
Development of concepts and solutions for challenging tasks in Engineering Geodesy using real-world examples

Objective
The students learn to develop, assess and realize concepts and solutions for real-world problems in Engineering Geodesy. They advance the knowledge and skills which they have acquired in relation with geodetic metrology, engineering geodesy. They establish links between these subjects. Particular attention is paid to the selection of appropriate sensors and measurement systems, selection of appropriate measurement and data processing methods, end-to-end quality control, fulfillment of non-technical criteria, and to the documentation of the work.

Content
Actual real-world problems are chosen for this lab depending on the number, background and experience of the students.

In Fall 2016 one of the problems will be a study of the layout of railway tracks associated with changes of a train station, carried out under various technical and legal restrictions.

An additional problem will be chosen in connection with current research projects within the Geosensors and Engineering Geodesy Group. Examples of such problems are:
- high-precision transfer of coordinates and orientation through a long vertical shaft
- monitoring of the deformation of an ice-palace
- development of a 2D-machine-control-and guidance system
- bridge vibration monitoring
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation. At the end of the course the student has the understanding of:
1. SAR basics and principles, 2. SAR polarimetry, 3. SAR interferometry and 4. environmental parameter estimation from multi-parametric SAR data.

The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

If the timetable of the participants allows it, the 3-hourly lab units will partially be combined to individual full-time units.

### Literature

---

**Project Parameter Estimation**

**W** 3 credits 3P  A. Wieser, J. A. Butt

**Abstract**

Solving engineering problems with modern methods of parameter estimation for network adjustment in a real-world scenario; choosing adequate mathematical models, suitable data-flow and performing software analysis of the given problem, selection of effective mathematical models, use of appropriate software.

**Objective**

Learn to solve engineering problems with modern methods of parameter estimation in a real-world scenario.

**Content**

Assignment of tasks; selected documentation

**Lecture notes / notice**

Prerequisite: Statistics and Probability Theory, Geoprocessing and Parameter estimation, Geodetic Reference Systems and Networks

---

**Basics and Principles of Radar Remote Sensing for Environmental Applications**

**W** 3 credits 2G  I. Hajnsek

**Abstract**

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

**Objective**

The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of:
1. SAR basics and principles, 2. SAR polarimetry, 3. SAR interferometry and 4. environmental parameter estimation from multi-parametric SAR data.

**Content**

The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

**Lecture notes / notice**

Handouts for each topic will be provided

---

**Property Law for Geometers: Land Registry and Geoinformation Law**

**W** 2 credits 2V  M. Huser

**Abstract**

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

**Objective**

Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

**Content**

Overview of the legal norms of land registry and surveying law.

**Lecture notes / notice**

Abgegebene Unterlagen: Skript in digitaler Form

**Literature**

- Meinrad Huser, Datenschutz bei Geodaten

**Prerequisites / notice**

Requirements: Property Law (12-722)

---

**Cadastral Systems**

**W** 2 credits 2G  D. M. Steudler

**Abstract**

Nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs).

**Objective**

The students will get an understanding of the nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs). The Swiss cadastral system as well as a range of international approaches both in developed and developing countries will be reviewed.
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5902-00L
Computer Vision
W 6 credits 3V+1U+1A

4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

051-0203-15L
360° - Reality to Virtuality
W 4 credits 4G
Abstract
Basics of 3D-scanning of rooms and bodies, individual scan projects, 3D-visualizations and animations. Working alone and in groups.

Objective
Understanding of 3D-technologies, handling positive and negative spaces, handling hardware and software, processing 3D-data (registering of scans, precision, interconnecting, filtering, visualizations and animations), interpretation of the generated data.

Content
1. Introduction in hardware and software (getting to know technologies and context, administer tests)
2. Project development within the group (idea, concept, target, intention, election of methods, strategies)
3. Project implementation within the group (possible results, videos, pictures, prints, publications, web, blog, forum etc.)
4. Project presentation (exhibition incl. critiques, discussions)

Major in Space Geodesy and Navigation

Number Title Type ECTS Hours Lecturers
103-0187-01L Space Geodesy O 4 credits 3G M. Rothacher
Abstract

Objective
Understanding the major observation techniques in space geodesy as modern methods applied in Earth system monitoring (geometry, rotation and gravity field of the Earth and the atmosphere), in national surveying and navigation.

Content
Overview of GPS, VLBI, Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations. Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters. Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

Lecture notes
Script M. Rothacher "Space Geodesy"

103-0657-01L Signal Processing, Modeling, Inversion
Abstract
Timeseries analysis, orthogonal decomposition, Interpretation of measurements, Parameterestimation and Inversion of analytical and voxel-type models

Objective
Students are able to analyse data in view of specific scientific questions and interpretations. They have basic methodologies at hand to mathematically formulate engineering and scientific problems. Students know terminologies and basic methodologies in order to be able to further study the expert literature.

Content
Timeseries analysis, fourier transformation, DFT, auto- crosscorrelation, ARMA Interpretation of measurements, Parameterestimation and Inversion of analytical and voxel-type models, resolution, uncertainties

Lecture notes
Geoprocessing
Altain Geiger

Prerequisites / notice
Courses corresponding to:
Analysis I+II, Geoprocessing and Parameterestimation, Linear Algebra I

103-0627-00L Astro and Gravity Lab
W 5 credits 4P S. Guillaume
Abstract
Knowledge of up-to-date astro-geodetic methods aiming at the determination of the direction of the local plumb line in terms of astronomical latitude and longitude.

Objective
Knowledge of the astro-geodetic methods aiming at the determination of the direction of the local plumb line in terms of astronomical latitude and longitude.

Content
Earth- and space fixed coordinate systems and their changes in time, basic astronomic calculation procedures, time scales, time keeping, transformations, star catalogues, computation of precise apparent places, relevant methods for the determination of latitude/longitude, CCD technique and astrometry, application of deflections of the vertical as regards the geoid determination.

Lecture notes
div. sources

Additional literature will be distributed during lectures
Prerequisites / notice
The lectures will be given in English in case of need.

Abstract
Solving engineering problems with modern methods of parameter estimation for network adjustment in a real-world scenario; choosing adequate mathematical models, suitable data-flow and performing software.

Objective
Learn to solve engineering problems with modern methods of parameter estimation in a real-world scenario.

Content
Analysis of the given problem, selection of effective mathematical models, use of appropriate software.

Lecture notes
Assignment of tasks; selected documentation.

Prerequisites / notice
Prerequisite: Statistics and Probability Theory, Geoprocessing and Parameter estimation, Geodetic Reference Systems and Networks.

Abstract
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective
The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data.

Content
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes
Handouts for each topic will be provided.

Abstract
Nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs).

Objective
The students will get an understanding of the nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs). The Swiss cadastral system as well as a range of international approaches both in developed and developing countries will be reviewed.

Content
Origins and purposes of cadastral systems
Importance of documentation
Basic concepts of cadastral systems (real estate, legal basis, conceptual principles, property-ownership, property types)
Swiss cadastral system:
- legal basis
- organization
- technical elements
- methods of data acquisition and maintenance
- profession
- quality assurance
Digital revolution, access to data
Benchmarking and evaluation of cadastral systems
International trends, developments and initiatives

103-0258-00L Interoperability of GIS

Abstract
Content: Transform back and forth (geo-)data with same content but different structure.
Themes: System-neutral model-driven approach with reality selection, conceptual modelling, flexible standard formats, 1:1 processors and
semantic transformation.
Tools: Conceptual schema languages UML and INTERLIS, formats ITF, XML, tools ILI-Checker and awk, and for the semantic
transformation UMLT and FME.

Objective
- Explain and apply the model-driven approach based on standards
- Know and use interoperability types
- Know transfer formats and reformat with 1:1 processors
- Explain object-oriented modelling (with graphic and text)
- Know and use communication technologies and OGCI Web services
- UML, EBNF, INTERLIS, ITF, XML, awk, FME
- Know and apply appropriate software tools

Content
Semantic interoperability of GIS is in the main part of this lecture and means to transform back and forth (geo-)data with same content but
different structure. The reduction of the necessary programming amount to a modest minimum is provided by the system-independent
model-driven approach. Its elements reality selection, conceptual modelling, flexible standard formats, 1:1 processors and semantic
transformation are presented and used. As generally useful tools are introduced and applied the conceptual schema languages UML and
INTERLIS, the flexible transfer formats ITF, XML the ILI-Checker, the efficient reformating tool awk and for the semantic transformation
UMLT and FME.

Prerequisites / notice
Condition for participation: Successful bachelor lecture GIS II

103-0778-00L GIS and Geoinformatics Lab

Abstract
Independent study project with (mobile) geoinformation technologies.

Objective
Learn how to work with (mobile) geoinformation technologies (including application design and programming).

Major in Planning

Number Title Type ECTS Hours Lecturers
103-0347-00L Landscape Planning and Environmental Systems ■ O 3 credits 2V A. Grêt-Regamey

Abstract
In the course, methods for the identification and measurement of landscape characteristics, as well as measures and implementation of
landscape planning are taught. Landscape planning is put into the context of the environmental systems (soil, water, air, climate, flora and
fauna) and discussed with regard to socio-political questions of the future.
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To point out basic information about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of existing and foreseeable utilization of space (nature goods and services and landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use the instrument of GIS appropriately in landscape planning.

In this course, the following topics are discussed:
- Definition of the concept of landscape
- Landscape change
- Landscape planning
- Methods, instruments and aims of landscape planning (politics)
- Socio-political questions of the future
- Environmental systems, IUCN Red List, ecological connectivity
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Objectives of the lecture are:
- Reading data from files
- Writing data to files
- Plotting data: histograms, boxplots, scattered plots
- Creating and handling R objects such as matrices, vectors and arrays
- Writing for- and while-loops
- Writing your own functions
- Use of GIS in landscape planning
- Cooperative planning, participation processes, mediation
- Use of GIS in landscape planning
- Use of GIS in landscape planning
- Use of GIS in landscape planning
- Use of GIS in landscape planning

The course will be held in English and no prior knowledge on R is required.

The main focus of the lecture is on site and project development questions in relation to recycling of industrial wasteland. A semester exercise covers a specific major project and serves as the semester grade (project report and presentation).

Objectives of the lecture are:
1) Get knowledge of comprehensive and multifunctional large-scale projects and their problem areas
2) Get deepened knowledge in selected fields (site analysis, market analysis, project development, cooperative planning, participation processes).
3) Practical orientation, insight into occupational fields
4) Independent acquisition and acquisition of theoretical knowledge

The main focus of the lecture is on site and project development questions in relation to recycling of industrial wasteland. Technical presentations, lectured by scientific staff of the division of Planning of Landscape and Urban Systems PLUS as well as well guest referees treat different subjects.

The subjects are:
- Site and market analysis
- Real estate development
- Project development from the perspective of project developers and investors
- Parking and transportation models
- Cooperative planning, participation processes, mediation

The theory is discussed and illustrated at case studies and exercises. Specific large-scale projects that are currently in the development phase will be discussed, for example the area Sihl- Manegg in Zurich (GreenCity) or the area Alter Pilatusmarkt (Niedfeld) Luzern. For one specific industrial wasteland area the students will develop a vision for a possible redevelopment and a new land-use concept, which will be discussed with experts.

The course will be held in English and no prior knowledge on R is required.
Objective

Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation. The concept of sustainable development in spatial planning leads necessarily to an efficient management of the resources, especially regarding the resource land. The basics of this important discipline will be the subject of this lecture, which is therefore organised in three parts:
- Inner development
- Integrated spatial and infrastructure development
- Cross-border issues in spatial development

Content

Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring spatial changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial Design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus Issues - Integrated spatial and infrastructure development

Abstract

In order to solve problems in spatial planning it is necessary to explore actions and to judge them; finally, one has to argue why a certain option should be preferred to others. Assessments of the situation are the basis for the problems to treat. Specific knowledge, represented in an adequate manner, is required.

Objective

The participants know the interdependencies between the assessment of a situation, decision making, knowledge and language. They know the nature of a decision dilemma and maximes, how to deal with it. Especially they learn that the requirement of information for a decision depends upon the preferences of the deciding actor. They are also familiar with difficulties and pitfalls within these contexts and know what can be done against it.

Content

Assessment of the situation, deciding, language and knowledge are the main parts.

Literature

- Cliff, E. Rabe, A. Stritih

Prerequisites / notice

- No remarks.

Lecture notes

A script in German will be provided for the course. The slides are made available.

Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

---

101-0417-02L Theory and Methodology of Spatial Planning W 3 credits 2G M. Nollert

Only for master students, otherwise a special permission by the lecturer is required.

Abstract

In order to solve problems in spatial planning it is necessary to explore actions and to judge them; finally, one has to argue why a certain option should be preferred to others. Assessments of the situation are the basis for the problems to treat. Specific knowledge, represented in an adequate manner, is required.

Objective

The participants know the interdependencies between the assessment of a situation, decision making, knowledge and language. They know the nature of a decision dilemma and maximes, how to deal with it. Especially they learn that the requirement of information for a decision depends upon the preferences of the deciding actor. They are also familiar with difficulties and pitfalls within these contexts and know what can be done against it.

Content

Assessment of the situation, deciding, language and knowledge are the main parts.

Literature

References to technical literature will be included in the course script. An additional list of literature will be given during the course.

Prerequisites / notice

No remarks.

Lecture notes

A script in German will be provided for the course. The slides are made available.

Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

---

101-0417-01L System and Network Planning W 6 credits 4G U. A. Weidmann

Public transports in the context of the transport systems; customer needs in the transport market; service planning processes for regular public transport services; long distance, regional and urban public transport service strategies; access to public transport and the last mile

Objective

Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them.

Content

(1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; urban service offers; regional and local service offers; access to public transport and the last mile.

Lecture notes

A script in German will be provided for the course. The slides are made available.

Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

---

101-0417-00L Transport Planning Methods W 6 credits 4G K. W. Axhausen

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by dividing the forecasting problem into sub-problems.

Objective

- Knowledge of methods and algorithms commonly used in transport planning
- Ability to independently develop a transport model able to solve / answer the given problem / questions
- Understanding of algorithms and their implementations commonly used in transport planning

Content

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

Lecture notes

The slides of the lecture are provided electronically.

---

103-0347-01L Landscape Planning and Environmental Systems (GIS W 3 credits 2U A. Grêt-Regamey, S. Huber, S.-E. Rabe, A. Strith

Abstract

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated.

Objective

To show the importance of ecosystem services.
Analysis and assessment of the complex interactions between landscape elements.
To identify and measure the characteristics of landscape.
Learn how to use the instrument of GIS appropriately in landscape planning.
- Environmental systems, IUCN Red List, ecological connectivity
- Calculating urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning
- Modelling
- Landscape analysis
- Landscape metrics

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on the PLUS website.

Literature
Will be named in the lecture.

Prerequisites / notice
Basic GIS skills are recommended. A brief introduction to GIS will be given in the first exercise.

