Chemistry I

**Abstract**
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

**Objective**
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**
1. **Stoichiometry**
   - Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
2. **Atoms**
3. **Chemical bonding and its representation**
   - Spatial arrangement of atoms in molecules. Molecular orbitals.
4. **Basics of chemical thermodynamics**
   - System and surroundings. Description of state and change of state of chemical systems.
5. **First law of thermodynamics**
6. **Second law of thermodynamics**
   - Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
7. **Gibbs energy and chemical potential**
8. **Chemical equilibrium**
9. **Acids and bases**
10. **Dissolution and precipitation**
    - Heterogeneous equilibrium. Dissolution and solubility product. Carbon dioxide-carbonic acid-carbonate equilibrium.

**Lecture notes**
Online-Skript mit durchgerechneten Beispielen.

**Literature**

General Biology I

Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny.

First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

Objective

The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

Content

The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and speciation
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular&seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Lecture notes

no script

Literature

Prerequisites / notice

The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

701-0243-01L

Biology III: Essentials of Ecology

This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. Threats to biodiversity and the appropriate management are discussed.

Objective

The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented.

A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

Content

- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflüsse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

Lecture notes

Unterlagen, Vorlesungsfolien und relevante Literatur sind in Moddle abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

Environmental Systems I

The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.
The lecture discusses the role of the environmental systems based on selected environmental problems, among these the exploration of raw materials and fossil fuels, climate change and its impacts on man and environment, and the spread and control of infectious diseases in the human population and agricultural systems.

Literature
For further reading (not obligatory):
Gerhard Wanner: Mikroskopisch-Botanisches Praktikum, Georg Thieme Verlag, Stuttgart.

Prerequisites / notice
Groups of a maximum of 30 students.

529-0030-00L Laboratory Course: Elementary Chemical Techniques O 3 credits 6P N. Kober, A. de Mello, M. H. Schroth

Abstract
This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

Objective
This course is intended to provide an overview of experimental chemical methods. The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

Content
The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:
- Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

Lecture notes
The script will be published on the web.
Details will be provided on the first day of the semester.

Literature
A thorough study of all script materials is requested before the course starts.

Prerequisites / notice
Safety concept: https://chab.ethz.ch/studium/bachelor1.html

252-0839-00L Informatics O 2 credits 2G L. E. Fässler, M. Dahinden

Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists and tables and with relational databases, introduction to programming.

Objective
The students learn to
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data.

Content
1. Modeling and simulations
2. Data management with lists and tables
3. Data management with a relational database
4. Introduction to macro programming
5. Introduction to programming with Python

Lecture notes
All materials for the lecture are available at www.evim.ethz.ch

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Abstract
Introduction to the concepts and tools in Physics, with the help of demonstration experiments. The Chapters treated are Electromagnetism, Refraction and Diffraction of Waves, Elements of Quantum Mechanics with applications to Spectroscopy, Thermodynamics, Phase Transitions, Transport Phenomena. Whenever possible, examples relevant to the students' main field of study are given.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve them.

Lecture notes
A script will be distributed.

Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

Grundlagen und Ziele unternehmerischen Entscheidens
Kosten und Leistungsrechnung
Produktionstheorie
Produktionsprogrammplanung
Investitionsplanung und Finanzierung
Entscheidungen unter Unsicherheit und Risikomanagement

Lecture notes
Vorlesungsunterlagen werden im Laufe des Semesters zur Verfügung gestellt

Literature

752-6003-00L
Introduction to Nutritional Science
O 2 credits 1.5V M. B. Zimmermann, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

Objective
To introduce the students to the both the macro- and the micronutrients.

Content
The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

Lecture notes
There is no script. Powerpoint presentations will be made available.

### 363-0537-00L Resource and Environmental Economics

**Objective**: Students acquire a deeper understanding of basic microeconomic models. They acquire the ability to apply these models in the interpretation of real world economic contexts.

**Content**: Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

**Lecture notes**: Course material in e-learning environment [https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php](https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php)

**Prerequisites / notice**: This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

### 751-0903-00L Microeconomics of the Agriculture and Food Sector

**Abstract**: In dieser Vorlesung sollen Mikroökonomische Zusammenhänge am Fallbeispiel des Agrar- und Ernährungssektors vermittelt werden. Ziel ist das Verständnis theoretischer mikroökonomischer Methoden und deren Anwendbarkeit auf den Ernährungssektor.

**Objective**: Zunächst sollen ökonomische Charakteristika des Lebensmittelsektors herausgearbeitet und gegenüber anderen Industriesektoren differenziert werden. Daraufhin sollen theoretische mikroökonomische Modelle und Indikatoren erlernt werden. Insbesondere soll deren Anwendung auf reale Fälle der Schweizer und EU Lebensmittelindustrie vermittelt werden.

**Content**: - Der EU Lebensmittelsektor
- Preiselastizitäten von Angebot und Nachfrage im Ernährungssektor (Marktmacht, Lancaster Modell)
- Gewinnmaximierung
- Wettbewerbsangebot
- Monopol/ Monopolistischer Wettbewerb/ Monopson
- Oligopol (Stackelberg, Cournot, Bertrand)
- Preisbildung/ Preisdiskriminierung
- Konsumentenverhalten
- Kartelle
- Dominante Firma

**Prerequisites / notice**: - Pindyck und Rubinfeld. Mikroökonomie, 7. Aufl., Pearson Studium.

### 751-0401-00L Optimization of Agricultural Production Systems

**Abstract**: Introduction in to optimization of agricultural production systems with linear and non-linear programming models.

**Objective**: Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications.

**Content**: The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented. Students will learn the underlying principles (Optimization, Duality, Simplex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrange, Kuhn-Tucker) and illustrated with various examples.

**Lecture notes**: Handed out during lecture

**Prerequisites / notice**: - Grundkenntnisse der Ökonomie/Agrarökonomie
- Vorlesung Einführung in die Mikroökonomie

Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of non-renewable resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

The objective of this course is to equip students with a solid foundation in agroecology and the transition to sustainable food systems. Students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology. The students will have hands-on experiences with equipment used in plant ecophysiology.

Prerequisites / notice
Dieser Kurs basiert auf Grundlagen der Pflanzenbestimmung und der Pflanzenphysiologie. Er ist Basis für die Veranstaltungen Pflanzenbau, Teil Futterbau und Graslandsysteme.

751-3401-00L
Plant Nutrition I

Abstract
The aim of these lecture is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

Objective
At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

Content
A general introduction explains the appropriates of managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

Lecture notes
The slides will be distributed.

Innovation in Smart Farming

Number of participants limited to 16.

Abstract
A motivation letter must be submitted after the first lecture (Monday 27.9. (maximum 100 words) until 29.9. to Achim Walter (Achim.Walter@usys.ethz.ch). A confirmation of the definitive participation in the course will be communicated on 1.10. The definitive registration for the course will be undertaken by the study secretariat.

Objective
During the course, the students generate their own ideas on 'Smart Farming'. They explore, which technologies provide possibilities for a more sustainable agriculture. They realize trade-offs between economic and technological possibilities.

Content

751-4504-00L
Plant Pathology I

Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathway life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, pythotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-4801-00L  System-Oriented Management of Herbivore Insects  W+  2 credits  2G  to be announced

Abstract

Does not take place this semester.

The focus is on the potential to assess strategies and tactics of pest management, in view of the demands from the economy, environment and society. Significant management measures will be explained using practical examples, such as surveillance and forecasting, resistance management, biological control as well as the use of plant protection products, incl. regulatory aspects and ecology.

Objective

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will be able to assess options for action in view of requirements from the economy, environment and society. Further, they will learn to elaborate on current issues in pest management, and to critically evaluate case studies.

751-5003-00L  Sustainable Agroecosystems II  W+  2 credits  2V  K. Benabderrazik, M. Hartmann

Abstract

This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective

1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.

2) Learn and experiment on methods for field and laboratory investigations in agroecology.

3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.

4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.

5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content

The course will address a wide range of agricultural and food system challenges (e.g. food security, climate change, soil degradation, etc.) in both temperate and tropical contexts, from building food system resilience through innovative measures, to addressing soil fertility and GHG emissions. A wide variety of case studies will be presented, covering different scales (e.g. value-chains, farm and soil management). The class is complemented by a role-playing exercise on food system transformation. Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the exercise, students will learn to cooperate through a teamwork exercise and understand what is the role of each stakeholders in the food system in order to support a sustainable transformation.

Literature

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.
The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetables (6 h) and viticulture (6 h).

Insight into the topic of horticulture in general.

The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetable growing (6 h) and viticulture (6 h).

Under the responsibility of Agroscope representatives, basic knowledge of production systems (yield formation and physiology, cultivation methods, main varieties, quality) of these horticultural crops, which are important in Switzerland, is imparted.

Delivered during the lectures by the different teachers, ELBA upload.

On the Moodle-page you can find some pre-readings for the course.

Agroecology and the Transition to Sustainable Food Systems

The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

Organization of the lecture:
The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).

Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture: At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):
The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.

While most public lectures will take one hour, the last public lecture on "Agroecology, The Way Forward", on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):
The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/61315399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

The course is designed as a public lecture on "Agroecology in the transition to sustainable food systems" to allow for different perspectives to be represented, heard and discussed.
Handouts in German language will be provided by each lecturer when starting his part of the lecture.

Data: 20.09.2021 12:40

Autumn Semester 2021
Objective

Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions. This course enables students and an interested public to engage in a lively and critical debate and to learn about scientific contributions to agroecology. Based on the knowledge gained, students are able to form a personal opinion on the role of agroecology and to reflect on the different facets and real-world applications supporting a transition towards sustainable food systems.

Content

Lecture notes

Mainly German (with some English passages from text books)

Prerequisites /
notice

The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and the foundation of the theory with different normative concepts in terms of efficiency and fairness. Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications. Therefore, electives can be chosen from the complete course offer of the ETH Zurich and University of Zurich.

### Electives

The electives are recommended. However, electives can be chosen from the complete course offer of the ETH Zurich and University of Zurich.

### Content
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

A motivation letter must be submitted after the first lecture Monday 27.9. (maximum 100 words) until 29.9. to Achim Walter (Achim.Walter@usys.ethz.ch). A confirmation of the definitive participation in the course will be communicated on 1.10. The definitive registration for the course will be undertaken by the study secretariat.

### Abstract
Agriculture needs to become more sustainable via innovative approaches. This course allows students to explore in group work, how this could be realized. There are short impulse talks on 'Smart Farming' given by experts on technology and entrepreneurship. Most importantly, students elaborate the first steps to create a startup company in this field.

### Objective
During the course, the students generate their own ideas on 'Smart Farming'. They explore, which technologies provide possibilities for a more sustainable agriculture. They realize trade-offs between economic and technological possibilities.

### Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

### Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytopoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritic folioblotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-4801-00L  System-Oriented Management of Herbivore Insects  W  2 credits  2G  to be announced

Abstract

Does not take place this semester.

Objective

The focus is on the potential to assess strategies and tactics of pest management, in view of the demands from the economy, environment and society. Significant management measures will be explained using practical examples, such as surveillance and forecasting, resistance management, biological control as well as the use of plant protection products, incl. regulatory aspects and ecotoxicology.

751-5003-00L  Sustainable Agroecosystems II  W  2 credits  2V  K. Benabderrazik, M. Hartmann

Abstract

This class covers current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective

(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.

(2) Learn and experiment on methods for field and laboratory investigations in agroecology.

(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.

(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.

(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content

The course will address a wide range of agricultural and food system challenges (e.g. food security, climate change, soil degradation, etc.) in both temperate and tropical contexts, from building food system resilience through innovative measures, to addressing soil fertility and GHG emissions. A wide variety of case studies will be presented, covering different scales (e.g. value-chains, farm and soil management). The class is complemented by a role-playing exercise on food system transformation. Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the exercise, students will learn to cooperate through a teamwork exercise and understand what is the role of each stakeholder in the food system in order to support a sustainable transformation.

Literature

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.
Taught competencies

Domain A - Subject-specific Competencies: Concepts and Theories
Domain B - Method-specific Competencies: Analytical Competencies
Domain C - Social Competencies: Cooperation and Teamwork
Domain D - Personal Competencies: Critical Thinking

751-7101-00L Applied Animal Nutrition

Abstract

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective

The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content

- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxistrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und - bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxistrieb durch die Gruppe.

- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und hinweise. Rationengestaltung und Rezeptoptimierung für Mischfuttermittel anhand verschiedener Beispiele; Einsatzgrenzen von Futtermittel; technologische Futterbearbeitung.

Lecture notes

Handouts in German language will be provided by each lecturer when starting his part of the lecture.

Literature

Die Dozierenden geben in der Lehrveranstaltung die relevante Literatur bekannt.

Prerequisites / notice

Blockkurs in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.

751-7103-00L Animal Feed and Feeding of Ruminants

Abstract

The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Objective

Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes

Eine Literaturliste ist im Skript enthalten.

Lecture notes

Fach mit benoteter Semesterendprüfung.

751-6121-00L Regulatory Physiology

Abstract

Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Homöostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerzen) wird diese komplexe Funktion verständlich.

Objective

Content

- Thermoregulation (Fieber)
- Flüssigkeitshomöostase (Durchfall)
- Calciumregulation (Milchfieber)
- Energiehomöostase (Ketose)
- Schmerz (zootechnische Eingriffe)
- Stress (allostatische Last, Epigenetik)

Lecture notes

Unterlagen werden individuell von den Dozierenden abgegeben.

Prerequisites / notice

Spezifische Literatur wird individuell von den Dozierenden angegeben.

751-5005-00L Agroecology and the Transition to Sustainable Food Systems

Abstract

The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

Objective

Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions. This course enables students and an interested public to engage in a lively and critical debate and to learn about scientific contributions to agroecology. Based on the knowledge gained, students are able to form a personal opinion on the role of agroecology and to reflect on the different facets and real-world applications supporting a transition towards sustainable food systems.
Organization of the lecture:
The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).
Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture:
At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):
The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.
While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):
The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/6135399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

Lecture notes
On the Moodle-page you can find some pre-readings for the course.

Literature

Prerequisites / notice
The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.

701-0903-00L The Sustainable Development Goals Book Club  W+  2 credits  B. B. Pearce, J. Ghazoul

Abstract
The ETH Sustainable Development Goals Book Club is a colloquium for Bachelor students within and outside of Department of Environmental Systems Science centered around the discussion of themes from a single book, with the aim of fostering interdisciplinary, intellectual and critical exploration of the scientific and societal complexities related to the Sustainable Development Goals.

Objective
The aims of this course are to:
- Create an interdisciplinary approach to understanding key concepts of sustainable development and the SDGs
- Create solidarity through a cultural of intellectual exchange at ETH Zurich
- Create a common object of intellectual reference for students with different disciplinary interests to enable diverse ways and modes of thinking

Content
The course is similar to 701-0019-00L Readings in Environmental Thinking with the following differences:
- Targeted at Bachelor’s students (especially first and second year, but open to all) within and outside of the department.
- All participating students will read one book whose themes will be the basis for discussions.
- These discussions, taking place both online and in-person, will be moderated by the main lecturers of the course and discussed by additional professors from within and outside of D-USYS.
- Each discussion will be based on a chapter of a book, always linked to a particular aspect of the SDGs.
- The modes of discussion will vary in length and form, ranging from the traditional, sit-down meeting, to a Twitter book club format (as already pioneered and popularized by author Robert MacFarlane).
- Both students and professors will lead the discussions alternatively.
- Each discussion session will result in a visual output or another shareable output that will be developed by a student or group of students.

Literature
TBD
Could be one of the books already used in 701-0019-00L Readings in Environmental Thinking (Silent Spring, The Sand County Almanac, Collapse..etc.)

Other possibilities:
- Thinking in systems
- Limits to Growth
- Operating Manual for Spaceship Earth
- Small is Beautiful
- For the Common Good
- Factfulness
- The Prize: The Epic Quest for Oil, Money and Power (history of the global petroleum industry from 1850s-1990)

Prerequisites / notice
none

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Literature from the learning sciences is critically discussed with a focus on research methods.

ECTS

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

Human Learning (EW 1)

Thematische Schwerpunkte:

- Understanding of research methods used in the empirical human sciences
- Getting to know cognitively activating instructions in MINT subjects

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Thematische Schwerpunkte:

- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzaufbau unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkei und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Coping with Psychosocial Demands of Teaching (EW 4 W)

S. Peteranderl

This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

Cognitively Activating Instructions in MINT Subjects

R. Schumacher

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Human Intelligence

E. Stern

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

The focus will be on the book "Intelligenz: Große Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Research Methods in Educational Science

P. Edelsbrunner, T. Braas, C. M. Thurn

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

Literature from the learning sciences is critically discussed with a focus on research methods.

At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Coping with Psychosocial Demands of Teaching

U. Markwalder, S. Maurer, S. Peteranderl

Number of participants limited to 20.

The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

<tr>
<td><strong>Abstract</strong></td>
<td>The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Content** | Fields (contact hours)  
- Introduction: 2 h  
- Special topics: 20 h  
- Rumen Anatomy  
- Hohenheim Gas Test  
- Calf health  
- Reproduction Techniques  
- Fertility in Cows  
- Disciplinary topics: 32 h  
- Ruminal Digestion: 8 h  
- Ruminant Nutrition Physiology: 12 h  
- Reproduction in Ruminants: 8 h  
- Lectures held by the students: 4 h  
In summary  
- Contact hours: 58 h  
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)  
- Self-study in semester break: 32 h  
Total: 120 h |
| **Lecture notes** | Documentations, links and other materials will be provided at the start of the course |
| **Literature** | Information on books and other references will be communicated during the course |
| **Prerequisites / notice** | The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.  
Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.  
The control of performance will consist of:  
- an own short lecture  
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details |
| 751-6601-00L | Pig Science (HS)                | W+   | 2 credits | 2V    | to be announced |
| **Does not take place this semester.** | | | | | |
| **Abstract** | The overall goal of the course is to provide the essential scientific knowledge of pig animal health and behaviour and of the implications for husbandry and animal welfare. |
| **Objective** | Students will  
- understand the complex interactions of health management, behaviour and husbandry.  
- be trained to understand interdisciplinary and disciplinary research.  
- be able to critically analyze published research data.  
- be able to present precise scientific reports in oral and written form. |
| **Content** | Topics:  
- Understanding natural behaviour of pigs to improve their management  
- Welfare challenges in pig production  
- On-farm and post-mortem health assessment  
- Farrowing and lactation  
- Pig reproduction and associated problems  
- Piglet mortality and morbidity  
- Emotions  
- Cognition  
- Pain  
There will be 1 excursion to the pig stable of AgroVet Strickhof. |
| **Lecture notes** | Handouts/scripts are distributed by the the lecturers. |
| **Literature** | Specific literature is indicated by the lecturers. |
| **Prerequisites / notice** | Knowledge in animal health, animal welfare and ethology is recommended but not required.  
The lectures will be in English and German (depending on the lecturers) |
| 751-6001-00L | Forum: Livestock in the World Food System | W+ | 2 credits | 1S | S. Meese |
| **Number of participants limited to 20.** | | | | | |
At the end of this course, the students are aware of food and feed as sources of different bioactive compounds. By a comprehensive understanding of the connection between bioavailability, molecular mechanisms and biological effects, they are able to apply their knowledge on beneficial and detrimental effects of bioactive food and feed components in the fields of human and animal nutrition.

This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

The course provides students with the basic knowledge to understand the connection between the structure of nutritious and non-nutritive bioactive food and feed components and their effects on the nutrient supply and health of humans and livestock as well as on the quality of animal-derived foods.

The Forum “Livestock in the World Food System” will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

There will be a discussion in small groups at several choosable dates.

Lecturers: S. E. Ulbrich
ECTS: 2 credits
Ruminal Digestion

Bioactive Food and Feed Components

Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 23 of 2140
Content

The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

Lecture notes

The teaching slides and other materials will be provided during the course.

Literature

Information about books and other references will be communicated during the course.

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

Abstract

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes

Publications and class notes can be downloaded from a web page announced during the lecture.

Literature

Papers will be assigned and downloaded from a web page announced during the lecture.

★★★ Livestock Genetics

</tbody>
</table>

Abstract

Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.

Objective

Learning Objectives: Part 1:
- At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:
- The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

The students:
- have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
- can name the national and international efforts to conserve agricultural livestock breeds.
- know how to describe genetic diversity.
- can point out what is important in the management of small populations.
- can describe different conservation measures, especially in situ and ex situ conservation.
- can describe current national and international conservation programmes for different livestock breeds.

Prerequisites / notice

Examination:
- Examination Part 1: Graded written examination (1 hour) on the material covered.
- Examination Part 2: Graded semester performance completed during the block course.

Parts 1 and 2 contribute equally to the final grade.

751-6305-00L Livestock Breeding and Genomics

Abstract

Swiss routine breeding value estimation/genetic evaluation systems of cattle, pig, sheep and goats are presented with methods and evaluated traits. Examples will be demonstrated using the statistical software R.

Objective

The students know the theoretical and practical application of breeding value estimation in Switzerland for cattle, pig, sheep and goats. The students are able to interpret estimated breeding values.

Content

- Applied genetic evaluation in cattle (data, methods, traits, national and international genetic evaluations)
- Applied genetic evaluation in pigs (data, methods, traits)
- Applied genetic evaluation in sheep and goats (data, methods, traits)

Learning notes

Course notes in the form of a monograph, copies of the slides and solutions to the exercise questions are available on the net.

Literature

To be announced in the lectures.

★★★ Methodology Competences

★★★ Methods for Scientific Research

Number

<table>
<thead>
<tr>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

Abstract

Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

Objective

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.
Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Prerequisites / notice

Handouts will be available (in English)

Lecture notes

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

Taught competencies

Domain A - Subject-specific Competencies

751-6127-00L Practical Course in Microscopy of Functional Histology

W+ 3 credits 6P not available

Objective

Grundlagen der Histologie; Gewebedünn schnitte (Gefrier- und Paraffinschnitte) und deren Übersichtsfärbungen und Immunhistochemie; Fortgeschrittene Mikroskopie von Gewebedünn schnitten; Kritische Bewertung von Physiologiedaten, pathologisch/histologischer Kriterien

Abstract

Die "Funktionelle Histologie" beschreibt die histologischen und zytologischen Strukturen mit ihren jeweiligen Aufgaben und Wechselwirkungen innerhalb ausgewählter Organsysteme. Die endokrinologisch relevanten Organe und deren Präparationen werden am Beispiel des Rindes kenne gelernt.

Literature

Lecture notes

Skript über die Herstellung mikroskopischer Präparate, zu Übersichtsfärbungen und zu den Prinzipien der Immunohistologie sowie zu den mikroskopischen Techniken und originäre Literatur über die Funktion des Organs in Zusammenhang mit agrarwissenschaftlichem Kontext.

952-1911-00L Practical Course Epigenetics

W+ 3 credits 6P not available

Abstract

The practical course will comprise of lecture elements introducing the topic of epigenetics and a large amount of practical work for performing DNA methylation analyses on your own. We will focus on DNA extraction and the estimation of global and local DNA methylation.

Objective

- The competencies and aims for the course are:
- Get first hands-on experience with the experimental techniques.
- Answer a scientific question by conducting experiments.
- Obtain results of an experiment and get insight into what affects technical variation and thus influences reproducibility.
- Interpret results in an adequate manner to solve a scientific question.
- Combine results to draw an adequate conclusion.
- Present a research paper on epigenetics.

Lecture notes

You will receive in advance a selection of research papers, a document with the theoretical background of the techniques included in the course, the slides of the lessons in pdf and a detailed protocol of the work we will do.

Prerequisites / notice

For receiving a total of 3 Credit Points for this practical course we kindly ask you to actively take part in the practical performance. In addition, you will have to pass a short written examination about the theoretical background of the techniques and results interpretation. Finally, after the course, you will have to submit a lab report to be handed in at the beginning of the spring semester.

751-6003-00L Training Course in Research Groups (Large)

W+ 6 credits 13P

S. M. Bernal Ulloa, S. Neuenschwander, H. Pausch, M. Saenz de Juano Ribes, S. E. Ulbrich
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Abstract
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.

Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends.

The total time budget is equivalent to about 90 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

751-6003-01L Training Course in Research Groups (Small) W+ 3 credits 6P S. M. Bernal Ulloa, S. Neuenschwander, H. Pausch, M. Saenz de Juano Ribes, S. E. Ulbrich

Project Management for Scientific Research

Number Title Type ECTS Hours Lecturers
751-6001-00L Forum: Livestock in the World Food System W+ 2 credits 1S S. Meese

Abstract
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Content
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

Lecture notes
Introductions to both forms of presentation will be offered by the lecturer.

Prerequisites / notice
The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time. No scriptum is required.

751-5201-10L Tropical Cropping Systems, Soils and Livelihoods W+ 2 credits 2G J. Six, K. Benabderrazik

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.
At the end of the course the students are qualified to develop sustainable solutions for weed problems in agricultural and natural habitats.

Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops. Accordingly, this knowledge will be imparted during the course and will be required to understand the mechanisms of integrated weed control strategies.

</table>

**Abstract**
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus on coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

**Content**
Students of this course will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. The course includes lectures, small group discussions and outside readings.

<td>2</td>
<td>2G</td>
<td>J. Collatz, M. Meissle</td>
</tr>
</tbody>
</table>

**Abstract**
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

**Objective**
Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

**Content**
Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

**Prerequisites / notice**
Material will be distributed during the course.

**Lecture notes**
A part of the course will take place in flipped classroom mode, i.e. the lectures on 28.9., 5.10., 19.10., 16.11. and 23.11. will be available as podcasts.

---

### 701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

<table>

<td>2G</td>
<td>R. R. Regös, S. Bonhoeffer</td>
</tr>
</tbody>
</table>

**Abstract**
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

**Objective**
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

**Content**
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

**Prerequisites / notice**
A part of the course will take place in flipped classroom mode, i.e. the lectures on 28.9., 5.10., 19.10., 16.11. and 23.11. will be available as podcasts.

**Lecture notes**
Material will be distributed during the course.

**Literature**
Publications and class notes can be downloaded from a web page announced during the lecture.

</tbody>
</table>

**Abstract**
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

**Objective**
The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

**Content**
One exercise will be on an e-learning base (with computers) also to prepare the students for the final e-exam.

**Prerequisites / notice**
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise.

**Lecture notes**
A part of the course will take place in flipped classroom mode, i.e. the lectures on 28.9., 5.10., 19.10., 16.11. and 23.11. will be available as podcasts.

**Literature**
Publications and class notes can be downloaded from a web page announced during the lecture.

W. Frossard

The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Abstract

The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective

At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes

Documents will be distributed during the lecture.

Prerequisites / notice

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosembio in the 3rd semester of the agricultural study program of the ETH or bring an equivalent knowledge. This knowledge is indispensable for this 7th semester.

751-5125-00L

Stable Isotope Ecology of Terrestrial Ecosystems

Number of participants limited to 20.

Abstract

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsopProject, practice to search and analyze literature as well as to give an oral presentation.

Content

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

Lecture notes

Handouts will be available on the webpage of the course.

Prerequisites / notice

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

</tbody>
</table>

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”.

Objective

Analyze publications on long-term field experiments regarding their content on integrated nutrient management; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

751-4003-01L

Current Topics in Grassland Sciences (HS)

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 29 of 2140
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:
- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along to up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes

Handouts will be available (in English)

Literature

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L).

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

751-5201-10L Tropical Cropping Systems, Soils and Livelihoods  W+  2 credits  2G  J. Six, K. Benabderrazik

Abstract

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

Objective

Part 1
- (1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
- (2) Interdisciplinary analysis of agricultural production systems
- (3) Knowledge on methods to assess Food and energy security in tropical agroecosystems

Part 2
- (4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
- (5) Gain practical knowledge on how to assess Food and Energy Security
- (6) Collaboration in international students and stakeholders

Content

Part 1 (Fall semester 2021)

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics or agricultural economics. Students will engage in readings, discussions and exchanges on the specificities of tropical agriculture.

Part 2 (Spring 2022)

On the second module, students gain practical knowledge on field - An integral part of the course is the two-week field project in a Tropical region, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to Food and Energy Security.

Prerequisites / notice

Students can only join Part 2 if Part 1 was taken and validated first.

A selection of 20 students for the Part 2 will be done on the basis of several elements. We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 28th 2021, justifying your motivation to enroll to this class.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity

Domain C - Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management
### Decision Making and Management

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
---|---|---|---|---|---
363-0403-00L | Introduction to Marketing | W+ | 3 credits | 2G | S. Brüggemann, F. von Wangenheim

**Abstract**
Students who take this course will increase their knowledge of marketing, its effect on consumer behavior and its role in creating long-term value. The course will introduce important concepts, frameworks and methods for marketing decision-making. A focus will be on managing customer relationships with the help of targeted promotions and data collected through digital technologies.

**Objective**
After taking the class, students will be able to

1. Define what marketing is and describe its role at different stages of the value chain
2. Apply psychological theories to analyze behavior (e.g., purchase behavior) and identify the needs of (prospective) customers in consumer and business markets
3. Design elements of the marketing mix—e.g., develop new products and set prices—in a way that creates long-term value
4. Create an effective and efficient marketing mix that attracts and engages customers, e.g., by running targeted promotions
5. Use quantitative methods and customer data to manage relationships with customers

**Content**
The class will center on the importance of marketing as an activity that creates long-term value for the benefit of organizations and their customers. It will teach concepts, frameworks and methods for marketing decision making.