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

European spatial policy agenda: introduction and basic directives

Governance models:
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives: CODE 24 (Rotterdam-Genoa), Orient/east-Med corridor (Hamburg-Athens), Danube region

The documents for the lecture will be provided at the moodle, https://moodle-app2.let.ethz.ch/course/view.php?id=2298.

Obligatory literature:

Recommended literature:
Goverance models:

Planning models:

EU as a political context:

Territorial cooperation in Europe:

Planning families and cultures:

Planning systems in Europe:

Only for master students, otherwise a special permission by the lecturer is required.

---

**Electives**

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

**Recomended Electives of Bachelor Degree Programme**

Approach with Cost Benefit Analysis in Transport

Abstract
The course presents cost benefit analysis and related evaluation methods in transport and introduces the survey methods used to derive the monetary values of non-market goods.

Objective
Familiarity with the essential methods of project appraisal

Content
Cost-Benefit-Analysis; multi-criteria analysis; European guidelines; stated response methods; travel cost approach and others; Valuation of travel time savings; valuation of traffic safety

Lecture notes
Handouts

Literature

References to technical literature will be included in the course script. An additional list of literature will be given during the course.

101-0449-00L Management, Marketing, Quality 6 credits 4G U. A. Weidmann

Abstract
Does not place take this semester.

Objective
Comprehension of the transport and administrative policy as well as of the regulation of public transport companies. To develop a full understanding of the three important public transport system operations management processes: (1) Business management; (2) Marketing; (3) Quality control. The course will teach essential working techniques in each of these processes.

Content
- (1) Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.
- (2) Business management in public transport enterprises: goals of public transport companies, goals of the business management; management of public transport on the different management levels, business organization. (3) Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action. (4) Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

Lecture notes
Course notes will be provided in German. Slides will be made available.

Literature
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

Prerequisites / notice
Lectures System and Network Planning as well as Systems Dimensioning and Capacity recommended.

363-1065-00L Design Thinking: Human-Centred Solutions to Real World Challenges 5 credits 5G A. Cabello Llamas, F. Rittiner, S. Brusoni, C. Hölscher, M. Meboldt

Abstract
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Objective
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Content
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Prerequisites / notice
Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Seminar Work

Number  Title  Type  ECTS  Hours  Lecturers
103-0817-00L Geomatics Seminar  O  4 credits 2S  M. Rothacher, K. W. Axhausen, A. Geiger, A. Grét-Regamey, L. Hurni, M. Raubal, B. Scholl, U. A. Weidmann, A. Wieser

Abstract
Introduction to general scientific working methods and skills in the core fields of geomatics. It includes a literature study, a review of one of the articles, a presentation and a report about the literature study.
Objective
Learn how to search for literature, how to write a scientific report, how to present scientific results, and how to critically read and review a scientific article

Content
A list of themes for the literature study are made available at the beginning of the semester. A theme can be selected based on a moodle.

Prerequisites / notice
Agreement with one of the responsible Professors is necessary

► Interdisciplinary Project Work

<table>

Abstract
Working on a concrete interdisciplinary task in Geomatics

Objective
Promote independent, structured and scientific work in an interdisciplinary context; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content
The project work is supervised by a professor. Students can choose from different subjects and tasks.

Prerequisites / notice
The project can be carried out in German upon mutual agreement between supervisor and student.

► GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-BAUG.

see GESS Science in Perspective: Type A: Enhancement of Reflection Capability

see GESS Science in Perspective: Language Courses ETH/UZH

► Master’s Thesis

</tbody>
</table>

Abstract
Before starting the Master’s thesis, students must have:
- obtained the Bachelor's degree;
- fulfilled all specified admission conditions, if any;
- acquired at least 90 credits in the Master's programme, including 12 credits in the area of the interdisciplinary project.

Objective
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

► Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

<tr>
<td>103-0115-AAL</td>
<td>Geodetic Metrology II</td>
<td>E</td>
<td>5 credits</td>
<td>4R</td>
<td>A. Wieser</td>
</tr>
</tbody>
</table>

Abstract
Advanced topics in geodetic metrology with focus on instrumental and methodic aspects for applications with higher accuracy demands.

Objective
The students acquire enhanced knowledge regarding the operating mode, the application and the limitations of modern geodetic standard instruments. They will be able to properly select, test and apply these instruments for geodetic tasks with higher accuracy requirements. They will get acquainted with the typical workflow from the preparation of the field works to the digital or plotted plan. Finally, the students will be introduced to specific geodetic tasks related to construction and civil engineering.

Content
- The geomatics workflow
- Propagation of light in the atmosphere
- The modern total station
- Terrestrial Laserscanning
- Digital levels
- Field tests
- Traverses
- Trigonometric leveling
- Precision leveling
- Route planning and transition curves
- Earthworks: Area and cubature

Lecture notes
Slides and documents for enhanced study and further reading will be provided online.

Autumn Semester 2016

Page 717 of 1571
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Overview over the entire spectrum of Higher Geodesy**

**References and other materials will be distributed by the supervisors.**

**Introduction to the most important sensors, operation and calculation methods of Geodetic Metrology**

**Basic theoretical links between transport, space and economic development; basic terminology; measurement and observation of travel behaviour; methods of the four stage approach; cost-benefit analysis.**

**Getting to know the most important sensors, operation and calculation methods of Geodetic Metrology**

**Geodetic instruments and sensors**

**Determination of 3D-coordinates with GNSS, total station and levelling**

**Calculation methods of geodetic metrology**

**Survey and staking-out methods**

**Geodetic instruments and sensors**

**Determination of 3D-coordinates with GNSS, total station and levelling**

**Calculation methods of geodetic metrology**

**Survey and staking-out methods**

**Lecture notes**

Slides and additional material used in the associated regular course Geodätische Messtechnik GZ (in German) are provided in electronic form.

**Literature**

**Prerequisites / notice**

If evidence of equivalent practical experience in surveying cannot be provided by the student, participation in the field course during the respective next available period (i.e. 1 week in the beginning of the summer holidays) is required.

**Transport Planning (Transportation I)**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Abstract**

The lecture course discusses the basic concepts, approaches and methods of transport planning in both their theoretical and practical contexts.

**Objective**

The course introduces the basic theories and methods of transport planning.

**Content**

Basic theoretical links between transport, space and economic development; basic terminology; measurement and observation of travel behaviour; methods of the four stage approach; cost-benefit analysis.

**Literature**

**Cartography I**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Abstract**

Basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.

**Objective**

Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics. Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

**Content**

Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analog and digital map production technology, prepress technology, printing technology, topographic maps, map critics.

**Literature**

none.

**Higher Geodesy**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Abstract**

**Objective**

Overview over the entire spectrum of Higher Geodesy

**Cartography I**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Abstract**

Introduction and basics in mathematics of geometric geo-objects in the three-dimensional space (with exercises).

**Objective**

Basics, structures and processes in modern geovisualisation and computer graphics. Exercises in 2D and 3D computer graphics with software from desktop publishing, GIS, and computer visualisation.

**GIS I**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Abstract**

Fundamentals in geoinformation technologies: database principles, including modeling of spatial information, geographic and semantic models, topology and metrics; practical training with GIS software.

**Objective**

Know the fundamentals in geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.
This course provides basic knowledge on parameter estimation and data processing. The necessary mathematical and statistical methods are developed and are applied to actual examples in geomatics. 2 credits 4R M. Raubal

Advanced course in geoinformation technologies: conceptual and logical modelling of networks, 3D- and 4D-data and spatial processes in geospatial web services into a Spatial Data Infrastructure (SDI).

Students will be able to carry out the following phases of a GIS project: data modelling, mobile data acquisition and analysis, Web publication of data and integration of interoperable geospatial web services into a Spatial Data Infrastructure (SDI).

Students will deepen their knowledge of conceptual and logical modeling by means of the particular requirements of networks as well as 3D- and 4D-data.

The basics of photogrammetry, its products and applications: the principle of image-based measurement; digital aerial cameras and related sensors; projective geometry; mathematical modeling, calibration and orientation of cameras; photogrammetric reconstruction of points and lines, and stereoscopy; orthophoto generation; digital photogrammetric workstations; recording geometry and flight planning.

The students are capable of analysing measurements with appropriate methods. They can optimally extract model parameters from real measurements and are able to analyse and to retrieve additional information from time series. They understand the underlying algorithms of different geodetic analysis tools and processing methods.

103-0254-AAL
Photogrammetry
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. 5 credits 4R J. D. Wegner

Prerequisites / notice
Requirements: knowledge of physics, linear algebra and analytical geometry, calculus, least-squares adjustment and statistics, basic programming skills.

Photogrammetry (slides on the web)

103-0255-AAL
Geodata Analysis
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. 2 credits 4R M. Raubal

The course deals with advanced methods in spatial data analysis.

- Understanding the theoretical principles in spatial data analysis.
- Understanding and using methods for spatial data analysis.
- Detecting common sources of errors in spatial data analysis.
- Advanced practical knowledge in using appropriate GIS-tools.

The course deals with advanced methods in spatial data analysis in theory as well as in practical exercises.

103-0274-AAL
Image Processing
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. 3 credits 2R J. D. Wegner

Understanding core methods and algorithms in image processing and computer vision and the underlying signal processing foundations. Applying image processing algorithms to relevant problems in photogrammetry and remote sensing.
The following topics will be covered in the course:
- Image segmentation
- Properties of digital images
- Signal processing/Sampling
- Image enhancement
- Image restoration: Spatial domain
- Image restoration: Fourier domain
- Color/Demosaicing
- Image compression
- Feature extraction
- Texture analysis

A script will be provided as PDF files on the lecture website.

We suggest the following textbooks for further reading:

Rafael C. Gonzalez, Richard E. Woods
Digital Image Processing
ISBN: 013168728X

Rafael C. Gonzalez, Steven L. Eddins, Richard E. Woods:
Digital Image Processing Using MATLAB
Prentice Hall, 2003
ISBN: 0130085197

The course is accompanied by programming assignments, that need to be completed in order to pass the semester performance.
### 406-0023-AAL

**Physics**

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Basic topics in classical as well as modern physics, interplay between basic research and applications.

**Content**

Electrodynamics, Thermodynamics, Quantum physics, Waves and Oscillations, special relativity

**Literature**

Hans J. Paus, Physik in Experimenten und Beispielen, Carl Hanser Verlag München Wien (als unterrichtsbegleitendes und ergänzendes Lehrbuch)

---

### 406-0141-AAL

**Linear Algebra and Numerical Analysis**

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction to Linear Algebra and Numerical Analysis for Engineers. This reading course is based on chapters from the book "Introduction to Linear Algebra" by Gilbert Strang (SIAM 2009), and "A first Course in Numerical Methods" by U. Ascher and C. Greif (SIAM, 2011).

**Objective**

To acquire basic knowledge of Linear Algebra and some aspects of related numerical methods and the ability to apply basic algorithms to simple problems.

**Content**

- Linear systems of equations: Gaussian elimination, row echelon form, theory about existence and uniqueness of solutions (Strang Ch. 2 and 3.4)
- Mathematical modelling by linear systems (e.g. networks, trusses) (Strang, parts of Ch. 8)
- Column space, null space and rank of matrices (Strang 3.2, 3.3)
- Linear combinations, linear (in)dependence, bases, dimension theorem for matrices (Strang 3.5, 3.6)
- Inner product, orthogonality, length in Euclidean space (Strang 4.1, 4.2)
- Least squares solutions and orthogonalization (Gram-Schmidt and QR) (Strang 4.3, 4.4)
- Linear mappings, matrix representation and change of basis (Strang Ch. 7)
- Determinants and diagonalization of matrices (eigenvalues and eigenvectors) (Strang 6.1, 6.2, 6.5, 6.6)
- Diagonalization applied to linear differential and difference equations. (Strang 6.3)
- Numerical methods for solving linear systems of equations (Ascher/Greif 5.1, MATLAB Documentation of ")
- Interpolation with polynomials and splines (Ascher/Greif Ch. 10 and 11)

**Literature**

---

### 406-0242-AAL

**Analysis II**

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Mathematical tools of an engineer

**Objective**

Mathematics as a tool to solve engineering problems, mathematical formulation of problems in science and engineering. Basic mathematical knowledge of an engineer.

**Content**

**Literature**

- J. Stewart: Multivariable Calculus, Thomson Brooks/Cole
- V. I. Smirnov: A course of higher mathematics. Vol. II. Advanced calculus

### 406-0243-AAL

**Analysis I and II**

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Mathematical tools for the engineer

**Objective**

Mathematics as a tool to solve engineering problems. Mathematical formulation of technical and scientific problems. Basic mathematical knowledge for engineers.

**Content**

**406-0603-AAL** Stochastics (Probability and Statistics)  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

**Content**
From "Statistics for research" (online)
Ch 1: The Role of Statistics  
Ch 2: Populations, Samples, and Probability Distributions  
Ch 3: Binomial Distributions  
Ch 6: Sampling Distribution of Averages  
Ch 7: Normal Distributions  
Ch 8: Student’s t Distribution  
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics  
Ch 2: The R Environment

- **Abstract**: The lecture series are held by all scientific disciplines involved in the HPK-Master programme and are meant to acquaint the students with the different ambitions, methods and techniques of each discipline. Furthermore, the lectures should serve as a “helpdesk” and “workshop” for all theses written within the M.A. programme.

- **Objective**: The interdisciplinary lecture series are exclusively addressed to the students of the HPK-M.A. programme. They provide an insight into all the disciplines which participate in the M.A. programme and their specific demands, approaches, problems and techniques. Subsequent to the lectures, there will be an opportunity to discuss difficulties occurring within the procedures of thesis-writing. The series should provide and secure a substantial, methodological and formal orientation within the disciplines taught in the M.A.-program.

- **Abstract**: Rights in Objects are founded by an inalienable Self-Ownership. These ideas are central for personal rights. We speak of my body, my genes, my name, my portrait, my ideas or ways of expression.

- **Objective**: Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

- **Abstract**: In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature.

- **Objective**: By the end of this lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.

| Content       | Texts by Locke, Nozick, Christian, Otsuka, Rasmussen, Schneider, Stirmer, Fichte and Forschner. Founding of property right in self-ownership (Locke), revival of this concept in Nozick and his egalitarian critics. Critique of the concept of self-ownership related to property in one's body. Looking back to the personal self-relatedness that comes up again in Intellectual Property and in modern personal rights. |

- **Abstract**: Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

| Content       | According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocibernetics and the importance of visualizing the brain and its parts, but it will also include works of art and literature. |

Abstract
Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to a
autonomous philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's
philosophy).

Objective
The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different
philosophies of technology (compensation, objectification, externalisation). For credit point a critical protocol is to be written.

851-0609-06L
Governing the Energy Transition
Number of participants limited to 30.
W 2 credits
2V
T. Schmidt

Abstract
This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-
Economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

Objective
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent
United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the
energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these
challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-
technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying
innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of
political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to
give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in
the discussions (20%) will form one part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

Lecture notes
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Literature
A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

Prerequisites
This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science &
Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH
PhD programmes.

851-0144-19L
Philosophy of Time
Does not take place this semester.
Particularly suitable for students of D-BIOL, D-INFK, D-
MATH, D-PHYS
W 3 credits
2V
N. Sieroka

Abstract
This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of
past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological
counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

Objective
By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time,
historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines -
especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and
evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

"Bollywood and Beyond" - A Cultural History of Indian Cinema in the 20th Century
W 3 credits
2V
H. Fischer-Tiné

Abstract
The Indian film industry has been around for 100 years and is one of the richest and most variegated of the world. The lecture reconstructs
the historical development of Indian cinema and uses it as a lens through which cultural, social and political change in the subcontinent can
be explored.

Objective
The objectives of this course are three-fold. For one, the participants shall learn to question aesthetic certainties and received modes of
perception of cinematographic art. Secondly they will be acquainted with the huge potential of films as a historical source to grasp
processes of social and cultural change. Besides, the reconstruction of the international career of a specific variety of art and entertainment
will also raise important questions of cultural globalisation and consumerism. As a side-effect, a sit were, the students will also be provided
with important insights into the chequered history of the Indian subcontinent in during the course of the 20th century.

Zur Einführung:

VIRDIK, Jyotika, The Cinematic Imagination: Indian Popular Film as Social History, New Brunswick, NJ and London: Rutgers University
The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert's perspective. It aims at a critical reflection on the modern images of mathematics. Moreover, Gödel's theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and order in the history of mathematics. Mathematics started to not only reflect on their own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. This lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics. How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. Mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

Abstract
The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

Objective

Literature

851-0125-05L Development Cooperation from a Biographical Point of View

W 3 credits G. Spuhler

Objective
The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims at a critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

Course Content
The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims at a critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

Literature

In this course we will examine fundamental questions of epistemology, e.g. What is knowledge? How are we to conceive of perception? Which beliefs are rational and justified? How do we acquire knowledge? By discussing a selection of seminal philosophical texts we will study fundamental epistemological theories.

- conceptions of fundamental epistemological concepts
- sensitivity to epistemological questions
- capacity to reflect epistemological theories
- capacity to discuss epistemological theories
- reading philosophical texts (including English texts)

<td>Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>identifying the key points made within the text</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>identifying issues of particular personal interest and resonance</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>considering the impact of the text at the time of publication, and its importance now evaluating the text from the perspective of our current societal and environmental position</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.</td>

This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

851-0301-05L

Beginnings

Number of participants limited to 25

Abstract

"All beginnings are difficult," goes the saying, "but without them there wouldn't be an end." However, what makes beginnings so difficult? What kind of action is that? Which knowledge does it presuppose? And what would a beginning say about the end? We will pursue these questions by reading sacred, philosophical, literary, and scientific texts that, each in its own way, make a beginning.

Objective

- thorough reading and critical analysis of the texts
- reflection upon the conditions and practice of beginnings in terms of their epistemology and rhetorical strategy (i.e. as an intellectual and literary operation)
- consider the cultural and historical function of fictions that tell of origins, such as cosmological myths, foundationalist philosophy, or poetic incantations

Literature

Myths of Creation and First Origins (Genesis und Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wordsworth, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizierte Essays (Konstanz 2013).

Prerequisites / notice

(readings partly in English)

851-0306-05L

Literature and Technology - Simulations, Prototypes, Machines

Abstract

Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature converts not only technology into fiction, but it also creates new cultural and social contextualisations, which reveal alternative readings of configurations of knowledge.

Objective

Students are familiar with different relations between literature and technology. They can verbalise and analyse central contentions.

Content

Im Seminar lesen wir unter anderem Texte von E.T.A. Hoffmann, Franz Kafka, Georg Kaiser und Max Frisch.

851-0551-03L

Postal Knowledge and the History of Digital Societies

Abstract

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture offers problem oriented insights into this sociotechnical process of translation.

Objective

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

Content

Die Vorlesung bietet einen problemorientierten Einblick in diesen sozio technischen Übersetzungsprozess.

851-0157-66L

Who was Sigmund Freud?

Abstract

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.

Objective

30 years ago it would have been bizarre to ask the question: Who was Sigmund Freud? The influence of psychoanalysis on twentieth century thinking was taken for granted even by those ones who rejected Freud's ideas. In contrast, the question today would be: What are Freud’s central theories? We will tackle this question in the seminar and reconstruct Freud's thinking from his early medical writings to those writings, in which he developed a critical view of his time. The aim of the seminar is not only to understand Freud's thinking in historical context, but also to reflect, what it could mean to us in early twentyfirst century.

851-0127-28L

Death - The Secret Problem of Life

Abstract

No detective novel without a corpse, no religion without knowledge about death and life, no large transplantation of an organ without certificate for the donor's death. Is a dead person always a corpse? - Death is part of life and yet stands simultaneously in opposition to it. We cling to life and nonetheless wish to have the option to commit suicide. Do we know what we really want in that case? What kind of action is that? Which knowledge does it presuppose? And what would a beginning say about the end? We will pursue these questions by reading sacred, philosophical, literary, and scientific texts that, each in its own way, make a beginning.

Discussion of 1) several conceptions of death in history, 2) determination of death in a medical sense (brain-death, etc.). 3) The search for a personal view about life and death. 4) The practice of a precise manner of speaking based on reflection.

Leistungsnachweise der Studenten:

- Es besteht Anwesenheitspflicht. Einmaliges Fehlen ist möglich mit Entschuldigung. Als Ersatz die Sitzung wird eine 4-seitige Darstellung

- Ab dem 2. Seminartermin erfolgt im Voraus pro Sitzung (d.h. insgesamt 6mal) eine 2-seitige Darstellung bzw. Stellungnahme zu einem vorgegebenen Text.

- Die 2-seitigen Darstellungen müssen bis Dienstag Abend in der Woche vor der nächsten Sitzung vorliegen, damit wir Zeit haben, sie zu lesen.

- Statt einer der 6 Kurzdarstellungen kann ein einführendes Referat (15 min, max. 2 Personen) gehalten werden.

- MA-Studenten Philosophie und Geschichte des Wissens schreiben zusätzlich einen 5-seitigen Essay zu Michael Theunissen: "Die Gegenwart des Todes im Leben".

- Ihre Texte schicken Sie bitte an die eigens eingerichtete Email-Adresse:

  grundpro@post.ethz.ch

Formal a (Minimalanforderungen):

- Schriftbild: Zeilenabstand 1,5, Schriftgröße 12, Seitenabstand 2,5cm, Schriftart: Arial, Times New Roman.

- Vor- und Nachname, Matrikelnummer, Veranstaltungsnamen, Dozent, E-Mail-Adr., Studiengang.

- organisatorische Rückfragen bitte an den Assistenten Raphael Salvi: raphael.salvi@phil.gess.ethz.ch
Abstract
Should science be free from moral, political or ideological influences? According to the so-called value-free ideal it should. Many scientists think of themselves as committed to truth and objectivity and nothing else. In this seminar, we will track the history of the value-free ideal and engage in a debate about the potential role of so-called non-epistemic values in science.

Objective
In the past decades, philosophers of science have begun to challenge the value-free ideal in science. With the help of recent literature from the philosophy of science, students will be introduced to the debate on values in science and the reasons for why the value-free ideal has come under attack. They will be familiarized with the distinction between epistemic (truth-conducive) values and so-called non-epistemic values. The course aims at enabling students to critically reflect the potential role of non-epistemic values in science.

Creativity
Number of participants limited to 40.

Abstract
Being creative may appear to be the most important requirement of the present age: creative thinking, start-ups, project development all seem to promise an ongoing innovation of work and life. Instead of repeating that promise once again, this course asks for the historical conditions of discourses of creativity.

Objective
We will deal with historical and contemporary theories of inventive imagination, fantasy, and creativity. Looking at artistic, psychological, pedagogical, economic, and entrepreneurial discourses of creativity from the 18th to the 21st century we will discuss their specific contexts in order to uncover historical differences and changes. Is it indeed possible to identify conjunctions between the economicization, scientification and normalization of creativity? Are there any alternatives to the reigning paradigm of creativity? And if so, what are those?

Prerequisites / notice
Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 729 of 1571
This colloquium is devoted to the introduction into the theory and practice of scientific work. The learning target is the development of a problem oriented differentiation of arguments in the history of technology. L. Wingert

Key problems of research projects will be discussed. Participants will learn to know arguments and ideas dealing with systematic problems.

This paper aims at the differentiation of one topic in the current seminar in the history of technology and has to connect its topic with the seminars discussions.

The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research presented topics (approx. 5 pages).

This essay is the outcome of an individual teaching and learning process during several terms and draws upon representative books and articles in history of technology. It has to consider the state of the art in the field.

Writing this essays intents to become acquainted with methods, tools and concepts relevant for the students master thesis.

In the seminars topics from the introductory courses are taught in more detail. Topics for essays are to be arranged with the teachers of the courses.

| 862-0002-16L | Research Colloquium History of Knowledge (HS 2016) ✓ W Only for MAGPW students, D-GESS PHD and D-ARCH 2 credits 1K+1A | A. Kilcher, K. M. Espahangizi, D. Gugerli, M. Hagner, P. Sarasin,
PHD students.

This colloquium is highly recommended for first and second semester MAGPW students.

Abstract

The colloquium of the ZGW focuses on present developments, debates and perspectives in the field of history of knowledge. On the second and fourth date there will be public events in the Cabaret Voltaire.

Objective

The colloquium deals with the general problems, questions and methods of the interdisciplinary research field “The History of Knowledge”. Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is getting more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production, circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only within science but also in relation to art, literature, technology, everyday life, and so on.

Prerequisites / notice

Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Esphahangizi).

Free childcare available.

Abstract

For PhD students and postdoctoral. Masterstudents are welcome.

Objective

PhD students will have an opportunity to improve their presentation skills and obtain an important chance to receive feedback both from peers and more advanced scholars.

862-0004-03L Philosophical Colloquium (HS 2016) W 2 credits 1K L. Wingert

Abstract

Ph.D. students, post docs, members of staff, and senior colleagues from other philosophy departments will report on their work in progress. Furthermore, promising new philosophical articles and parts of new philosophical books will be studied.

Objective

Ideas and arguments dealing with systematic problems especially in epistemology, ethics, political philosophy, and the philosophy of mind will be scrutinized and elaborated.

Master's Thesis

The work on the master-thesis is supervised by one of the teachers that are allowed to offer tutorials for it, named in the Leitfaden.

A student is only permitted to commence the Master thesis if
a. the Bachelor degree programme has been completed
b. any additional requirements for admission to the degree programme have been fulfilled
c. all credits have been acquired in the categories basic courses and major courses and at least 6 credits have been acquired in the category research colloquium

Abstract

The master thesis gives a thorough historical, philological or philosophical analysis of a topic related to the experimental or formal sciences or to technology. It incorporates the relevant research literature on this topic as well as first attempts at original research.

Objective

The master thesis gives a thorough historical, philological or philosophical analysis of a topic related to the experimental or formal sciences or to technology. It incorporates the relevant research literature on this topic as well as first attempts at original research.

</table>
The following topics are covered: modeling and simulations, introduction to programming, visualizing multi-dimensional data, introduction matrices, managing data with lists and tables and with relational databases, universal methods for algorithm design.

Objective

The students learn to:
- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

Content

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

Lecture notes

All materials for the lecture are available at www.gdi.ethz.ch

Prerequisites / notice

This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

376-0003-00L

Introduction to Health Sciences and Technology I

Overview on various aspects of health and disease (health models, classification of diseases, prevention and rehabilitation, therapy, epidemiology); introduction to technical aspects (diagnostics, measurement technique); fundamentals of scientific working (ethics, literature search, study design, data collection, data analysis and data presentation).

Objective

Students should know the terms, models and classification systems used in health and disease; in addition, they should understand the methods of scientific working.

Content

- Health: biomedical model and classification of diseases, salutogenesis and ICF, prevention and rehabilitation, therapy, epidemiology.
- Technology: diagnostics, measurement technology, automatic control engineering.
- Science: ethics, literature search, study design, tests, data analysis, data presentation.

Abstract

Delivery of practical insight into research methods relevant to the field by means of demonstrations and small projects in the areas of Human Movement Science and Sport, Medical Technology, Molecular Health Sciences, and Neurosciences.

Objective

Students can experience research methods that may arise in the field of Health Sciences and Technology.

Content

- Human Movement Science and Sport: movement analysis, biomechanical measurement techniques
- Medical Technology: prostheses
- Molecular Health Sciences: metabolism, behaviour
- Neurosciences: neurological measurement techniques, neurorehabilitation
- Clinical Research

Abstract

The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective

The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes

The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the nethz (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Literature

Prerequisites / notice

Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

Autumn Semester 2016

376-0002-00L Product Design in Medical Engineering  O 4 credits  2V+2U  S. J. Ferguson

Abstract
This course will provide insight into various aspects of medical device design such as patient needs assessment, product specification, research and technical design, validation, regulatory affairs and clinical evaluation.

Objective
The goal of this lecture series is to enable the students to (i) identify the principal functional requirements for a medical device, (ii) to understand the mechanical properties of natural tissues and synthetic biomaterials, (iii) to apply this information and a basic knowledge of mechanics in the calculation of implant performance, (iv) to develop a plan for the pre-clinical evaluation and regulation of a new device.

Content
1. Introduction to Medical Technology
2. Design Process
3. Mechanics
4. Mechanics of Materials
5. Tissue Mechanics
6. Prostheses: Biomechanics and Design
7. Prostheses: Biomaterials, Surfaces and Wear
8. Allografts: Heart Valves
9. Preclinical Evaluation
10. Regulatory Affairs (MepV, FDA, CE)
11. Intellectual Property
12. Group Work and Presentation

Abstract
Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

Objective
Die Studierenden
+ verstehen Mathematik als Sprache zur Modellbildung und als Werkzeug zur Lösung angewandter Probleme in den Naturwissenschaften.
+ können anspruchsvolle Modelle analysieren, Lösungen qualitativ beschreiben oder allenfalls explizit berechnen: diskret/kontinuierlich in Zeit, Ebene und Raum.
+ können Beispiele aus anwendungsrelevanter Mathematik interpretieren und bearbeiten.

Content
### Modellbildung ###
- Einführung und Beispiele
- Mehrdimensionale Modelle
- Pocken-Modell
- SIR-Modell

### Lineare Modelle ###
- Vektorräume
- Diagonalisierbarkeit
- Normalformen
- Exponential einer Matrix
- Lösungsraum eines Linearen DGL-Systems

### Fourier-Reihen ###
- Euklidische Vektorräume
- Orthogonale Projektion
- Anwendungen

### Nichtlineare Modelle ###
- Stationäre Lösungen, Qualitative Aussagen
- Mehdimensionale Modelle: Räuber-Beute, Lotka-Volterra

### Partielle Differentialgleichungen ###
- Einführung, Repetition, Beispiele
- Fourier-Methoden: Wärmeleitung, Laplace, Wellengleichung, Filter, Computertomographie

### Laplace-Transformation ###
- Definition und Notation
- Rechenregeln
- Anwendungsbispiel

Vorlesungen Mathematik II/II

401-0643-13L Statistics II  O 3 credits  2V+1U  M. Kalisch

Abstract
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.
**ECTS**
C. Spengler, R. List, S. Lorenzetti, N. Wenderoth, Lecturers

4V
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. 3G

**Lecturers**
B. Taylor, R. List, S. Lorenzetti
C. Spengler

**Objective**
The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems influencing factors, e.g. genetics, gender, age, altitude/depth, heat/cold, with respect to performance and health.