The structure of the course will roughly follow the different steps of the value chain, i.e., the set of activities necessary for offering valuable products to customers. First, it will introduce students to psychological theories that help explain behavior, e.g., purchase behavior. It will also familiarize students with different methods from marketing research, which can be used to identify the needs of customers. Next, the course will look at the role of the marketing mix in satisfying customer needs. For example, the class will cover new product development and pricing. A focus will be on managing profitable, long-term relationships with customers. To this end, students will gain in-depth knowledge on the use of targeted promotions and marketing data to (1) attract, (2) convert and engage and (3) retain customers.

The course is designed to be “hands-on”, with opportunities to apply skills on business cases involving real-world marketing data. It will feature guest lectures from industry experts. The class might be taught in an in-person, remote or in a hybrid format.

751-2205-00L | Management for Enterprises in the Agri-Food-Chain II | W+ | 2 credits | 2G | M. Weber

**Abstract**
Advanced Management in the Agri-Food Chain: Framework and models for management of organizations in the Agri-Food Chain in a complex environment

**Objective**
After the lecture the students...

- know the characteristics and consequences of complexity in the organizational world,
- know and can apply selected comprehensive models for managing in complex situations,
- know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and... are able to deepen the relevant topics in an autonomous way.

**Content**
The lecture the following contents will be treated:

- State, reasons and effects of complexity in the organizational world.
- A basic framework for shaping and governing intelligent organizations.
- Selected contemporary models for managing in the complex organizational world.
- Transfer and adaption of the models to organizations in the Agri-Food Chain.

**Lecture notes**
Reader with selected contents.

751-2903-00L | Evaluation of Agricultural Policies | W+ | 3 credits | 2G | R. Huber, R. Finger, C. Schader

**Abstract**
In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.
The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

Content

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ’environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Prerequisites / notice

A detailed course schedule will be made available at the beginning of the semester. During the lecture we will work on Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

Taught competencies

- Domain A - Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies

- Domain B - Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Problem-solving
  - Project Management

- Domain C - Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
  - Negotiation

- Domain D - Personal Competencies
  - Adaptability and Flexibility
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

Abstract

The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

Objective

Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.
This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences. After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Lecture notes
Assigned reading materials and slides will be available via Moodle.

Literature
Assigned reading materials and slides will be available via Moodle.

Prerequisites / notice
This course will take place fully online. Course units have three components:

2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Methodology Competences
Methods in Agricultural Economics
### Empirical Methods in Management

**Number:** 363-0305-00L  
**Type:** +  
**ECTS:** 3 credits  
**Hours:** 2G  
**Lecturers:** S. Tillmanns

**Abstract:** In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evidence-based decision-making. The class includes group assignments, where students will cover small parts of the lecture content in self-created videos.

**Objective:** The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data using basic statistical approaches.

**Content:** Data has become an important resource in today's business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understanding of statistical approaches.

Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis for their decision-making. We recommend the lecture also to students without basic statistical skill, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics.

The lecture will be taught online this fall semester. Therefore, it involves group work, where students form groups in order to create small learning videos, which cover small parts of the lecture. These videos will be shown and discussed in the online lecture and will make up 30% of the final grade. Part of this assignment will be the evaluation of videos from other students. The preparation of the videos will also prepare students for the final exam. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.

**Literature**  
Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangelhem.

**Prerequisites / notice**  
The course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will form groups and create a learning video regarding one specific topic. Assignments will be graded and need to be turned in on time as they will be shown and discussed in class. Students will also have to evaluate the videos of other student groups. Online class participation is encouraged and can greatly improve students' learning. In this spirit, students are expected to attend class regularly and come to class prepared.

**Intermediate Econometrics**

**Number:** 363-0585-00L  
**Type:** +  
**ECTS:** 3 credits  
**Hours:** 2V  
**Lecturers:** G. Masllorens Fuentes

**Abstract:** The aim of the course is to discuss different econometric models and their empirical applications. We will cover cross-sectional linear and non-linear regression models, models for estimating treatment effects, and linear panel data models.

**Objective:** By the end of the course, students should understand the different existing approaches, their applicability, and their advantages and disadvantages. They should be able to read and understand regression output tables. Additionally, students will be able to apply the estimation approaches in practice using STATA.

**Content:** The lectures will consist of both theoretical and practical components. In the theoretical part, we will discuss each estimation approach in detail. The lecture will present the assumptions, derivations, as well as the advantages and disadvantages of the estimation approach.

In the empirical part, we will look at simulation results using artificial data. Furthermore, we will investigate a particular research question using STATA.

The course will tentatively cover the following subjects:
- review of ordinary least squares (OLS) estimation
- instrumental variable estimation and two-stage least squares estimation
- seemingly unrelated regression models
- simultaneous equation models
- maximum likelihood estimation
- binary response models
- count data models
- censored and truncated regression models
- sample selection models
- treatment effect models
- static linear panel data models (random effects and fixed effects estimation)

For the theoretical portions of the lectures, we will prepare slides for in-class discussion. Slides will be distributed electronically before each lecture.

For the applied portion of the lectures, we will provide STATA do files, log files, and data sets.

Problem sets will also be made available after every lecture. These problem sets will not be collected or graded, but students can use them in order to prepare for the final exam. Solutions will be made available in the following lecture.

While there is no required textbook for the course, we draw from the following texts, which are also recommend for the preparation of the exam:
- Angrist, J.D. and Jörn-Steffen Pischke. Mostly Harmless Econometrics.

**Risk Analysis and Risk Management in Agriculture**

**Number:** 751-0423-00L  
**Type:** +  
**ECTS:** 3 credits  
**Hours:** 2G  
**Lecturers:** R. Finger

**Abstract:** Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on farmers' decision making under risk and risk management. We present innovative insights, empirical example from European agriculture.

You gain hands-on experience using R.

**Objective**  
- to develop a better understanding of decision making under uncertainty and risk;  
- gain hands-on experience in risk analysis and management using R  
- to gain experience in different approaches to analyze risky decisions;  
- to develop an understanding for different sources of risk in agricultural production;  
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;  
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions.
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against the consequences of small changes are discussed.

The course is structured along three main tasks:

1. **PART 1** introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

2. **PART 2** discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

3. **PART 3**, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. Another objective of the self-study tasks is to practice efficient communication of such concepts. These are provided as home work and two of these will be graded (see “Prerequisites”).

**Lecture notes**
- The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

**Abstract**
- **Dynamic Simulation in Agricultural and Regional Economics**
  - In this class, students learn the basics of system dynamics and its application to agricultural and regional economic questions. In the second half of the class, students develop their own simulation model, with which they evaluate potential interventions for improving the economic as well as the ecological sustainability of food systems.

- **Systems Dynamics and Complexity**
  - Finding solutions: what is complexity, problem solving cycle.
  - Implementing solutions: project management, critical path method, quality control feedback loop.
  - Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption.

- **Introduction to Mathematical Optimization**
  - The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.
  - Topics covered in this course include: Linear programming (simplex method, duality theory, shadow prices, ...), Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...), Modelling with mathematical optimization: applications of mathematical programming in engineering.

- **Principles of Macroeconomics**
  - This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

The course webpage (to be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15062) contains announcements, course information and lecture slides.

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

**Abstract**

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

**Objective**

Part 1

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
2. Interdisciplinary analysis of agricultural production systems
3. Knowledge on methods to assess Food and energy security in tropical agroecosystems

Part 2

4. Hands-on training on the use of field methods, diagnostic tools and survey methods.
5. Gain practical knowledge on how to assess Food and Energy Security
6. Collaboration in international students and stakeholders

Part 1 (Fall semester 2021)

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, resilience to soil physics or agricultural economics. Students will engage in readings, discussions and exchanges on the specificities of tropical agriculture.

Part 2 (Spring 2022)

On the second module, students gain practical knowledge on field - An integral part of the course is the two-week field project in a Tropical region, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to Food and Energy Security.

**Prerequisites / notice**

Students can only join Part 2 if Part 1 was taken and validated first. A selection of 20 students for the Part 2 will be done on the basis of several elements. We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 28th 2021, justifying your motivation to enroll to this class.
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomics parameters like social capital or perceptions.
Data has become an important resource in today's business environment, which can be used to make better management decisions.

Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on risk analysis and risk management in agriculture. Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

Empirical Methods in Management - Students learn the basic theory and practice of dynamic simulation
- By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

Risk Analysis and Risk Management in Agriculture - Students learn how to understand and conduct empirical research. It will enable them to manage a business based on evident-based decision-making. Students will form groups and create a learning video regarding one specific topic. Assignments will be graded and need to be turned in on time as they will be shown and discussed in class. Students will also have to evaluate the videos of other student groups.

Dynamic Simulation in Agricultural and Regional Economics - Students learn the basic theory and practice of dynamic simulation. Therefore, this course introduces problems and key concepts of empirical research, which might be qualitative or quantitative in its nature.

In this class, students learn how to understand and conduct empirical research. The course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will form groups and create a learning video regarding one specific topic. Assignments will be graded and need to be turned-in on time as they will be shown and discussed in class. Students will also have to evaluate the videos of other student groups. Online class participation is encouraged and can greatly improve students' learning. In this spirit, students are expected to attend class regularly and come to class prepared.

Prerequisites / notice
Basic economic knowledge is expected.

Empirical Methods in Management
In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evident-based decision-making. The class includes group assignments, where students will cover small parts of the lecture content in self-created videos.

Objective
The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data by using basic statistical approaches.

Content
Data has become an important resource in today’s business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understand of statistical approaches. Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in its nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis auf their decision-making. We recommend the lecture also to students without basic statistical skill, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics.

The lecture will be taught online this fall semester. Therefore, it involves group work, where students form groups in order to create small learning videos, which cover small parts of the lecture. These videos will be shown and discussed in the online lecture and will make up 30% of the final grade. Part of this assignment will be the evaluation of videos from other students. The preparation of the videos will also prepare students for the final exam. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.

Literature
Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangenheim.

Prerequisites / notice
The course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will form groups and create a learning video regarding one specific topic. Assignments will be graded and need to be turned-in on time as they will be shown and discussed in class. Students will also have to evaluate the videos of other student groups. Online class participation is encouraged and can greatly improve students’ learning. In this spirit, students are expected to attend class regularly and come to class prepared.

851-0626-01L
International Aid and Development
Number of participants limited to 60

Prerequisites: Basic knowledge of economics

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 38 of 2140
Abstract
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Objective
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

Content
Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support; Fair-Trade.

Literature
Articles and book abstracts will be uploaded to a course website.

</tr>
</tbody>
</table>

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems, be able to analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices, based on real-life data. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Literature
Handouts will be available on the webpage of the course.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

</table>

Abstract
The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Literature
Documents will be distributed during the lecture.

Prerequisites / notice
Number of participants limited to 15. Priority will be given to students in Agricultural Sciences

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Objective
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsotopeProject, practice to search and analyze literature as well as give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

Literature
Handouts will be available on the webpage of the course.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Agronomy and Plant Breeding

Abstract

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

751-3603-00L Current Challenges in Plant Breeding

Number of participants limited to 15.

Abstract

The seminar 'Current challenges in plant breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding.

The topic this year will be: 'Plant Breeding a(nd) Data Science'.

Objective

The educational objectives cover both thematic competences and soft skills:

- Deepening of scientific knowledge in plant breeding
- Critical evaluation of current challenges and new concepts in plant breeding
- Promotion of collaboration and Master Thesis projects with practical plant breeders
- Soft skills:
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Presentation and discussion of the teamwork outcome
  - Establishing contacts and strengthening the network to national and international plant breeders and scientist

Content

Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA).

Lecture notes

Material will be distributed during the course

Literature

Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

Prerequisites / notice

Papers will be assigned and downloaded from a web page announced during the lecture.

751-5121-00L Insect Ecology

The number of participants is limited to 30.

Abstract

This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes lectures, small group discussions and outside readings.

Objective

The aim of the course is to gain an understanding of how insects have specialised and adapted to occupy diverse environmental niches and become vital to ecosystem processes. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions and examining insect ecology in an evolutionary context.

Lecture notes

Provided to students through Moodle

Literature

Peer-reviewed research articles, selected according to the topic.

Prerequisites / notice

Participation in the BSc course 'Pflanzenzüchtung' is strongly recommended, a completed course in 'Molecular Plant Breeding' is highly advantageous.

751-4811-00L Alien Organisms in Agriculture

Number of participants limited to 30.

Abstract

The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

Objective

Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content

Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Lecture notes

Material will be distributed during the course

Prerequisites / notice

A part of the course will take place in flipped classroom mode, i.e. the lectures on 28.9., 5.10., 19.10., 16.11. and 23.11. will be available as podcasts.

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

Abstract

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes

Publications and class notes can be downloaded from a web page announced during the lecture.

Literature

Papers will be assigned and downloaded from a web page announced during the lecture.

751-4506-00L Plant Pathology III

Number of participants limited to 20.

Abstract

Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective

The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content

One exercise will be on an e-learning base (with computers) also to prepare the students for the final e-exam.

Lecture notes

A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

Prerequisites / notice

The course will be in German (spec. nomenclature)

</table>
Theoretical basics and fundamental concepts of GIS are imparted and subsequently further elaborated. Communication

After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in small teams (2 to 3 members) to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

Lecture notes
Copies of the slides and exercises will be provided on the course web page.

Literature

Prerequisites / notice
No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

701-0951-00L GIS - Introduction into Geoinformation Science and Technology
Number of participants limited to 50.
Waiting list will be deleted October 8th, 2021.

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS.

Objective
At the end, the students will be able to independently solve basic realistic GIS problems.

Content
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;
### Functioning of Soil Systems

</table>

**Abstract**

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical mechanisms and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**

Students will understand and analyse the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems, be able to analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices, based on real-life data. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**

Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems. Responses of agroecosystems to the environment, i.e., climate and weather events, but also to management will be studied. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets and carbon sequestration. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

**Lecture notes**

Handouts will be available on the webpage of the course.

**Literature**

Will be discussed in class.

**Prerequisites / notice**

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

**Abstract**

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”.

**Objective**

Analyze publications on long-term field experiments regarding their content on integrated nutrient management; link this information, write it up in a report and present the results in an oral presentation; work in a group, ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

**Content**

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

**Abstract**

The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

**Objective**

At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.
### Lecture notes
Documents will be distributed during the lecture.

### Literature
Documents will be distributed during the lecture.

### Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH (or bring an equivalent knowledge). This knowledge is indispensable for this 7‘th semester.

### 751-5125-00L
**Stable Isotope Ecology of Terrestrial Ecosystems**

- **Number of participants limited to 20.**

**Abstract**
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions. Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

**Objective**
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

**Content**
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

**Lecture notes**
Handouts will be available on the webpage of the course.

**Literature**
Will be discussed in class.

**Prerequisites / notice**
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

### 701-0533-00L
**Soil and Water Chemistry**

- **W 3 credits**
- **2G**
- **R. Kretzschmar, D. I. Christl, L. Winkel**

**Abstract**
This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

**Objective**
1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

**Content**
Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

**Lecture notes**
Lecture slides on Moodle

**Literature**
- Chapters 1, 3, 4, 6, 7 and 11 in Sigg/Stumm – Aquatische Chemie, 6. Auflage, vdf, 2016.

**Prerequisites / notice**
The lecture courses Pedosphere and Hydrosphere are highly recommended.

### 701-0535-00L
**Environmental Soil Physics/Vadose Zone Hydrology**

- **W 3 credits**
- **2V+1U**
- **A. Carminati, P. U. Lehmann Grunder**

**Abstract**
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales.

**Objective**
Students are able to
- characterize porous media at different scales
- parameterize structural, flow and transport properties of partially-saturated porous media
- quantify driving forces and resulting fluxes of water, solute, and heat in soils
Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed. The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying pedoclimatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research.

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants; to calculate plant water status for varying pedoclimatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research.
Part 1 (Fall semester 2021)
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, resilience to soil physics or agricultural economics. Students will engage in readings, discussions and exchanges on the specificities of tropical agriculture.

Part 2 (Spring 2022)
On the second module, students gain practical knowledge on field - An integral part of the course is the two-week field project in a Tropical region, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to Food and Energy Security.

Prerequisites / notice
Students can only join Part 2 if Part 1 was taken and validated first.
A selection of 20 students for the Part 2 will be done on the basis of several elements. We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 28th 2021, justifying your motivation to enroll to this class.

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

| W | 3 credits | 2G | R. R. Regös, S. Bonhoeffer |

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year to correspond to the progress and new results occurring in the current year.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

751-5101-00L Biogeochemistry and Sustainable Management

| W | 2 credits | 2G | W. Eugster, V. Klaus |

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems, be able to analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices, based on real-life data. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems. Responses of agroecosystems to the environment; i.e., to climate and weather events, but also to management will be studied. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets and carbon sequestration. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Handouts will be available on the webpage of the course.

Prerequisites / notice
Will be discussed in class.

751-3405-00L Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

| W | 4 credits | 4G | E. Frossard, L. P. Schönholzer, M. Wiggenhauser |

Abstract
The course discusses the mechanistic relationships between nutrient specification in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the specification of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes
Documents will be distributed during the lecture.

Literature
Documents will be distributed during the lecture.

Prerequisites / notice
Documents will be distributed during the lecture.

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH (or bring an equivalent knowledge). This knowledge is indispensable for this 7th semester.

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

| W | 2 credits | 2G | R. A. Werner, N. Buchmann, A. Gessler, M. Lehmann |

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective
Students will become familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know concepts classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small lab project, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Handouts will be available on the webpage of the course.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.
Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For

Copies of the slides and exercises will be provided on the course web page

Current Aspects of Nutrient Cycle in Agro-
Ecosystems

Does not take place this semester.

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”.

Objective

Analyze publications on long-term field experiments regarding their content on integrated nutrient management; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

Current Topics in Grassland Sciences (HS) W 2 credits 2S A. K. Gilgen

Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

Plant Pathology III W 2 credits 2G M. Maurhofer Bringolf

Number of participants limited to 20.

Abstract

Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective

The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content

One exercise will be on an e-learning base (with computers) also to prepare the students for the final e-exam.

Lecture notes

A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

Prerequisites / notice

The course will be in German (spec. nomenclature)

Introduction to Agricultural Robotics W+ 3 credits 2G S. Mintchev

Number of participants limited to 20.

Abstract

In this course, students will learn theoretical and practical aspects of robotics. Lectures will give an introduction to how robots operate in the real world. Students will apply the concepts learned in class on educational robots to simulate a weeding task.

Objective

After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

Content

Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding. The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

Domain A - Subject-specific Competencies

Concepts and Theories

Techniques and Technologies

Domain B - Method-specific Competencies

Analytical Competencies

Problem-solving

Domain D - Personal Competencies

Critical Thinking

not assessed

not assessed

not assessed

Copies of the slides and exercises will be provided on the course web page

No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Class size limitation to 20 students.
Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation
- Self-direction and Self-management

Non-Ruminant Science

<table>

<tr>
<td>751-6601-00L</td>
<td>Pig Science (HS)</td>
<td>W</td>
<td>2</td>
<td>2V</td>
<td>to be announced</td>
</tr>
</tbody>
</table>

Abstract
The overall goal of the course is to provide the essential scientific knowledge of pig animal health and behaviour and of the implications for husbandry and animal welfare.

Objective
Students will
- understand the complex interactions of health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

Content
Topics:
- Understanding natural behaviour of pigs to improve their management
- Welfare challenges in pig production
- On-farm and post-mortem health assessment
- Farrowing and lactation
- Pig reproduction and associated problems
- Piglet mortality and morbidity
- Emotions
- Cognition
- Pain

There will be 1 excursion to the pig stable of AgroVet Strickhof.

The final grade will be based on a poster presentation (30%, mid-semester) and a final written exam (70%, end of semester)

Lecture notes
Handouts/scripts are distributed by the lecturers.

Literature
Specific literature is indicated by the lecturers.

Prerequisites / notice
Knowledge in animal health, animal welfare and ethology is recommended but not required.

The lectures will be in English and German (depending on the lecturers)

Breeding and conservation of Animal Genetic Resources

Abstract
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.

Objective
Learning Objectives: Part 1:
At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:
The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

The students:
- have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
- can name the national and international efforts to conserve agricultural livestock breeds.
- know how to describe genetic diversity.
- can point out what is important in the management of small populations.
- can describe different conservation measures, especially in situ and ex situ conservation.
- can describe current national and international conservation programmes for different livestock breeds.

Prerequisites / notice
Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered.
Examination Part 2: Graded semester performance completed during the block course.
Parts 1 and 2 contribute equally to the final grade.

Forum: Livestock in the World Food System

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 49 of 2140
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

### Prerequisites / notice

**Prerequisites:**
- Examination Part 1: Graded written examination (1 hour) on the material covered.
- Examination Part 2: Graded semester performance completed during the block course.
- Parts 1 and 2 contribute equally to the final grade.

**Notice:**
- Does not take place this semester.
- Not available.
Content
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
  - Disciplinary topics: 32 h
  - Rumen Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

Lecture notes
- Documentations, links and other materials will be provided at the start of the course
- Information on books and other references will be communicated during the course

Prerequisites / notice
- The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.
- The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.
- Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.
- The control of performance will consist of:
  - an own short lecture
  - a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

751-7211-00L Ruminal Digestion

Abstract
This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

Objective
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Content
Structure of the contact hour part of the course (16 h):

2 h Introduction and blackboard exercise

8 h Basic topics in ruminal digestion, lectures and group exercises:
- Systematics of the microbes involved in microbial digestion
- Measurement of microbial digestion
- Interactions of microbes and epithelium of the digestive tract
- Differences between ruminal and hindgut microbial digestion
- Microbial nutrient degradation and its modification
- Efficiency of microbial protein synthesis
- Manipulation of the ruminal digestion

4 h exercise at AgroVet-Strickhof:
- Measurements of microbial digestion
- Laboratory exercise with a rumen fistulated cow and a Rumen Simulation Technique

2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

751-6001-00L Forum: Livestock in the World Food System

Abstract
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

Introductions to both forms of presentation will be offered by the lecturer.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

There will be a discussion in small groups at several choosable dates.

Introductions to both forms of presentation will be offered by the lecturer.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

### Safety and Quality in Agri-Food Chain

</tbody>
</table>

**Abstract**
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

**Content**
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

Introductions to both forms of presentation will be offered by the lecturer.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

**Lecture notes**
no script

**Prerequisites / notice**
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

**Abstract**
This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

**Objective**
The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.

**Abstract**
This course will provide knowledge and biological background on genetically modified organisms (GMO) which are used worldwide in food production systems. The course discusses health issues, the legislation frame and food safety aspects of GMO applications in agriculture, food production and consumption in Switzerland and EU-countries.

**Objective**
This course will provide knowledge and biological background on genetically modified organisms (GMO) and food produced with the help of GMO, especially on the molecular basis of GMO constructions with emphasis on genetically modified food in Switzerland and the EU. Criteria of rationale food safety and health assessment in agriculture and food consumption will be elaborated.

**Content**
Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used transgenes in food as well as on GMO used for food production and their detection technologies in food; food safety assessment of GMO foods; information on the legislation in Switzerland and EU-countries

**Lecture notes**
Copies of slides from lectures will be provided

**Literature**
Actual publications from literature will be provided

**Prerequisites / notice**
Good knowledge in biology, especially in microbiology and molecular biology are prerequisites. Some contents will be provided by registered students who will present as a group an actual publication.

<td>B. E. Baumer, J. M. Sych</td>
</tr>
</tbody>
</table>

**Abstract**
Lecture type course with an interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing.

**Objective**
Students should be able to:
- describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food
- apply these criteria when assessing the effects of selected processing technologies on nutritional quality.
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods).

**Content**
The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g. nutritional profile) will be addressed.

**Lecture notes**
There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course.
The course provides students with the basic knowledge to understand the connection between the structure of nutritive and non-nutritive bioactive food and feed components and their effects on the nutrient supply and health of humans and livestock as well as on the quality of animal-derived foods.

**Objective**

At the end of this course, the students are aware of food and feed as sources of different bioactive compounds. By a comprehensive understanding of the connection between bioavailability, molecular mechanisms and biological effects, they are able to apply their knowledge on beneficial and detrimental effects of bioactive food and feed components in the fields of human and animal nutrition.

**Content**

The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

**Lecture notes**

The teaching slides and other materials will be provided during the course.

**Literature**

Information about books and other references will be communicated during the course.

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

**Objective**

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Prerequisites / notice**

### 751-5510-00L Introduction to Agricultural Robotics

**W+** 3 credits 2G S. Mintchev

**Number of participants limited to 20.**

**Abstract**
In this course, students will learn theoretical and practical aspects of robotics. Lectures will give an introduction to how robots operate in the real world. Students will apply the concepts learned in class on educational robots to simulate a weeding task.

**Objective**
After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

**Content**
Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding. The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in small teams (2 to 3 members) to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this “robot design” exercise during presentations and in a journal report.

**Lecture notes**
Copies of the slides and exercises will be provided on the course web page

**Literature**

---

### 751-5005-00L Agroecology and the Transition to Sustainable Food Systems

**W+** 2 credits 2G M. Sonneveld, M. Grant, S. E. Ulbrich, B. Wehrli

**Abstract**
The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

**Objective**
Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions. This course enables students and an interested public to engage in a lively and critical debate and to learn about scientific contributions to agroecology. Based on the knowledge gained, students are able to form a personal opinion on the role of agroecology and to reflect on the different facets and real-world applications supporting a transition towards sustainable food systems.

**Content**
Organization of the lecture:
The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).

Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture: At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):
The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.

While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):
The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/61315399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

**Lecture notes**
On the Moodle-page you can find some pre-readings for the course.

**Prerequisites / notice**
The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.

---

### 701-0903-00L The Sustainable Development Goals Book Club

**W+** 2 credits B. B. Pearce, J. Ghazoul

**Abstract**
The Sustainable Development Goals Book Club is designed as a public lecture on “Agroecology and the Transition to Sustainable Food Systems” to allow for different perspectives to be represented, heard and discussed.
Abstract
The ETH Sustainable Development Goals Book Club is a colloquium for Bachelor students within and outside of Department of Environmental Systems Science centered around the discussion of themes from a single book, with the aim of fostering interdisciplinary, intellectual and critical exploration of the scientific and societal complexities related to the Sustainable Development Goals.

Objective
The aims of this course are to:
- Create an interdisciplinary approach to understanding key concepts of sustainable development and the SDGs
- Create solidarity through a cultural of intellectual exchange at ETH Zurich
- Create a common object of intellectual reference for students with different disciplinary interests to enable diverse ways and modes of thinking

Content
The course is similar to 701-0019-00L Readings in Environmental Thinking with the following differences:
- Targeted at Bachelor’s students (especially first and second year, but open to all) within and outside of the department.
- All participating students will read one book whose themes will be the basis for discussions.
- These discussions, taking place both online and in-person, will be moderated by the main lecturers of the course and discussed by additional professors from within and outside of D-USYS.
- Each discussion will be based on a chapter of a book, always linked to a particular aspect of the SDGs.
- The modes of discussion will vary in length and form, ranging from the traditional, sit-down meeting, to a Twitter book club format (as already pioneered and popularized by author Robert MacFarlane).
- Both students and professors will lead the discussions alternatively.
- Each discussion session will result in a visual output or another shareable output that will be developed by a student or group of students.

Literature
TBD
Could be one of the books already used in 701-0019-00L Readings in Environmental Thinking (Silent Spring, The Sand County Almanac, Collapse..etc.)
Other possibilities:
- Thinking in systems
- Limits to Growth
- Operating Manual for Spaceship Earth
- Small is Beautiful
- For the Common Good
- Factfulness
- The Prize: The Epic Quest for Oil, Money and Power (history of the global petroleum industry from 1850s-1990)

Prerequisites / notice
none

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written under the guidance of an agricultural science professor.

Objective
The independent writing of a scientific paper/thesis

### Structural Design I

**Number:** 052-0603-00L  
**Title:** Structural Design I  
**Type:** O  
**ECTS:** 2 credits  
**Hours:** 3G  
**Lecturers:** P. Block, J. Schwartz

**Abstract:** Determination of internal forces and description of structural behaviour of mixed arches and cable structures, of truss systems, beams, slabs, panels and frames using method of graphical statics as well as dimensioning of these structural systems. Structural behaviour of columns. Discussion of reference buildings and illustration of interplay of structural system and architectural intention.

**Objective:** Awareness of the most important structural systems. Understanding of the interplay of load and form. Estimation of the inner forces and dimensioning of elements.

**Content:** After a general introduction of basic concepts, structural systems such as cable and arch structures will be analyzed with the help of graphic statics. The students will learn to understand the flow of forces in a structural system in relation to the system’s form. They will be able to modify this force flow and give dimension to the structural components.

**Lecture notes:** 
- **on eQuilibrium**  
  "Script Tragwerksentwurf I/II"  
  http://www.block.arch.ethz.ch/eq/course/4?lang=en
- A printed version can be bought at the chair of Structural Design Prof. Schwartz for sFr. 55.-

**Literature:**
- "Rule of thumb structural design"  
  (Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2013, ISBN: 978-3-421-03904-0)
- Further learning material:
  - "Form and Forces: Designing Efficient, Expressive Structures"  
  - "The art of structures, Introduction to the functioning of structures in architecture"  

### Sociology I

**Number:** 052-0703-00L  
**Title:** Sociology I  
**Type:** W  
**ECTS:** 2 credits  
**Hours:** 2V  
**Lecturers:** C. Schmid, I. Apostol, N. Bathla, A. Hertzog-Fraser

**Abstract:** Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and contemporary forms of urbanization, and typical examples of models of urbanization.

**Objective:** This series of lectures should enable students to comprehend architecture in its social context.

**Content:** Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part central aspects of social change are examined, in particular the transition from Fordism to Neoliberalism and the interlinked processes of globalization and regionalization. The second part deals with historical and current forms of urbanization. Among other aspects, it focuses on the changed significance of the urban-rural contradiction, the processes of suburbanization, periurbanization, and planetary urbanization; the formation of global cities and metropolitan regions; the development of new urban configurations in centres (gentrification) and in urban peripheries (edge city, exopolis, new urban intensity). In the third part these general processes are illustrated by typical models of urbanization: Manchester, Chicago, Los Angeles, Paris and Zürich.

**Literature:** A detailed collection of original texts will be distributed.

### Building History I

**Number:** 052-0901-00L  
**Title:** Building History I  
**Type:** O  
**ECTS:** 2 credits  
**Hours:** 2V  
**Lecturers:** S. Holzer

**Abstract:** History of building from classical antiquity to modernity: building types, constructions, forms, with particular reference to functional issues such as flexibility of use, statics, durability. This is not a mere history lecture, but an important part of the basic introduction into construction.

**Objective:** Participants know the fundamentals of building history, including landmark monuments of each era, key historic constructions and forms. They are able to "read" a historic building and to relate it to building history. They are aware of the variety of historic building constructions.

**Content:** Building History I covers the period from classical Greek antiquity to Gothic architecture. The principal topics include construction issues such as Greek megalithic building, Roman mortar-and-rubble construction, and Gothic rationalism of vaulted architecture.

Within the Vitruvian and Albertian triad of firmitas, utilitas and venustas, we focus on the first two topics, whereas the last topic (deciphering the "meaning" of architecture) stands at the heart of the "architectural history" lectures. The present lecture contributes essentially to deepening knowledge about historic constructions, an indispensable precondition for building within existing fabric.

**Lecture notes:** Please keep a tight record of manuscript notes yourself. Lecture notes to some topics will be provided. pdf of lecture slides will be on line before each lecture.

**Literature:** Will be announced during the lectures.
The lecture introduces the most common building materials concrete, steel, masonry and timber, but also clay, glass and polymers. It covers the chronology and key works, protagonists and discourses of early modern European architecture. ‘Fundamentals for the History and Theory of Architecture I-II’ provides a practical introduction to the methods and instruments of the history of art and architecture.

</tbody>
</table>
| **Objective** | 1. Acquiring basic knowledge of the history and theory of architecture during the early modern period, of its key protagonists and discourses and of the methods and instruments of architectural research.  
2. Identifying the main architectural issues and debates of the period and recognising the places and architectural works covered in the course.  
3. Acquiring the tools to develop a historically informed reading of the built environment, recognising debates, styles, ideas and problems which drive and inform architectural production.  
4. Developing the tools to draw on historical, theoretical and critical research to the benefit of one’s own architectural culture. |
| **Content** | The course ‘History and Theory of Architecture I-II’ offers a chronological and thematic survey of early modern architecture and architectural theory produced in Europe from the 15th to 19th century. The course is based on thematic lectures, analysing key European architectural works, texts and iconography. Themes will include the origin of the Vitruvian tradition in architectural theory and practice and its dissemination in Italy during the 15th and 16th centuries; the mediation of architectural principles through the development of book production during the 16th century; the development of divergent theories of architectural composition and design in Italy and France between the 16th and 17th centuries; the formation and international spread of religious symbolism through architecture; analyses of original design practices, such as in the case of Michelangelo; a study of building types, such as the palazzo and the villa, and their codification by architects like Andrea Palladio; debates over questions of beauty and ornament, especially in the 17th and 18th centuries; questions of patronage and the relationship between architecture and political and religious powers (e.g. the French Monarchy and the Roman Papacy); the relation between buildings and their urban setting in the development of European capitals like Rome, Paris and Berlin; historicism and attitudes towards the past in architectural styles. In addition to the main lectures, the course ‘History and Theory of Architecture I-II’ will also include a series of seminars, called ‘Small Narratives’. These seminars are meant to widen the scope of the programme by exploring case studies, such as buildings and ruins in Zurich, which relate and contribute to the content of the course. While content of the ‘Small Narratives’ seminars is not part of the exam, students are invited to make use of it for their study, and attendance is compulsory. |
| **Literature** | Course scripts, PowerPoint presentations, and lecture recordings for ‘History and Theory of Architecture I-II’ will be available to download from the course page at the beginning of the semester. Printed copies of the course scripts will also be available for purchase. |
| **Prerequisites / notice** | For the course ‘History and Theory of Architecture I-II’ students will rely on assisted self-study to acquire basic knowledge of the history of architecture in Europe. |

Data: 20.09.2021 12:40  
Autumn Semester 2021  
Page 59 of 2140
The means and potentials in the field of urban planning and design are pointed out from different perspectives in order to shape the city in the sense of a future-proof and humane environment. To this end, the basic principles are explained and concrete methods of urban design are presented.

The goal is to provide students with a broad systemic basic knowledge, that enables them to synthesize and evaluate complex urban design and planning problems.

The lecture series imparts basic knowledge in urban planning and design. Pressing questions and main topics of contemporary urban design practice and theory will be addressed. The focus is on illustrating the richness of relationships as well as the potential of the discipline and its handling in everyday urban planning and design practice.

There is no script to the lecture series. The lectures are recorded on video and made available online on http://www.video.ethz.ch/lectures.html a few days after each lecture.

At the end of the year course a reader with secondary literature will be made available for download.

Further Informations: https://www.staedtebau.arch.ethz.ch

This course introduces computational design and teaches how design can be modeled and materialized using digital technology. Participants learn to use the computer strategically, thoughtfully, and sensitively within the design process. With the “digital literacy” acquired in this course, they develop an understanding of the potential of a digital building culture.

To systematically harvest the potential of the computer in their work processes, architects need an insight into the fundamental principles of information technology. In this course, students learn the concepts, methods, and instruments of computational design. By the end of the two semesters, students will have mastered the basics of 3D modeling techniques, parametric design, programming code for Computer-aided-design (CAD), and digital prototyping. The acquired knowledge qualifies students to use the computer as a unique instrument to model their designs. Participants also learn to apply CAD and programming code creatively and productively in planning, design, and construction.

Specifically, the learning goals are:

- Critical understanding of the possibilities of information technology in design
- Acquiring an overview of the mechanisms and types of CAD systems and digital building models
- Gaining knowledge of the basic principles of computational geometry
- Applying visualization techniques and creatively using various digital media
- Learning concepts and application of parametric design.
- Being able to integrate computer-aided analysis and optimization methods in design-process
- Understanding the principles of digital process chains from design to production
- Strategically using visual programming code
- Reading, understanding, and adapting programming code within CAD software.

Architecture is no longer conceivable without information technology. The planning, construction, operation, and ultimately the nature of buildings are increasingly influenced by digital technology. The digital is omnipresent both in the work of architects and in our built environment itself.

The courses Computational Design 1 and 2 offer an introduction to the character, challenges, and possibilities of digital technology in architectural design. The lectures will discuss the topics of digital building models and data, computational geometry, digital fabrication, machine intelligence, and mixed reality.

In this course, students will practice digital modeling processes and related techniques. The spectrum of exercises includes manual modeling, visual programming, and programming code within CAD software. Students learn to read, understand and adapt this code. In addition, the courses will provide insights into the nature and handling of different digital media formats, from real-time rendering to mixed reality.

Topics discussed within the lectures:

- CAD - background, and developments
- On the nature of digital models and data
- Architectural geometry
- Computational geometry
- Parametric and generative creation of models
- Computer-aided analysis and optimization of models
- Artificial intelligence and architectural models
- Materialization of digital models
- Mixed reality

Course Structure

The course consists of theoretical lectures, practical tutorials introducing technical concepts, and exercises supported by tutors. Participants can find updated and detailed information on Moodle, which is the learning platform for the course.

iology and Art I

Project grading at semester end is based on the list of enrolments on 2.11.21 (valuation date) only.
This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Attendance in the lecture „Thinking and Speaking about Art“. Elaboration of a self-contained artistic work in the framework of the group mentorates. (Emphasis of grading for the final semester grade: 3/5 final presentation, 1/5 written project-conception, 1/5 drawing examination in free and perspective drawing).

Objective
In the HS21, students prove artistic thinking and practise and develop their knowledge in a mentored course with an independent artistic work.

<tr>
<td>Abstract</td>
<td>This two-semester course is an introduction to the history of architecture from the Second Industrial Revolution in the 1850s to the Oil Crisis in the 1970s in Europe. Students will be able to identify the “things”—technical objects and ensembles—that transformed architecture, and to relate them to the technical, scientific, and cultural concerns that introduced them as key features of modernity.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>To introduce students to the history and theory of architecture, the course has three objectives. First, students will be able to identify the “things” that transformed architecture in modernity, and the crucial events, buildings, theories, and actors that characterize their history. Second, students will be able to describe how these “things” operated at different scales, focusing less on the formal level, and naming instead the different forms of expertise that constituted them historically, as well as the processes within which they were embedded. Third, students will be able to reflect on a series of apparatuses, devices, and building parts that are in fact micro-architectures which have often been neglected, despite their pivotal role in shaping the daily lives of modern societies.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course proposes a new approach to the study of the history and theory of architecture in Europe during modernity. It focuses less on single architects or their buildings, and more on those “things” that have brought profound transformations in the built environment and daily life over the last 200 years, such as the revolving door, the clock, and the partition. The notion of “thing” includes both the concrete building parts and the concerns associated with them, such as material performance, social synchronization, and individual expression. To understand buildings as assemblages of “things,” therefore, does not mean to diminish their significance, but on the contrary to add reality to them, to understand them in terms of the complex, historically situated, and diverse concerns within which they were designed. Each lecture introduces one “thing” through a genealogy that shaped it, from patents and scientific discoveries and technological advancement, to cinema, the visual arts, and literature. A set of renowned projects as well as lesser-known buildings from all around Europe offer a variety of case studies to describe these “things,” to understand how they operated in relation with one another, and to identify the theories and tactics that architects mobilized to make sense of them.</td>

<tr>
<td>Abstract</td>
<td>An introduction to information technology for architects. It is not about the HOW, but rather about the WHAT, not about virtuosity when dealing with digital tools, but rather about understanding coding. Not about pragmatism, but rather about literacy. It forms the basis of digital architectonics, the art of joining, which needs to be cultivated with care, prudence and patience.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Normally, one would expect this course to teach students how to draw architecture while using computers. This course does not because digital architectural models are not drawn, but encoded. In the current discussion about building information models (BIM), we see how blocked the situation can become when one draws architecture digitally. Today, digital models are a tedious ‘minefield’ with hundreds of gigabytes of data of all kinds. A digital model as code, however, is lightweight, compact and fast – a sparkling crystal, like poetry. That is why coding is the focus of this course. More specifically, students learn to read code and to value thinking in code. Learning active coding goes beyond the time-frame and should not be forced upon people. Thanks to digital awareness, students can quickly learn a wide variety of software using help available in the Internet, and competently use it according to their personal preferences. The aim of the course is for the students to develop as architects and to grow a digital personality. Specific reference is made to the history of architecture in conjunction with mathematics and philosophy. The essential tool of the trade is the lambda calculus in the implementation of Mathematica. The information technology interconnection of all digital media will be presented: text, image, graphic, model, animation, film, audio and the corresponding software. Current issues will be discussed: Internet, Internet of things, cryptography, privacy, big data, machine intelligence, building information models, responsive cities, smart homes, robotics, energy and logistics. Current and historical modelling processes will be worked on.</td>

**Abstract**

Moisture-related problems are common in buildings leading to costly damage and uncomfortable indoor environments. This course aims at providing the necessary theoretical background and training in order to foresee and avoid these problems.

**Objective**

- to develop a basic understanding of mass transport and buffering
- to become aware of potential moisture-related damage and health risks
- to learn how to (i) design building components and (ii) assess their hygrothermal performance

**Content**

- hygrothermal loads
- conservation of mass (dry air, water vapor, liquid water)
- moist air: constitutive behavior, transport, potential problems and solutions
- liquid water: constitutive behavior, transport, potential problems and solutions
- exercises

**Lecture notes**

Handouts, supporting material and exercises are provided online via Moodle.

**Prerequisites / notice**

Prior knowledge of "BP I: heat" is required.

### 052-0801-00L Global History of Urban Design I

**Abstract**

This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

**Objective**

The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01: The History and Theory of the City as Project
02: Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
09: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
010: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
011: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuiderplein

Lecture notes
Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

Literature
There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

Prerequisites / notice
A list of further recommended literature will be found within each chapter of the reader (Skript).

052-0707-00L Urban Design III

Abstract
Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

Objective
How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.

Content
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instablity present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

Lecture notes
The learning material, available via https://moodle-app2.etb.ethz.ch/ is comprised of:
- Toolbox Reader with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings

Literature
- Reading material will be provided throughout the semester.

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 63 of 2140
The two-semester course offers an introduction to the history of modern and contemporary art and architecture since ca. 1970. Motivated by questions of the current discourse, central topics and exemplary works of art and architecture are discussed. Concepts such as "labor", "economy", "experience", "research", "nature", "diversity" or "surface" are used to focus on specific historical developments and connections. Art and architecture is considered as a field of cultural change as well as an indicator of social, economic, and political conflicts which in turn helps to understand historical dynamics.

Abstract
The lecture series on History and Theory of Garden Design and Landscape Architecture deals with the historical development of designed landscapes within the cultural background of a changing perception of nature and landscape. The focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

Objective
Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic using case studies that investigate current structures as well as those relevant in terms of architecture and urban design. Active participation as well as interdisciplinary and process-oriented thinking are prerequisites.

Content

The focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

Literature
A reading list will be provided for the exams. Exchange students or students from other departments: Students, who are attending only one semester, may pass the oral end-of-semester examination. Test-relevant literature will also be made available for download for this purpose. The students are requested to get in touch by email with the Chair.

Lecture notes
The Slides from the lecture serve as lecture notes and are available as download.

052-0651-00L Building Process I

Abstract
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time. The lecture series is conceived as a yearlong course. Since the written session examination will test knowledge from both semesters, it is necessary for students to attend the lectures of both semesters.

Objective
Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic using case studies that investigate current structures as well as those relevant in terms of architecture and urban design. Active participation as well as interdisciplinary and process-oriented thinking on the part of students is a prerequisite.

Content

Lecture notes
A video documentation of the lecture class is available.

https://video.ethz.ch/lecture-d-arch/2019/0502-0807-00L.html

052-0705-00L Landscape Architecture I

Abstract
Introduction to the history and theory of garden design and landscape architecture. Analysis of the design of historical gardens and landscapes within the cultural background. Process thinking and a look at neighbouring countries complement the series.

Objective
The course covers the basic history and theory of garden design and landscape architecture from its beginnings to the 21st century. The course aims to raise awareness of a changing perception of nature and landscape.

Content

052-0609-00L Energy- and Climate Systems I

Abstract
The first semester of the annual course focuses on physical principles, component and systems for the efficient and sustainable heating, cooling and ventilation of buildings on different scales and the interaction of technical systems with architectural and urban design. After this lecture, students can identify relevant physical principles, active and passive approaches, technical components and systems for efficient and sustainable supply of buildings with heat, cold and fresh air. Students are aware of the implications and interactions of such technical systems on urban and architectural design, construction and operation of buildings. Using simplified methods of analysis and quantification, students are able to estimate the relevant qualities and quantities to supply a building.

Objective
1. Introduction and overview
2. Heating and cooling systems in buildings
3. Ventilation

Content
1. Introduction and overview
2. Heating and cooling systems in buildings
3. Ventilation

Lecture notes
The Slides from the lecture serve as lecture notes and are available as download.

Literature
A list of relevant literature is available at the chair.

052-0507-00L Architectural Technology V

Abstract
The lecture series explores the correlation among intentions of design, architectonic expression and construction premises. These critical areas or aspects of study, which are presented with selected projects, their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion.

Objective
The final part of the lecture series Konstruktion V/VI aims to analyse (structural) construction techniques and their formal appearance and expression in their interrelation. The different themed parts of structural design, building shell and knowledge of material get connected with architectural design in practice and reflected in the wider context of architectural theory. The intention is to consolidate the understanding of the connection between structure, process and formal appearance and expression in the architecture of the 20th century. The lecture series in the course entitled Architecture and Constructive explores the correlation among intentions of design, architectonic expression and construction premises. Each lecture is focused on individual themes, as for example, the application of certain materials (glass, or natural stone), of particular construction systems (tectonic, hybrid) or design generators (grids, series) and alternatively the search for a definable, tangible architectural expression (vernacular architecture, readymades). These critical areas or aspects of study, which are presented with their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion. The yearlong lecture cycle is comprised of twenty individual lectures, in which the majority of projects being analyzed date from the last few decades.
Lecture notes

The brochures published by the chair offer additional help. Knowledge of these brochures and their key subjects is recommended for the exam. The brochures can be ordered at the chair after the last lecture before the examination. However, the subject matters of the brochures and the lectures are not identical, the brochures provide information for a deeper understanding of the lectures. Apart from additional articles written by the chair, the brochures are composed of three modules: Project documentation, crucial texts on the work reception as well as theoretical articles about the particular thematic priorities by various authors. Concerning their content these anthologies allow insights into a wide range of theories, lines of reasoning and fields of research up to diverging point of views of specific problems.

Literature

List of literature per lecture.

Prerequisites / notice

General remarks (on exam as well as exam preparation)

The comprehensive topics of the lectures are the subject matter of the exam. The lectures are scheduled for a full year (Konstruktion V/VI) and therefore the knowledge of the subject matter of the running as well as of the preceding semester's lectures is required. To improve your chances to pass the examination at first try, we strongly recommend you to take the exam after having visited the lecture during two semesters.

A “Leistungslelement” as an interim exam will take place as part of the lecture in the first half of the semester. The interim exam is voluntary. It will be conducted under exam conditions and will be graded. Its grade will contribute to the overall grade of the course, if it has a positive influence.

If you are an exchange student, or a student from a different department and wish to take a partial examination covering only the subject matter of the last semester (Konstruktion V or VI), you need to contact the chair in advance.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Students who do not wish to change the design class don't have to partcipitate in the internal enrolment.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only.

This is the ultimate deadline to unsubscribe or enroll for the studio.

**Abstract**

The time spent in the home office has led, among other things, to the accumulation of trillions of bytes. The question of storage arises almost automatically. Starting from historical architectures of storage in Switzerland (HS), we discuss social, political and ecological questions of contemporary globalised flows of goods and data (FS) and try answer through an architectural design.

**Objective**

HS21

Ability to systematically analyse buildings from different eras and describe them photographically. The study and understanding of architectural rules, qualities and principles by means of graphic representations such as axonometrics, plan representations with shadows and colours, but also photographs and models.

FS22

Develop an independent, responsible and visionary attitude to a current social issue using the medium of (plan) collages. Ability to critically read and discuss (architectural) theoretical texts and relate them to the question. Developing an independent project that is coherent in terms of urban planning, typology and form, which deals constructively with the topic of reuse and is presented by means of a model and plans.

**Content**

Ideal Architecture: Storage

We understand the issue of storage space as an urgent and constant problematic for all human societies in all historical periods. Form the prehistoric jars to the city of Delphi where the ancient Greeks stored for the first time in history of Europe written documents and personal belongings. From the primitive caves to the Knosos palazzo, from the roman corn warehouses to the Nevada desert, where the hidden side of our cloud society lies with his enormous amount of space used for data storage.

The act of storing something has to do with the issue of the “standard” measure. Every epoch and every society culturally defines what their standards are, based on the very necessity of their historical time, and so the architecture of the storage space adapts itself to the ever-changing standards and thus evolves. For many periods the most important conventions about storing were derived from the human body. From the weight a healthy person can lift to the way a hand reaches for an object, the body conditions storage.

To categorize the things our society stores, is as vast as the society itself. Along most Swiss train tracks, one can observe form de-signed to hold materials in different consistencies. From liquid to aeriform to solids, from bulldozed bulk freight to stacked blocks, the physical forces demonstrate the movement and storing.

In this semester we want to look closely at the architecture of storage in Switzerland. By means of fieldwork, drawing, reading, discussion and designing we will search for the ideal in storage and propose a collection of the most interesting storage buildings. We believe that these buildings, in addition to being a crucial part of any functioning of society, possess an underappreciated beauty, and that through typological mapping have the potential to shed light on the mechanism of the built world.

FS22

REAL ARCHITECTURE: SPACE OF ACCUMULATION

Accumulation describes the gradual gathering of elements. It is the law by which many great things operate, such as civilization, history, economy and not least the formation of planets. Architecture is also subject to the law of accumulation, as buildings do not appear in an instant, but are gradually put together on the building site. What are the pyramids if not an accumulation of stones? One possible answer would be to say that they are storage, an architectural response to accumulation as old as time itself. Is the traditional storage still valid today? What can spaces of accumulation mean for architecture?

With the increased focus on accumulation of capital, goods and data in today’s society, you’d think that spaces of accumulation would be an essential part of our daily lives. Instead it is suspiciously missing from the public imagination, hidden away as some-thing necessary but unsightly. It’s true that the complexity and scale of accumulation can be unnerving and as the saying goes; you don’t want to know how the sausage is made. Nevertheless, could it be necessary to understand the sausage for a sustainable future?

In our studio, using the knowledge from the previous semester on the ideal storage, we will combine the ideal and the real in order to speculate about how recycling meets tomorrow’s space of accumulation, because we believe that answering the question about the accumulation of the future means implicitly linking architecture to the necessities and urgencies of the world to come.

**Literature**

- Book recommendation BUK I - IV: "Construction"; A reference work on contemporary construction

**052-0543-21L Architectural Design III: House Behaviorology in Switzerland (Kaijima)**

Teaching languages are English and German.

- Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class must not enrol.

- Project grading at semester end is based on the list of enrolments on 2.11.21 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

**Abstract**

The course focuses on a house and housing design in and around Zurich. Through the analysis of existing houses, including their users and locations, and by designing a housing complex, students learn about basic principles of housing design and the knowledge about issues of private/public, common spatial design for urban ecology.

**Objective**

- **Knowledge:**
  - Design research by actor network drawing (Week 1-4)
  - Learning about actor networks
  - Learning basic research methods (collection and analysis of data and information)
  - Understanding a building design by actor networks
  - Visualizing a building by actor network drawing
  - Finding design principles by drawing
  - Principles of house and housing design (Week 5-9)
  - Understanding the form of a house by understanding the behavior of climate, material, users, elements and typology
  - Learning which spaces are needed for houses and housing
  - Learning about dimensions in a house and housing design
  - Private/public and common spaces in an urban context, Design for inclusivity, Principles of Detailing and Construction (Week 10-14)
  - Learning about the architectural form and the gradient of privacy in houses and housing
  - Finding the potential of commonly used spaces
  - Learning how to design common spaces
  - Learning about how to design housing for everyone (children, elderly and differently abled people).
  - Learning about the behavior of architecture in relation to weather and climate
  - Learning about the behavior of materials
  - Learning about the behavior of structure and gravity
  - Learning the basics of detailing and construction
- **Skills:**
  - Hand drawing by pencil
  - CAD drawing and 3d modeling
  - Model building
  - Learning the character of different tools, the skills to apply them as design methods and hybridizing them to achieve the desired results.
Architectural behaviorology and actor network theory are our two guiding principles to not only design architecture but also understand our current existing environment.

By understanding a building, a house not as an isolated object but as a node in a vast and far reaching network, or several networks, we grow conscious of the impact, which our design has, not only on the specific plot, but on the neighbors, the city, the environment, the society. Vice-versa, analyzing and understanding the networks, which have shaped existing buildings, helps us to better understand how and why the design of those buildings came to be.

While identifying the relationship between actors within the network, we simultaneously observe the behavior of each actor as a result of their relationship. The behavior can be static or dynamic, actors can be human, non-human, animate or inanimate. How does a building behave towards its environment? What behavior do inhabitants engage in within and around a building? How do we have to design to take Behaviors of certain materials into account?

House and housing is the base of our living environment and a diverse fields in architecture. House behaviorology will set the challenge to find sustainable living condition in the city, by understanding historical examples and their geography, density, economic standing, and time period.

At first, to find the character and essence of today’s house and housing design in Zurich, we will start with analyzing existing single-family houses in and around the city. We will research and map how these basic units of housing relate to the users, to each other and to their surroundings. What kind of purposes they fulfilled and what kind of activities and behaviors do these houses enable?

Second, we will try to improve on the design by changing the single-family house into housing complexes, responding to the need of greater density, but still retaining the qualities of the original houses. Where do we find synergies, when combining houses? What kind of common spaces arise and how can we make use of them to make better neighborhoods?

Simultaneously we will have a close look on designing for inclusivity. How do we design for marginalized groups, such as the elderly, children or differently abled people? How can we live together in the urban ecology?

Grading Criteria

The submissions will be graded before each review. Students are expected to do individual work. Each submission will be graded according to the following points:

- Completeness and punctuality of the submission
- Research method, the ability to find and analyze information
- Understanding of the concept of behaviorology and the ability to implement behaviorology within the design
- Structural design, construction details and choice of material, in connection with concept of behaviorology and the actor network
- Choice of typology and design, in connection with the concept of behaviorology and the actor network
- Visualization, the ability to make easy to understand and compelling drawings

The final grade consists of the following partial grades:

- Mid review 1 submission: 30%
- Mid review 2 submission: 30%
- Final review submission: 40%

Lecture notes

Each student will receive a printed reader, containing the basic information about the course, such as schedule, syllabus and other important information, as well as examples and references for the design task, and readings to support the theoretical framework of the course.

Prerequisites / notice

To attend this course, students have to enroll through the "Enrolment in the Design Studios of D-Arch"-page:

The design studio is structured as a year-long course.

The submissions during the autumn semester will be individual work.

Schedule Autumn Semester 2021:

- Mid Review 1: 12. & 13.10.21
- Mid Review 2: 16. & 17.11.21
- Final Review: 21. & 22.12.21

Individual work only.

Costs: ca. 100 CHF (besides the seminar week)

Assistants

Teaching: Sandrine Badox, Tanguy Caversaccio, Christoph Danuser, Kelly Man

Research: Tazuru Harada

Collaboration: GTA, Chair for the Theory of Architecture

ITA, Chair of Structural Design

Domain A - Subject-specific Competencies

Concepts and Theories

Techniques and Technologies

Domain B - Method-specific Competencies

Analytical Competencies

Decision-making

Media and Digital Technologies

Problem-solving

Project Management

Domain C - Social Competencies

Communication

Cooperation and Teamwork

Customer Orientation

Leadership and Responsibility

Self-presentation and Social Influence

Sensitivity to Diversity

Negotiation

Domain D - Personal Competencies

Adaptability and Flexibility

Creative Thinking

Critical Thinking

Integrity and Work Ethics

Self-awareness and Self-reflection

Self-direction and Self-management

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
Students who do not wish to change the design class 
don't have to participate in the internal enrolment.

Project grading at semester end is based on the list
of enrolments on 2.11.21, 24:00 h (valuation date) only.
This is also the ultimate deadline to unsubscribe or enroll
for the studio.

Abstract
We are going to design a bath in the nearby forest. You are going to acquire profound knowledge about structural concepts and work with contradictions and corresponding aspects between spatial structure and support structure. Further key aspects are materials and their inherent properties, light and the roof structure as such. The specific context of the forest strongly informs the design process.

Objective
Over the course of the design studio, you are going to acquire specific knowledge about different concepts of construction and apply them to your own projects. Central topic during the semester is the development of a design based on a central structural idea.

You will be working on
- a precise relation between spatial and supporting structure
- a materialisation based on the principles of the structural concept
- a concept for openings and lighting based on the principles of the structural concept

You will learn to develop your project based on
- your structural concept
- specific aspects of building in the forest
- your in-depth analysis of the immediate surroundings of the chosen site

Most of the spaces we design will not be insulated. This allows for a simple and direct way of construction. Based on this, you will work out a part of your project in detail, relating to measurements of the human body.

Concerning the representation of your project, you will
- learn a solid way of drawing in CAD in a 1:200 scale
- use combinations of CAD and analog drawing to convey the intended atmosphere
- use and enhance your hand drawing for 3D illustrations

By building physical models, you can
- learn about the adequate detailing in a respective scale
- simulate actual joinings and find out about their impact on the architectural expression
- develop further abilities to represent materials and surfaces in an appropriate way

The acquired knowledge in relation to structure, material, lighting, drawing and model building will be the base for the 4th semester where we are going to elaborate on these topics in a more complex way, designing urban residential buildings.