This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/depth, heat and cold on the named factors.

**Prerequisites / notice**
Prerequisites: Mathematics I & II
Content

History of Exercise Physiology, research methods, fiber type heterogeneity and its functional significance, neural control of muscle force, molecular nad cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

Lecture notes

Online material is provided during the course.

Abstract

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective

This course focuses on the concepts of classical and modern genetics and genomics.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

Scripts and additional material will be provided during the semester.

Abstract

The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
Auxiliary tools:
None. Bring something to write and your student ID

376-1305-01L Structure, Plasticity and Repair of the Nervous System W 3 credits 2V M. Schwab, L. Filli, K. A. Martin, further lecturers
Abstract
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.
Objective
The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.
Content
The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.
Lecture notes ETH students: Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.
Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

**Abstract**

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Objective**

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Content**

A fundamental knowledge of the atomistic and macroscopic concepts of material science.

**Literature**

**Prerequisites / notice**

Two tests are offered for practicing the course material. Participation is mandatory.

**Introduction to Materials Science**

- **Objective**
  - Basic concepts in materials science.
- **Content**
  - Atomic structure
  - Atomic bonds
  - Crystal structure, perfection - imperfection
  - Diffusion
  - Mechanical and thermal properties
  - Phase diagrams
  - Kinetics
  - Structural materials
  - Electric, magnetic and optical properties of materials
  - Materials selection criteria
- **Literature**
  - James F. Shackelford
  - Introduction to Materials Science for Engineers
- **Lecture notes**
  - http://www.multimat.mat.ethz.ch/education/lectures/intro.html

**Laboratory Course in Exercise Physiology**

- **Objective**
  - Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.
- **Content**
  - Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.
- **Literature**
  - Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg
  - Kenney/Wilmore/Costill: Physiology of Sport and Exercise, Human Kinetics
- **Prerequisites / notice**
  - Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)
  - Number of participants limited to 48.

**History of Sports**

- **Objective**
  - Comprehension for development and changes of sports from the ancient world to the presence. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.
- **Content**
- **Literature**
  - Ein Skript für die aktuelle Veranstaltung wird abgegeben.
### 376-1117-00L  
**Sport Psychology**  
**W 2 credits 2V**  
**H. Gubelmann**

**Abstract**
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

**Objective**
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

**Content**
Inhaltliche Schwerpunkte der Vorlesung sind:
- Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
- Bedeutung des Sports im Jugendalter
- Zeitgemäßer Sportunterricht
- Sport und Leistung
- Heterogenität im Sportunterricht
- Sport und Gesundheit
- Geschlechterfragen im Sport
- Soziale und moralische Entwicklung im Sportunterricht

**Lecture notes**
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

### 376-1127-00L  
**Sociology of Sport**  
**W 2 credits 2V**  
**M. Lamprecht**

**Abstract**
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

**Objective**
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

**Content**
- Sport and social change: developments and trends
- The economy and the media: dependencies, consequences, scandals
- Social inequalities and distinctions: gender differences and group behavior
- Conflicts and politics: sports organizations, doping, violence

**Lecture notes**
Unterrichtsmaterialien für die einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

**Literature**

### 376-1155-00L  
**The Musculoskeletal System and Work**  
**W 3 credits 2V**  
**T. Läubli**

**Abstract**
Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

**Objective**
Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

**Content**
- Insights of human movement sciences concerning wear, overtraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insertion tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

**Lecture notes**
Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

**Prerequisites / notice**

### 376-1581-00L  
**Cancer: Fundamentals, Origin and Therapy**  
**W 2 credits 2G**  
**H. Nägeli**

**Abstract**

**Objective**
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions. The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. Phenomenons like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Prerequisites:
- Deimel et al.: Neue aktive Wege in Prävention und Rehabilitation, Deutscher Ärzteverlag, Köln 2007

Abstract:
Training fundiert erklärt, Handbuch der Trainingslehre, Ingold Verlag 2006
Das sportliche Talent, W. Joch, Meyer&Meyer Verlag, 2002
Das neue Konditionstraining, Grosser/Starischka/Zimmermann, blv 2002
Kredit/Prüfung
Für die Kreditvergabe sind die vorgeschriebenen Semesterarbeiten und die Präsenz zwingend. Die Benotung erfolgt durch eine schriftliche Arbeit.
Planung
Die Planungsunterlagen werden zu Semesterbeginn abgegebenen, sind provisorisch und können vom Dozenten geändert werden. Die Praxislektionen werden jeweils am Mittwoch von 13.00 - 15.00 abgehalten. Die Termine werden in Absprache festgelegt.
Die Semesterarbeit ist 4 Wochen nach Semesterende abzugeben.

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 740 of 1571
Practical Basics in Sports and Exercise Therapy

**Objective**
The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

**Prerequisites / notice**
The courses "Introduction in Sports and Exercise Therapy" and has been completed successfully.

**Literature**

**Prerequisites**
Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

Nucleic Acids and Carbohydrates

**Objective**
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

**Prerequisites / notice**
Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

Physical Chemistry I (for Biology and Pharmacy)

**Objective**
Understanding the fundamental thermodynamical properties of chemical and biological systems.

**Prerequisites / notice**
Prerequisite: mathematics I-II, functions of multiple variables, partial derivatives.

Medicinal Chemistry I

**Objective**
Basic understanding of therapeutic agents with respect to molecular, pharmacological and pharmaceutical properties.

**Prerequisites / notice**
Molecular mechanisms of action of drugs. Structure function and biophysical basis of ligand-target interactions will be provided in parts before each individual lecture.
Für jede Vorlesung wird ein Skript abgegeben, das eine Zusammenfassung mit den wichtigsten Stichpunkten beinhaltet.

535-0421-00L Galenical Pharmacy I

**Objective**
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dosage forms.

**Content**
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, stabilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid ophthalmics. Surfactants, micelle formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.

**Literature**
C.-D. Herzfeldt und J. Kreuter (Hrsg.) Grundlagen der Arzneiformenlehre, Springer Verlag, Berlin 1999

535-0521-00L Pharmacology and Toxicology I

**Objective**
The lectures will provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

**Content**
Topics include disease-relevant macroscopic, microscopic, pathbiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drug classes. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

**Literature**

535-0810-00L Gene Technology

**Objective**
The course will provide a solid overview of the science and issues in gene technology and its pharmaceutical applications. The aim of the lecture course is to provide a solid overview of gene technology, with a special focus on drug development. Topics: Antibody phage technology, DNA-encoded chemistry, protein modification technology, genome sequencing, transcriptomics, proteomics, functional genomics, principle of drug discovery. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.
1. Antibody phage technology
- The antibody molecule
- V genes, CDRs, basics of antibody engineering
- Principles of phage display
- Phagemid and phage vectors
- Antibody libraries
- Phage display selection methodologies
- Other phage libraries (peptides, globular proteins, enzymes)
- Alternative screening/selection methodologies
- DNA-encoded chemical libraries

2. Proteins: chemical modification and detection of biomolecular interactions
- Homo- and hetero-dimerization of proteins
- Chemical modifications of proteins
- Antibody-drug conjugates
- Radioactive labeling of proteins
- Kinetic association and dissociation constants
- Affinity constant: definition and its experimental measurement

3. Genomics: Applications to Human Biology
- Protein cloning and expression
- DNA sequencing
- Some foundations of genetic analysis
- Knock-out technologies
- Transcriptomics
- Proteomics
- Recombinant vaccines

4: Pharmaceuticals: Focus on Discovery
- Ligand Discovery
- Half-life extension
- Cancer therapy
- Gene therapy

Lecture notes
- Skript "Gene Technology" by Prof. Dario Neri and slides of the lecture

551-0309-00L Concepts in Modern Genetics
- Abstract: Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.
- Objective: This course focuses on the concepts of classical and modern genetics and genomics.
- Content: The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.
- Lecture notes: Scripts and additional material will be provided during the semester.
- Prerequisites / notice: This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.
Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signalling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1003-00L Methods of Biological Analysis

Abstract

Principles of the most important separation techniques and the interpretation of molecular spectra.

Objective

Knowledge of the necessary basics and the possibilities of application of the relevant spectroscopical and separation methods in analytical chemistry.

Content

Lecture notes

A comprehensive script is available in the HCI-Shop. A summary of the part "Spektroskopie" defines the relevant material for the exam.

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Content Bioinformatics I will cover the following topics:

From genes to databases and information
BLAST searches
Prediction of gene function and regulation
RNA structure prediction
Gene expression analysis using microarrays
Protein sequence and structure databases
WWW for bioinformatics
Protein sequence comparisons
Proteomics and de novo protein sequencing
Protein structure prediction
Cellular and protein interaction networks
Molecular dynamics simulation

Objective

Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycans, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

Prerequisites / notice

Some of the lectures are given in the English language.

Abstract

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Objective

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Objective

Introduction to consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective

Introduction to consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP’s of Food Microbiology
   2. Overview of Microorganisms in Foods
      2.1 Origin of foodborne Microorganisms
      2.2. Bacteria
      2.3. Yeasts
      2.4. Molds
      3. Microbial Spoilage of Foods
      3.1. Intrinsic and Extrinsic Parameters
      3.2. Meats, Seafoods, Eggs
      3.3. Milk and Milk Products
      3.4. Vegetable and Fruit Products
      3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
      3.6. Drinks and Canned Foods
   4. Foodborne Disease
      4.1. Significance and Transmission of Foodborne pathogens
      4.2. Staphylococcus aureus
      4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
      4.4. Listeria monocytogenes
      4.5. Salmonella, Shigella, Escherichia coli
      4.6. Vibrio, Yersinia, Campylobacter
      4.7. Brucella, Mycobacterium
      4.8. Parasites
      4.9. Viruses and Bacteriophages
      4.10. Mycotoxins
      4.11. Bioactive Amines
      4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature

Recommendations will be given in the first lecture.

Content

This course introduces basic concepts of micro- and macronutrient nutrition. Macronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective

To introduce the students to the both macro- and micronutrients in relation to food and metabolism.
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeothesis are emphasized.

Lecture notes: There is no script. Powerpoint presentations will be made available.

752-6301-00L Selected Topics in Physiology Related to Nutrition

W 3 credits 2V W. Langhans

Abstract: Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

Objective: Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

Lecture notes: Handouts for each lecture will be made available every week: http://www.fpb.ethz.ch/teaching/handouts.html

752-6403-00L Leadership I

W 3 credits 2V F. Kernic

Abstract: The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

Objective: To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content: The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes: Lecture slides and required handouts will be available on the ETH website. Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Literature: General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

Prerequisites / notice: The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

853-0033-00L Leadership II

W 3 credits 2V F. Kernic

Abstract: The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

Objective: The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

Prerequisites / notice: The 1-hour written exam will take place during the last lecture in the semester.

Cognitively Activating Instructions in MINT Subjects

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Research Methods in Educational Science

Number of participants limited to 30. This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Enrolment at the earliest possible with the lecture 851-0240-00 "Human Learning"

Abstract
In this course students learn the principles and techniques of teaching singular lessons, based on scientific knowledge about learning. The aim is to plan, realize, evaluate and reflect lessons effectively and efficiently.

Objective
- Students know how to prepare, conduct and reflect a single lesson based on educational requirements.
- Students can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

<table>

The teaching internship can just be visited if all other courses of TC are completed. Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Didactics of Health Sciences and Technology I

Only for Health Sciences and Technology TC students.

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

Abstract
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

Objective
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).
Objective
Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Abstract
The mentored paper is designed to bring together the findings from the FD1 and the FD2. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for a given topic.

Objective
1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

Translational Science for Health and Medicine

**Objective:**
After completing this course, students will be able to understand:
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

**Methods and Concepts in Human Systems**

**Principles of translational science**

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Content:**
What is translational science and what is it not?
How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

**Physical Activities and Health**

**Objective:**
Students gain further knowledge and a deeper understanding of concepts in exercise physiology. Emphasis is put on critical analysis and discussion of scientific publications as well as on improving scientific presentation skills.

**Content:**
- Physical activity assessment
- Physical activity policies
- Population prevalence of physical activity and sedentary behavior
- Physical activity and all cause morbidity and mortality
- Physical activity epidemiology; concepts principles and approaches
- Physical activity and all cause morbidity and mortality
- Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
- Physical activity and brain health
- Physical activity and sedentary behavior recommendations
- Population prevalence of physical activity and sedentary behavior
- Physical activity policies
- Physical activity assessment

**Advanced Topics in Exercise Physiology**

**Objective:**
This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

**Content:**

**Physical Activities and Health**

**Objective:**
Students gain further knowledge and a deeper understanding of concepts in exercise physiology. Emphasis is put on critical analysis and discussion of scientific publications as well as on improving scientific presentation skills.

**Content:**
This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

227-0447-00L Image Analysis and Computer Vision W 6 credits 3V+1U L. Van Gool, O. Göksel, E. Konukoglu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

327-2125-00L Microscopy Training SEM I - Introduction to SEM W 1 credit 3P S. Rodighiero, A. G. Bittermann, K. Kunze, J. Reuteler

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

Abstract
The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists.

Objective
- Set-up, align and operate a SEM successfully and safely.
- Achieve imaging tasks successfully and optimize microscope performances.
- Master the operation of a low-vacuum and field-emission SEM and EDX instrument.
- Perform sample preparation with corresponding techniques and equipment for imaging and analysis.
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs.
- Perform EDX qualitative and semi-quantitative analysis

Content
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) qualitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

- Discussion of students' sample/interest
- Introduction and discussion on Electron Microscopy and instrumentation
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the SEM microscope
- Practice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescans and spectral mapping
- Practice on real-world samples and report results

Literature
- Detailed course manual

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

327-2126-00L Microscopy Training TEM I - Introduction to TEM Does not take place this semester.

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer).

Abstract
The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.
Objective
- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Content
Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.
- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

Literature
- Detailed course manual

Prerequisites /
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0301-00L Work Design and Organizational Change W 3 credits 2G G. Grote

Abstract
Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology-interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.

Objective
- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

Content
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterium
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

Literature
A list of required readings will be provided at the beginning of the course.

Prerequisites /
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0790-00L Technology Entrepreneurship W 2 credits 2V U. Claesson, B. Clarysse

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

Objective
This course provides the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Content
See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

376-0130-00L Laboratory Course in Exercise Physiology W 3 credits 4P C. Spengler

Number of participants limited to 48.

Abstract
Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

Objective
Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.

Content
Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.

Movement and Sport Biomechanics

Abstract
Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective
Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

Exercise Physiology

Abstract
This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interactions of the different systems influencing factors, e.g. genetics, gender, age, altitude/depth, heat/cold, with respect to performance and health.