Zurich has a very high density of outdoor and indoor swimming pools. Nevertheless, the use of the various institutions is intense, and the demand for additional facilities is increasing according to the rapid growth of the city’s population. In contrast, land reserves for the realization of further communal construction projects are scarce, and the pressure on local recreation areas is rising.

In this regard, our design task will be a forest bath in the Käferberg area close to the campus. Bathing in the forest allows a new experience of the local recreation area and adds a new level of use. The bath is explicitly not expected to feature a single large pool. Hence the actual way of bathing in the forest needs to be developed specifically in every project based on the structural idea and specific aspects of the chosen site. The bath is supposed to be open all year round. Therefore it offers both open and enclosed spaces, a rest area and the usual auxiliary spaces of a public bath. Special attention will be given to the transition of indoor and outdoor spaces which offers vast opportunities for specific designs between covered and uncovered, bright and dark, open and closed, and intelligent concepts for heated and uninsulated spaces.

During the definition of our approach to the design task, we will have several opportunities to spend time in the forest and get to know the controlled natural environment of the "urban forest". In several exercises at the beginning of the semester, we are developing collections of objects, drawings, and impressions. This pool of ideas will be present in the studio as a base to define your own field of interest, which will later condense in your projects.

The forest will be present in the studio in the form of a large model which we are going to build during the first weeks as a base for your daily work on your projects and the critiques. During the course of the semester, you can choose from a range of sites that differ in respect to the density of the forest, topography and access.

Throughout the 3rd semester, we are focusing on structure as a catalyst for our designs. You will learn about different structural concepts and apply their basic principles in your projects. Further key aspects are the use of materials and their inherent properties, a conscious way of designing with daylight, and the development of coherent roof structures.

Outlook 4th Semester
Next semester, the core subject of our studio will be programme instead of structure. We are going to design residential buildings in Zurich. Starting from a selection of inspirational houses and apartments which we are analysing and measuring during extensive visits at the beginning of the semester to get an understanding for their architectural elements and spatial, you are going to develop your own specific form of living. From a selection of different sites in the city center, you determine the best suited for your project and develop dwellings right down to the materialisation in detail. In doing so, we will pick up and elaborate the topics we are touching in the first semester on a more complex level.

The 3rd semester has been newly developed based on core topics of the chair. It replaces the respective fall semester courses which used to focus on working in the built fabric. Further information about the housing semester are available on our Website in the form of semester documentation brochures (see Small Pleasures of Life I-III, https://spiro.arch.ethz.ch/lehre/zweiter-jahreskurs).

Lecture notes
Documents provided by the chair.

Literature
We will be reading and discussing texts that are relevant for the main topic of the current series of exercises on a regular basis (extracts provided by the chair) throughout the semester.

052-0547-21L Architectural Design III: 333%. - (P)re-Zu-rich (J. De Vylder)

Teaching languages are English and German.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class must not enrol.

Project grading at semester end is based on the list of enrolments on 2.11.21 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

In semester HS / III, a simple exercise will explore the development of the same program in the two different contexts of NEW-USE and RE-USE. On a given free plot versus a given build plot, the same project will be designed. In the FS / IV semester, the same simple exercise will test the results of the previous semester on a subsequent change.

Objective

It is clear. As good as the whole realm is on track on Re-Word today, a critical moment must be ambitioned. But not just to be critical. But to give the idea of Re-Prefix a chance to go beyond the tendency and give a chance for a truly different Future of Attitude. And not just a Pragmatic Future, but a Future to Dream about. d-RE-AM. About.

Content

The 333% studio is a studio on the scale of the BA SEM III & IV expectations. At the same time, the 333% studio is part of a broader ambition shaped by the title 3.33% 33.3% 333%.

In fact, these 3 sets of 3 numbers are 3 different studios but sharing the same interest 3 times. The interest of RE-USE. In the 33.3% and 3.33% studio - MA SEM I, II and III - the idea of economy, ecology and ergonomics is explored with a gesture of 3.33% or 33.3% of the normal 100% investment. A true belief in the under-explored capacity to really do less. Or said: needing less.

The 333% studio takes the perspective across two semesters - HS / III and FS / IV. In semester HS / III, a simple exercise will explore the development of the same program in the two different contexts of NEW-USE and RE-USE. On a given free plot versus a given build plot, the same project will be designed. In the FS / IV semester, the same simple exercise will test the results of the previous semester on a subsequent change. Both projects from the previous semester will be challenged with a new program, twice each time. One can say: it is a matter of RE-USE - semester FS / IV - of the RE-USE and the NEW-USE - semester HS / III -.

We introduce the word (P)RE-USE here since the NEW USE - semester HS / III - will still be tested in its first concept for its ability to be prepared for the next RE-USE. Likewise, the RE-USE project will be evaluated for its ability to change once more.

We will talk about many more RE-PREFIX words. The RE-WORD - once started with the word RE-USE - is everywhere and always today. The RE-word is omnipresent and in many ways. Many RE-words have now been found and defined. And many more must and will be added. Never is it a play on words. Always it is another angle. Or to explore the idea more and more. And to discover yet another entrance.

re-use re-store rest-ore re-pair
re-act re-cycle re-care re-accept
re-sumptions re-compress(ions)* re-economy*
re-love re-leave re-less re-confirm
re-silence re-vive re-live
re-veal un-re-vel
re-collage re-configurate
re-observe re-call re-read re-focus re-draw re-practice re-detail re-invent re-question
re-strategy re-confront re-venture

At all. We will find out together that in the end, taking into account all these RE-WORDS, it is and will be more a matter of RE-ATTITUDE. USE words in account. Attitudes must be changed. At all.

RE-THINKING-RE is the alter ego of the 3.33% 33.3% 333% studios. If we are not critical, RE-ERA may only be a trend, but in fact it is and will always be an eternal URGE. The urge of u-R-g-E.

It is clear. As good as the whole realm is on track on RE-WORD today, a CRITICAL moment must be ambitioned. But not just to be CRITICAL. But to give the idea of RE-PREFIX a chance to go beyond the tendency and give a chance for a truly different FUTURE of ATTITUDE. And not just a PRAGMATIC FUTURE, but a FUTURE to DREAM about. d-RE-AM. About.

Course language are English and German.

Group work only.

No extra costs.
We aim to redefine and rediscover the architecture of the institution, “an organism that carries out a function of public interest” (according to Kahn). As the conditions were very modest. Due to the limited availability of materials, people had to be inventive. The possibilities for action were not limitless. It was necessary to observe the regularities written in the materials. The power of a place and its architecture emerged from the repetition of the almost identical.

In HS21 in Falera, we will investigate the question of whether, in our time of individual action and unrestricted access to materials, places can emerge that are able to inspire us.

Architecture requires a fine perception of what already exists and a courageous design for what is to come. As a basic requirement for both moments, we consider a sustainable attitude to be developed from the lifeworld collective. The aim of the course is to increase the sensitivity to such an attitude. At the same time, the skills should be learned to make this attitude effective. Dealing with the immediate reality of construction and material plays a key role in this.

There are places that touch us. The conditions that led to it were very different. In the mountain regions, for example, foreign capital worked on important trade routes or at the base of pass crossings, in other places the power of faith and religion. In remote regions, living conditions were very modest. Due to the limited availability of materials, people had to be inventive. The possibilities for action were not limitless. It was necessary to observe the regularities written in the materials. The power of a place and its architecture emerged from the repetition of the almost identical.

Many mountain villages were in a similar situation. There were major changes towards the end of the last century. Above all, tourism and the hotel industry, followed a little later by the construction of second homes, led to modest prosperity. The new opportunities resulted in a radical decline in agricultural livelihoods. The social structure of the village and the influence of the church have fallen. Liberation from these mighty bonds has been a relief for many. Effects were not lacking. Individual forms of life and the disappearance of local knowledge led to a leveling of phenomena in the entire Alpine region. The power of a specific place has largely been dissolved.

The freedom gained also has a downside. The canon of values that characterized the culture of space has disappeared. Orientation guidelines are always in question.

The big change also took place in the Graubünden village of Falera. The small farming village became a tourist place. Falera still likes to see itself as a farming village. Agriculture is still present. With the change, the farmers have moved to the edge of the village. The stables in the village center are empty or have been converted. Holiday homes were built in the style of farmhouses. The stable entity, which used to see itself as a farming village. Agriculture is still present. With the change, the farmers have moved to the edge of the village. The stables in the village center are empty or have been converted. Holiday homes were built in the style of farmhouses. - Managing with environmental conditions of a site (orientation, visual, circulation, resources, pre-existences, etc.).
- Having the ability to rethink the pre-established and the interest to discover unknown approaches.
- Incorporating an emotional approach to architecture – designing from experience.
- Controlling and articulating the various qualities of space (dimensional, material, environmental, etc.).
- Integrating the behaviour of the building as a fundamental part of the project.
- Designing with natural systems and thermodynamics to create spaces with “real” comfort.
- Re-learning how to live and build in future climate paradigms.
- Knowing how to find expression and character of spaces through the use of matter.
- Understanding the potential offered by construction systems and technology.
- Combining technical decisions with formal ones in a significant way.
- Detecting opportunities to give innovative answers to the relationship between buildings and nature.
- Incorporating interdependence as a determining factor in the design of buildings.
- Organizing the work in a way which is appropriate to the available time and the requested objectives.

Content

- Inspired by Louis Kahn's passionate and enigmatic interest in institutions and their origins, the aim of this studio is to investigate the possibility of a primordial architecture. A search for a “small” but essential architecture, able to define the character of an institution. What is substantial? What is really defining a theatre, a library, or a school? We are looking for new approaches that transcend the functionality of pre-established programs and discover their hidden nature, the invisible condition that characterizes each type of space and institution.

We aim to redefine and rediscover the architecture of the institution, “an organism that carries out a function of public interest” (according to the dictionary), “a world within the world”, “a centre around which existential space is organized” (according to Kahn).

The Studio will take place in a specific location in Zurich: a small but complex plot, cohabitating with various pre-existing elements that surround and condition it. Each student will be assigned one of these possible institutions:

LIBRARY - MUSEUM - SCHOOL - TEMPLE - TOWN HALL - MARKET - THEATRE - HOSPITAL - BATH - COURTHOUSE - GYM - ADMINISTRATION

The chosen site is voluntarily small - smaller than could be expected. The lack of space must be a positive condition, forcing us to take radical decisions. Necessary steps to discover the essence of the space: what is a priority, far from inherited or pre-established solutions.

To design the primordial (what really defines a place and the institution) we will need to go back and free ourselves from a part of what we have learned. To re-investigate the genesis of human activities, the sources and origins of what has historically set architecture.

This research requires a critical positioning. A confrontation with the established form, what could be a convention or just a trend. A fight against the status quo to allow us to redefine our values and our priorities, to discover the indispensable that qualifies as architecture.

We propose to deconstruct the great institutions, extracting the insubstantial and unnecessary to find their most elemental definition, their substance.

In the design of a new „small“ institution, as in a good poem, it will be necessary to synthesize, reconstruct and retain only the fundamental. To find what awakens the most emotional dimension of architecture. What is necessary and unnecessary. What supports its meaning, its form, and its character. How is it built. What is it made of. How it behaves. It will be a precision exercise: learn to prioritize.

The reduction to the essential does not mean giving up ambition. It is an opportunity to find the most decisive expression of architecture (where nothing is superfluous or missing). A unique architecture that remains convincing over the years. Architecture that transforms inert matter into something vivid and extraordinary.

We will look for architecture that activates these processes from a pragmatic and reciprocal approach. From thermodynamics and interactions with the environment to the structure and tectonics of construction techniques. From space composition to social behaviours. Everything necessary to design and calibrate exceptional spaces. Spaces of inspiration, precision and interdependence.

Pre-institutions (or small primordial institutions) that redefine our priorities. A soft but radical plot twist, that perhaps can show us a different understanding of architectural space.

Individual work and group work, whereof at least 5 weeks of group work.

Critiques: Dates will follow.

No extra costs.

Prerequisites / notice

052-1105-21L Architectural Design V-IX: (N.N.)  ■
Does not take place this semester.
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

Not offered in HS21.

052-1107-21L Architectural Design V-IX: Amplitude (Guestprof. M. Voser)  ■
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

Amplitude. Dynamic landscape structures for the Zealand.
The search for future-oriented strategies in dealing with these extremes requires a paradigm shift - from fighting against to working with natural processes. It is necessary to lay new landscape structures that can deal with the fluctuations of the amplitudes.

Objective

Basic knowledge in landscape architecture, development of an attitude, formulation of a hypothesis, choice of appropriate design elements, design and representation of complex / dynamic systems and landscapes, alternation between different scales.
Heat, drought, heavy rain events - in the course of climate change, the extremes are getting stronger and the frequencies in which they occur faster and faster. Natural and cultural landscapes that were in equilibrium until a few years ago need to be adapted. These changes will not only affect the life of flora, fauna and people, but also the character and ultimately the identity of our Swiss landscape.

The search for future-oriented strategies in dealing with these extremes requires a paradigm shift - from fighting against to working with natural processes. It is necessary to lay new landscape structures that can deal with the fluctuations of the amplitudes.

But how can the forces of extremes be used and turned into positive things? And how should the new landscape deal with the dynamics - direct, balance, absorb?

As the most important production area in Switzerland, the Three Lakes Region is exposed to these extremes, as witnessed by the debris flow in Cressier and the floods in July as well as the dry periods of recent years. Therefore, the third Jura water correction is currently being considered, which, in addition to the previous tasks of large-scale drainage and bed load management, also includes irrigation.

The territory between Lake Neuchâtel and Lake Biel is characterized by the most varied levels of culture, infrastructure, settlement and industrial landscapes. The spatial planning consideration reveals extremes: small-grained, historical settlement cores collide with sprawling industrial areas such as the last refinery in Switzerland.

In search of new scenic identities for this valley, we will deal intensively with systems, processes and strategies without losing sight of spatial qualities, atmospheres and poetry.

The introduction of a new water system serves as a design engine. Due to the complexity of the territory and the task, an iterative design method is pursued that oscillates between design and analysis and between large and small scales. The development of an attitude, the crystallization of the specific topics and the selection of the appropriate design means are just as much a part of the work process as the design of the transformation processes.

Prerequisites / notice
Group work only.
Critiques: 13.10.21, 17.11.21, 7.12.21.
Costs: CHF 150.-- (besides seminar week).

Abstract
This studio works on the idea that a substantial understanding of todays technology (internet of things, big data, machine intelligence ... ) changes the perspective to architectural theory and will result in different architectural designs and building constructions.

Objective
1) Identification and understanding of the challenges of todays technologies;
2) techniques of working within the plenty of the internet;
3) a methodology to design digital architectures;
4) understanding of the shift from hard building construction to soft building applications, and
5) an understanding of the importance of becoming a literate digital persona in order to be an architect today.

Content
FASHION, JOURNALISM, FEMINISM
‘IF NATURE IS UNJUST, CHANGE NATURE.’

About freedom, nature, technology, gender, intellect.

What it is, a HUMAN?

Gendered by nature or engendered by ratio?

An architectonic stageplay:
Coco Chanel (1918) moves into the Villa Lemoine of Rem Koolhaas (1998) to discuss the XENOFEMINIST MANIFESTO (2018)

METEORA #05 will use artificial intelligence to write a text to explicate a precise position in today’s world, to create a spectrum of images to reflect this world and design an architectural artefact which brings things into adequate proportions.
Visibility and its Hidden Dimensions:

We aim to seize economic requirements to transform constraints into levers, producers of qualities. These may well be tangible or intangible, prosaic or poetic, constant or unstable, general or occasional... As long as they are initiated by the economy and located far from any rationality. Creating generosity, “excesses” that make the strength and uniqueness of a place.

Starting from the book “Appearance of That Which Cannot Be Seen” by Armin Linke, the semester will unfold in three chapters:

CHAP 1: MYTHOLOGY
CHAP 2: FINDING FREEDOMS
CHAP 3: BINDING FRAGMENTS

Mandatory workshop on project site (Basel) with photographer Johannes Schwarz: 02-03.10.2021

It is highly recommended to students enrolling to our studio to also enroll and take part in our Seminarweek “Réactions / Actions”, which will take place at the Kunstgiesserei & Sitterwerk St-Gallen,

INTEGRATED WORKSHOPS:
Three sessions with Raphael Hefti
Photography with Johannes Schwarz
3D visualisations with Olivier Campagne
Structure with Giotto Messi
Facade and envelope with Gontran Dufour
Building climate with Illias Hischier

Visibility and movement:
There are also territories where one does not stop, places devoted to transit and exchange (business and industrial zones, areas near railway stations or airports, etc.). From these places, we can only have a partial vision, but also a vision in movement, a dynamic vision. From then on, they call for an architecture that adapts itself to this new speed of vision, and which opens onto another imaginary world. The history of art is full of these regenerations: the impressionists who revealed a new Paris by painting the “hidden banks” of the capital on the outskirts of the stations; street-art which gives back a cyma value to the gable walls, elements a priori the least worthy of attention in architecture.

Visibility and intimacy:
There is a “hidden dimension” (to use the title of Edward T. Hall's famous essay) that concerns our bubbles of intimacy, which vary according to times and cultures. These spheres remain the founding gauge of the human relationship with architecture. At what distance is a vis-à-vis acceptable? At what point does one start to see too much? Where is the boundary between proximity and voyeurism? Here we touch a balance, both intimate and social, between the visible and the invisible. What's more, we are living at a time when the apprehension of these “bubbles” is being altered by the health crisis.

Visibility and illusión:
The gaze is, in any case, fallible and to take note of it is also to explore new areas of the visible. The art of trompe l'oeil works on certain productive ironies between painting and architecture (the frescoes in the Hall of Giants in the Té Palace in Mantua, a simulacrum of a building collapse, or closer to us, the “masking” of the Louvre Pyramid by J.R.). This art of camouflage does not always have artistic aims. Just think of the tarpaulins that hide the scaffolding on monuments that are being renovated, and on which the façade of the monument in question is drawn or photographed. Proof of the need to keep the facade of an emblematic building in the field of visibility (and even in the simulacrum mode)!

Visibility and new tools:
The change in the way we look at things is also accompanied by an addiction to new tools. The advent of the digital image has had an unexpected consequence: in the cinema, in photography, on television, the nights are dimmer! Contours are better defined. Humans seem to have the vision of a cat! While the silver image better restores the density of the night, this darkness is both compact and indistinct, endowed with an enveloping dimension, with the impression that one can get lost in it. A digital night simply makes you believe that you are more in the dark, but in reality it is your mind that is being fooled.

Visibility and new tools: The advent of the digital image has had an unexpected consequence: in the cinema, in photography, on television, the nights are dimmer! Contours are better defined. Humans seem to have the vision of a cat! While the silver image better restores the density of the night, this darkness is both compact and indistinct, endowed with an enveloping dimension, with the impression that one can get lost in it. A digital night simply makes you believe that you have "dimmed the light" of the day, not that day and night are two opposing reigns.

Prerequisites / notice
Individual work only.

Critiques: Dates to follow

No extra costs.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Visibility and its Hidden Dimensions:
If something catches the eye, what is next to it will be mechanically less looked at. For a light to appear, it has to emerge from the surrounding darkness. And what attracts the light often leaves its surroundings in shadow. Hence an implacable theorem: the visible is always born from the invisible.

Objective
We aim to seize economic requirements to transform constraints into levers, producers of qualities. These may well be tangible or intangible, prosaic or poetic, constant or unstable, general or occasional... As long as they are initiated by the economy and located far from any rationality. Creating generosity, “excesses” that make the strength and uniqueness of a place.

Introduction: By Armin Linke, 20.09.2021 at 18:00
Midterm reviews: 13.10.2021 and 16.11.2021
Final review: 22.12.2021

Costs: CHF 150.-- (besides the seminar week).
The architecture of the city lies between the buildings. Too complex in nature, form and design to be understood as a single space, ground has become the network of mobility that defines the contemporary city. This semester, earth works will be the primer for a new experimental garden prepared with the Crowther Lab which, will in turn, lead to actions across Zurich’s greatest continuous interior.

**Prerequisites / notice**

Individual work and group work, whereof at least 5 weeks of group work.

**Critiques:** Dates to follow.

No extra costs.
Autumn Semester 2021

052-1117-21L
Architectural Design V-IX: What Counts? – Metabolism II (A.Gigon) 

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio

Abstract
Ecological issues have been current since the 1970s, but, despite all attempts to counter the trend, worldwide energy consumption has continued to increase unabatedly since then. The main problem is the associated greenhouse-gas emissions, a large proportion of which are caused by buildings, i.e. their construction and operation.

Objective
Ability to develop a draft from an idea, from a concept to a mature project, to constantly self-critically question intermediate stages and to find an individual design methodology and design stance.

Content
This semester we will tackle various questions:

- How good do different building materials – such as concrete, wood, steel, glass, brick, clay, natural stone – perform in terms of grey energy, grey CO2 and longevity? And in that case: What about thermal insulation, also with a view to the expected energy savings? This means: How can we find a critical balance between useable energy and grey energy in buildings in relation to their life cycles?
- What are the requirements that enable zero-energy or even zero-emission houses?

- What contribution can photovoltaic elements make, and under what conditions? And how can buildings be designed when incorporating them?

- And last but not least: What approach should we take to the mass of existing buildings with high energy and cooling requirements but equally with durable structures? When should we remodel, when should we rebuild?

- What should be done, what should be left as it is?

Based on a highly topical building assignment – the conversion and vertical extension of multi-storey office buildings to residential and commercial uses – we test if and how high ecological standards can be met in urban buildings. The interplay between existing buildings and new architectural elements interests us in terms of design, occupancy, constructional, and also ecological conceptualisation. The skilful balance is an art.

Construction and detailing are fundamental to this process (integrated discipline).

Along with the application of classic planning tools (sketches, plans, details, models), this semester we also practice with other/new instruments. Calculation tools are intended to allow us to produce initial gray energy estimates and assess the corresponding greenhouse gases, as well as the future useable energy, including CO2 emissions. The tools are introduced and discussed in tutorials.

Parallel to this, the architectural appearances of the projects are to be tested and refined, for which several tutorials will be held mid-semester onwards.

In addition, the experienced civil engineers Gregorij Meleshko, Christof Aerni and Markus Aerni will provide expert advice on the specific projects in an early “question time” session.

The semester will be co-supervised by Prof. Dr. Arno Schlüter and Dr. Illias Hischier from the Chair of Architecture and Building Systems. Inputs from an artistic perspective are provided by Prof. Karin Sander, who will also take part in the evaluations.

The semester starts with a joint seminar day, giving an initial overview of the breadth and challenges of the topics involved.

Various guests have been invited for lectures, discussions or evaluations, including:

- Prof. Dr. Karen Scrivener, STI, EPFL; and Prof. Dr. Guillaume Habert, D-BAUG, ETHZ
- Katrin Pfläfi, architect, co-author of, amongst others, SIA 2040, lecturer at the ZHAW; and Dr. Rolf Frischknecht, founder of treeze Ltd. life-cycle assessments, lecturer ETHZ
- Axel Simon, architectural critic and editor at Hochparterre; Philipp Noger, Competence Centre for Sustainable Building, City of Zurich.
- Prof. Dr. Harald Welzer, sociology, social psychology, author and publicist; Prof. Karin Sander, D-ARCH, ETHZ, artist; DanielBinswanger, journalist and editor at Republik
- Ingemar Vollenweider (jessenvollenweider architektur, Basel)
- Dr. Gianluca Ambrosetti, co-founder and CEO of Synhelion
- Louisa Hutton and Matthias Sauberbruch (Sauerbruch Hutton Architekten, Berlin);
- Erika Fries (Huggenbergerfries Architekten); Astrid Stauffer (Stauffer Hasler Architekten)

Markus Joachim and Dr. Katja will provide us with the opportunity to hold an exhibition in the Architecture and Civil Engineering Library on materials and their energetic and CO2 footprints.

Architectural Design V-IX: Before the Collapse - Architecting (Eco)Systems (A. Brandlhuber) 

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
We are continuing to explore the theme of cohabitation: the interplay of human and nonhuman systems in our built environment. We are focusing on a given ecosystem, as the context for our architectural proposals. Further, we are expanding our toolbox: storytelling and film continue to play an overarching role, but we are opening up the studio to other media and forms of architectural exploration.
Objective
The design studio is aimed at the students acquiring the following skills:

Prefigurative Architecting

The ability to think in different scales and systems, in order to determine issues and themes by observing the changing conditions of our environment. The aim is to develop an architectural position in relation to these observations and to translate it into a viable and sustainable proposal for the future of our coexistence.

Storytelling and Narrative-Design

The ability to translate factual knowledge about architecture and architectural systems into a story. These narratives function in parallel and offer other ways and speeds of communicating the design arguments besides the factual approach. In addition to time-based media such as film and episodic video formats which we call television, we will be developing additional formats with the students from this semester on.

Both learning objectives will be introduced in topic-specific lectures at the beginning of the course.

Content
This semester we are continuing to explore the theme of cohabitation: the interplay of human and nonhuman systems in our built environment. But this time, we are focusing on a given ecosystem, as the context for our architectural proposals. Further, we are expanding our toolbox: storytelling and film continue to play an overarching role, but we are opening up the studio to other media and forms of architectural exploration. (see learning objectives)

“Europe’s sea of plastic”, Almería in the south of Spain, is our point of departure. It is one of the many places where our globalized and accelerated ways of life become visible and take on built form. Together, we want to explore and understand the different types of architecture that can be found on site. Dating from different times, created for different needs. A deeper understanding of the systemic relations of these local structures is essential in order to become active and to produce architectural models for the future — for Almeria and beyond.

Global (Eco)Systems

The ongoing industrialization and urbanization of our environment is the main driver of depletion on our planet. These changes are human-made, which is why we speak today of the Anthropocene: an unofficial unit of geologic time, used to describe the most recent period in Earth’s history when human activity started to have a significant impact on the planet’s climate and ecosystems.[1] It is indispensable taking a look at the motives and conditions of our global actions, which laid ground for the occurrences and changes we are experiencing today and which led to the concept of the Anthropocene. Exponential growth has long been the western societal leitmotif, which places economic interests over ecological ones. But as economist Kenneth Boulding puts it: Anyone who thinks that you can have infinite growth in a finite environment is either a madman or an economist.

And although Western societies have access to data and knowledge about the consequences of their actions, and the limits and finiteness of the Earth’s ecosystem, we still seem unable or unwilling to act differently. The concept of the Anthropocene sees humanity equally responsible for this change. But it was mainly Western societies that emitted and benefited from the massive industrialization and are triggering the ongoing urbanization of our environment. From a relative point of view, it was the capital that drove Western societies. This is why other scholars such as environmental historian and political economist Jason W. Moore have been prompted to recast the notion of the Anthropocene, with the more nuanced and connective concept of the Capitalocene.

Capital-driven thinking is also evident in architecture, both in the built and unbuilt environment. Every crisis, including the most recent one, has caused economic eruptions that led to increasing investments in land and real estate and thus, resulted in profit-oriented-architectures. These take shape in different places, forms and typologies. Exploring them is of great importance, in order to understand the local and global role architecture plays in different systems. By doing so, we reflect on how urbanization — as the most prevalent socio-material form of environment-making under capitalism — has re-ordered human and non-human relations in profound ways.[2] This knowledge enables us to design an architecture that questions the status quo and, beyond that, creates new spaces for our coexistence.

Prerequisites / notice
Individual work and group work, whereof at least 3-4 weeks group work.

Critiques: 19.-20.10. and 23.-24.11.

Costs: CHF 100.-- (besides seminar week).

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
The ONA building was not built to foster human life and interaction. As a welding factory, it was meant for machines. Situated on the border between Oerlikon and Seebach, it was part of an industrial zone where a.o. weapons were produced. In recent decades the area was transformed into a primarily residential neighbourhood, and the ONA building was converted into a mixed-use office building.

Objective
Understanding and exploring your body and the senses to design and facilitate dialogues.

Developing your ability to improvise and adjust to a dynamic environment.

Collaborating with a multitude of actors from different (professional) backgrounds.

Identifying physical and intangible borders and boundaries that define space.

Communicating complex ideas through a performative approach to architecture.

Being a host and creating a welcoming environment for a wide variety of people.

Documenting a non-linear creative process through a mix of media.

Getting immersed in the world around you.

Grading criteria:
Clarity and Independence of Position
Relevance regarding the case
Depth of engagement
Representation
Design in Dialogue
Mutual Collaboration
Personal Development

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 76 of 2140
After a long period of forced social distancing and self-isolation, we will be seeing each other soon for the start of the semester. Finally freed from endless Zoom sessions, we can reconnect to the people and places around us. Our HS2021 design studio centres around this reconnection and rediscovery of the physical world and the power of proximity and embodied knowledge. Starting from ONA, the building where we are developing the Design in Dialogue Lab, we will use our brains, bodies and all of our senses and creativity to explore the building's potential as a safe and social space where we can be and work together.

Like many other buildings in cities across the world, ONA was not built to foster human life and interaction. As a welding factory, it was meant for machines. Situated on the border between Oerlikon and Seebach, it was part of an industrial zone where a.o. weapons were produced. In recent decades the area was transformed into a primarily residential neighbourhood, and the ONA building was converted into a mixed-use office building with ETH being one of the main tenants.

While approaching or entering the ONA building, you are confronted with a series of both physical and intangible obstacles and borders. Despite efforts to make it more accessible, the building's introverted nature continues to echo in its appearance. The grey concrete walls communicate the story of a space constructed to keep noise inside and people outside. Surrounded by railway tracks and other infrastructure, the main entrance is hidden behind a busy loading bay where trucks pull up during the day to load or unload goods. Once inside, the vast open ground floor is subdivided by walls in an attempt to create a sense of intimacy.

By joining Studio Seebach - Sensing Space, you will become part of a collective effort to identify, reimagine, and potentially remove or redesign some of these barriers. As users and hosts of the space, we will revisit ONA and explore it as - what we like to call - an 'Open Public Structure' that is welcoming to a wide variety of users, from students to local residents. Simultaneously we will also question whether ONA should become a seamless environment or keep certain 'meaningful thresholds' that help preserve existing values.

Instead of taking an intellectual approach based on a rational analysis of the spatial conditions, we instead will introduce a more intuitive approach that makes use of our senses and explores our body's ability to experience the (open) borders and (closed) boundaries that define ONA. We will be joined by practitioners from such diverse disciplines as dance, performing arts, anthropology, philosophy and club culture who will help us to Swarm, Sense and Settle.

French philosopher Maurice Merleau-Ponty once wrote that: “Rather than a mind and a body, a (wo)man is (...) a being who can only get to the truth of things because its body is, as it were, embedded in those things.” According to him, we are all "caught in the fabric of the world". His words resonate with the assignment formulated by the late American composer and philosopher Pauline Oliveros ("listen to everything until it all belongs together and you are part of it"). The studio takes inspiration from these and other thinkers and practitioners and turns their ideas into actions that allow you to test and train your senses and get immersed in the world around you.

Individual work and group work, whereof at least 3-4 weeks of group work.

Critiques: 19./20.10., 23./24.11.

No extra costs.

|--------------|---------------------------------------------------------------|-----------------|-------------|

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php. Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

We as a society, but also specifically we as architects, must use land, resources and energy as sparingly as possible in the future. Therefore, the focus of the design is a holistic consideration of climate-conscious building: we are developing hybrid systems made of earth in combination with re-use building components.

Objective
- Dealing with dense, sustainable, simple building
- Development of a broad theoretical and historical knowledge of a topic in order to transfer the resulting findings to the current context
- Understanding of sustainable building techniques and building materials, rammed earth
- Holistic design of spatial atmospheres in the interplay of context, construction, climate, sustainability, and materiality
- Recognizing the potential of building materials with different technical properties in order to develop own ideas for new building systems and translate them into a design
- Practical work on the model and in the visualization program as part of the design process

Content
The Binz - an urban fragment, which with its contrasts and heterogeneous development forms an ideal area of investigation, is to be analyzed in the coming semester. The possibilities of a spatial redensification of the entire area will be examined and a vision for the future in the form of a master plan will be developed. In addition to the large-scale studies, the focus will be placed on the material clay, as a low Co2 building material, right at the beginning of the semester. Inspired by the history of the Binz region as a clay mining area, clay samples taken on site will provide information on the composition and processing potential of the material. Not only the local availability of clay, but also the positive physical properties of the building and the low proportion of gray energy speak for an examination of this material. Based on the findings of the clay samples and the knowledge about synergies and compensation potentials with other materials such as wood or recycled materials, prefabricatable hybrid nodes will be developed at the beginning of the semester, which will be realized as mock-ups during the seminar trip. The development of the nodes thus becomes the primary design element. In addition to material technology and construction issues, we will pursue a climate-based design methodology that sees the responsible use of finite resources and thus cycle-based construction and the reuse of building materials as the potential of a new, contemporary architectural expression.

A new awareness and thinking in dealing with finite resources will also let us this semester explore the material clay for its various properties. In addition to the low proportion of gray energy and the outstanding physical properties of the building material, the local availability of the material is of interest. Millions of tons of clay-containing excavated material are produced worldwide every year, for which our construction industry has no use and which therefore has to be disposed of (over 25 million tons in Switzerland alone). So why not use this unused resource to build with?

From our point of view, however, this requires new building methods that correspond to today’s standards and needs for a rational construction method and that better exploit the physical potential of the building material. Prefabrication, a hybrid clay building technique or liquid clay technology are examples of possible answers.

The students will receive a reader at the beginning of the semester.

**052-1125-21L Architectural Design V-IX: Elemental Living (E. Mosayebi)**

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 78 of 2140
Abstract
How do we want to live? Hardly any building task in architecture is so fundamentally and so strongly determined by conventions as housing. The focus of the work in the studio is the critical and experimental examination of new forms of living in different climatic regions of Switzerland.

Objective
- Knowledge of history, theory and typology of basic elements.
- Design of new forms of housing
- Pictorial representation of complex narratives in the form of miniatures
- Constructive Details
- Experimental photography

Content
How do we want to live? Hardly any building task in architecture is so fundamentally and so strongly determined by conventions as housing. The focus of the work in the studio is the critical and experimental examination of new forms of living in different climatic regions of Switzerland. The comparatively small scale allows the projects to focus on the themes of interior space, living form and basic architectural elements.

These basic elements are understood comprehensively and mean not only structural elements such as load-bearing parts, windows, doors, stairs, but also include secondary components such as beds, tables, curtains. Is it conceivable to develop the living form starting from an architectural element or furniture? Can we imagine a habitable elevator? How would a floor plan be designed starting from a refrigerator? Who would inhabit such spaces? The basic elements represent the thingness and craftsmanship of architecture. In the discourse on social and ecological building, the importance of everyday elements is often forgotten, even though it is the things themselves that create meaning or absurdity between life and the world.

Starting with a basic element, you will analyze at the beginning of the semester the specific characteristics and the variety of manifestations in different geographical contexts. You will ask: What functions does the element serve, what histories has it gone through, what norms has it cemented, in what materials and principles of construction is it created, and what future potential can it unlock? In addition to political, social, gender, and climatic contexts, you will also address the interaction of space, body, and scale, and thus the perception, impact, and use of architecture.

The semester takes place in cooperation with Prof. Dr. Ákos Moravánszky. In workshops with the artists Taiyo Onorato and Nico Krebs, experimental images of the projects will be created.

Prerequisites / notice
Group work only.
Critiques: 19.10., 17.11., 7.12.
No extra costs.

052-1127-21L Architectural Design V-IX: (Girot) ■
W 14 credits 16U not available

Does not take place this semester.
Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Is not offered in HS21.

Literature
A reader will be provided at the introduction. Furthermore, a pre-selection of relevant books will be available to the students at the ILA Library.

052-1129-21L Architectural Design V-IX: Structure and Space - Negotiation on the Inventory (GD C.Menn) ■
W 14 credits 16U C. Menn

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
The theme of the studio is in the overriding interest for the architectural resource of the housing stock on the outskirts of Switzerland. We are concerned with the conversion of an industrial building that has been disused for decades in the rural context of the Gonzen mine in Sargans. Core topic is dealing with the phenomena of structure and space as a "negotiation" on and with this inventory.

Objective
The students learn to discover a building stock in its temporal and spatial structural context, which enables them to take a critical stance and to act in it as a designer. You learn to formulate an architectural idea of a change of use from the existing resource and to develop it into a consistent project.
The theme of the studio is the overriding interest for the architectural resource of the housing stock on the outskirts of Switzerland. We are concerned with the conversion of an industrial building that has been disused for decades in the rural context of the Gonzen mine in Sargans. The core topic is dealing with the phenomena of structure and space as a "negotiation" on and with this inventory.

The subject is the Malerva ore processing plant, a solitary witness to the industrial history of disused mining in the Sarganser Rhine Valley plain. The iron on the Gonzen shaped the region for centuries. After numerous scientific and technical development steps, the extraction of raw materials attained its greatest importance during the Second World War, before the decline and the cessation of operations in 1966. The Malerva ore processing and sorting plant was designed in 1940 as a three-dimensional steel framework, its structure and shape free of aesthetic goals or thoughts of flexibility of use, it was tailored to the vertical and horizontal processes of ore processing and the economical use of the material.

Based on this special building typology and materiality, we would like to formulate design strategies for conversion and at the same time adopt an attitude towards the location and its historicity. We are researching the original machine, which today is a space structure that has lost its purpose. We are interested in the inner regularities and the thinking of the design from the conditions of the primary structure and material and the spatial potentials from them. We are guided by questions: What architectural relationship can be established with this filigree steel skeleton and its specific shape? Which spatial strategies and potentials does it open up? How evolutionary does an architectural concept emerge from the existing structure as a further development or how much does the intervention become a reshaping and new creation?

Programmatically, we design a mixed use in which a collective space formulates the heart of the facility. This public space is a new bearer of meaning and a meaningful part of the concept based on the existing conditions.

With the projects we would like to formulate answers to the memory and the future of this cultural heritage and to include questions of sustainability. In addition to dealing with material resources, we ask whether interventions in the specific space structure open up potential for a generic, open-use structure. Is a narrative conceivable that understands the project as an intermediate form in an open-ended life cycle?

In-it-together. This will allow us to become a critical audience reflecting on the decision making strategies behind large scale developments and to potentially find presences and qualities that are often overlooked and only surface in the slowness of being-present. Moving in will allow us to engage with the day to day life of the buildings. It will make us complicit to what we design, to get close and personal, to potentially find presences and qualities that are often overlooked and only surface in the slowness of being-in-it-together. This will allow us to become a critical audience reflecting on the decision making strategies behind large scale developments in the Zurich agglomeration. With our concrete and situated knowledge gained by actively being there, we will reflect on alternative futures for the four existing buildings, challenging the tabula rasa approach, and the accompanying architectural interventions and strategies.

Regensdorf. This semester, after exploring Zurich and its surroundings twice by means of walking, we will inhabit a Dorf longing to be a Stadt. Next to the Regensdorf station, a real estate operation called ZWHATT plans 1000 new housing units, developed by Pensimo and its demolition and replacement. A gesture erasing existing users and uses at the same time, as those are rarely given a place in the planned developments. So how can we trust in the value of what is there? How can we learn from the existing to propose models for the future, a future capable of accommodating all the lives that can exist in the city, including the less profitable ones?

Inhabitation. Your studio will be located on the empty fourth floor of an existing office building: 400 m2 at the very center of the future planned developments. So how can we trust in the value of what is there? How can we learn from the existing to propose models for the future, a future capable of accommodating all the lives that can exist in the city, including the less profitable ones?

The Dept. of the Ongoing. The Dept. of the Ongoing will move in with us to install an open research room, host the lecture series You're Not My Type and surprise us with other ghostly modes of exchange and interaction. Building Out Loud. During an integrated seminar week, we will take it a notch up and use our building as a test site, producing 1:1 interventions, guided by the skilled carpenters of NAME and the practice of scenographer Jozef Wouters and his Brussels based Decoratelier.
The students have the opportunity to examine spaces that are shaped by architectural elements. We carry out this search throughout the semester and divide it into three phases: space, structure and whole. We will delve deeply into the architectural space and the materialized elements that define that space.

Throughout the whole semester, and for your final presentation, we require that you work with physical (fragment) models of your building in the actual material(s). It is important, in this design studio, not to make a complete building, but to show and support the found values of the material engagement in a spatial way, based on the full potential of the inherent qualities of the material itself and your way of working it.

This semester, we will focus on water. We will research water as an agency continuously shaping our environment and reacting to and forming other materials. At the same time, water will also be seen as the crucial element shaping the work of an architect.

Our relationship with water is complex and contradictory. Water is vital to all forms of life and to the genesis of matter, organic and inorganic. And yet it remains relatively invisible, and as a design agent, underestimated. Architecture today is, to a large extent, about controlling water, whether in the atmosphere, in the soil, or in a building. Condensation, rainwater penetration and unwanted moisture can damage a building and impact on its longevity. An architect's response to the durability of a construction and its materiality generally consists of designing resistance against weathering caused by water.

Our society increasingly demands controlled, standardised comfort: the building envelope separates indoor and outdoor climates and ecologies; the vapour barrier keeps window openings airtight and ensures the high performance of thermal insulation. In turn, the pesticide-applied plaster prevents mould growth on the façade.

In a wider territorial frame, analogous to its role for architecture, the control of water following the Industrial Revolution has been crucial to the creation of the modern rationalised landscapes we now inhabit. It appears, however, that the modern mentalities and techniques of control of water have reached their limits. Today, water stands at the centre of the most urgent environmental challenges—from the melting glaciers, increasing droughts and floods and the demand for (green) hydroenergy, to the struggles over water pollution and access to water sources, water is becoming increasingly precious, scarce and politicised.

In this semester, we offer the possibility to reimagine the notion of durability by reconsidering our fraught relationship with water. In a movement from hydrophobic to hydroscopic design of buildings and environments, we will embrace the fundamental and unique characteristics of water and its influence on the changing states of matter and ecologies in the territory and architecture.

The sites we will study and travel to are situated in the Valais on the slopes of Jungfraujoch, from the summit to the Rhone River. Following the trail of water, we will encounter extraordinary places — convergence of glaciers, geological formations, an ancient alpine pilgrimage route, a water reservoir and a dam, rare crystal and mineral sites, riverbed movements, an active gypsum quarry, a salt mine and the largest debris-flow measuring system in the world.

When we take all aspects of the material into consideration – the geology, the sourcing, the industry, the different properties, the craftsmanship, the specialised techniques and the cultural significance – we can deploy the full potential of the inherent qualities of the material itself and our way of working it in what we call "Material Gesture".

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

The students have the opportunity to examine spaces that are shaped by architectural elements. We carry out this search throughout the semester and divide it into three phases: space, structure and whole. We will delve deeply into the architectural space and the materialized elements that define that space.

The students develop a design based on the architectural theme "Hortus" with the integrated disciplines of structural design. They deal with the topic, a specific material, its constructive logic and supporting structure. The aim is to arrive at a holistic design for all designs based on individual inspiration and the logic of the material and to visualize this at the end.
The students have the opportunity to examine spaces that are shaped by architectural elements. We carry out this search throughout the semester and divide it into three phases: space, structure and whole. We will delve deeply into the architectural space and the materialized elements that define that space.

In a first step, elements that define the space are explored. Starting from an inspiration, rooms are designed that represent this inspiration. The rooms lead to a structure which, under the aspect of reuse, leads to its own detailed architectural project with an individual program.

The students work with working models, different types of renderings (renderings of the rooms and the structure), as well as detailed black and white CAD drawings and texts.

Assistants: Lorenz Bachmann, Elena Miegel
Assistant assistant: Lieselotte Düsterhus

Integrated discipline (3 ETCS points): Professorship for structural design, Prof. Schwartz, Dr. Lluis Enrique (requirement: design and supporting structure are mutually dependent)

Landscape architecture / plant knowledge expert: Maja Tobler

Expert 3D visualization: Stefan Meyer, Lukas Burkhard

Individual work only.

Critiques: 5.10., 19./20.10., 16./17.11.

Costs: CHF 100.-- (besides seminar week).

How can we as designers radically reimagine place-making in Sarajevo by connecting the existing natural and built environment with local resources and digital infrastructures as models for sustainable living?

The watershed of the Miljacka River has the potential to unlock socio-ecological systems and multifunctional corridors, that address urban fragmentation, and Climate Action.

Objective

Students will emerge in our Chair’s “method-design” to step by step develop their individual prototypical design projects. They will address both architectural urban scales and will be guided to collaboratively develop a baseline scenario. Mapping, identifying existing and future challenges and opportunities, students will take the role of stakeholders and translate their demands and resources into different scenarios.

They will design urbanistic concepts and translate them into an evidence-based prototypical architectural project-intervention. This prototype is the synthesis of a process in time and space on different scales. The design project will be framed as a narrative that is consequentially visualized and communicated in analogue and digital graphic representations. The project concept will be tested and upscaled through urbanistic design-policy recommendations within overlapping spatial and programmatic systems of Climate - CORRIDORS.

Content

The basic thesis for this Studio Fall Semester 2010 is constructing an urban imaginary creating an interplay of a linear public space system providing identity and orientation in the Miljacka River valley of Sarajevo. Sarajevo’s culture is as diverse as its rich architecture and history of urbanization. Located on the Balkan Route, a crossroads between north and south, east and west, the city confronts us with one of the highest pollution levels of air, soil, water, of any capital city in Europe. The watershed of the Miljacka River, wells, fountains, retention infrastructures, and flood plains are our point of departure. They have the potential to unlock socio-ecological systems, multifunctional corridors, and catalytic projects, that can transform fragmented neighborhoods, offering a living system of public water-places to the inhabitants.

At the intersection of architecture, landscape, and public art, the studio envisions trans-scale processes and interventions, addressing the cities social and ecological crisis, in support of the Sarajevo Canton Planning Office, applying a systemic design methodology, and responding to the urgent need for concrete projects and Climate Action. Policy recommendations and general advice for upscaled such prototypical concepts are already successful in other cities globally and apply to the Sarajevo-Case.

The design challenge includes redesigning and densifying public open space, that combines social and environmental developments into a system of architecture, urban, and landscape design networks. The transformative redevelopment of existing street corridors and the interplay of architecture with landscape design and concrete prototypical and small-scale design interventions is critical for bringing together segregated communities in quality public space along degraded transport corridors. Linear multifunctional corridors can strategically connect to the immediate context and subcenters with feeder routes (considering Zmaja od Bosne), participatory public spaces, markets, playgrounds, production, and creating new eco-systemic connections with increased social and ecological qualities.

Atmospheric contamination, fine dust, and CO2 have created during inversion weather one of the highest air contamination levels of any capital city in Europe compromising the health of Sarajevo’s people. Climate change is challenging necessary processes to re-planting the forest and trees of the city. The compliance with the targets and indicators of the SDGs pose considerable additional tasks to solve. In recent years, the bust and boom cycle in Sarajevo has put doubt on opportunistic international urban upgrading models linked with opportunistic investments, gentrification, and short-term gains for private investors.

We have developed a toolbox by analyzing internationally recognized developments, sometimes permanent and temporary strategies such as Chengyecheon River Park, Seoul, Isarpark, Schlachthof / Munich, Corredores Verdes / Medellin or Cali, communal target-plan Zurich, Closed Highways in Sao Paulo or Bogota, Etc. These spatial processes have followed a widely known practice of consolidating a sequence of transformations, short-term strategies for long-term value production. Neighborhoods are re-evaluated through investment often initiated by art, popular culture, local participation, and place-branding.

Urban- and Landscape Design can create a measurable impact in cities by increasing social justice, health, and wellbeing. The development of robust frameworks adaptable to change enable processes for regeneration with long-term operational, environmental and social benefits in response to global, local, and site-specific challenges. The role of architects is to imagine and model sustainable urban scenarios recognizing urban corridors as new possibilities and lifelines to impact meaningful and multidimensional transformative design strategies.

Lecture notes

“Method-design”: Systematically engaging students in the Studio topic, to unlock their potential and skills towards developing prototypical design resolution on an urban and architectural scale. Identifying, understanding and developing local stakeholder networks, so as to translate challenges into opportunities and negotiate diverse interests into strategic ideas for development, geo-references, inter-linked systems, diagrams and maps. Develop design concepts for urban prototypes on different scales, framed by a narrative of a process that is consequentially visualized and communicated in analog as well as digital tools.

Investigative Analysis/ Local Perspective: Registering the existing; prioritizing challenges and opportunities through qualitative and quantitative information; mapping on different design scales and periods of time; configuring stakeholder groups; connecting top-down and bottom-up initiatives; idea mapping and concept mapping; designing of citizen scenarios.

“Project Design”: Synthesizing between different scenarios and definition of a thesis and program between beneficiaries and stakeholders; projecting process presentation as a narrative embedded in multiple steps; describing an urban and architectural typology and prototypes; defining an urban paradigm.

“Domain Shift”: Shifting and translating different domains; testing and evaluating the design in feedback loops; including the project in the Urban Toolbox.

Literature

Reading material will be provided throughout the semester, as well as references to case studies.

The class material can be downloaded from the student server.
Prerequisites / notice

Individual work and group work, whereof at least 3-4 weeks of group work (group work during research / Individual project design)

Critiques: 2nd/3rd November 2021.

No extra costs.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Improvising and adapting have a long history in the built environment and now that the time for new building is coming to an end, perhaps architects need to more fully embrace the sensibility of the interim.

Objective
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.
Refining an idea until it is precise, developing a project so that it can be materialised, managing a design through the complexity of realisation. Architecture takes a long time and there is a strong temptation to reach for the eternal. Most of the constructed environment around us emerges out of even more complex circumstances and yet often comes together more quickly and flexibly. Are there things that architects can learn from how a farmer plans their fields to be productive and sustainable, how a tailor can mend a garment so that it acquires qualities that didn't exist in the original, how resourceful builders can make do when materials and time are in short supply, improvising and adapting have a long history in the built environment and now that the time for new building is coming to an end, perhaps architects need to more fully embrace the sensibility of the interim.

There is a long tradition of interim inhabitation, it is what squatters do, and it is acknowledged by artists when they move, like pioneers, into an unpopular quarter of the city. More recently the idea of interim inhabitation has become part of the development process, protecting empty buildings from squatters and vandalism, beginning to build the brand of what comes next. We are interested in all of these examples and wish to explore ways in which the positive qualities of the interim can be extended so that the seeming inevitability of gentrification is deferred, perhaps forever.

We will work in a series of buildings in Zurich that are currently being provisionally occupied under different legal arrangements. We will begin by closely observing and recording current conditions, learning something about the relationships between creative programme and inventive spatial practice. By deploying a series of processes; to repair, to collect, to mark, to remove, to arrange, to support, we will work to develop the current contingent situation into something more robust. In this process we will engage with the existing networks of inhabitants, building owners and spatial/material arrangement, and challenge the social, legal and aesthetic limitations of architecture.

Prerequisites / notice
Group work only.

Abstract
Not offered in HS21.

Objective
Objectives: Research & curation of contemporary concepts, articulation of a discursive argument, visual literacy & storytelling, image montage & composition, architectural drafting and projecting.

Incentives: Movies & scenario, territorial & urban scale, collectivity, situations & artefacts, socio-political dimension, critical position, contemporary conditions.

Steps: (1) Analyze a movie, research contemporary concepts, identify potentials, articulate a critical position. (2) Project an urban scenario on both the artefactual and the territorial scale, focusing on collectiveness and the socio-political aspects of society. (3) Express a critical position towards a contemporary condition by the means of such a fictive context in both image and plan. (4) Train rhetoric and argumentation, master drafting skills as well as image montage.
From the age of the dinosaurs, cars have run on gasoline.

Repentir, s.m.
A.1. RELIG. Regret douloureux de ses péchés avec le désir de les réparer et de ne plus y retomber. Synon. contrition, repentance (vielle ou litter.) P. ext. Vl repent d'une faute, d'une erreur, d'une faiblesse. 2. P. ext. Regret d'une action quelconque.

“Since the trace is not a presence but the simulacrum of a presence that dislocates itself, displaces itself, refers itself, it properly has no site—erasure belongs to its structure. And not only the erasure which must always be able to overtake it (without which it would not be a trace but an indestuctible and monumental substance), but also the erasure which constitutes it from the outset as a trace, which situates it as the change of site, and makes it disappear in its appearance, makes it emerge from itself in its production. The erasure of the early trace of difference is therefore the “same” as its tracing in the text of metaphysics. […] The paradox of such a structure, in the language of metaphysics, is an inversion of metaphysical concepts, which produces the following effect: the present becomes the sign of the sign, the trace of the trace. It is no longer what every reference refers to in the last analysis. It becomes a function in a structure of generalized reference. It is a trace, and a trace of the erasure of the trace.” (J. Derrida, Margins of Philosophy, Différence, 1982 [1972])

Content:
Pursuing our rambling exploration on the lookout for urban environments beyond reasonable and more than ever considering humankind as embedded in, acting upon and dependent on its geological era, we shall look upon history’s intertwined layers and sediments as raw potential to be appropriated and composed with — joyfully disrespecting scientific authenticity. The visionary Histor seeks, finds novelty in the old, rather than an unfounded assertion of the present with the past. This semester aims at both designing erratic hyper-contexts generated by hypothetical ruling incentives, and the obsessive recording of their past and present traces of erasures and becomings.

Prerequisites / notice
Group work only.

Criticues: Dates will follow:
Costs: 30 CHF per Student (besides the seminar week).

NOTHING BUT FLOWERS - Nature and Territory in Zurich

Objective
From the age of the dinosaurs, cars have run on gasoline
Where? Where have they gone?
Now, it’s nothing but flowers
(Talking Heads, 1988)
The studio will investigate and imagine nature in the metropolitan territory of Zurich. The results will be made public in the form of online investigative reportages, meant to inform design practices and public discourse on ecology and nature conservation.

Content:
New Ecologies is a studio series at Architecture of Territory dedicated to ecologising architecture. Ecological thinking, which foregrounds the interactions between organisms (or by extension between objects, or social and technical systems) and their environments, is applied in considering design practices in their social and environmental effects. The studio series is affiliated with the Future Cities Laboratory and the new Master of Advanced Studies MAS UTD starting in the fall 2021. Citizens, experts, and fellow designers and artists will accompany us in the process.

PROCESS AND RESULTS
The semester consists of investigative journeys and intensive studio sessions. Architecture of Territory values intellectual curiosity, commitment and team spirit. We are open to attract adventurers and team workers, motivated to make strong and independent contributions. Our approach enables students to work with a range of methods and sources pertaining to territory, including ethnographic fieldwork, interviews, literature research and essay writing, large-scale drawing techniques, photography, videography, and online publishing. Experts and guests will help us sharpen our skills and craft common agendas through debates. Students work in groups of two to three.

SEMINAR WEEK: PIONEERS OF CONSERVATION
Investigative journeys constitute the core of the project. The first studio day starts with an exploratory walk through the forested backstage of the Hönggerberg. The investigation will continue throughout the seminar week, dedicated to pioneers of nature conservation. Foresters, gardeners, volunteers and veterans of nature associations, scientists, and environmental activists will be our guides. We will traverse the metropolitan territory of Zurich by foot, by bike, by bus and by train. The common trip is followed by a period dedicated to fieldwork in respective student teams. The seminar week takes place from October 24–30 (cost frame A). It is integrated, mandatory, and open to all interested students.

LECTURES SERIES: MY SPECIES
Within the lecture series ARCHITECTURE OF TERRITORY. Territorial Design running in alignment with the studio, four guest speakers engaged in fields ranging from art and landscape to bioethics and environmental philosophy, will address the theme MY SPECIES, approaching territory through the notions such as multispecies, coexistence, and diversity.

CREDITS
The semester offers the total of 19 credit points. The Design Studio with Integrated Discipline (Planning) 14+3 KP and the Seminar Week 2 KP.
We are often told that Nature is being lost, damaged and polluted, sacrificed to consumption habits and ambitions of urban development. We are told of the environmental crisis of planetary proportions, of the loss of species and the imminent collapse of the web of life. We hear appeals to preserve and respect Nature, to curb our resource use and manifest an ethos of care. Nature is the concept governing actions of individuals and societies, and yet, if we try to put our finger on "nature", to situate it in our environments, it is slippery and far from clear. The politics of space and territory relies on both green arguments, as well as privileging of our own species. Nature is often not more than a convenient gesturing: the net loss or gain of forest; the carbon offsetting; the nature compensation, the green tech, the greenwash.

But nature is also a space of imaginary. As a concept, Nature has played a historical role for the human communities through its association with the divine, the primitive, the bestial, the corporeal, and the feminine. In Switzerland and other countries, the forming of nature conservation as a scientific discipline mirrored the industrialisation processes throughout out the XIX century as a specific reaction. Invigorated by aesthetic and patriotic sentiments, early activist movements deplored the industrial destruction of both "nature" and "homeland". Gradually conservation efforts consolidated, working their way into institutional and land use frameworks. Much of nature conservation effort historically has been rooted in the nature-culture divide, an understanding where any product of human activity is seen as being separate from nature, and thus resulting in the production of landscapes cleared from human inhabitants and demarcated from human use. But different paradigms of conservation took hold as well. Some approaches have emphasised on the role of the human carer in the protection and a sustainable use of nature (through for example mining or logging). Others have explored rewinding of landscapes through the reintroduction of previously disappeared species.

In the seemingly pastoral, but essentially highly technological territory of Switzerland, the meaning and the role of nature is far from settled. Being woven into the territory, nature areas remain an object of multiple pressures and interests. As the failures of recent initiatives—the CO2-Gesetz, the Trinkwasser-Initiative and the Pestizidfrei-Initiative—have patently shown, there is little agreement on what kinds of nature are worth preserving, by whom, and how. As designers, we may add that, there is also a lack of environmental imagination, which ought to be explored.

In this semester we will investigate and imagine nature in the metropolitan territory of Zurich. We will analyse political, financial, cadastral and other entanglements between urban space and nature. We will engage in multispecies ethnography, tracing our relations with other species. We will engage with aesthetics, science, and the philosophy of nature. Focusing on selected sites, from the Rhine plains, through the fields of Weinfelden, the logistic valleys and leisure hilltops around Winterthur, to the forests and pastures of Zürcher Oberland, we will look at nature in its different incarnations—the protected biotopes, the nature monuments, the second natures and the third landscapes of the agglomeration, the cheap natures of industrial farming, and so on.