Objective
The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/depth, heat and cold on the named factors.

Content
History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular and cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

Writing your Master’s Thesis: Natural Sciences and Engineering C1-C2

Abstract
Does not take place this semester. Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Objective
We'll prepare you to produce your MSc thesis. You'll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You'll receive detailed feedback on work in progress.

Content
The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion), and whole texts; presenting and integrating non-textual elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual tasks, pairwork, and groupwork. Active participation is expected.

History of Sports

Abstract
Overview of development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding the development and adaptation of sports from the ancient world to present times.

Sport Pedagogy

Abstract
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

Objective
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.
Fitt's law applied in manipulation tasks

Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research

Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for

Sport and social change: developments and trends

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary

The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how fast sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

The economy and the media: dependencies, consequences, scandals

Social inequalities and distinctions; gender differences and group behavior

Conflicts and politics: sports organizations, doping, violence

Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

A detailed program with additional references will be delivered at the beginning of the lecture.

This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary

Main Topics
- Introduction to sport psychology
- Cognitions in sports; mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sports-injury rehabilitation
- Group dynamics in sport

Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

- Brouchures, checklists, key articles etc. are uploaded in ILIAS
- Further textbooks are introduced in the lecture
- Interaction among consumers, environments, behavior, and tasks
- Human factors and ergonomics in system designs, product development and innovation
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation

### Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

### Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes

Handouts can be accessed online.
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact and a discussion of prevention measures. The lecture provides an introduction to the basic principles of trauma biomechanics. The lecture will cover topics such as accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

**Abstract**  Based on practical examples out of sport, everyday movement and therapy, students use and compare different methods of movement analysis.

**Objective**  Students are able to assess human movement using different methods of movement analysis.

**Content**  During the course students get acquainted with different methods of movement analysis such as: functional, morphological, clinical, mechanical, and others. Based on practical examples, these methods are used and compared. The examples range from sport, everyday movement and therapy, such as hockey, gymnastics, acrobatics, badminton, gait / running and strength training. In the first phase of the class, the different approaches are applied. In the second phase, small teams are working on individual projects. These will be discussed and presented in plenum.

**Lecture notes**  Class material will be distributed using the moodle platform.

Abstract
Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

Objective
- Acquisition of knowledge in the field of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings
- Practising of academic writing in English
- Giving an oral presentation with discussion on the topic of the review paper

Content
Topics are offered in the domains of the major ‘Human Health, Nutrition and Environment’ covering ‘Public Health’, ‘Infectious Diseases’, ‘Nutrition and Health’ and ‘Environment and Health’.

Lecture notes
Guidelines will be handed out in the beginning.

Literature
Literature will be identified based on the topic chosen.

376-0300-00L Translational Science for Health and Medicine

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

Content
- What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

752-6105-00L Epidemiology and Prevention

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module CS16_101 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

Objective
- The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

Content
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

752-6151-00L Public Health Concepts

Abstract
The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.
This course provides a detailed understanding of modern genetic sequencing technology, and algorithms to obtain sequence alignments. Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

- optimization of B cell responses by intelligent design of new vaccines
- development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- overview of cytokines and their effector function
- co-stimulation (signals 1-3)
- dendritic cells
- evolution of the "Danger" concept
- cells expressing pattern recognition receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

- computational biology
- phylogenetic & phylodynamic inference
- maximum likelihood and bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm). GWAS approaches. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

### Objective
At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects

### Content
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

### Lecture notes
Handouts are provided to students in the classroom.

### Prerequisites / notice
Language of the course is english

### Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

### Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

### Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm). GWAS approaches. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. ### Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Publications and class notes can be downloaded from a webpage announced during the lecture.

### Lecture notes

#### 701-1703-00L
**Evolutionary Medicine for Infectious Diseases**

- **Objective**: This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

- **Content**: Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

- **Literature**: Students will read the primary literature on each topic, and in places we will use the following books:
  - Schmid Hempel 2011 *Evolutionary Parasitology*
  - Stearns & Medzhitov 2016 *Evolutionary Medicine*

- **Prerequisites / notice**: A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

- **Number**: 752-4009-00L

- **Title**: Molecular Biology of Foodborne Pathogens

- **Abstract**: The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

- **Objective**: Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

- **Content**: Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimi crobial intervention.

- **Lecture notes / literature**: Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

- **Prerequisites / notice**: Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break!

- **Abstract**: This integration course will discuss new applications of microorganisms with functional properties in food and functional food products. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.

- **Objective**: To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for the consumers. This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.

- **Content**: This course will address selected and current topics on new applications of microorganisms with functional properties in food and functional food products and characterization of functionality and safety of food bacteria. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to the selected topics as follows:
  - Probiotics and Prebiotics: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.
  - Bioprotective Cultures and Antimicrobial Metabolites: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.
  - Legal and Protection Issues Related Functional Foods
  - Industrial Biotechnology of Flavor and Taste Development
  - Safety of Food Starter Cultures and Probiotics

- **Lecture notes / literature**: Students will be required to complete a group project on food products and ingredients with of from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.

- **Abstract**: This is an advanced course that will require significant student participation. Students will learn to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

- **Objective**: Students will learn (i) how to identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

- **Content**: We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 30 minutes) introductory lecture, before students independently research the primary literature and develop half a page of discussion points and questions, followed by interactive discussion in class.

- **Literature**: A list of references will be given at the beginning of the course for the different topics presented during this course.
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

There is no script. Powerpoint presentations will be made available on-line to students.

To be provided by the individual lecturers, at their discretion.

No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

Abstract

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes

There is no script. Powerpoint presentations will be made available on-line to students.

Literature

To be provided by the individual lecturers, at their discretion.

Abstract

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective

The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Objective: The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content: Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes: The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice: The lecture will be taught in English.

---

227-0385-10L Biomedical Imaging

Abstract: Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective: To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound, and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content:
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes: Lecture notes and handouts

Prerequisites / notice: Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

---

227-0391-00L Medical Image Analysis

Abstract: It is the objective of this lecture to introduce the basic concepts used in Medical Image Analysis. In particular the lecture focuses on shape representation schemes, segmentation techniques, and the various image registration methods commonly used in Medical Image Analysis applications.

Objective: This lecture aims to give an overview of the basic concepts of Medical Image Analysis and its application areas. Basic knowledge of computer vision would be helpful.

Prerequisites / notice: This lecture will be taught in English.

---

227-0393-10L Bioelectronics and Biosensors

Abstract: The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

Objective: During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
Supervised exercises solving real-world problems. Some Matlab based exercises in groups.

227-0447-00L Image Analysis and Computer Vision W 6 credits 3V+1U L. Van Gool, O. Göksel, E. Konukoglu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Prerequisites:
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

227-0965-00L Micro and Nano-Tomography of Biological Tissues W 4 credits 3G M. Stamparoni, P. A. Kaestner

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.
This course teaches state-of-the-art methods and models for fMRI data analysis. It covers all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

### 227-0969-00L Methods & Models for fMRI Data Analysis

**Abstract**
This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

**Objective**
To obtain in-depth knowledge of the theoretical foundations of SPM and DCM and of their application to empirical fMRI data.

**Content**
This course teaches state-of-the-art methods and models for fMRI data analysis. It covers all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, frequentist and Bayesian inference, multiple comparison corrections, and event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of studies in psychiatry, neurology and neuroeconomics.

### 327-0505-00L Surfaces, Interfaces and their Applications I

**Abstract**
After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of tribology (friction, lubrication, and wear) and corrosion.

**Objective**
To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems.

**Content**
- Introduction to Surface Science
- Physical Structure of Surfaces
- Surface Forces (static and dynamic)
- Adsorbates on Surfaces
- Surface Thermodynamics and Kinetics
- The Solid-Liquid Interface
- Electron Spectroscopy
- Vibrational Spectroscopy on Surfaces
- Scanning Probe Microscopy
- Introduction to Tribology
- Introduction to Corrosion Science

**Lecture notes**

**Literature**

**Prerequisites / notice**
Chemistry: General undergraduate chemistry including basic chemical kinetics and thermodynamics

Physics: General undergraduate physics including basic theory of diffraction and basic knowledge of crystal structures

---

### 227-1125-00L Microscopy Training SEM I - Introduction to SEM

**Abstract**
The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists.

**Objective**
- Set-up, align and operate a SEM successfully and safely.
- Accomplish imaging tasks successfully and optimize microscope performances.
- Master the operation of a low-vacuum and field-emission SEM and EDX instrument.
- Perform sample preparation with corresponding techniques and equipment for imaging analysis.
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs.
- Perform EDX qualitative and semi-quantitative analysis.

**Content**
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the SEM microscope.
- Practice on beam/specimen interaction, image formation, image contrast and imaging modes.
- Student participation on sample preparation techniques.
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis.
- Perform EDX qualitative and semi-quantitative analysis.
- Practice on real-world samples and report results.

**Literature**
- Detailed course manual.

**Prerequisites / notice**
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

---

### 327-2126-00L Microscopy Training TEM I - Introduction to TEM

**Abstract**
This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) quantitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

**Objective**
- Perform EDX qualitative and semi-quantitative analysis.
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs.
- Perform sample preparation with corresponding techniques and equipment for imaging and analysis.
- Master the operation of a low-vacuum and field-emission SEM and EDX instrument.
- Accomplish imaging tasks successfully and optimize microscope performances.
- Perform sample preparation with corresponding techniques and equipment for imaging analysis.
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs.
- Perform EDX qualitative and semi-quantitative analysis.
- Practice on real-world samples and report results.

**Literature**
- Detailed course manual.

**Prerequisites / notice**
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

---

**Number of participants limited to 6.**

**Does not take place this semester.**

**Does take place this semester.**
The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer).

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

Objective
This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are entrepreneurial understanding.

Content

Literature
- Detailed course manual

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0790-00L Technology Entrepreneurship W 2 credits 2V U. Claesson, B. Clarysse

Abstract
Technology entrepreneurship is the creation and running of new business ventures. This course aims to provide theory-grounded knowledge and practice-driven skills for founding, financing and growing new technology ventures.

Objective

Content
- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Literature
- Detailed course manual

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

376-0815-00L Writing your Master's Thesis: Natural Sciences and Engineering C1-C2 W 2 credits 2V S. Milligan

363-1065-00L Design Thinking: Human-Centred Solutions to Real World Challenges W 5 credits 5G A. Cabello Llamas, F. Rittiner, S. Brusoni, C. Hölscher, M. Meboldt

Abstract
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Information and application: www.sparklabs.ch/ethz

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 769 of 1571
Objective
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Content
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validate them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

Content
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes
All the enrolled students will get a access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

Abstract
Everyday humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Objective
The goal of the lecture is to enable the students to better understand the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brochures, checklists, key articles etc. are uploaded in ILIAS

Abstract
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Literature
Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

376-1279-00L  Virtual Reality in Medicine ■ W 3 credits 2V R. Rienner

**Objective**

Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (auditory, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

**Content**

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components in a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

**Objective**

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

**Content**

Mostly formal lectures (2 × 45 min), with a 2 hour visit and introduction to cleanroom and micro/nanotechnology instruments, last 3 sessions would be dedicated to the presentation and evaluation of projects by students (3 students per team).

Prerequisites / notice
The registration is limited to 26 students.
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.
http://www.relab.ethz.ch/education/courses/phri.html

376-1622-00L Practical Methods in Tissue Engineering W 5 credits 4P K. Würtz-Kozak, M. Zenobi-Wong

Number of participants limited to 12.

The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Practical exercises and demonstrations on topics including sterile cell culture, light microscopy and histology, protein and gene expression analysis, and viability assays are covered. The advantages of 3D cell cultures will be discussed and practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

376-1651-00L Clinical and Movement Biomechanics W 4 credits 3G S. Lorenzetti, R. List, N. Singh

Number of participants limited to 12.

Measurement and modeling of the human movement during daily activities and in a clinical environment.

The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

This course includes study design, measurement techniques, clinical testing, accessing movement data and anaysis as well as modeling with regards to human movement.

376-1985-00L Trauma Biomechanics W 4 credits 2V+1U K.-U. Schmitt, M. H. Muser

Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes
Handouts will be made available.

Literature

376-1974-00L Colloquium in Biomechanics W 2 credits 2K B. Helgason, S. J. Ferguson, R. Müller, J. G. Shedenek, B. Taylor, K. Würtz-Kozak, M. Zenobi-Wong

Current topics in biomechanics presented by speakers from academia and industry.

376-0629-00L Applied Biostatistics W 4 credits 3G M. Müller

Principles and main methods in biostatistics with emphasis on practical aspects. Experimental and observational studies.Regression and analysis of variance. Introduction into survival analysis.

Getting an overview of the problems and statistical methods used in health sciences. Practise in using the software R to analyze data and interpreting the suits.

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 773 of 1571
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, porous 3D microstructures, and the determination of tissue's anisotropies within the human body.

Objective

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

Physics in Medical Research: From Atoms to Cells

402-0674-00L

Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For qualitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

Literature

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

Immunology I

551-0317-00L

Abstract

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Abstract**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to The Clinics.
6. Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

**Abstract**

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Objective**

After completing this course, students will be able to understand:

- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

**Content**

- What is translational science and what is it not?
- How to identify need?
  - Disease concepts and consequences for research
  - Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
  - Outcome variables
  - Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

**Abstract**

The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists.

**Objective**

- Set-up, align and operate a SEM successfully and safely.
- Perform sample preparation with corresponding techniques and equipment for imaging and analysis
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs
- Perform EDX qualitative and semi-quantitative analysis

**Content**

- Discussing students' sample/interest
- Introduction and discussion on Electron Microscopy and instrumentation
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the SEM microscope
- Pratice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, line scans and spectral mapping
- Practice on real-world samples and report results

**Literature**

- Detailed course manual

**Prerequisites / notice**

**Abstract**

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

**Objective**

- Overview of TEM theory, instrumentation, and applications.
- Alignment and operation of a TEM, as well as basic acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

**Content**

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, Image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your

Electronic access to the documentation will be provided. The link can be found at “Lernmaterialien”

Current Topics in Molecular and Cellular Neurobiology

Objective
The course is a literature seminar or “journal club”. Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
By the end of the course students are able to plan, draft, and edit academic English papers and theses; structure and write clear texts in a style which is acceptable to their academic discourse community; manage the writing process efficiently; select formal vocabulary and use it in a generally accurate and correct manner; choose and use generally suitable grammatical structures, punctuation, and orthographic conventions, assess their own effectiveness as writers of academic English, and identify areas in which further development is needed.

Content
The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion), and whole texts; presenting and integrating non-lexical elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual tasks, pairwork, and groupwork. Active participation is expected.

Number of participants limited to 15 (3 courses are available).

Attention: Registration is only possible from 12.9. (from 11.30h) - 15.9.2016

Abstract
We’ll prepare you to produce your MSc thesis. You’ll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You’ll receive detailed feedback on work in progress.