Students will write their own project briefs, and will develop territorial analysis and projects for the chosen sites. The takes form of a web-based investigative reportage. During the production we will work with GIS and CMS experts, a journalist, a data scientist, a videographer and a photographer. The results of the studio are delivered in the public forum, meant to inform design practices and public discourse on nature conservation.

Content
Design, construction, re-use
The design program focuses on the reuse of components divided into three phases:

1. Handling of components and materials, component hunting and dismantling. Through dismantling workshops, the students will learn the theory, but above all the practical side of dismantling. The students will deal with the collected components in order to design and construct building systems and elements in the form of mockups.
2. The researched and developed building systems and elements will be applied to a real case. The researched and developed building systems and elements will be applied to a real case.

Prerequisites / notice
In addition to the design and practice, knowledge on the topics of circular economy, CO2 balance, pollutants and component logistics will be imparted. Reuse projects that have already been implemented will be presented and visited.

Objective
- Respect for the existing, recognizing the identity
- Reversal of the design process, construction with rescued / found materials
- Understanding of the component hunting (dismantling, component logistics)
- Circular construction, dismantability, circular economy
- Calculation of the CO2 savings when reusing
- Expansion one’s own noosphere

Literature

- Reversal of the design process, construction with rescued / found materials

Prerequisites / notice
Individual and group work.

No extra costs.

Prerequisites
Architectural Design V-IX: Re-Use "selon arrivage"
(GD B. Buser)
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Teaching Language is German and English.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
In addition to the design and practice, knowledge on the topics of circular economy, CO2 balance, pollutants and component logistics will be imparted. Reuse projects that have already been implemented will be presented and visited.

Group work only.

Critiques: 19./20.10., 23./24.11., 21./22.12.
Introduction: 21.9.21, 10:00 h.

No extra costs.

052-1151-21L Architectural Design V-IX: A House for 10'000 People (Ch. Kerez)
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the
**Abstract**

Architecture defines the spaces in which we live and work in during every moment of our lives. We will study the large scale in which the work of an architect has an impact on the biggest possible amount of people. A house as big and complex as a whole village. The design work is understood as an investigation on the daily conditions of our times, through the media of architecture.

**Objective**

This semester the design studio will focus on the big scale. Students will develop a design based on a given competition brief and will deal with the theme through a critical approach.

Analysis of fundamental aspects of the given task, fast track design methods leading to alternative concepts should establish the strategic and factual basis for a critical understanding on how to deal with the big scale. The goal is to develop an individual and critical understanding of the topics and, just like in a real office, students will work individually towards a final collective output.

**Content**

Architecture defines the spaces in which we live and work in during every moment of our lives. We will study the large scale in which the work of an architect has an impact on the biggest possible amount of people. A house as big and complex as a whole village. The design work is understood as an investigation on the daily conditions of our times, through the media of architecture.

The brief and the site of actual competitions will be the starting point of the semester. In the studio, students will work individually during some design stages and they will work together during others. This collaboration is understood as a teamwork in which each participant has a clear task, different from the others.

Students will develop their design capacities, which relate specifically to the work in the large scale and they will develop their own individual and critical understanding of the challenges of our times. Throughout the semester there will be lectures and discussions with architects working on large commissions. Zaha Hadid Architects, Christine Binswanger, Bjarke Ingels and Ma Yansong will be guests of this semester and give some inputs.

**Prerequisites / notice**

Individual work and group work, whereof at least 3-4 weeks of group work.

Costs: CHF 40.-- (besides the seminar week).

- Representation
- Design in Dialogue
- Mutual Collaboration
- Personal Development

Critiques: 19./20.10.; 16./17.11.
Teaching and learning methods are evolving. The complexity of our lived reality demands new sets of skills and competencies to be integrated in education, especially in architecture, which is changing from a competitive model based on individual authorship to a complex, interdisciplinary challenge. Real-world problems urge universities worldwide to invest in pedagogical approaches that support exchange and reflexive learning, i.e. constant self-reflection based on our own experiences and positions. Experimenting, testing and taking strong, sometimes diverging positions need Safe Spaces that offer professional and emotional stability to turn confrontations and discussions into productive dialogues. These include informal spaces that invite a diversity of uses, where students and staff meet, exchange and inspire each other. In order to precisely integrate collaboration, self-management, positionality and collective evaluation into the teaching and learning methodology, we need spatial configurations that enable and promote diverse and flexible behavioural settings. For this reason, we collectively aim to transform and integrate informal learning environments in three existing situations at ETH Zürich:

(A) Studio space at the Department of Architecture, ONA.

For this case study, 2 groups of 4 students will work on architecture studio spaces. During their education, architecture students are reflecting about a diversity of spaces and scales, often without taking into consideration their own learning environments. These spaces remain until today, with some exceptions, very generic, very often lacking attractiveness. How can the education of architecture benefit from a transformation of its spatial environment? How can this spatial transformation support students in testing their own positions regarding complex problems?

(B) Public library at the InfoCenter of the ETH Library, in the main building of ETH

ETH Library offers a range of services that are unfortunately largely unknown to users. For this case, 2 groups of 4 students will think about the following questions: How could the spatial environment of the library offer both, an understanding and a visibility of the provided services? How can the functions of a library be combined with a learning space itself? How to manage acoustic or representational issues while offering the necessary representative freshness? Students are invited to collectively think about possibilities of the future of the library considering the different expectations of departments' staff, students, librarians and public.

(C) Classroom at the Department for Environmental Systems (D-USYS), with the Transdisciplinary Lab (TdLab)

During the Course "Tackling Environmental Problems" students of D-USYS work in groups and in close collaboration with different stakeholders for solutions of environmental issues. Their methods include role plays and performative presentations that enable participants to reflect on different positions in complex situations. 2 groups of 4 students will accompany the course and observe the spatial settings and use of a rather conventional classroom of ETH. How do staff and students work in groups in classrooms? What kind of intervention could strengthen collaboration? Which spatial configuration functions both, as a representative stage, and as a safe ground to strengthen roles and communicate information?

Assignment and deadlines

Week V: Research Drawing & Documentation, Process Book*, Design of Presentation Setting
Week VI: no class during Seminar Week
Week VII-XI: Intervention
Week XII-XIV: Translation

*Process Book and Research Report are individual work.

Documentation, evaluation, reflection and translation of results into a Research Report and a 1:1 collective installation in Studio.

Literature

Prerequisites / notice

Group and individual work, whereof at least 5 weeks group work.

Introduction: 21.09.21
Mid-term review 1: 20.10. 21
Mid-term review 2: 01.12.21
Final Review: 23.12.21

Costs: 100 CHF (besides the seminar week).

Students could work for int. Disziplin class below.

Name: Architecture and Urban Design
LV-Nr.: 051-123319L

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The objective is that the students engage in a debate of a differentiated functional planning as a basis for complex buildings which are to be successful functionally, operationally and in design. On the basis of a given scope of themes the students carry out research aiming for possible improvements for example in health facility planning. The scope of subjects is announced at the beginning of each semester.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.</td>

052-0513-00L Spatial Concepts in Film and Architecture (HS) | W | 1 credit | 1V | M. Bächtiger Zwicky, A. Gigon |
|               | This course (ends with <00L>) can only be passed once! Please check this before signing up. |
| Abstract      | The course deals with spatial phenomena at the interface of film and architecture. The alternating influence of these two media will be analyzed, the dispositions of perception and effect will be compared and thus will sharpen the view for a architectural way of looking at space. |
| Objective     | The examination of filmic space situations and performance discloses new perceptions of architecture which will be studied on behalf of film analyses and experimental topics. During the course space-effective creative means such as editing or framing will be introduced and discussed under perceptive aspects. Mediality within spatial perception can thus be integrated into a development of cultural history and leads towards a conception which goes beyond the limits of architecture and stimulates new processes of design. |

052-0521-00L 3D Scanning and Freeform Modeling (HS) | W | 2 credits | 2U | A. Grüninger |
|               | Enrolment in agreement with the lecturer only (grueninger@arch.ethz.ch). |
|               | This course (ending with <00L>) can only be passed once! Please check this before signing up. |
| Abstract      | Design in virtual space - 360 ° Reality to Virtuality (052-0523-00L) meets 3D Scanning & Modeling (052-0521-00L) |
| Objective     | Our program this semester is to try out virtual design with the technology of VR glasses in the form of independent work. We make every effort to ensure that new design techniques are taught at the ETH and that they find their way into design practice. The aim is to be able to scan and digitize the existing building structure and then to learn to expand and adapt it with the virtual VR Sketch Tool. It is a completely new technology for us architects. First we have to calibrate our senses and think differently in order to understand the possibilities of the tools. Finally, we will work together on a submission of VR architecture and present it in our showroom in HIL F. |
| Content       | Our program this semester is to try out virtual design with the technology of VR glasses in the form of independent work. We at the Chair of Architecture and Art endeavor to ensure that new design techniques are taught at the ETH and find their way into design practice. The aim is to be able to scan and digitize existing building structures and then to learn to expand and adapt them with virtual VR sketch tools. It is a completely new technology for us architects. First we have to calibrate our senses and think differently in order to understand the possibilities of the tools. Finally, we will work together on a submission of VR architecture and present it in our showroom in HIL F. We will run the courses as follows this semester. 1. Both courses are combined. (2 x 2 ECTS points & please enter both courses) 2. Present tense lessons (online or physically according to the instructions of the school management, Mondays 2 p.m. to 4 p.m. (Course time 3D Modeling) 3. Self-study Mondays from 12 noon to 2 pm (course time 360 ° Reality to Virtuality) in self-study or whenever you can find the time. |
| Limited number of participants. |

We will provide Oculus Quest 2 glasses for each course participant. To register for the “virtual design” course, a deposit fee of CHF 200.00 is required for the Oculus Quest 2 VR glasses. This deposit must be submitted to the professorship no later than 2 weeks before the start of the course. This will also give you the Oculus Quest 2. (Maria HIl F 48/48, every Monday and Tuesday afternoon) The glasses remain in your possession until December 20th, 2021 and you have a reserved place in the course. In the event of loss or defect without guarantee coverage, you will be charged CHF 510.00. Less the prepaid deposit of CHF 200.00. If you have your own Oculus Quest 1 & 2 VR glasses, you can also be there. When registering in the system, please provide a separate e-mail to rolle@arch.ethz.ch. Of course, there are no custody fees.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 90 of 2140
To enroll in the course, please consult the lecturer: Adi Grüniger; grueninger@arch.ethz.ch

Please send us a letter of motivation, stating your aspirations, goals / wishes for this elective.
Email to:
rolle@arch.ethz.ch
CC:
grueninger@arch.ethz.ch
kiryk@arch.ethz.ch

Tools where we use:
Gravity Sketch
Reality capture (3D scan program)
Oculus Quest 2
USB for Oculus Link (Beta Oculus Air)

We will use these tools and learn «design in virtual space» on the joint journey.

### 052-0523-00L 360° Reality to Virtuality (HS)

- **W**: 2 credits
- **G**: K. Sander

**Abstract**
Design in virtual space - 360° Reality to Virtuality (052-0523-00L) meets 3D Scanning & Modelling (052-0521-00L)

**Objective**
The goal is to 3D-scan an existing space and use it in VR as a context for further design.
First, we learn the tools; then we work on an architectural VR-project; at the end of the course, we present the works in our exhibition space in HIL F.
Every student gets Oculus Quest VR-Headset to work with at home during the semester.

**Content**
We focus on virtual reality design process and create our own spaces using VR-headsets. We hope that this new technologies will change the design of architecture in the near future and will influence the learning process at ETH as well.
The goal is to 3D-scan an existing space and use it in VR as a context for further design.
First, we learn the tools; then we work on an architectural VR-project; at the end of the course, we present the works in our exhibition space in HIL F.
Every Student gets Oculus Quest VR-Headset to work with at home during the semester.

Each student will be charged with 200 chf deposit for the VR-Headset 2 Weeks before the beginning of the course. The deposit has to be paid the latest 2 weeks before the beginning of the course. It will be paid back after the return of the Headset (it has to be returned until Monday, 20.12.2021).

In case of loss or damage that is uncovered by the warranty the student has to cover the equipment cost 510chf (minus 200chf deposit). If you already have Oculus Quest (Model 1 or 2) you don’t need to pay any deposit and you can work on your own device.

**Prerequisites / notice**
Course requirements:
Both courses are connected “360 – Reality to Virtuality” and “3D-Modeling”
Please register for both courses:
“360 – Reality to Virtuality” (052-0523-00L) meets 3D Scanning & Modelling (052-0521-00L)
Classroom-teaching (online or physical meetings, Mondays, 14:00 – 16:00)
Self-teaching, research etc. (Mondays 12:00 – 14:00, or whenever you have time)

Please send us your short letter of motivation to Nicolas Rolle: rolle@arch.ethz.ch

**Tools:**
Gravity Sketch
Photogrammetry 3D-scanning (Reality Capture)
Oculus Quest 2
Oculus Link (USB-C cable)

### 052-0525-00L Material-Workshop (HS)

Does not take place this semester.

**W**: 3 credits
- **G**: A. Spiro

**Abstract**
The elective course is not taking place in HS21.

**Objective**
The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

**Content**
The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

**Prerequisites / notice**
Is not offered in HS21.

### 052-0535-00L Model and Design (HS)

Max. Teilnehmerzahl: 16

**W**: 3 credits
- **U**: A. Tellini, K. Derleth

**Abstract**
The course Model and Design teaches architectural model building in an explorative way through systematic experiments and the development of corresponding methods in design.

**Objective**
The primary pursuit is an in-depth study of three-dimensional form, color, material and composition along with the practical development of your own technical and artistic competences.
In the first part of the semester, we are going to explore a variety of materials and techniques, both typical and atypical for the architectural model building. Equipped with the knowledge gained during the first phase we’ll go ahead and try to put all of that experience into use during the final build. With this final build, we reflect on basic design topics like the initial intent, color, material, composition, and construction in order to understand the sensual role of the model considering its sculptural properties.

In addition, a processing time during the week of about 4 hours can be expected.

**052-0537-00L**

**Course Title:** Free Drawing (HS)  
**Number of participants limited to 35.**

*This course (ends with «00L») can only be passed once! Please check this before signing up.*

**Abstract**
Drawing is used to ascertain and develop the artistic ideas and abilities of students. Different techniques and methods will be tested.

**Objective**
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

**Content**
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

**Prerequisites / notice**
The number of participants is limited.
Application for the course via e-mail: Maude Léonard-Contant <leonard@arch.ethz.ch>

**052-0549-00L**

**Course Title:** Hybrid Modeling: 3D-Printing for the Architectural Design (HS)

*This course (ends with «00L») can only be passed once! Please check this before signing up.*

**Abstract**
3D printing is a versatile representation tool for illustrating a design idea. This course teaches and practices how the design process can benefit greatly from 3D printing.

**Objective**
The students are motivated to use the machines for other subjects as well.

**Content**
The course is suitable both for complete beginners who have never modeled a project in 3D before and for experienced 3D modelers.

**Prerequisites / notice**
Knowledge of 3D printing technology is not required.

**052-0517-21L**

**Course Title:** Theory and Practice: Heterotopia, Referential Space and Spatial Effects

**Abstract**
In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such intertwaving in current local situations and tries to think about potentials for spatial policy practice.

**Objective**
The students gain insight into the spectrum of epistemological and perceptual theories, learn to read them and analyze and critique their respective requirements. From this work an object relationship model is developing in progress, which serves self-examination in the design process as well as the evaluation of architectural situations in general and in particular. The writing of "scientific diaries" in which the contents of the colloquium are combined with the everyday experience of the students in free form, trains the concentrated result-oriented design process as well as the evaluation of architectural situations in general and in particular. The writing of "scientific diaries" in which the contents of the colloquium are combined with the everyday experience of the students in free form, trains the concentrated result-oriented design process as well as the evaluation of architectural situations in general and in particular. The writing of "scientific diaries" in which the contents of the colloquium are combined with the everyday experience of the students in free form, trains the concentrated result-oriented design process as well as the evaluation of architectural situations in general and in particular.

**Prerequisites / notice**
The additional personal work (besides the course) is about 20 working hours for the creation of a scientific journal, individual deepening and filming!

**052-0533-00L**

**Course Title:** New Focal Points of Construction: Steel Constructions

*This course (ends with «00L») can only be passed once! Please check this before signing up.*

**Abstract**
The elective subject "New focal points of construction" investigates the complex interaction of construction elements by means of exemplary architectonic tender points such as base, wall, chamber, roof etc.

**Objective**
Target of the course is the understanding of the impacts of material, technology and construction to the architectural education of constructive points. With comparative analysis of built constructions of high architectonic relevance, by means of exemplary building elements such as base, wall, chamber, roof etc., the genesis of constructive building parts, the interaction of the building elements and stand of technique for the most of common constructive tender points is imparted. The conjunction to current constructive methods and basic conditions enables a critical evaluation of the constructive Status Quo within the contemporary producing architecture as well as a perspective to new konstruktive education.

**Content**
- Lecture:
  1. Comparative analysis for derivation and understanding of the constructive points base, wall, chamber, roof etc.
  2. Description of current level of technique, typical methods, and set of problems.
  3. Colloquium with guests of producing and processing companies.
- Exercise:
  New formulation of a future constructive point as a result of a diagnostic work.

**Prerequisites / notice**
This course (ends with «01L») can only be passed once! Please check this before signing up.

https://www.buk.arch.ethz.ch/Lehre/VorlesungenNKOFS2021
052-0569-21L Lecture Series Design and Architecture: Architecture of... W 2 credits 1V E. Christ, A. Caruso, C. Kerez, E. Mosayebi

Abstract Specialists give lectures on current architecture-specific topics.

Objective Obtaining knowledge from architectural practice after 2020.

Content Specialists give lectures on current architecture-specific topics.

Prerequisites / notice Lecturers are listed in due time.

The lecture series take place on Tuesdays from 6-8 pm in HIL E4 (s. room reservations):

Speakers:
- 28.09.21: Prof. Patrick Heiz
- 05.10.21: PD Dr. Erik Wegerhoff - Note: This lecture takes place in the HIL underground carpark (follow the signs!)
- 12.10.21: Prof. Mike Geyer
- 02.11.21: Prof. Freek Persyn
- 16.11.21: GD Roger Boltschauer
- 30.11.21: GD Angela Deuber
- 07.12.21: Prof. Alexandre Theriot

063-0561-21L Integrated Discipline HS21 in the Field of Design and Architecture (IEA) W 3 credits 2A Lecturers

Abstract Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

Objective The elective examines the architecture that produces the neoliberal ideology. Based on the method of historical building surveys, the formal-architectural properties are described, analyzed and finally summarized in the sense of a formal catalog of neoliberal architecture.

Content Students critically deal with contemporary urban and building production from a design perspective. By applying the method of the course, they learn the ability to describe and analyze the formal-architectural properties of architecture.

052-0565-21L Formalistic Analysis of the Architecture of the Neo-Liberal Ideology: Richti-Areal W 2 credits 3G E. Christ, C. Portmann

Abstract Using the example of the Richti-Areal in Wallisellen, the elective examines the architecture that produces the neoliberal ideology. Based on the method of historical building surveys, the formal-architectural properties are described, analyzed and finally summarized in the sense of a formal catalog of neoliberal architecture.

Objective Students will be invited to select a game, dissect it according to the theoretical input previously received, and select a key aspect of it. This key aspect will in turn be used as lenses through which students should analyse and question their reality, a milieu of their own choice: from the spaces and urban situations forming their daily routine in the city, to their hometown or fetish city. From this analysis, an essay presenting and defending their hypothesis of reading of their milieu through gaming should emerge.

Content Instead of comprehending the complex planning process and accepting the built as a consequence, the elective turns the analysis 'head on its feet': What kind of quarter, piece of city has been realized? What kind of quarter, piece of city has been realized? What kind of quarter, piece of city has been realized?

052-0561-00L Territories of Play - Surveying Architecture Through Gaming (HS) W 2 credits 2S P. Heiz, F. Charbonnet, F. Moura Veiga

Abstract The seminar addresses a way of perceiving reality which has become key: through the lenses of Play and Gaming. Besides offering students steady footing on the makings of an architectural publication, it will provide students with a complementary, yet extremely relevant tool with which to approach architecture and urbanism.

Objective Input - an in-depth introduction to the theoretical frame of the seminar through three lectures; by a game designer, by an architectural historian or architect, and by the seminar's tutor. The theoretical works and authors which make up the core of the seminar - Jesse Schell, Johan Huizinga and Kate Salen & Eric Zimmerman - will thus be presented and analysed, hinting at possible bridges to a critical analysis of architecture and the built environment through its decomposition into Mechanics, Aesthetics, Narrative and Technology, the four pillars of game design.

Speakers:
- 05.10.21: Prof. Patrick Heiz
- 12.10.21: Prof. Freek Persyn
- 16.11.21: GD Roger Boltschauer
- 30.11.21: GD Angela Deuber
- 07.12.21: Prof. Alexandre Theriot

07.12.21: Prof. Alexandre Theriot

05.10.21: PD Dr. Erik Wegerhoff - Note: This lectures takes place in the HIL underground carpark (follow the signs!)

Lecturers are listed in due time.

This course is offered until end of FS22.

The participants critically deal with contemporary urban and building production from a design perspective. By applying the method of the course, they learn the ability to describe and analyze the formal-architectural properties of architecture.

The Richti-Areal was created and advertised as fulfilling the highest demands that can currently be made on architecture and planning by the Allreal, a subsidiary to a former factory for machines, in close cooperation with the authorities of the municipality of Wallisellen. Just completed, in the Swiss context it exemplifies the self-image of what 'good planning' and 'good politics' are with regard to the development of urban space in the agglomeration.

Just completed, in the Swiss context it exemplifies the self-image of what 'good planning' and 'good politics' are with regard to the development of urban space in the agglomeration.

Students will be invited to select a game, dissect it according to the theoretical input previously received, and select a key aspect of it. This key aspect will in turn be used as lenses through which students should analyse and question their reality, a milieu of their own choice: from the spaces and urban situations forming their daily routine in the city, to their hometown or fetish city. From this analysis, an essay presenting and defending their hypothesis of reading of their milieu through gaming should emerge.

The writing will be conducted during the seminar's attendance time.

Students are to produce a coherent, ludic publication compiling the classes' essays into an accessible survey.

Autumn Semester 2021

052-0551-00L The Architecture of Maintenance (HS) 

Abstract

We interrogate the possibilities of repair as a method for a new kind of architectural design model, as a disciplinary response in the era of climatic change. The course should pose range of questions and challenges to conventional building economies, standards of construction industry ranging in scale from urban to material choices.

Objective

- Investigate design research methods through analyses of architectural examples that focus on repair.
- Produce an in-depth survey of the maintenance of one building in the form of a Maintenance Manual.
- Question and suggest improvements to repair methods applied in the contemporary building culture.
- Compare possibilities of repair-as-design method in multiple disciplines (art, landscape, medicine, industry, software, etc) with the help of invited specialist guests.

Content

The garden project has been an integral part of the teaching curriculum at Studio Tom Emerson, involving over 300 students in its conception over the past five years. On the one hand it is a design project, a pedagogical tool, focusing on ideas of construction, reuse, renovation, rejuvenation, maintenance and subtraction, yet we also see it as a form of constant and continuing research into our interactions with the dynamic processes of time and passing seasons. Can we practice architecture, with the care of a gardener?

In this weekly elective course, the goal will be to look at repair as a possible method for a new kind of design. As a disciplinary response in an era of climatic change, it is envisioned that this study should pose a range of questions to challenge conventional building economies and the durability of the constructed environment. We will interrogate and look for ways of improving and repairing standards of construction industry ranging in scale from the urban to material choices. The methods developed and gathered should become an outline of experimental possibilities for designers and practitioners who face the growing challenge of a lack of newly built form, and ever growing need to address the existing built substance, with an outlook to a conflict between construction industry standards orientated toward new buildings and acknowledged methods of prolongation and altering architecture. Instead of aspiring to build new, can we as a generation focus mainy on what is already there. A 2-weekly rhythm of lectures and tutorials will help us to produce a detailed picture of the maintenance architecture of one case study building.

Prerequisites / notice

The course is not taking place in HS21.

Submission of a project in written, drawn or documented form.

Data: 20.09.2021 12:40

Autumn Semester 2021 Page 94 of 2140
### History, Theory and Practice of Photography in Relation to Architecture

**Title:** Representation of architecture is inextricably linked to photography since the mid 19th century. As buildings are commonly discussed on the basis of images, understanding their technical origin is key to reading and making them. By teaching students how to use a 4x5” view camera, the artist and photographer Tobias Wootton will introduce different techniques of 'thinking through the lens'.

**Objective:** Knowledge of architectural photography

**Content:** History, theory and practice of photography in relation to architecture

**Prerequisites / notice:** Accommodation costs EUR 400 for two weeks.

Independent catering;

Travel expenses individually.

In the course of organizing the workshop, it was possible to bring together older local craftsmen with young apprentices, who were taught traditional techniques for a month before.

Objective

The doors of the D-Arch have been closed for over a year. We stayed at home and pretended digital teaching was still our concern. Meanwhile, over 4 million people worldwide died as a result of Corona, and the climate crisis is advancing, our construction industry is responsible for 38% of CO2 emissions. The time has never been so pressing. Let's start critique the status quo. Let's start writing.

In this seminar, writing is taught as a craft, and text work as well as journalistic strategies for its publication are dealt with intensively. The research materials that were put together by the students in part I of the seminar last semester will serve as a basis: We will deal with mental health issues from before and during the pandemic, as well as the absence of ecology in teaching, among others.

Theory of Architecture: What Drawings Did and Do

The course is limited to 24 students.

For centuries, architectural drawings have been at the center of the profession: how architects come up with ideas, share them with clients, and communicate with builders. The seminar takes the point of view that hand drawing can still be a useful instrument for the architect, and that the ways how may be understood in part through a study of past drawings, studied in the original.

The seminar meetings will convene as often as possible in the drawing study rooms in and around Zurich, including the Archives of ETH, the Graphische Sammlung of ETH, the Kunsthaus Zurich, and the Stadthaus Zurich.

Students will develop a knowledge of techniques of historical drawings from the Renaissance forward, as well as a conceptual understanding of their uses, and the different graphic strategies adopted by draftsmen in response to varying conditions, materials, and aims. They will also have a chance to explore a range of approaches to making their own drawings, when possible in response to the earlier drawings we examine. The course will challenge students to consider what the future role of hand drawing could be for the architect.

The function of drawing changed with the advent of digital modeling, which made hand drawing marginal at best to both firms and schools. In light of current conditions, the seminar considers both historical techniques of drawing as well as a range of conceptual approaches and functions, and its possible future within the altered profession of architecture.

It will take an interest not only in drawing as a practice, but also as a representational tool. It will adopt a critical attitude towards the traditional architectural conventions of plan, section, elevation, axonometric drawing and challenge students to think about how those conventions might be interrogated or undermined.

The chronological scope of the seminar will be very broad. The professor's expertise is in Renaissance drawing, however the seminar aims to take advantage of the resources available in Zurich which include everything from fifteenth century drawings to the present.

Interested students will have the opportunity to take part in the conception and organization of a conference on the topic of drawing, including both architects and historians.

There will be some assigned reading, but relatively little, focused on historical techniques and special topics in the history of drawing; most of the historical background will be conveyed through the professor's presentations and select guests, and most of the work will be drawing exercises.

The seminar will be limited to 24 students; groups of 12 will visit the drawing rooms while the other group does a drawing exercise lead by a teaching assistant. Interested students should email the professor indicating the reason for their interest and any drawing experience or studio art background.

Because the class will be located at various sites around Zurich, students should allow 30 minutes before or after class for travel.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 96 of 2140
In this seminar, we focus on two crucial perspectives that represent some of the most radical changes in the understanding of architecture. Although the profession of architecture in the second half of the 20th century has increasingly become understood as a complex practice that combines knowledge and expertise from different disciplines, architectural historiographies are still being written as histoires des idées that focus almost exclusively on the concepts and work of architects. As a result of this gap between writing about architecture and the actual practice of architecture, architects and students of architecture nowadays find it hard to recognize themselves in these histories.

This course sets out to make a correction to the existing historiographies of architecture by exploring the interdisciplinary concepts and theories that shaped the architectural discourse in the second half of the 20th century. In this seminar, we focus on two crucial perspectives—gender and urban sociology—as a way of unlocking an alternative historiography of architecture, one that more truthfully aligns with the experience of architects and architectural students.

During the course, we will analyze one edition of The Any Conferences (1996 Anybody, Buenos Aires) from the perspectives of gender and urban sociology, and try to cross these perspectives, with associated books, on the undecidability of architecture at the end of the second millennium, convened by editor Cynthia Davidson. In this series of exploratory conferences, it was not the product, but the encounter of ideas, thinking, and concepts that was the goal. By inviting activists, art theorists, economists, artists, and philosophers to engage with architects in architectural discourse, The Any Conferences tried to expose architecture and its theories to contemporary concerns.