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551- 1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses, - Recognition of pathogenic microorganisms by the host cells and molecular events thereafter;
- - events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- - Optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=2581\&noti\editingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

551-0223-00L Immunology III

Abstract
This course provides a detailed understanding of
- - development of T and B cells
- - the dynamics of a immune response during acute and chronic infection
- - mechanisms of immunopathology
- - modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective
Obtain a detailed understanding of
- - the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- - Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- - events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- - Optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=2581\&noti\editingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

551-0317-00L Immunology I

Abstract
Introduction into structural and functional aspects of the immune system.

Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system.

Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Literature
Electronic access to the documentation will be provided. The link can be found at “Lernmaterialien”

Prerequisites / notice
Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”.

551-0512-00L Current Topics in Molecular and Cellular Neurobiology

Objective
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be made available after the seminars.

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

By the end of this module, each student should be able to:

- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:

- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others
### 551-1145-00L Viral and non-Viral Vectors for Human Gene-Therapy - W from Pathogens to Safe Medical Applications

**Objective**
- Knowledge of important viral and non-viral vector systems.
- Knowledge of application in human diseases.
- Knowledge of limiting factors.

**Prerequisites / notice**
- The course will be given in English. There is no enrolment to this course at ETH Zurich. Get the corresponding module directly at UZH.
- UZH Module Code: BIO709
- Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

**Literature**
- Polybuchhandlung
- Autoren: Berg/Tymoczko/Stryer, 8th edition, Palgrave Macmillan, International edition (the English version will be preordered at the Polybuchhandlung)

**Content**
- Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.
- Knowledge of important viral and non-viral vector systems.
- Knowledge of application in human diseases.
- Knowledge of limiting factors.

**Literature**
- Milestones in Immunology: on old concepts and modern experiments; Y. Barral, A. Oxenius, University lecturers
- Milestones and current topics of innate immunity, antigen presentatino, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunology.

**Lecture notes / handouts**
- Script and original publications will be supplied during the course.

**Abstract**
- Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.

**Prerequisites / notice**
- The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.
- The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advancements. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

**Prerequisites / notice**
- University lecturers

### 551-1153-00L Systems Biology of Metabolism

**Objective**
- Knowledge of important viral and non-viral vector systems.
- Knowledge of application in human diseases.
- Knowledge of limiting factors.

**Prerequisites / notice**
- The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

**Literature**
- Milestones in Immunology: on old concepts and modern experiments; Y. Barral, A. Oxenius, University lecturers

**Content**
- Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.
- Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.
- The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.
- For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Prerequisites / notice**
- The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

### 551-1171-00L Immunology: from Milestones to Current Topics

**Objective**
- Knowledge of important viral and non-viral vector systems.
- Knowledge of application in human diseases.
- Knowledge of limiting factors.

**Prerequisites / notice**
- The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

**Literature**
- Milestones in Immunology: on old concepts and modern experiments; Y. Barral, A. Oxenius, University lecturers

**Content**
- Milestones in Immunology: on old concepts and modern experiments.
- The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advancements. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

**Prerequisites / notice**
- The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

### 551-1303-00L Cellular Biochemistry of Health and Disease

**Objective**
- Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

**Prerequisites / notice**
- The literature will be provided during the course.

### 551-1323-00L Fundamentals of Biology II: Biochemistry and Molecular Biology

**Objective**
- The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

**Lecture notes / handouts**
- none

**Literature**

**Prerequisites / notice**
- Some of the lectures are given in the English language.
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will expand our ability to treat them effectively.

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are: * stochastic models in molecular evolution * phylogenetic & phylodynamic inference * maximum likelihood and Bayesian statistics Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.
After completing this course, students will be able to understand:

- To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

ECTS

- Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective

- Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content

- Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes

- Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Prerequisites / Literature

- Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break!

752-610-00L

- **Molecular Biology of Foodborne Pathogens**

  **Abstract**

  The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

  **Objective**

752-610-00L

- **Dietary Etiologies of Chronic Disease**

  **Abstract**

  To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

  **Objective**

  To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

  **Content**

  - The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

  **Lecture notes**

  - There is no script. Powerpoint presentations will be made available on-line to students.

  **Prerequisites / notice**

  - To be provided by the individual lecturers, at their discretion.

  - No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

752-610-00L

- **Epidemiology and Prevention**

  **Abstract**

  The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

  **Objective**

  - The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware of how epidemiological facts are used in prevention, practice and politics.

  **Content**

  - The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

  **Literature**

  - Stearns & Medzhitov 2016 Evolutionary Medicine
  - Schmid Hempel 2011 Evolutionary Parasitology

  **Prerequisites / notice**

  - A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

  - Students will read the primary literature on each topic, and in places we will use the following books:

    - Translational Science for Health and Medicine, C. Wolfrum
    - Translational Science for Health and Medicine, R. Heusser

  - Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

  - Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break!

  - To be provided by the individual lecturers, at their discretion.

  - No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

**Abstract**

- Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Objective**

- After completing this course, students will be able to understand:

  - Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

**Content**

- What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences
- Positive and negative examples will be illustrated by distinguished guest speakers.

**Electives**

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 781 of 1571
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related approaches.

The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cellular mechanisms, and diseases of the developing NS.

The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

The course covers concepts of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

The course focuses on the concepts of classical and modern genetics and genomics.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

Data: 06.08.2021 13:03  Autumn Semester 2016  Page 782 of 1571
It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. We will read both original papers and explore the conceptual links between them and discuss the ‘sociology’ of science, the pursuit of basic science questions over a century of research.

To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent regulation of blood flow in the brain.

As the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.
Microscopy Training I - Introduction to TEM

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs
- Perform EDX qualitative and semi-quantitative analysis
- Perform X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescans and spectral mapping
- Practice on real-world samples and report results
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on beam/sample interaction techniques for EM
- Brief description and demonstration of the SEM microscope
- Practice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstration on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescans and spectral mapping
- Practice on real-world samples and report results
- Detailed course manual
- No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551- 1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

Microscopy Training SEM I - Introduction to SEM

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists.

- Set-up, align and operate a SEM successfully and safely.
- Accomplish imaging tasks successfully and optimize microscope performances.
- Master the operation of a low-vacuum and field-emission SEM and EDX instrument.
- Perform sample preparation with corresponding techniques and equipment for imaging and analysis
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs
- Perform EDX qualitative and semi-quantitative analysis

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) qualitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

- Discussion of students' sample/interest
- Introduction and discussion on Electron Microscopy and instrumentation
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the SEM microscope
- Practice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstration on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescans and spectral mapping
- Practice on real-world samples and report results
- Detailed course manual
- No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551- 1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

Objective
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

Content
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

Lecture notes
None

Literature
We display articles pertaining to the issues we cover in the class on the course's webpage.

Prerequisites / notice
Since we are all experts on consciousness, we expect active participation and discussions!
Content

Using two Transmission Electron Microscopes the students learn how to align a TEM, perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, Image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

Literature

- Detailed course manual

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

376-0221-00L Methods and Concepts in Human Systems Neuroscience and Motor Control

Number of participants limited to 18

Objective

This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

376-0815-00L Writing your Master's Thesis: Natural Sciences and Engineering C1-C2

Does not take place this semester.

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Number of participants limited to 15 (3 courses are available).

Objective

We'll prepare you to produce your MSc thesis. You'll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You'll receive detailed feedback on work in progress.

376-1177-00L Human Factors I

Objective

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Content

- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being.
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

376-1179-00L Applications of Cybernetics in Ergonomics

Objective

- Physiological, physical, and cognitive factors in sensation and perception
- Psychophysical, physical, and cognitive factors in sensation and perception
- Human factors and ergonomic design
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature

- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students.
- Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

Data: 06.08.2021 13:03
Autumn Semester 2016 Page 785 of 1571
Abstract
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Literature

---

Abstract
Different national and international scientific guests are invited to present and discuss their actual scientific results.

Objective
To exchange scientific knowledge and data and to promote communication and collaborations among researchers.

Content
Different scientific guests working in the field of molecular cognition, neurochemistry, neuromorphology and neurophysiology present their latest scientific results.

Lecture notes
no handout

Literature
no literature

Abstract
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

Objective
The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content
This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://www.relabor.ethz.ch/education/courses/phri/request-ethz-haptic-paddle-hardware-documentation.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes
Will be distributed through the document repository before the lectures.

http://www.relabor.ethz.ch/education/courses/phri.html
Literature

Prerequisites / notice

Notice:
The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.
http://www.relab.ethz.ch/education/courses/phri.html

551-0317-00L

Intensive introductions to structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objectives:
- Introduction of historical and background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Tumors and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- TH1 and TH2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes:
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

551-0319-00L

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objectives:
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Data: 06.08.2021 13:03   Autumn Semester 2016   Page 787 of 1571
Lecture notes: Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biolog.ethz.ch)

Literature: Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice: To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract: The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective: Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content: Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes: Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature: Recommendations will be given in the first lecture.

Prerequisites / notice: Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break !

Abstract: The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

Objective: To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content: The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes: Lecture slides and required handouts will be available on the ETH website.

Literature: Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice: General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

Language: English

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

**Abstract**
Mathematics I covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**
Main focus of Mathematics II: multivariable calculus and partial differential equations.

**Content**
1. Linear Algebra and Complex Numbers:
   - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
   - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Multivariable Differential Calculus:
   - functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.

5. Multivariable Integral Calculus:
   - multiple integrals, line and surface integrals, work and flow, Green, Gauss and Stokes theorems, applications.

6. Partial Differential Equations:
   - separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

**Literature**
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).
- Thomas, G. B.: Thomas' Calculus, Parts 2 (Pearson Addison-Wesley).

**Prerequisites / notice**
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

**Assistance:**
- Tuesdays and Wednesdays 17-19h, in Room HG E 41.
Abstract

Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective

"Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics."

Content

Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

406-0062-AAL Physics I

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

Objective

Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

The student should acquire an overview over the basic concepts in mechanics.

Content

Book:

Chapters:
1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6), 15 (without 15-3, 15-5)

**Abstract**

This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.

- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Radiative corrections

**Objective**

The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore, it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

**Abstract**

Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today.

**Objective**

The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons.

**Content**

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From pionic hydrogen to the strong interaction and effective field theories
- etc.
Successful students know:

First semester (Astro-Particle Physics I):

- Introduction to the physics of neutrinos with special consideration of phenomena connected with neutrino masses.
- U. Langenegger

Experimental Methods and Instruments of Particle Physics

Abstract

Physics and design of particle accelerators.
Basics and concepts of particle detectors.
Track- and vertex-detectors, calorimetry, particle identification.
Special applications like Cherenkov detectors, air showers, direct detection of dark matter.
Simulation methods, readout electronics, trigger and data acquisition.
Examples of key experiments.

Objective

Acquire an in-depth understanding and overview of the essential elements of experimental methods in particle physics, including accelerators and experiments.

Content

1. Examples of modern experiments
2. Basics: Bethe-Bloch, radiation length, nucl. interaction length, fixed-target vs. collider, principles of measurements: energy- and momentum-conservation, etc
3. Physics and layout of accelerators
4. Charged particle tracking and vertexing
5. Calorimetry
6. Particle identification
7. Analysis methods: invariant and missing mass, jet algorithms, b-tagging
8. Special detectors: extended airshower detectors and cryogenic detectors
9. MC simulations (GEANT), trigger, readout, electronics

Lecture notes

Slides are handed out regularly, see http://www.physik.uzh.ch/en/teaching/PHY461/HS2016.html

402-0713-00L

Astro-Particle Physics I

Abstract

This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

Objective

Successful students know:

- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

Content

First semester (Astro-Particle Physics I):
- definition of 'Astro-Particle Physics'
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- 'extended air showers' and 'cosmic muons'
- 'knee' and 'ankle' in the energy spectrum
- the 'anti-matter problem' and the Big Bang
- 'cosmic accelerators'

402-0833-00L

Particle Physics in the Early Universe

Abstract

Does not take place this semester.

Prerequisites / notice

Prerequisites: Particle Physics Phenomenology 1 or Quantum Field Theory 1

Recommendation: Quantum Field Theory 2, Advanced Field Theory, General Relativity

402-0849-00L

Introduction to Lattice QCD

Abstract

This course offers an introduction to quantum field theories, in particular QCD, formulated on a space-time lattice. The lattice provides a non-perturbative, gauge-invariant regularization scheme for the Euclidean path integral. The course introduces both the theoretical background and the computational tools, like Monte Carlo simulations, used for the quantitative study of quarks and gluons.

Objective

To gain familiarity with the formalism of lattice field theories and their numerical simulation methods.

402-0767-00L

Neutrino Physics

Abstract

Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, interactions with leptons and quarks).

Objective

Introduction to the physics of neutrinos with special consideration of phenomena connected with neutrino masses.

Script

D.O. Caldwell, Current Aspects of Neutrino Physics, Springer.

402-0883-63L

Symmetries in Physics

Abstract

The course gives an introduction to symmetry groups in physics. It explains the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrates their important role in modern physics.

Objective

The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.
### General Relativity

**402-0830-00L**  
**General Relativity**  
W  
10 credits  
4V+2U  
P. Jetzer

**Abstract**  
Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime curvature; Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury's perihelion precession, light deflection.

**Objective**  
Basic understanding of general relativity, its mathematical foundations, and some of the interesting phenomena it predicts.

**Literature**  
Suggested textbooks:
- C. Misner, K. Thorne and J. Wheeler: Gravitation  
- S. Carroll - Spacetime and Geometry: An Introduction to General Relativity  
- R. Wald - General Relativity  
- S. Weinberg - Gravitation and Cosmology  
- N. Straumann - General Relativity with applications to Astrophysics

### The Physics of Electroweak Symmetry Breaking

**402-0898-00L**  
**The Physics of Electroweak Symmetry Breaking**  
W  
6 credits  
2V+1U  
not available

**Abstract**  
The aim is to understand the need of physics beyond the Standard Model, the basic techniques of model building in theories BSM and the elements of collider physics required to analyze their phenomenological implications. After an introduction to the SM and alternative theories of electroweak symmetry breaking, we will investigate these issues in the context of models with warped extra dimensions.

**Objective**  
After the course the student should have a good knowledge of some of the most relevant theories beyond the Standard Model and have the techniques to understand those theories that have not been surveyed in the course. He or she should be able to compute the constraints on any model of new physics, its successes explaining current experimental data and its main phenomenological implications at colliders.

**Prerequisites / notice**  
The former title of this course unit was "The Physics Beyond the Standard Model". If you already got credits for "The Physics Beyond the Standard Model" (402-0898-00L), you cannot get credits for "The Physics of Electroweak Symmetry Breaking" (402-0898-00L).

### Higgs Physics

**402-0899-65L**  
**Higgs Physics**  
W  
6 credits  
2V+1U  
M. Grazzini

**Abstract**  
The course introduces the theory and phenomenology of the recently discovered Higgs boson. With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

**Objective**  
With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

**Content**  
**Theory part:**
- the Standard Model and the mass problem: WW scattering and the no-lose theorem  
- the Higgs mechanism and its implementation in the Standard Model  
- radiative corrections and the screening theorem  
- theoretical constraints on the Higgs mass; the hierarchy problem  
- Higgs production in e+e- collisions  
- Higgs production at hadron colliders  
- Higgs decays to fermions and vector bosons  
- Higgs differential distributions, rapidity distribution, pt spectrum and jet vetoes  
- Higgs properties and beyond the Standard Model perspective  
- Outlook: The Higgs sector in weakly coupled and strongly coupled new physics scenarios.

**Experimental part:**
- Introductory material:  
  - reminders of detectors/accelerators  
  - reminders of statistics: likelihoods, hypothesis testing  
  - reminders of multivariate techniques: Neural Networks, Decision Trees  
- Main topics:  
  - pre-history (pre-LEP)  
  - LEP1: measurements at the Z-pole  
  - LEP2: towards the limit mH<114 GeV  
  - Tevatron searches  
  - LHC:  
    -- main channels overview  
    -- dissect on analysis  
    -- combine information from all channels  
    -- differential measurements  
    -- off-shell measurements  
    -- Future:  
      -- pseudo-observables / EFT  
      -- Beyond Standard Model

**Literature**  
- Higgs Hunter's Guide  
  (by S.Dawson, J. Gunion, H. Haber and G. Kane)  

**Prerequisites / notice**  
Prerequisites: Quantum Field Theory I, Phenomenology of Particle Physics I

### Particle Accelerator Physics and Modeling I

**402-0777-00L**  
**Particle Accelerator Physics and Modeling I**  
W  
6 credits  
2V+1U  
A. Adelmann

**Abstract**  
This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modeling techniques. It emphasizes the multidisciplinary aspect of the field, both in methodology (numerical and computational methods) and with regard to applications such as medical, industrial, material research and particle physics.

**Objective**  
You understand the building blocks of particle accelerators. Modern analysis tools allows you to model state-of-the-art particle accelerators. In some of the exercises you will be confronted with next generation machines. We will develop a Python simulation tool (AceLEGOra) that reflects the theory from the lecture.
Here is the rough plan of the topics, however the actual pace may vary relative to this plan.

- Particle Accelerators an Overview
- Relativity for Accelerator Physicists
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Applications to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Particle Tracking
- Linear & Circular Machines
- Cyclotrons
- Free Electron Lasers
- Collective effects in linear approximation
- Preview of Particle Accelerator Physics and Modeling II

---

**Literature**

Particle Accelerator Physics, H. Wiedemann, ISBN-13 978-3-540-49043-2, Springer

---

**Prerequisites / notice**

This lecture is also suited for PhD. students

---

**Content**

- QCD: Theory and Experiment
- Quantum Field Theory III: EFT and SUSY
- The BFKL Equation Reloaded and the Multi-Regge Kinematics in QCD and in N=4 SYM

---

**Abstract**

- QCD: Theory and Experiment
  - An introduction to the theoretical aspects and experimental tests of QCD, with emphasis on perturbative QCD and related experiments at colliders.

- Quantum Field Theory III: EFT and SUSY
  - This course provides a comprehensive introduction to two advanced topics in Quantum Field Theory: Effective Field Theories (EFTs) and Supersymmetry (SUSY).

- The BFKL Equation Reloaded and the Multi-Regge Kinematics in QCD and in N=4 SYM
  - The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

---

**Objective**

- Knowledge acquired on basics of perturbative QCD, both of theoretical and experimental nature. Ability to perform simple calculations of perturbative QCD, as well as to understand modern publications on theoretical and experimental aspects of perturbative QCD.

---

**Content**

- QCD Lagrangian and Feynman Rules
- QCD running coupling
- Parton model
- Altarelli-Parisi equations
- Basic processes
- Experimental tests at lepton and hadron colliders
- Measurements of the strong coupling constant

---

**Literature**

2. R. K. Ellis, W. J. Stirling, B. R. Webber: "QCD and Collider Physics" (Cambridge Monographs on Particle Physics, Nuclear Physics & Cosmology)

---

**Prerequisites / notice**

This course is also suited for PhD. students.

---

Abstract
The Master's thesis is normally conducted in the fourth semester and concludes the degree programme. With the Master's thesis students verify their ability to undertake independent and scientifically structured work in the area of high energy physics.

Prerequisites / notice
The time limit for completing the Master's thesis is six months.

**Abstract**
Foundations of information systems from a user's viewpoint. The focus is on structured data: relational databases, the data language SQL, designing relational databases. Additional topics: Information Retrieval (searching documents), and estimating their relevance and authority with respect to free-text queries; XML as a format for data exchange; Characteristics and processing of "Big Data".

**Objective**
Following the course should enable students to

1. answer non-trivial queries on existing relational databases by formulating (entry-level) SQL statements, as well as to add new database content and to update or delete existing content,
2. formalize facts as perceived in the real world in terms of the entity-relationship model, and derive a set of normalized relations (tables) which define the structure of a relational database
3. explain how a database management system (DBMS) essentially works and what kind of services it provides
4. understand how a web search engine such as Google basically works
5. know and apply the core concepts to structure and query XML-documents
6. list the characteristics of "Big Data" and know the basics of processing "Big Data"

**Content**
Die Lehrveranstaltung vermittelt Grundlagen und Konzepte von Informationssystemen aus der Sicht eines Anwenders.

Im Zentrum stehen relationale Datenbanksysteme, die Abfrage- und Datenmanipulationssprache SQL sowie der Entwurf bzw. die Strukturierung relationaler Datenbanken. Dieser Stoff wird auch in praktischen Übungen vertieft.

Weitere Themen sind der Umgang mit unstrukturierten und semistrukturierten Daten, die Integration von Daten aus verschiedenen autonomen Informationssystemen, sowie eine Übersicht der Architektur von Datenbanksystemen.

**Inhalt:**
1. Einleitung.
2. Das Relationenmodell.
3. Die Abfrage- und Datenmanipulationssprache SQL.
5. Architektur relationaler Datenbanksysteme.

**Literature**
Vorlesungsunterlagen (PowerPoint Folien, teilweise auch zusätzlicher Text) werden auf der Web-Site publiziert. Der Kauf eines Buches wird nicht vorausgesetzt.

**Prerequisites / notice**
Voraussetzung:
Elementare Kenntnisse von Mengenlehre und logischen Ausdrücken.

**Abstract**
The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

**Objective**
Primary educational objective is to learn programming with C++. When successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed.

Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking of a computer scientist.

**Content**
The course covers fundamental data types, expressions and statements, (Limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism, simple dynamic data types are introduced as examples.

In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

**Lecture notes**
A script written in English will be provided during the semester. The script and slides will be made available for download on the course web page.

**Literature**
Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

**Prerequisites / notice**
From AS 2013, an admission to the exam does not any more formally require an attending of the recitation sessions. Handing in solutions to the weekly exercise sheets is thus not mandatory, but we strongly recommend it.

**Examination**
An examination is a one hour-long written test.

### Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, visualizing multi-dimensional data, managing data with lists and tables and with relational databases, introduction to programming, universal methods for algorithm design.

### Objective
The students learn to
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

### Content
1. Modeling and simulations
2. Visualizing multidimensional data
3. Data management with lists and tables
4. Data management with a relational database
5. Introduction to macro programming
6. Introduction to programming with Python

### Lecture notes
All materials for the lecture are available at www.gdi.ethz.ch

### Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Data: 06.08.2021 13:03   Autumn Semester 2016   Page 798 of 1571
The unit "Computer Science in Secondary School Mathematics" addresses key contributions of computer science to general education, the tight relations between the algorithmic and the mathematical way of thinking, and the thoughtful choice of computer science topics for high school mathematics classes.

The general goal of the course consists in presenting ways to teach fundamentals of computer science, which are closely related to contents and methods of mathematics. After attending the course unit, a mathematics teacher is able to teach selected fundamentals of computer science in mathematics classes.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

#### Abstract

- Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?

#### Objective

Learning the basic concepts of computer science along their historical development

#### Content

This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:

- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

#### Lecture notes

The lecture is covered in detail by the textbook "Theoretical Computer Science".

#### Literature

**Basic literature:**

**Further reading:**

**More exercises and examples in:**

6. A. Asteroth, Ch. Baier: Theoretische Informatik

#### Prerequisites / notice

During the semester, two non-obligatory test exams will be offered.

#### Abstract

Introduction to computer architecture and system programming:

Instruction sets, storage hierarchies, runtime structures with an emphasis on computers as engines for the execution of compiled programs. Interaction between system software and the hardware. Problems that arise from the final representation, performance measurement and tuning, and program portability issues are covered.

#### Objective

The objective is to allow students to understand all aspects of the execution of compiled (C) programs on modern architectures -- the instruction set, the storage resources (registers, stack, memory), input/output, the impact of compiler decisions, and the interaction between the operating system and hardware. Two main themes are correctness issues (esp. those that arise from the finite representation of data) and performance issues (incl. measurement and tuning issues). The interface to the operating system is discussed to prepare for subsequent classes on more advanced systems topics.

The two key goals are:

1) To equip students with a thorough understanding of how to write correct programs that run fast on modern computer, and
2) How to write correct and efficient low-level systems code.

This course does not cover how to design or build a processor or computer.
Content
This course provides an overview of "computers" as a platform for the execution of (compiled) computer programs. This course provides a programmer's view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extend that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

Literature
The course is based in part on "Computer Systems: A Programmer's Perspective" (2nd Edition) by R. Bryant and D. O'Hallaron, with some additional material.

Prerequisites / notice
252-0024-00L Parallel Programming, 252-0014-00L Digital Circuits

401-0613-00L Probability and Statistics
6 credits 3V+2U J. Teichmann

401-0663-00L Numerical Methods for CSE 7 credits 4V+2U R. Hiptmair

Abstract
The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods in C++.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content
1. Direct Methods for linear systems of equations
2. Least Squares Techniques
3. Data Interpolation and Fitting
4. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Iterative Methods for non-linear systems of equations
11. Single Step Methods for ODEs
12. Stiff Integrators

<tr>
<td></td>
<td>This course uses compilers as example to expose modern software development techniques. The course introduces the students to the fundamentals of compiler construction. Students will implement a simple yet complete compiler for an object-oriented programming language for a realistic target machine. Students will learn the use of appropriate tools (parser generators); the implementation language is Java. Throughout the course, students learn to apply their knowledge of theory (automata, grammars, stack machines, program transformation) and well-known programming techniques (module definitions, design patterns, frameworks, software reuse) in a software project. Specific topics: Compiler organization. Lexical analysis. Top-down parsing via recursive descent, table-driven parsers, bottom-up parsing. Symboltables, semantic checking. Code generation for a simple RISC machine: expression evaluation, straight line code, conditionals, loops, procedure calls, simple register allocation techniques. Storage allocation on the stack, parameter passing, runtime storage management, heaps. Special topics as time permits: introduction to global dataflow and its application to register allocation, instruction scheduling.</td>

Abstract
Advanced design and analysis methods for algorithms and data structures: Random(ized) Search Trees, Point Location, Minimum Cut, Linear Programming, Randomized Algebraic Algorithms (matchings), Probabilistically Checkable Proofs (introduction).

Objective
Studying and understanding of fundamental advanced concepts in algorithms, data structures and complexity theory.

Lecture notes
Will be handed out.

Literature
Introduction to Algorithms by T. H. Cormen, C. E. Leiserson, R. L. Rivest;
Randomized Algorithms by R. Motwani und P. Raghavan;
Computational Geometry - Algorithms and Applications by M. de Berg, M. van Kreveld, M. Overmars, O. Schwarzkopf.

Electives
Compulsory major courses may also qualify as electives. Students may also choose courses from the Master's program in Computer Science. It is their responsibility to make sure that they meet the requirements and conditions for these courses.

Abstract
The course provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

Objective
The goal of the course is that students should understand the principles of user-centred design and be able to apply these in practice.

Content
The course will introduce students to various methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing. Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

227-0627-00L Applied Computer Architecture

Abstract
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective
Understand the function, the design and the performance modeling of parallel computer systems.
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties.

ECTS

All material and information of this course is available on the webpage http://lec.inf.ethz.ch/gep/ (in german).

4 credits

The main goals of this seminar are 1) learning how to read and understand a recent research paper in computer science; and 2) learning how to present a technical topic in computer science to an audience of peers.

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

Students can enroll in this course for optimal preparation for the exam of the mentioned lecture.

Studienreglement 2008

regulations - are able to apply this knowledge to solve algorithmic tasks on their own - understand the basic concepts of object-oriented programming using Eiffel

The objective of this course is to learn how to solve algorithmic problems given as descriptions in natural language, similar to those posed in ACM Programming Contests. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and their efficient implementation using C/C++ and the STL.

The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits.

Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)?

Which architecture is behind the alarm center of the Swiss Railway (SBB)?

Which computer architectures are applied for driver assistance systems?

Which computer architecture is hidden behind a professional digital audio mixing desk?

How can data streams of about 30 TB/s, produced by a protone accelerator, be processed in real time?

Can the weather forecast also be processed with GPUs?

Which can a good computer architecture be found?

Which are the driving factors in succesful computer architecture design?

Content

Lecture notes

Prerequisites / notice

Basics of computer architecture.

Cell and Molecular Biology for Engineers

This course is part I of a two-semester course.

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

Students can enroll in this course for optimal preparation for the exam of the mentioned lecture.

The course is an introduction to research in software engineering, based on reading and presenting high quality research papers in the field. The instructor may choose a variety of topics or one topic that is explored through several papers.

The main goals of this seminar are 1) learning how to read and understand a recent research paper in computer science; and 2) learning how to present a technical topic in computer science to an audience of peers.

The technical content of this course falls into the general area of software engineering but will vary from semester to semester.

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

Students can enroll in this course for optimal preparation for the exam of the mentioned lecture.

Studienreglement 2008

regulations - are able to apply this knowledge to solve algorithmic tasks on their own - understand the basic concepts of object-oriented programming using Eiffel

The objective of this course is to learn how to solve algorithmic problems given as descriptions in natural language, similar to those posed in ACM Programming Contests. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and their efficient implementation using C/C++ and the STL.
Prerequisites / notice
- Have been enrolled in "Einführung in die Programmierung" in fall semester 2015
- are studying in the bachelor regulations 08

**Abstract**
The Bachelor thesis is the final requirement of the BSc program and is supervised by one of the D-INFK professors. The thesis encourages students to show and produce a scientifically structured work.

**Objective**
In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work.

**Prerequisites / notice**
The supervisor of the thesis defines the task, start and end date. A written report will be prepared on the scientific studies carried out, followed by a final presentation. The thesis must be handed in within 6 months.

Lecturers
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching

Subject Didactics of Computer Science I

This unit "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

851-0242-06L Cognitively Activating Instructions in MINT Subjects

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L Human Intelligence

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is compulsory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

851-0242-08L Research Methods in Educational Science

Number of participants limited to 30.