To test our interdisciplinary perspectives, we will focus on a particularly productive “encounter” between architects and other disciplines: The Any Conferences (1990-2001). The Any Conferences were ten exceptional cross-cultural and multidisciplinary conferences, with associated books, on the undecidability of architecture at the end of the second millennium, convened by editor Cynthia Davidson. In this series of exploratory conferences, it was not the product, but the encounter of ideas, thinking, and concepts that was the goal. By inviting activists, art theorists, economists, artists, and philosophers to engage with architects in architectural discourse, The Any Conferences tried to expose architecture and its theories to contemporary concerns.

During the course, we will analyze one edition of The Any Conferences (1996 Anybody, Buenos Aires) from the perspectives of gender and urban sociology, and try to cross these perspectives. Collaboratively, we will reconstruct these conference discussions by making “assemblages” of the actors and positions taken in the conferences. Next, by visualizing how architects and leaders in other disciplines encountered particular architectural ideas from multidisciplinary perspectives, this seminar will unlock an entirely new, more inclusive perspective of architecture and the city.

This course is offered mainly to master’s students or students from the 5th semester.

The course will be graded as follows:

Active participation in the course: 10%

Mid-term assignment: 40%
Students will each submit a draft mapping (KUMU map, gender perspective) of a single “actor” in The Any Conferences as well as a well-written analysis of ca. 1 page of A4, situating this singular actor within the wider architecture culture. The text will serve as a draft for the final in-class presentation.

Final assignment: 50%
Students will each present a part of the collaboratively made concept map, and as such, offer an analysis of one “actor” in The Any Conferences from the perspectives of gender and urban sociology, explaining the relationship between these perspectives and deciphering the new ideas that materialized in the crossing of these perspectives. This analysis will also be submitted as a written text of ca.1000 words.

052-0829-21L History of Art and Architecture: Exhibiting Architecture

W 2 credits 2S A. Abhelakh

Not eligible as a Compulsory GESS Elective for students of D-ARCH.

To exhibit architecture is an oxymoron. In architecture we need many tools to communicate a project to an audience. These evidences of architectural thought are used to “exhibit the architecture.” Images, words and representations transmit ideas, concepts and ideologies and create shared meaning of things, which we will analyze and discuss.

To exhibit architecture is an oxymoron. In architecture we need sketches, drawings, models, plans, scribbles, videos, interviews, and renderings to communicate a project to an audience before and even after it is built. These evidences of architectural thought are used to "exhibit the architecture." Images, words and representations transmit ideas, concepts and ideologies and create shared meaning of things, which we will analyze and discuss. The object is to provide an imaginative space for the students to examine methods and relations between discourse and medium, context and institutional frameworks that inform representations of architecture in historical and contemporary practices.

Not eligible as a compulsory GESS Elective for students of D-ARCH.

052-0833-21L PhD Teaching: Beijing to Baghdad - Commons/Communism/Communalism

W 2 credits 3S L. Stalder, F. Mari

The commons is a concept that is garnering increased interest in academia and beyond. This course will critically approach this concept from a non-Western perspective based primarily on the work of the Sufi-Marxist Iraqi scholar Hadi Al-Alawi.

Students will be introduced to the concepts of the commons and musha’, they will critically explore the theory of Hadi Al-Alawi and its Asian influences, as well as the context in which this theory was produced, and will reflect on it based on diverse experiences.
The commons has become the subject of artistic examination, ranging from Black studies, feminist technoscience theory, to Black queer/trans studies. By asking questions around exclusion and belonging in the contemporary study of spaces, the course explores how constructs around race & gender have created interlocking forms of oppression that permeate the culture practice and discipline of architecture. From the notion of the universal artist so common during Renaissance, looking back into history, the seminar will deal with the question how artistic research can be defined in the 21st century and how it differs from the notion of the universal artist so common during Renaissance. Students will read and discuss texts (for example from Hans-Jörg Rheinberger, Elke Bippus or Dieter Mersch) and dispute the phenomenon theoretically. Besides, they will engage in conversation with artists and scientists, who are doing “Artistic Research”. They will particularly discuss the challenges and chances of artists and scientists, whenever they embark on the context of the other one.

Rheinberger, Elke Bippus or Dieter Mersch) and dispute the phenomenon theoretically. Besides, they will engage in conversation with artists and scientists, who are doing “Artistic Research”. They will particularly discuss the challenges and chances of artists and scientists, whenever they embark on the context of the other one.

Hadi Al-Alawi, a prominent Iraqi scholar who wrote, towards the end of the 20th century, on the concept of mush'a’ (an Arabic word that closely resembles the commons). Based on pan-Asian history, and focusing on Chinese and Islamic civilizations, Al-Alawi theorizes the musha’ (commons) and musha’iya (communalism) as central to communism, and argues that these practices are historically rooted in Asia. In this approach, he is influenced by Maoism and its relationship to Taoism—an ancient Chinese philosophy. We will critically explore the theory of Al-Alawi, situate its historical and intellectual context, and reflect on it in relation to various experiences and theorizations of commons and communes around the world, past and present.

The seminar uses close readings of texts and weekly written reading responses as a means to develop intersectional reading and writing competencies. The compulsory texts will be available at the beginning of the seminar.

L. Schädler Meiler, P. Ursprung
Prerequisites / notice

Students have to attend regularly at the seminar inside and outside of ETH, to take part in the discussions and to prepare the selected texts. Each participant has to hold an input lecture.

The seminar is limited to 20 people. There will be a waiting list.

Please note:
Around 4-5 meetings will take place outside ETH Hönggerberg and some at Graphische Sammlung ETH Zürich in the main building. Time for travel before and after the meetings is therefore necessary.

052-0835-21L Summer School: Transects Through Alpine Water Landscapes (ETH-EPFL)

For MSC ARCH students and Doctoral students.

Abstract

Through field expeditions, keynote lecture, discussion, workshops, and exchanges with experts, participants will contribute to the production of a synthetic ‘transect’ across a continuous water landscape. The transect operates as a record of relations along a set path, from the Aletsch glacier to the Rhone valley floor, revealing larger territorial logics.

Objective

Learning objectives include the acquisition of foundational conceptual knowledge related to (1) landscape, planning, and systemic design issues linked to water in the Alps, and (2) broader trans-disciplinary challenges facing water landscapes (climate change, agriculture, energy, urban drainage). Participants will also develop observational and analytical skills alongside the methodological tools of field research from architecture, landscape architecture, archaeology, geology, and surveying. The final outcome will be the production of individual field diaries and a synthetic transect discussed through formal presentation and critique.

Content

Water is a finite resource that has increasingly become a major geopolitical issue. In the European context, the Alps hold a strategic position as the ‘water tower of Europe’. Industrialization and urbanization apply significant pressure onto the water ecosystems of alpine valleys. Modifications to the flow of rivers can significantly impact downstream regions, across very extensive areas. Thus, concerted landscape management and urban planning is essential, especially as natural and man-made water systems are affected by climate change. The transect along the Massa river, from the Aletsch glacier to the Rhone valley floor, presents archetypal water management issues and opportunities. The transect is thought of as an autonomous territorial entity, which could be used as an abstract model for future systemic planning.

Fieldwork will be employed as a form of direct engagement with the landscape to document key infrastructure, such as irrigation channels, dams, and drainage systems. It will highlight specific urbanization processes and their associated ecosystem services (water retention, habitat provision, recreation). The objective is to develop a spatial, empirical, and material understanding of the landscape.

Lecture notes

Teaching involves 4 expedition days, 1 production day, and 1 final critique day. Doctoral students with relevant expertise will lead field research on expedition days, supplemented by keynote lectures by invited guest experts. Workshops will take place on site and in the seminar room at Villa Cassel. Professors from ETH and EPFL will take part in the final day of critique.

Prerequisites / notice

Location: Villa Cassel, 3987 Riederalp, Kanton Wallis
Duration: 6 days
Dates: 16-21 August, 2021

Participation fees cover accommodation including full board at Villa Cassel. Master students (ETH/EPFL): CHF 100; Doctoral students (ETH/EPFL): CHF 250; Doctoral/master students (external university): CHF 500. All participants are required to take part in the full 6-day summer school (2ECTS); mountain hiking is required.

Self-direction and Self-management

052-0851-21L Topical Questions in History and Theory of Architecture: Gendering History. Women Travellers

W 2 credits 2S

A. Huittsch, L. Stalder

Abstract

This course will take the form of reading seminars in which we examine women’s travel writings of the 18th and 19th centuries for their commentary on the designed environment. While architectural histories often focus on male-dominated processes of design and production, this seminar sets out to discover architecture’s past as seen through the eyes of female travellers.

Objective

Students will gain experience in different forms of reading primary sources (close and distant) and in placing these into an appropriate context. We will explore methodological approaches linking literary analysis to lived architectural experience, expanding the canon of our discipline as we include the view of women into our understanding of 18th and 19th-century architecture. Students will be familiarized with feminist approaches, intersectionality, and marginal historiography.

Primary readings are accompanied by secondary texts on feminist and intersectional methods and embedded into practical exercises. Students will prepare short presentations, engage in reading and sketching exercises, and undertake their own ficto-descriptive writing, expanding their critical writing skills.

Prerequisites / notice

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

### Objective
We expect that students pursue their examination of the design process independently and in an original manner or that they develop a related theme from the perspective of the history of art and architecture.

The work should be part of the design process and interact with it formally and in regard to content.

### Content
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

**Architecture Beyond the Studio: Reflecting the Social and Cultural Dimensions of Design Proposals**

This course is offered until end of spring 2023 semester.

**Abstract**

“Architecture beyond the studio” is a seminar with the aim to reflect and rethink the formal and spatial aspects of the students’ own design projects from the perspective of the Humanities and Social Sciences (HSS). Literature from the HSS is researched individually, related to the design projects in the form of a paper and presented jointly in an exhibition.

**Objective**

In this seminar students learn to critically reflect their practice as architects from the perspective of the humanities and social sciences (HSS). As object for these reflections serves one of the students' own design projects. This can be an architectural project they have designed at a chair for architecture and design, an architectural practice or independently.

The main focus of the seminar lies on identifying a spatially and architecturally clearly defined aspect within the students’ design projects and in reflecting as well as deepening one’s own understanding of this aspect. By writing texts alienating architectural plans and images of their design projects and establishing an individual collection of architectural examples, the students learn to relate their own design practice to research of the HSS as well as the built environment.

At the end of the semester, the students will be able to identify the historical, political sociological and/or economic dimensions of the architectural aspects in their design project as well as to locate these aspects in a contemporary architectural and HSS discourse. Furthermore, they learn to develop an individual conceptual position towards architectural-spatial questions and to communicate them visually and verbally.

**Content**

Currently, the discipline of architecture is undergoing substantial change. Political and social aspects are again becoming more important within the profession of architecture. In the 1980s and 1990s architects legitimized their designs by recurring to their artistic abilities and individual ingenuity. Today, however, practicing architects cannot escape the social and political responsibility that comes with the design of architectural buildings. An increasing number of public as well as private developers expect architects to include considerations about the social and cultural live of prospective inhabitants in their architectural designs.

Against this background, the seminar “Architecture beyond the Studio” bridges the gap between architectural design and the Humanities and Social Sciences (HSS). Supported by two lecturers – with backgrounds in architecture and the social sciences – the students develop texts in which they critically reflect on spatial aspects in one of their own design projects from the perspective of the HSS.

The aim of this seminar is to enable students to better understand social, political and/or historic dimensions of spatial aspects in their architectural designs. The students' tasks include reflexive and analytical writing, the presentation and discussion of these reflections, literature research and the production of a final text, in which they summarize their most important findings and define a theoretical position that could guide their future work as designers.

During the semester the seminar will be held as elective course (4 ECTS), including group-work, input by the tutors and individual feedback sessions. Additionally, this seminar contains two one-week-long writing workshops, which will be offered as focus work (6 ECTS) during the semester break. Next to a paper, the outcomes of this seminar will be presented in an exhibition taking place at the beginning of the following semester.

**Prerequisites / notice**

As the number of participants is limited, interested students are asked to send an A4 page including one image and/or one plan of a previous design project as well as 3-4 sentences describing the aspect of the design project the student wants to investigate and reflect on during this seminar. In order to register for the seminar, students have to send this document to both of the tutors of this course.

Students enrolling in this elective course are required to additionally enroll in the Focus-Work at the gta at the Chair of Prof. Philip Ursprung (063-0852-21L). By successfully completing the whole seminar students receive 4 ECTS for the elective course and 6 ECTS for the focus work.

---

**052-0855-21L**

**Summer School: On the Threshold - Guidebooks and Visions of Rome**

**Abstract**

The summer school explores the mediated territories between the city, its guidebook and the traveller. By adopting a selection of itineraries established by past and present guidebooks, students investigate the thresholds of Rome, between the built city and its tourists.
By the end of the five days every group will have worked on a series of different building elements for each guide, so that by the end of the week about 25 units will be produced. As a collective critical guidebook of Rome, the units designed and written by the students will be presented in a final, one-day public exhibition and lecture on the last day.

The instructors will follow the entire workflow, leading the visits, revisiting and checking the design outcomes, and coordinating the production phase.

The general aim of the week is not to present a linear or comprehensive history of the tourist guidebook, but rather to foster and implement a discourse around topics directly informed by the experience of tourism, such as everyday life, heritage, city planning, and artistic production. To this end, students will engage in in-depth analyses of specific historical periods through both scientific-synthetic and artistic-creative methods, and on a more comprehensive understandings around how to read a city, and how to critically employ a travel book. The itineraries are based on guidebooks stretching over a wide timeframe. Hence, by observing the contemporary phenomenon of tourism through a mass-social platform such as TripAdvisor, the programme introduces the topic of the Summer School from a familiar perspective, moving towards more historical and theoretical approaches as the week progresses.

The Summer School is planned for 15 international participants, ideally Master students or early career researchers, coming from different disciplines and curricula, such as architecture, applied arts, art history, literature, philosophy, sociology, photography, tourism studies and media studies. Use of personal laptops/tablets is expected. Students and tutors will stay at the magnificent Villa Maraini, the historical seat of the Istituto Svizzero. The fee will be 300 euro comprehensive of lunch (6 days).

This summer school is addressed to students from the 5th semester upwards.

The course will be limited to 16 students. Participation on the following events of the course is mandatory: Introduction, Workshop, Mid- and Final Presentations. The Chair will provide some financial support (costs for production), possible additional costs (transportation, overnight stay, food and drinks) are asked to be paid by the participants. Basic trekking experience and outdoor clothing is required.

Abstract

The final stop in our investigation of Zurich's water infrastructure is the outflow of the city. Through acoustic and visual field recordings the students find a variety of ways to represent urban systems.

Objective

Through the use of multimedia tools, this course will reflect on the contemporary use and perception of landscape. Analogue photography and audio recordings will be represent the core body of the work.

Content

Attention: The final inscription will take place on the first course date, everybody is treated the same.

After a long journey from its alpine sources, the water is pumped from the lake, cleaned and treated, stored in the reservoirs around the city and finally provided to the citizens as drinkable water. The process of providing fresh water is well respected and represented by dignified and sacral architecture; the freshwater reservoirs are surrounding the city like a pearl necklace. The outflow on the other hand is not very welcomed. In a delicate system, where the inclination and form of the container is crucial, the brown water is transported towards the city’s borders. Keeping it on a distance, the water is treated again in structures that lack any representative character.

The development of waste water treatment over the last seventy years have prepare the path for today’s life style and restored the water as an eco system. We swim in the lake and the river where animals resettled, while bacteria transform our left-overs. The kilometres-long canalization has lost its reputation as the source of evil and became a symbol of modern sanitation.

Water, the biggest flow under the surface of a city, creates a huge metabolism where the human catalyst is flown through. Ending in huge treatment plants on the outskirts of the city from where the water is released again into its grown environment.

Notes: The course will be limited to 16 students. Participation on the following events of the course is mandatory: Introduction, Workshop, Mid- and Final Presentations. The Chair will provide some financial support (costs for production), possible additional costs (transportation, overnight stay, food and drinks) are asked to be paid by the participants. Basic trekking experience and outdoor clothing is required.

23.09.2021: Introduction and final inscription!

02.-03.10.2021: Weekend workshop, all day, in Zurich (mandatory) [if the current state of the pandemic allows]

CORONA: Due to the pandemic and the current situation during the semester, the course may be adjusted. It is unclear at the moment whether the workshop can take place as planned. Whether the workshop can take place as planned. Likewise, the physical work in the laboratories will have to be adapted selectively, depending on the rules and regulations.

Abstract

Topological analysis through point cloud modelling.

The underground is an infrastructure in more than one way. Below the ground, various facilities enable the connectivity of today’s urban life. The topological approach using point cloud modeling reveals the seemingly invisible networks.

Objective

You will learn to use 3D point cloud technology in order to analyze complex urban landscape and develop new ways of representing these intertwined spaces.
The underground is an infrastructure in more than one way. Below the ground, various facilities enable the connectivity of today's urban life. The topological approach using the point cloud technology reveals the seemingly invisible networks and brings them in relation to the perceivable urban spaces.

The goal of the course is to document and analyze the given site to reveal its topological potentials. This understanding will be gained through point cloud modeling and sound recordings. In particular, we will develop a new, comprehensive sectional model of a topologically interesting site situation.

During the course, the students will work in groups of two with site-specific three-dimensional point cloud models and sound recordings. After a two-day workshop on site, the collected recordings will be assembled and built into an interactive application in the «Landscape Visualisation and Modelling Lab». All software required is open source and can also be installed on private laptops, facilitating work from home if necessary.

**Lecture notes**
A course booklet will be provided at the first introductory meeting. For further information, please see: https://girot.arch.ethz.ch/courses/elective-courses/deep-poly

**Literature**
A course booklet will be provided at the introduction. Furthermore, a semester apparat will be available to the students at the ILA Library.

**Prerequisites / notice**
Introduction and final inscription: Friday 24th (12:00-14:00) September (HIL C40.9 Foyer)

Workshop Weekend: 9th/10th October
The course space is ETH Hängenberg, LVML H40.8.

The assignment will be developed in groups of two.
Language of instruction is English; assistance in English or German.

<tr>
<td>The goals of this course include: - gaining insights into the variety of urban forms and practices in Africa - acquiring new skills in hosting and interviewing experts - strengthening ability to read, present and debate academic texts - making connections between scholarly findings and artistic productions</td>
<td>This course will unpack the range and variety of contemporary African urbanity. In doing so it will engage with both urban form and practices currently emerging, seeking to capture both their local manifestations as well as their regional, and global relevance. We will challenge the various cliché snapshots of African urbanity, as defined by a lack of infrastructure, a shortage of resources, or the informal slum. Instead, we will seek to produce a more complex portrait of African urbanity today, moving away from the city and its centre as the sole locus of urban activity, to consider the role of extended urbanisation, trans-local networks and the digital arena in shaping new urbanities.</td>
</tr>
</tbody>
</table>

**Data:** 20.09.2021 12:40  
**Autumn Semester 2021**

We will welcome a series of scholars and practitioners who are currently redefining what we understand by African urbanity. For example, we will speak with architects, anthropologists, geographers, theorists, economists, historians and curators. What are they observing on the field? And how does this challenge current understandings of urban Africa?

Each session will be structured a main reading and a presentation and discussion with our guest expert. In addition to this, students will be expected to present current representations of the topic under debate in form, art or fiction. Along-side these conversations, we will read our way through a rich syllabus of both scientific articles, book chapters, and reviews. This will be complemented with an exploration of how art, film and fiction has shaped, and continues to shape current representations of urban Africa.
We design models for the future of the Berlin-Brandenburg metropolitan region. We try to think about the future of the city explicitly from the perspective of the landscape. An analysis on two levels (pedestrian perspective: field trips as well as data and plan analyzes: GIS) lays the foundation for the design discussion in the second part of the course.

The students examine the metropolitan region of Berlin-Brandenburg and develop new approaches and strategies for the future of the urban landscape on different scales. They will familiarize themselves with methods of perception from the perspective of pedestrians, with GIS as an analysis tool, model making as a design method, and landscape architectural plan representation. Current issues with which urban landscapes will be confronted in the future (climate, densification, mobility, etc.) are addressed. The design process is accompanied by workshops, lectures, excursions, reviews, and a workbook.
Content

Based on an analysis of the urban landscape, the students develop models for the future of the Berlin-Brandenburg metropolitan region. The Winter School is organized and carried out together with the University of Applied Sciences Potsdam. Close cooperation between the students of both universities is sought.

The metropolitan region of Berlin-Brandenburg is expected to grow rapidly over the next few decades. Similar to other metropolitan regions in Europe, the background of current issues (land consumption, mobility, urban climate, etc.) the question is of how the development should take place.

As a starting point for the considerations, we suggest a change of perspective. The strategies and models should not be developed based on the city, but rather from the surrounding landscape. At the beginning of the Winter School, there is an intensive preoccupation with the urbanized landscape of the Großstad region. Based on an in-depth understanding of the conditions and genesis of undeveloped space, it is important to identify potential and explore room for maneuver. On this basis, the urban landscape is to be further considered holistically.

The students work in groups of two (ETH/FHP) and focus on different Perimeters. The work process is structured in four phases:
I: research and analysis,
II: program and design,
III: development and communication,
IV: synthesis.

In the last step, the different results become one "overall picture" and theses derived. The results are then publicly debated. Communication via exhibitions, newspapers, etc.

The Winter School will take place in Berlin. Between 30.01.22 and 14.02.22.

Objective

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

Further lectures from the core team:
- Prof. Dr. Silvia Malcovati, architect (FH Potsdam),
- Dipl. Ing. Maren Brakebusch, landscape architect (ETH Zurich / FHPotsdam),
- Prof. Bernd Albers, architect (FH Potsdam),
- Thomas Kissling, architect (ETH Zurich)

Technology in Architecture

Number Title Type ECTS Hours Lecturers
101-0587-00L Workshop on Sustainable Building Certification W 3 credits 2G D. Kellenberger

Abstract

Building labels are used to certify buildings and neighbourhoods in term of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, Minergie, 2000-Watt-Sites). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

Objective

After this course, the students are able to understand and use the different certification labels. They have a clear view of what the labels take into consideration and what they don't.

Content

Three buildings case study will be presented.

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), Label SNBS, MINERGIE-ECO and 2000-Watt-Site (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

This alternance of working session on one specific criteria for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus point (operation energy, mobility, daylight, indoor air quality).

Lecture notes

The slides from the presentations will be made available.

Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.

151-8015-00L Moisture Transport in Porous Media W 3 credits 2G J. Carmeliet, L. Fei, J. Huang, J. Zhao

Abstract

Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

Objective

- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Knowledge of pore network model and application to two-phase invasion percolation simulation
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

Content

1. Introduction
Moisture damage: problem statement, durability
Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application
Description of moisture transport
Determination of moisture transport properties
Liquid transport in cracked materials, flow and transport in deformable porous media

3. Pore network model: theory and application
Single- and two-phase pore network model: quasi-static and dynamic
Exercise on quasi-static two-phase pore network model: invasion pattern, capillary pressure curve
Application of pore network model in two-phase transport

Lecture notes

Handouts, supporting material and exercises are provided online via Moodle.

Literature

All material is provided online via Moodle.
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.
- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.
CAAD Theory: Digital Epic - Creative Writing for Integrated Discipline HS21 in the Field of Technology

No creative writing experience is required; you can forget everything you have learned. We will use experimental writing modes, since architecture is already saturated in images. To properly articulate the digital cosmos of today what we need is writing and code.

http://www.caad.arch.ethz.ch

The starting point for the historical consideration of the acoustic architectural design is the imagination of the harmony of the spheres: the Pythagorean-Babylonian cosmos is well-formed by proportions of whole numbers and elementary geometric figures. Mediated by Plato, Aristotle and the Stoics, the four Pythagorean mathematica (astronomy; geometry; music theory; algebra) appear as a medieval training course (quadrivium) in monasteries and thus also shape Leon Battista Alberti’s idea of well-formedness. Does Vitruvius share this Pythagorean world of ideas?

Reflerring to Aristoxenus, Vitruvius uses a theory of harmony for the dimensioning of sound vases in theaters, which makes the audible criterion and thus stands in opposition to the ideality of purely mathematical pitch division through the proportions of whole numbers. Connected with this turn towards the perceptible of the inner world, Vitruvius gives us a whole series of examples of acoustic design of architecture and uses the terms sound wave, sound beam, reflection, resonance and sound coloration.

The criticism of the theories of proportion, as produced in large numbers by Vitruvianism of the Renaissance, is essentially done by Claude Perrault, whose work also includes a contribution on sound and noises (Du bruit) and tries to transcend the music theory of Pythagorean origin.

The baroque author Athanasius Kircher dealt with the formation of analogies between the eye and the ear in his work “New Hall and Thon Art” and transferred the geometric representation of light rays by Galileo Galilei to sound rays. Based on the echo phenomenon, he succeeded in describing sound reflections, bundling and scattering, which today form the basis of room acoustic simulation programs.

The collaboration between Gottfried Semper, Otto Bückwald and Richard Wagner on the development of a festival theater for Wagner’s musical dramas has become an example of the acoustic design of architecture. An extraordinary performance space was created in Bayreuth, the diffuse orchestral sound of which contrasts sharply with the distinctness and clarity of the voices. Neither the architects nor Wagner had any room acoustic parameters available for planning; but after the final visual and acoustic voices, the composer and impresario was satisfied.

It was only with the experiments of Wallace Clement Sabine, published in the “Collected Papers on Acoustics”, that the reverberation time parameter was formed and used for the new “Boston Symphony Hall” to be built. Sabine has visited and listened to European concert halls in order to find an optimal space for symphonic music.

In addition to the structures for music and speech, the “soundscape” of cities and landscapes has recently established itself as a theme of sound ecology. As a follow-up to Murray Schafer’s “Tuning of the world”, a number of studies and designs have been carried out that are intended to enable acoustic comfort in all architecturally designed rooms.

Up until now, architecture has included building and room acoustics for special structures, but today it is being expanded significantly through electroacoustics. Today, buildings can be simulated and auralized from a 3D plan, not only through ambient and elevator sounds, but also through sound systems that create spatial impression, such as in the cinema. These auxiliary tools have already become indispensable for the acoustic planning of rooms.

ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE. ZoomLink: https://ethz.zoom.us/j/66588100789
Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

**Abstract**
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

**Objective**
Understanding of the importance of the ITA disciplines for architectural design and integration of structural thinking into the design process.

**Content**
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

**052-0639-00L Climate Responsive Architecture with Hive**

**W 1 credit 2G A. Schlüter**

**Abstract**
This Online course provides an introduction to climate-responsive design using the Hive tool and how to apply it in early building design stages. Hive allows architecture and building science students to understand the relation between architectural design, climate, comfort and energy. Hive is a plugin for the 3D modeling environment Rhino and its visual programming interface Grasshopper.

**Objective**
- Recall general principles of climate responsive design and examples of it.
- Utilize 3D building geometries to conduct simplified energy demand and supply simulations.
- Observe relevant physical principles and interactions between climate, energy and geometry.
- Implement passive and active concepts for Climate Responsive Design.
- Apply Hive for building design analysis and integrate it into own designs or in design courses.
- Identify and harness synergies and trade-offs between climate, energy and architectural design aspects.

**Content**
The course can be frequented individually, or as a prerequisite for other courses such as the master course Climate and Energy Systems 3 or architectural design studios.

**Prerequisites / notice**
A working Rhino 6 or 7 license is necessary.

**Abstract**
The formal framework needs to be discussed with the staff members.

**Objective**
A study in building research and preservation of building heritage with a clear topic.

---

**052-0913-21L Preservation: Communicate & Exhibit**

**W 2 credits 2S S. Langenberg**

**Number of participants limited to 40.**

**Abstract**
This elective course discusses current as well as historical practices and theories of preservation. Under the title “Communicate & Exhibit”, the focus in the fall semester of 2021 is on forward-looking positions on “Building in the Existing Building Stock” and how these are communicated to the public by preservation experts, architects, and curators.

**Objective**
This course provides students with insight into the most important theories and practices of historic preservation and ways of conveying and exhibiting them. Students can deepen their understanding of the subject and discuss issues in a group by examining a topic of their own choice.

**Content**
Current strategies of “building in the existing fabric” are backed by various historical theories and practices of preservation. But which architects follow - explicitly or implicitly - which theory? How do these points of view evolve through the activities of different actors in their preservation and building activities, what forms of sufficiency have been and are being practiced? What “first works” are worth showing that introduce significant architectural oeuvres as building within the existing built fabric?

In the fall semester of 2021, we will explore influential approaches to preservation and examine narratives associated with them, such as resource allocation, change of use, and “modernisation”. We will also analyse, discuss, and question their public communication. The insights gained will flow into the development of curatorial concepts, which will be applied and tested on the basis of a specific project site.
Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Domain B - Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies assessed
- Problem-solving assessed
- Project Management assessed

Domain C - Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation not assessed
- Leadership and Responsibility assessed
- Self-presentation and Social Influence assessed
- Sensitivity to Diversity assessed
- Negotiation assessed

Domain D - Personal Competencies
- Adaptability and Flexibility not assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection not assessed
- Self-direction and Self-management not assessed

052-0911-21L Repair: Making Things Better W 2 credits 2S S. Langenberg

ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.
ZoomLink: https://ethz.zoom.us/j/66588100789

Abstract
The lifespan of objects is decreasing not only in product design but also in architecture due to complex constructions, use of materials that are difficult to dismantle, and industrial manufacturing processes. Repairability is becoming less of a concern - replacement seems to be the norm. We need to rethink the way we build, starting already during the planning phase.