This course can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Understanding research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-09L Subject Didactics and Professional Training

Data: 06.08.2021 13:03 Autumn Semester 2016 Page 808 of 1571
### Content

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

### Prerequisites / notice

Lehrdiplom-Studierende müssen diese Lerneinheit zusammen mit dem Einführungspraktikum Informatik - 272-0201-00L - belegen.

### Lecture notes

Unterlagen und Folien werden zur Verfügung gestellt.

### Literature

### Specialized Courses in Respective Subject with Educational Focus

#### 271-0102-00L Teaching Internship Including Examination Lessons in Computer Science

*Teaching Internship Computer Science for TC and Teaching Diploma Computer Science as Minor Subject.*

*Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.*

**Objective**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

Wird von der Praktikumslehrperson bestimmt.

#### 272-0103-00L Mentored Work Subject Didactics Computer Science

*Mentored Work Subject Didactics in Computer Science for TC, Teaching Diploma and Teaching Computer Science as Minor Subject.*

**Objective**

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

Thematic Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

**Literature**

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

**Notice**

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the understanding of concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing high-performance computer systems without central control. The course discusses algorithmic aspects of game theory.

Course offered by another institution. Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. The course is accompanied by practical machine learning projects.

The aim is for the students to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.

To try out different options for specialist further training in their profession.

Thematic Schwerpunkte:
- Dimension reduction: principal component analysis (PCA) and beyond
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Ensemble methods: Bagging and Boosting
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Maximum likelihood and Bayesian parameter inference
- Bayesian theory of optimal decisions
- Classification with discriminant functions: Perceptrons, Fisher’s LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbor
- Dimension reduction: principal component analysis (PCA) and beyond

No lecture notes, but slides will be made available on the course webpage.

Lecture notes:

The course offers a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.

Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes: No lecture notes.

Literature:
- "Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Several copies of both books are available in the Computer Science library.

Prerequisites / notice:
Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.
Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

<td>Abstract</td>
<td>Las Vegas &amp; Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas. Randomized Algorithms are algorithms that &quot;flip coins&quot; to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.</td>

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

The main unit 272-0104-00L is mentored work subject didactics in computer science for students upgrading TC to Teaching Diploma and for students upgrading TC to Teaching Diploma Computer Science as Minor Subject.

Abstract

Mentored Work Subject Didactics Computer Science for Teaching Diploma and for students upgrading TC to Teaching Diploma Computer Science as Minor Subject

Objective

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Literatur

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Mentored Work Subject Didactics Computer Science for Teaching Diploma and for students upgrading TC to Teaching Diploma Computer Science as Minor Subject

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

The aim is for the students to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle. They analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training. The candidates create a context-specific topic, they develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readers. They analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Teaching Diploma in 2 Subjects in One-Step Procedure: no courses from this category have to be completed.

Abstract

Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

Abstract

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, SSAT, card shuffling, random walks

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous machine learning algorithms on real world data.

Contents:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

No lecture notes, but slides will be made available on the course webpage.

Content

The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1950s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes

No lecture notes.

Literature

"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

263-2800-00L

Design of Parallel and High-Performance Computing

Advanced topics in parallel / concurrent programming.

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC". see Compulsory Elective Courses Teaching Diploma

Additional Requirements (ETH-Masterstudents in PHYS/MATH/CSE)

Part 1

Number Title Type ECTS Hours Lecturers
252-0057-00L Theoretical Computer Science O 8 credits 4V+2U+1A J. Hromkovic

Abstract

Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CST? e) How to represent infinite objects by finite automata and grammars?

Objective

Learning the basic concepts of computer science along their historical development

Content

This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:
- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

Lecture notes

The lecture is covered in detail by the textbook "Theoretical Computer Science".

Basic literature:

Further reading:

More exercises and examples in:
6. A. Asteroth, Ch. Baier: Theoretische Informatik

During the semester, two non-obligatory test exams will be offered.
Abstract

Introduction to computer architecture and system programming:

Instruction sets, storage hierarchies, runtime structures with an emphasis on computers as engines for the execution of compiled programs. Interaction between system software and the hardware. Problems that arise from the final representation, performance measurement and tuning, and program portability issues are covered.

Objective

The objective is to allow students to understand all aspects of the execution of compiled (C) programs on modern architectures – the instruction set, the storage resources (registers, stack, memory), input/output, the impact of compiler decisions, and the interaction between the operating system and hardware. Two main themes are correctness issues (esp. those that arise from the finite representation of data) and performance issues (incl. measurement and tuning issues). The interface to the operating system is discussed to prepare for subsequent classes on more advanced systems topics.

The two key goals are:

1) To equip students with a thorough understanding of how to write correct programs that run fast on modern computer, and
2) How to write correct and efficient low-level systems code.

This course does not cover how to design or build a processor or computer.

Content

This course provides an overview of "computers" as a platform for the execution of (compiled) computer programs. This course provides a programmer's view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extend that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

Literature

The course is based in part on "Computer Systems: A Programmer's Perspective" (2nd Edition) by R. Bryant and D. O'Hallaron, with some additional material.

Prerequisites / notice

252-0024-00L Parallel Programming,
252-0014-00L Digital Circuits

252-0026-00L

Literature

Algorithms and Data Structures

This course is about fundamental algorithm design paradigms, classic algorithmic problems, and data structures. The connection between algorithms and data structures is explained for geometric and graph problems. For this purpose, fundamental graph theoretic concepts are introduced.

Objective

An understanding of the design and analysis of fundamental algorithms and data structures.

Content

Abstract

Advanced design and analysis methods for algorithms and data structures: Randomized (random) Search Trees, Point Location, Minimum Cut, Linear Programming, Randomized Algebraic Algorithms (matchings), Probabilistically Checkable Proofs (introduction).

Objective

Studying and understanding of fundamental advanced concepts in algorithms, data structures and complexity theory.

Lecture notes

Will be handed out.

Literature

Computer Science as Second Subject

Important: You can only enrol in the courses of subject didactics and professional training as a subsidiary subject if you have not more than 12 CP left for additional requirements.

Subject Didactics in Computer Science

Number Title Type ECTS Hours Lecturers

272-0101-00L Subject Didactics of Computer Science I Simultaneous enrolment in Introductory Practical in
The unit "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

Objective

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

Content

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Prerequisites / notice

Lehrdiplom-Studierende müssen diese Lerneinheit zusammen mit dem Einführungspraktikum Informatik - 272-0201-00L - belegen.

272-0203-00L Mentored Work Subject Didactics Computer Science | O 2 credits 4A J. Hromkovic, G. Serafini

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.

- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Literatur

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie von Betreuer zur Verfügung gestellt.

Prerequisites / notice

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own work.

Abstract

Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

Objective

The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them (using C/C++, STL, CGAL, and BGL).

Literature

263-0007-00L | Advanced Systems Lab        | O    | 6    | 4P+1A  | G. Alonso

Abstract

The goal of this course is to teach students how to evaluate the performance of complex computer and software systems. Accordingly, the methodology to carry out experiments and measurements is studied.

Furthermore, the modeling of systems with the help of queueing network systems is explained.

Objective

The goal of this course is to teach students how to evaluate the performance of complex computer and software systems.

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content

Biological networks are tremendously complex and their analysis is a challenging task. The course will focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and (vi) stochastic simulation methods.

| 263-5001-00L | Introduction to Finite Elements and Sparse Linear System Solving |
| Abstract     | The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods. |
| Objective    | Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations. |
| Content      | I. THE FINITE ELEMENT METHOD                    |
|             | (1) Introduction, model problems.                |
|             | (2) 1D problems. Piecewise polynomials in 1D.    |
|             | (3) 2D problems. Triangulations. Piecewise polynomials in 2D. |
|             | (4) Variational formulations. Galerkin finite element method. |
|             | (5) Implementation aspects.                     |
|             | II. DIRECT SOLUTION METHODS                     |
|             | (6) LU and Cholesky decomposition.               |
|             | (7) Sparse matrices.                            |
|             | (8) Fill-reducing orderings.                    |
|             | III. ITERATIVE SOLUTION METHODS                |
|             | (9) Stationary iterative methods, preconditioning. |
|             | (10) Preconditioned conjugate gradient method (PCG). |
|             | (11) Incomplete factorization preconditioning.  |
|             | (12) Multigrid preconditioning.                 |
|             | (13) Nonsymmetric problems (GMRES, BiCGstab).   |
|             | (14) Indefinite problems (SYMMLQ, MINRES).      |

| 636-0017-00L | Computational Biology                           |
| Abstract     | The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced. |

| Prerequisites / notice | Prerequisites: Linear Algebra, Analysis, Computational Science. The exercises are made with Matlab. |
Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (such as the HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Slides of the lecture will be available online.

https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences

Does not take place this semester.

Number of participants limited to 60.

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes

The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice

Fundamentals of Probability, Fundamentals of Computational Modeling

Seminar Computational Science

Focus Courses in Distributed Systems

Focus Core Courses Distributed Systems
The goals of the course are, firstly, to give students a broader perspective on OS design than that provided by knowledge of Unix or Windows, building on the material in a standard undergraduate operating systems class, and secondly, to provide them with practical experience in dealing directly with the concurrency, resource management, and abstraction problems confronting OS designers and implementers.

This course is intended to give students a thorough understanding of design and implementation issues for modern operating systems, with a particular emphasis on the challenges of modern hardware features. We will cover key design issues in implementing an operating system, such as memory management, scheduling, protection, inter-process communication, device drivers, and file systems.

The course is based around a milestone-oriented project, where students work in small groups to implement major components of a microkernel-based operating system. The final assessment will be a combination grades awarded for milestones during the course of the project, a final written report on the work, and a set of test cases on the final code.

Gain hands-on-experience with real products and the latest technology in distributed systems.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

**Abstract**

- Models of distributed computations, time space diagrams, virtual time, logical clocks and causality, wave algorithms, parallel and distributed graph traversal, consistent snapshots, mutual exclusion, election and symmetry breaking, distributed termination detection, garbage collection in distributed systems, monitoring distributed systems, global predicates.

**Objective**

Become acquainted with models and algorithms for distributed systems.

**Content**

Verteilte Algorithmen sind Verfahren, die dadurch charakterisiert sind, dass mehrere autonome Prozesse gleichzeitig Teile eines gemeinsamen Problems in kooperativer Weise bearbeiten und der dabei erforderliche Informationsaustausch ausschliesslich über Nachrichten erfolgt. Derartige Algorithmen kommen im Rahmen verteilter Systeme zum Einsatz, bei denen kein gemeinsamer Speicher existiert und die Übertragungzeit von Nachrichten i.a. nicht vernachlässigt werden kann. Da dabei kein Prozess eine aktuelle konsistente Sicht des globalen Zustands besitzt, führt dies zu interessanten Problemen. Im einzelnen werden u.a. folgende Themen behandelt:

- Modelle verteilter Berechnungen; Raum-Zeit Diagramme; Virtuelle Zeit; Logische Uhren und Kausalität; Weilenalgorithmen; Verteilte und parallele Graphtraversierung; Berechnung konsistenter Schnappschüsse; Wechselseitiger Ausschluss; Election und Symmetriebrechung; Verteilte Terminierung; Garbage-Collection in verteilten Systemen; Beobachten verteilter Systeme; Berechnung globaler Prädikate.

**Abstract**

We will study recent advances in computer networking by reading and presenting research papers from recent iterations of the top conferences in the area, including NSDI, SIGCOMM, and CoNEXT.

**Objective**

The objectives are (a) to understand the state-of-the-art in the field; (b) to learn to read, present and critique papers; and (c) to identify opportunities for new research.

Students are expected to attend the entire seminar, choose a topic for presentation from a given list, and make a presentation on that topic. Students are evaluated on the knowledge gained, the presentation made, and the report they present at the end of the semester.
Objective
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminar language: English

Different each year. For details see: www.disco.ethz.ch/courses.html

Slides of presentations will be made available.

Papers.

The actual paper selection can be found on www.disco.ethz.ch/courses.html.

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class

2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees

3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts

4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience

5. Model-driven security (Part II)
   - Continuation of above topics

6. Security patterns (design and implementation)

7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks

8. Testing
   - overview
   - model-based testing
   - testing security properties

9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach

10. Risk analysis: IT baseline protection
    - Overview
    - Example

11. Evaluation criteria
    - CMM
    - systems security engineering CMM

Literature

Prerequisites / notice
Prerequisite: Class on Information Security

252-1414-00L System Security W 5 credits 2V+2U S. Capkun, A. Perrig

Abstract
The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
Content

The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), crypticraphic support, and trustworthy computing (TGG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

263-4640-00L  Network Security  W  6 credits  2V+1U+2A  A. Perrig, T. P. Dübendorfer, S. Frei

Abstract

This lecture discusses fundamental concepts and technologies in the area of network security. Several case studies illustrate the dark side of the Internet and explain how to protect against such threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

Objective

Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students can identify and assess known vulnerabilities in a software system that is connected to the Internet. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience.

Content

Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authenticity, and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

Focus Elective Courses Information Security

Number  Title  Type  ECTS  Hours  Lecturers
252-0811-00L  Applied Security Laboratory  W  8 credits  7P  D. Basin

Abstract

In the Master Programme max. 10 credits can be accounted by Labs on top of the Interfocus Courses. Additional Labs will be listed on the Addendum.

Objective

Hands-on course on applied aspects of information security. Applied information security, operating system security, OS hardening, computer forensics, web application security, project work, design, implementation, and configuration of security mechanisms, risk analysis, system review.

Content

The Applied Security Laboratory addresses four major topics: operating system security (hardening, vulnerability scanning, access control, logging), application security with an emphasis on web applications (web server setup, common web exploits, authentication, session handling, code security), computer forensics, and risk analysis and risk management.

Prerequisites / notice

Knowledge in computer networking and Internet protocols (e.g. course Communication Networks (D-ITET) or Operating Systems and Networks (D-INF))

Lecture notes

Literature

Recommended reading includes:
- Various: OWASP Guide to Building Secure Web Applications, available online
- O'Reilly, Loukides: Unix Power Tools, O'Reilly & Associates.
- Friehl: Essential System Administration, O'Reilly & Associates.
- NIST: Risk Management Guide for Information Technology Systems, available online as PDF
- BSI: IT-Grundschutzhandbuch, available online

Prerequisites / notice

The lab allows flexible working since there are only few mandatory meetings during the semester. The lab covers a variety of different techniques. Thus, participating students should have a solid foundation in the following areas: information security, operating system administration (especially Unix/Linux), and networking. Students are also expected to have a basic understanding of HTML, PHP, JavaScript, and MySQL because several examples are implemented in these languages. Students must be prepared to spend more than three hours per week to complete the lab assignments and the project. This applies particularly to students who do not meet the recommended requirements given above. Successful participants of the course receive 8 credits as compensation for their effort. All participants must sign the lab's charter and usage policy during the introduction lecture.

252-1411-00L  Security of Wireless Networks  W  5 credits  2V+1U+1A  S. Capkun

Abstract

Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

Objective

After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques. The course's objective is to give the students the necessary intellectual skills for rigorous reasoning about building such systems.

The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

The reading list will be published on the course web site.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the SW development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