Objective
Traditional topics of preservation are combined with implementations of contemporary repair and FAB initiatives to raise awareness for a sustainable thinking and action. Students will learn both traditional and digital methods as well as the basic constructive and material criteria for repair. The objective is not only the hands-on repair of an object but especially the theoretical transfer to architecture.

Content
The elective course will discuss and examine the reparability of products and constructions. Based on a broken object of their choice, each student will first identify its defects and the reasons. Subsequently, they will develop a repair concept and carry it out under expert guidance or with the aid of digital fabrication processes. The objective is not only to restore the object to a working condition, but also to improve it through repair - if and where possible.

**052-0915-21L** An Example-Based Introduction into Building Archaeology

**W 2 credits 2V**

L. Vandenabeele

This course is offered until end of HS22.

**Abstract**

An introduction to the scope, methodology, theoretical and practical developments of Building Archaeology (historische Bauforshung) based on a large-scale ongoing project conducted by the institute IDB under the project lead of the lecturer himself.

**Objective**

Introduce students to the current methodology and scope of Building Archaeology.

**Content**

This lecture will introduce students to the scope and methodology of Building Archaeology (historische Bauforshung). It will be given by the project leader of the ongoing project “Building history of the Basilica of St Anthony, Padua”. Based on that project as a case study, but including other examples, the lecture will show how to formulate hypotheses in a BA project, how to develop a strategy of investigation, how to proceed methodologically and technologically. The course will cover surveying methods like laser scanning and 3D modeling (e.g. 3D printing, BIM for heritage), terrestrial and drone-based photogrammetry (structure from motion) and thermal imaging, as well as dating techniques like radiocarbon (14C), dendrochronology, mensiochronology (dating by statistical evaluation of brick sizes) and archival research. It will present the main project in parallel to the ongoing investigations, giving the students a unique opportunity to participate in the strategy, progress and preliminary results of an actual research project. Furthermore, the stage will be opened for an outlook on other projects, hence providing a broad overview of the field of BA and its recent developments. As the monument considered contains important historical structures from the 13th to the 18th centuries, this lecture will also offer a practical insight into Construction History.
Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

<td>Abstract This survey course offers an introduction to urban theory for students of architecture and urban design, by exploring the past and current discourses on cities and urban development.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective

It is often said that we live in an 'urban age': cities are the most common habitat for the inhabitants of the world, today. Moreover, while more than half the global population lives in cities according to the reports of the UN, it is expected that within the next few decades this amount will increase to two-thirds. This 'urban' condition, however, cannot be generalized. Within the term 'city' a broad range of different urban conditions are taken together: from metropolises to suburban neighborhoods, and from shrinking (old industrial) cities to the new cities that prosper under the conditions of globalization. Nevertheless, because of the increase of the urbanized environments, the development of cities forms the topic of discussion among a wide range of people. Urban developments do concern politicians, economists, anthropologists, philosophers, citizens and activists, developers and designers. In turn, the urban realm has provoked theorists, citizens, politicians, artists and designers to think and write about its form and functioning, appearance and structure. The discourse regarding the current growth of cities has a long pedigree in history, going back to the establishment of Greek and Roman city-states. In turn, urban planners have made valuable contributions to these discussions, in writings and in actual urban design projects and proposals.

This survey course aims to offer an introduction to urban theory for students of architecture and urban design, by exploring the past and current discourses on cities and urban development. By investigating a range of topics, from politics to poverty, and from modernization to commodification, it aims to show how urban and architectural design are related to theory. The aim of the course is to challenge the question how architects and urban designers can have an influence on urban development. With this question, also students are urged to reflect upon their own position regarding architectural interventions in the urban fabric.

This course aims to offer a survey of the history and current state of urban theory for students of urban design and architecture. Weekly, one-hour lectures address one particular topic at a time (e.g. politics, public space, capital). In each lecture, this theme is investigated through three case-studies (either of particular cities or seminal contributions by theorists or designers) that highlight crucial moments in the history and developments of cities. At the same time, the case studies will be structured so as to bridge between urban theories and concrete urban situations, design reflections and political ambitions. This will help convey to students the historical pedigree of current discourses on cities, whether simultaneously gain insight the role of designers in respect to the chosen topic. Students will prepare the meetings by reading fragments from core texts on the foreground.

Content

| Lecture 01 - Introduction | Lecture 02 - Politics |
| Lecture 03 - Public Space | Lecture 04 - Capital |
| Lecture 05 - Technology | Lecture 06 - Justice |
| Lecture 07 - Housing | Lecture 08 - Tourism |
| Lecture 09 - Immigration | Lecture 10 - Urban Form |

For this course, each week students will read fragments from key readings on the topics addressed. These readings will be made available via the website of the course.

Taught competencies

Domain A - Subject-specific Competencies: Concepts and Theories
Domain B - Method-specific Competencies: Analytical Competencies
Domain C - Social Competencies: Communication, Leadership and Responsibility, Self-presentation and Social Influence, Sensitivity to Diversity, Negotiation
Domain D - Personal Competencies: Critical Thinking, Integrity and Work Ethics, Self-awareness and Self-reflection

Literature

For this course, each week students will read fragments from key readings on the topics addressed. These readings will be made available via the website of the course.

063-0803-02L History and Theory of Architecture IX (Gnehm) W 1 credit 1V M. Gnehm

This core course (ends with 02L=) can only be passed once! Please check this before signing up.

Abstract

The lecture discusses Gottfried Semper’s complex approach to architecture as the «small world» created by mankind within a global scope framing history and the present between a cosmological totality and chaotic fragmentation.

Objective

Knowledge of Semper’s theory and practice in the disciplinary context of nineteenth-century historicism and present-day architectural discourse.

Content

The seductiveness of Semper’s theory of architecture lies not least in the fact that he exploded world art histories popularized around the Vitruvian categories to which it had been tied for centuries before. This parallels his linking the smallest object and detail to the largest monumental building and his addressing philosophical questions centred around architecture such as those of the relation between nature and culture, the universal and the local, the material and the immaterial, body and soul, image and language, art and interpretation. In doing so, his global scope provokes political questions regarding the relation of identity and foreignness, of the West to the rest of the world.

Prerequisites / notice

Please note, this is a core course and it can only be passed once during the curriculum. Please check before enrolling!

063-0313-21L History of Art and Architecture V: Caractère (Character) W 1 credit 1V M. Delbeke, S. de Jong

This course is full. Please do not enroll after 9.9.2021. Thank you.

Abstract

This course is a reading class in which the architectural category of 'caractère' or character - a key concept in the 18th century but of great relevance until today - will be examined by a close reading of several key texts, from the late 1700s up until today. Independent reading and vivid discussion in class make up this course’s character.

Objective

Deepen basic knowledge, improve ability to critically read and analyze texts of architectural theory, and understand shifts in architectural thinking.

Content

'Caractère' or character is not only a quality applied to human beings. It is also a category of architectural discourse, developed in the 18th century when architects and theorists were seeking new ways to talk about and judge buildings, pushing architectural discourse beyond linguistics, physiology and psychology, art and industry. This parallels his linking the smallest object and detail to the largest monumental building and his addressing philosophical questions centred around architecture such as those of the relation between nature and culture, the universal and the local, the material and the immaterial, body and soul, image and language, art and interpretation. In doing so, his global scope provokes political questions regarding the relation of identity and foreignness, of the West to the rest of the world.

This reading class will closely examine key texts that discuss the phenomenon of a building's 'character' from the 1700s until today. The weekly assigned texts (in the original French, English or German) will be read at home and then discussed in class. Independent reading and vivid participation in class are a fundamental prerequisite. In addition, there will be weekly written assignments, which will all be graded. A final written assignment at the end of the semester will be graded as well. To pass the course, students will have to read each assigned text, and hand in all written assignments on time.

|              | We study historic constructions in German-speaking Switzerland (individual small groups, objects within 2 hrs public transport reach from ETH Hoenggerberg). Each group will be assigned an individual tutor (PhD student) who will be present on-site, on individual appointment. |      |      |       |             |
|              | We will survey, document and analyze a historic construction, with particular attention to production traces, constructive detail and laod-carrying system. |      |      |       |             |
|              | We will start with introductory classroom lectures and on-site teaching during the first third of the semester. This will be followed by individual investigations on site. The progress will be pinpointed in three critiques: |      |      |       |             |
|              | 1) on site, with individual tutor                                     |      |      |       |             |
|              | 2) at institute, with professor and institute members                 |      |      |       |             |
|              | 3) final delivery, at institute, with professor and all institute members |      |      |       |             |
|              | The detailed schedule of the case studies can be found here:         |      |      |       |             |
|              | **Lecture notes**                                                    |      |      |       |             |
|              | Detailed instructions on on-site investigations, as well as manuscripts on the background, will be provided. It is mandatory to read them in due time! |      |      |       |             |
|              | **Literature**                                                        |      |      |       |             |
|              | Will be announced during the introductory lectures                    |      |      |       |             |
Prerequisites / notice

Elementary knowledge of architectural history and construction.

Semester program:
25.9.20: On site introduction, Rümlang (Glattbrücke).
Courses in HIL E 7 until end of October.
Group work on the object or individual work (at home).

Intermediate crits and final crits at the IDB (HIT, H Level). Details will follow in due time.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: assessed

Domain C - Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

Future Monuments

This core course (ends with «00L») can only be passed once! Please check this before signing up.

ITA Pool Introduction to courses within the institute ITA:
8.9.21, 10-11h, HIB Open Space.

Abstract
Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

Objective
In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensively justify their own positions within the context of preservation. Our goal here is to foster students' communication skills and the culture of discussion.

Content
The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. This core conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures. In addition to dealing with historical buildings, the course is also dedicated to younger (and very young) objects and inventories - for in addition to the preservation of already listed objects, the selection and inventorisation of future protected objects is also one of the core tasks of heritage conservation.

Abstract
This course conveys an introduction into methods of urban research in social sciences through lectures and accompanying exercises. It treats the basic principles of scientific research, literature research, different forms of participant observation, qualitative interviews (expert interviews and ethnographic interviews), and the analysis of urban qualities.

Objective
This course aims at enabling students of architecture to use sociological analysis as basis for concrete projects in architecture and urban design. It is based on a specific set of methods that is applied in design studios (integrated disciplines) as well as in the master thesis (supplementary discipline sociology).

Abstract
This lecture series sets up an agenda for widening the disciplinary field of architecture and urbanism from their focus on the city, or the urban in the narrow sense, to wider territorial scales, which correspond to the increasing scales of contemporary urbanisation. It discusses the concepts of territory and urbanisation, and their implications for the work of architects and urbanists.

Objective
The course will enable students to critically discuss concepts of territory and urbanisation. It will invite students to revisit the history of architects’ work engaging with the problematic of urbanising territories and territorial organisation. The goal is to motivate and equip students to engage with territory in the present day and age, by setting our contemporary urban agenda.

The lectures are animated by a series of visual and conceptual exercises, usually on A4 sheets of paper. All original student contributions will be collected and bound together, creating a unique book-object. Some of the exercises are graded and count as proof of completion.
Within the theme My Species, the four guest speakers engaged in fields ranging from art and landscape representation to bioethics and environmental philosophy, will approach territory through the notions such as multispecies, coexistence, and diversity. With a more-than-human perspective on the territory, the guest speakers will elaborate their take on “telling horrible stories in beautiful ways,” debate “the dignity of plants,” expound upon “mankind’s fascination to better the world,” and confer “the non-human turn” and what is to come after.

Abstract

Determination of the internal forces and description of the behaviour of load-bearing structures with the help of graphic statics. Design of details and simple dimensioning of these structures. Discussion of reference structures, illustration of the interaction of the structure and the architectural design. Application of all that in an own design.
### Objective
Understanding the relationship between internal forces and the design of load-bearing systems and their connection details. Creative integration of what has been learned into an open design task.

### Content
- Determination of the internal forces and description of the behaviour of load-bearing structures with the help of graphic statics. Design of details and simple dimensioning of these structures. Discussion of reference structures, illustration of the interaction of the structure and the architectural design. Application of all that in an own design.

### Literature
- "Faustformel Tragwerksentwurf" (Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2013, ISBN: 978-3-421-03904-0)
- "The art of structures, Introduction to the functioning of structures in architecture"

### Teaching Language
English and German.
The recordings of the lectures are available on the MAP under the link [https://map.arch.ethz.ch](https://map.arch.ethz.ch) (book symbol at the top right).

The course lectures and material are provided online via Moodle.

Subject of the course is robotic fabrication in architecture. Through exercises, basic skills such as robotic control are being taught and further information: [http://www.bauprozess.arch.ethz.ch/education/MSc/BauprozessOekonomie.html](http://www.bauprozess.arch.ethz.ch/education/MSc/BauprozessOekonomie.html)

Your presence on the first course day is obligatory!
choose a design class.

A student can only register once for a "Fachsemester" during the Master studies!

Abstract

Paying Attention: A Collective Manifesto.

Attention is a rare commodity. How do we deal with attention? How is it manipulated? Who pays?

Students produce autonomous texts.

Objective

Our aim is to increase the knowledge and sensitivity of architecture students toward the issue of attention, to make their voices heard and to develop a new teaching form for the history and theory of architecture. Students will be familiar with theories and practices of attention, they will learn to take position in a field, they will practice argumentation and increase their writing skills.

Literature

Will be provided.

Prerequisites / notice

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Wednesday, September 8, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Accompanying courses:

- 063-0803-00L History and Theory in Architecture IX.
- 052-0825-20L Special Questions in History of Art and Architecture (optional, individual events).

Self dependent work.

Within the frame of the semester topic, the choice of topic is free.

Abstract

The theme of this History Research Studio is 'Female Agency in Architecture before 1850'. The Studio aims at exploring the crucial role women played in the birth, life and afterlife of buildings in the early modern period. We will study female patronage, authorship, and criticism in architecture.

Objective

Students are invited to identify and investigate their own specific case studies that pertain to this theme. The Studio will teach students to articulate their research questions, carry out appropriate primary and secondary study and write a complete paper.

The structure of the studio will follow an input-exchange-output model. All members of the chair will provide input, to both the theme and method, as well as examples and references of research. There is also room for students to read and discuss together with the material prepared for them (short texts, summaries and reading lists) and the materials they found. Weekly group meetings and individual supervision by the chair members will help students in academic research and writing. Exchanges with the researchers at the chair are also beneficial to further develop their research themes and teaching.

Content

Focussing on 'Female Agency in Architecture before 1850' this studio examines the emergence of the role of women in architecture and architectural theory, in a period of great economic, social and cultural change: 1450-1850.

Women acquired a major role in architectural patronage in eighteenth-century France and England, when they came to independently design and commission innovative mansions and dwellings. They stand in a tradition of major female builders in early-modern (sixteenth-and seventeenth-century) Italy and in Ottoman Turkey. The relationship between architect and patron surfaces in different types of buildings commanded by women: stately residences (hotels urbains) and emerging types as pavilions and petites mansions. These women excited their influence in the various aspects of the design process. Female patrons used their expertise in determining the layouts of their dwellings and in arranging spaces that reflected as much their daily lives as special occasions. They tell us about women's lifestyles, their use of specific spaces, and the expression such spaces should have, as well as about their social and economic situations. While many of these patrons were women of fortune, from aristocracy, the period also sees a changing female clientele emerge with collectors, artists, dancers, actresses, writers and mistresses (the Petit Trianon for Madame de Pompadour for example). Furthermore, in this period women would increasingly express their ideas in pamphlets and articles in journals, in salons, in letter writing, in literature, or in travel accounts. They were thus voicing their ideas on architecture in both spoken and written form, and in drawing up plans for new buildings, when acting as a patron. Both as a patron and as a user of buildings women acted as a critical voice of how to design architecture from the point of view of the user of architectural spaces, be it in a domestic or a more public setting.

This Master Studio invokes students to adopt female agency as a primary investigative territory to critically examine the ways in which architecture is produced, conceptualised and historicised in a particular cultural and historical context. It was in a wide array of media that constituted architectural debate that the female voice was heard and influenced the larger debate. By examining the female perspective this Studio aims to open up the corpus and historiography of thinking about buildings.

While we understand the necessity of a canonical history the Studio actively searches and tests approaches and methods of enquiry that challenge that canon and propose a different history. By examining the professional, artistic, authorial and cultural role of women in architecture the courses and meetings of the semester will offer an opportunity to look afresh at architectural history and theory of the early modern period.
Prerequisites / notice

Places for this Subject Semester are limited. Please send your candidacy by email (a 300-word motivation letter and a 300-word statement on your topic of interest) to: professur.delbeke@gta.arch.ethz.ch
See also the website of the chair: https://delbeke.arch.ethz.ch/courses

Deadline for application is Wednesday, September 8, 2021, 20.00h. You will receive a message on your acceptance for the Fachsemester by Thursday, September 9, 2021, 14.00 h. This means rejected students can then still choose a design class for HS 2021.

A student can only register once for a Subject Semester during the Master studies!

Subject Semester (Fachsemester) HS21 in the Field of Historic Building Research and Conservation (IOB, Prof Holzer)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Friday September 3, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Subject Semester (Fachsemester) HS21 in the Field of Technology in Architecture (ITA, Prof. Schlüter)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is Wednesday, September 1, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Friday, September 3, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

In this research semester, we address the topic of Zero Emissions Building Design, which integrates aspects of energy, materials and technology, human behaviour and comfort into architectural design, aspiring synergetic design solutions.

After successfully concluding the research semester students can identify concepts and relevant design parameters for Zero Emissions Building Design and develop integrated architectural design strategies. They know how to select and use appropriate simulation and analysis tools to qualify and quantify their design solutions and visualize their concepts using both technical schematics as well as architectural drawings and visualizations.

Abstract

The subject semester includes the individual, independent processing of a specific task, whereby the relevance of the respective discipline is examined with regard to the specific architectural and design aspects of the task.

The subject semester includes the individual, independent processing of a specific task, whereby the relevance of the respective discipline is examined with regard to the specific architectural and design aspects of the task.

The subject of the semester is defined by the chair and published on the website:
https://holzer.arch.ethz.ch/en/education/Fachsemester.html

063-0655-21L

Subject Semester (Fachsemester) HS21 in the Field of Technology in Architecture (ITA, Prof. Schlüter)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is Wednesday, September 1, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Friday, September 3, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.
Content
First, students will be introduced to core concepts of Zero Emissions Building Design and discuss leading works and examples on a global scale. In combination with excursions and site visits (if possible), a catalogue of criteria and metrics for the development of their integrated design concepts will be developed.

Participants will work on an urban retrofit case study in a moderate climate. The analysis departs at analyzing the site, its climate, the status quo of the building and relevant architectural/urban parameters. After assessing the potentials for reducing energy demand and local renewable energy supply, students will develop integrated design concepts targeting zero carbon over the building lifecycle, both for building operation and construction/materials.

Using low-barrier modelling, simulation and optimization toolsets (preferably Rhino / Grasshopper, HIVe, etc.) the design concepts will be assessed and discussed both numerically as well as architecturally / aesthetically. For further development, students choose one component or aspect central to their design concept.

Lecture notes
Students will document the process and the results both numerically as well as architecturally, which then will be discussed with a final jury.

Literature
All materials (lectures, tools, examples) are available on the "A/S knowledge platform": https://moodle-app2.let.ethz.ch/course/view.php?id=11917

Prerequisites / notice
The working mode is an individual design research studio with weekly group meetings and reviews. We expect good basic knowledge on sustainable construction and energy- and climate systems. Prior knowledge in parametric design tools (Rhino) and/or simulation is a plus.

Abstract
Housing Commons and the City: Zurich

Objective
The Research Studio has two objectives. First, to develop an 'Archeology' of Zürich's housing commons. In this part, the work of the urban historian or theoretician is understood as an archaeological venture. The collective residential stock, as well as the integrated common-pool resources, but also political movements and society at large. Some of these issues – generally called 'the commons' – have also received growing academic attention in the last decades within the fields of critical urban studies, urban history, urban geography and the social sciences. An historian or theoretician is understood as an archaeological venture. Housing Commons and the City: The Case of Zurich

This Research Studio focuses on the housing commons of Zürich. By 'housing commons' we mean various collectively owned, non-profit forms of housing ownership such as associations, public (municipal) housing, and cooperatives, all formats that have built up the backbone of the city's affordable housing policy since the early 1900s. A long-standing alliance with the local government, financial subsidies historically ratified in popular referendums, and the possibility of leasing city-owned land for development have rendered housing commons prominent, in a housing sector otherwise dominated by market rental and private ownership. About a quarter of the city's residential stock qualifies as collectively owned housing, a ratio set up to increase to a third by 2040. In a city where 1-person households still make up almost half of the entire residential stock, housing commons are exemplary as models for sustainable densification and typological innovation.

In this research studio we will explore how housing commons have been produced, managed, used, maintained, and appropriated, how are they different from other forms of housing in the city, how they are strangerly distinguished from the housing on the market. We are particularly interested in how housing commons have contributed to ease the chronic housing shortage in the city, and might continue to do so in the future? We hold that housing commons offer us new perspectives to think about contemporary challenges such as densification, a growing housing demand, and sustainable urban living.

Cities have always been places based on common resources and common practices. While design and the architecture of the city, architects, urban designers, builders, and inhabitants have had to engage with common resources located in particular places and geographic: inherited common-pool resources (water, nature, air); material common-pool resources (clay, brick, stone, wood); and immaterial common-pool resources (craft, knowledge). This understanding of the city, as related to common resources and practices, has gained renewed attention, as neoliberalism replaces ever-shrinking welfare structures, and global urbanization is accompanied by rising inequality. It is not only architects and urban designers who are again becoming interested in alternative principles of governing common resources, but also political movements and society at large. Some of these issues – generally called the 'commons' – have also received growing academic attention in the last decades within the fields of critical urban studies, urban history, urban geography and the social sciences. This Research Studio continues the studio's investigations into the rich history of the 'commons' in the city of Zürich by focusing on its residential infrastructures. The housing commons' will be investigated from architectural, urban, typological, environmental, and material perspectives. We will explore how common practices and resources have affected their development in the city, and conversely how the built housing commons enable and structure common practices. The research will unlock an alternative reading of the urban and architectural qualities of the built environment of the city.
Methodology: Exploring the Tools and Knowledge of the Architect

The main hypothesis of the Research Studio is that historical and theoretical research can gain from a profound use of the tools and knowledge of an architect. During the Research Studio students will employ specific architectural tools, such as drawing, writing, and model making to explore historical and theoretical realities. Students will be urged to explore various methods of composing analytical and interpretative drawings. They will reflect upon the capacity of drawing methods from the field of architecture, such as plan drawing, sectional drawings, mappings, serial visions, public drawings, diagramming and perspective representations to act as tools of historical and theoretical research. At the same time, they will be asked to investigate various analytical and interpretative modes of scale-model making. Students may work with different types of models (structural models, mass models, counter form models, landscape and territorial models) as ways to historically or theorectically explore the reality of the city.

Far from being simple graphic or artefactual restitutions of the city, these drawings and models will create morphological, thematic or theoretical links between various occurrences in the city. These methods of drawing and model making will be combined with more conventional investigative techniques in the fields of history and theory such as discourse analysis, iconographic studies and compositional investigation, to support a better historical or theoretical understanding of specific occurrences and conditions in the city of Zürich.

Students will also be stimulated to use their spatial, formal, material and constructive architectural knowledge to offer alternative historical or theoretical interpretations of the reality that they encounter in the archives, in the library or in the city. They will be asked to activate their specific spatial, typological, compositional, technical, material and constructive expertise to probe into the various historical layers of the architecture of the city in newfangled ways.

Within the general theme of housing commons, students will be guided to identify their own subtheme, as well as explore their own different methodologies of doing research. During the Research Studio students will confront their empirical knowledge (about space, typology, composition, technique, material and construction), pertaining to the autonomy of architecture, with other types of knowledge (on politics, economy, the social and cultural) that belong to the heteronomy of architecture. In the relation between autonomous and heteronomous knowledge, a new understanding of the city will be constructed. The combination of these tools and methods will offer an in-depth mode of historical and theoretical research, wherein the students will retro-actively explore the spatial, formal, material and constructive features of a particular situation to uncover and reconstruct the logics that have led to a certain urban condition. On the basis of this research, students will be able to develop an architectural hypothesis of the developments in the city of Zürich.

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Wednesday 8th September, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Self-dependent work.
Enrollment on agreement with the chair only.
Meetings as required and after consultation with the chair (Wednesdays).

The collective and individual projects together will offer an alternative reading, which retro-actively traces the urban territory and architectural quality of the city of Zürich back to the local common resources and common practices. The different materials – texts, drawings, models – will be combined in an atlas, which presents this alternative reading to a larger audience.

**Focus Work**

Realization in the respective fields of the institutes. Definition of topics by professors, in consultation with the students. The content may also refer to an elective course.

The performance assessment comprises either a purely written examination followed by an oral examination or a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, drafting or drawing part, it also includes a written description of the question, methodology and knowledge gained.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

**Field of Historic Building Research and Conservation**

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

Performance assessment: Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, drafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.
### Field of Design and Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

### Field of History and Theory of Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis. The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available. The subjects can be proposed by the students. In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

### Field of Landscape Architecture and Urban Studies

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

Information on exams and grades: Art. 29 of the MSc D-ARCH regulations.

#### Focus Work HS21 in the Field Landscape and Urban Studies (LUS)

In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis. The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available. The subjects can be proposed by the students. In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

### European Aspects of Spatial Development

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

European spatial policy agenda: introduction and basic directives
- European spatial policies
  - horizontal - vertical - thematic
  - spatial planning strategies and programmes on territorial cooperation
  - the notion of planning culture and planning system
  - planning cultures in Europe
  - the relevance of European transnational cooperation for spatial planning
  - European transnational initiatives

Obligatory literature:
- The documents for the lecture will be provided at the moodle.

Recommended literature:
- Governance models:
  - Planning models:

EU as a political context:

Territorial cooperation in Europe:

Planning families and cultures:

Planning systems in Europe:

Prerequisites / notice
Only for master students, otherwise a special permission by the lecturer is required.

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Field of Technology in Architecture
Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

Performance assessment: Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the lecturers. The content of the in-depth work can also relate to the content of an elective course.

The Master's thesis is supervised by a design professor D-ARCH. The students can choose one of the topics presented by the D-ARCH. The Master's thesis is the completion of the Master's degree. It shows the students' ability to work independently and is a proof of the successful completion of their studies. The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

This doctoral seminar organised by the D-BAUG platform on data science and machine learning aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Students will
- Critically read scientific papers on the recent developments in machine learning
- Put the research in context
- Present the contributions
- Discuss the validity of the scientific approach
- Evaluate the underlying assumptions
- Evaluate the transferability/adaptability of the proposed approaches to own research
- (Optionally) implement the proposed approaches.

---

Data: 20.09.2021 12:40
Autumn Semester 2021
Page 128 of 2140
Content

With the increasing amount of data collected in various domains, the importance of data science in many disciplines, such as infrastructure monitoring and management, transportation, spatial planning, structural and environmental engineering, has been increasing. The field is constantly developing further with numerous advances, extensions and modifications.

The course aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Each student will select a paper that is relevant for his/her research and present its content in the seminar, putting it into context, analyzing the assumptions, the transferability and generalizability of the proposed approaches. The students will also link the research content of the selected paper to their own research, evaluating the potential of transferring or adapting it. If possible and applicable, the students will also implement the adapted algorithms. The students will work in groups of three students, where each of the three students will be reading each other’s selected papers and providing feedback to each other.

Prerequisites / notice

This doctoral seminar is intended for doctoral students affiliated with the Department of Civil, Environmental and Geomatic Engineering. Other students who work on related topics need approval by at least one of the organisers to register for the seminar.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

Abstract

The seminar week is obligatory for students of all semesters. There are many and varied study contents.

Objective

The students will be enabled to discuss narrowly formulated factual questions in small groups and in direct contact with the professors.

</tr>
</tbody>
</table>

### Prerequisites / notice

- **Physics I, II, Environmental Fluid Dynamics**
- **Concepts for non-ideal boundary layer conditions**

### Objective

**Understanding the dynamics of large-scale atmospheric flow**

**Objective**

Overall goals of this course are given below. Focus is on the theoretical background and idealized concepts. Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

**Content**

- The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. The course starts by providing the theoretical background and reviewing idealized concepts. These are contrasted to real world applications and discussed in the context of current research issues.
- Students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

### Literature

- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

### Prerequisites / notice

- **Physics I, II, Environmental Fluid Dynamics**
- **Concepts for non-ideal boundary layer conditions**

- **Physics I, II, Environmental Fluid Dynamics**
- **Concepts for non-ideal boundary layer conditions**

### Objective

**The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.**

### Content

- All participants will be on the waiting list at first. Enrollment is possible until September 19th, 2021. The waiting list is active until October 1st, 2021. All students will be informed on September 16th, if they can participate in the lecture.
- The lecture takes place if a minimum of 5 students register for it.

### Literature

### Prerequisites / notice

- **Target group: Doctoral and Master students in Atmosphere and Climate**

### Notice

- **Priority is given to PhD students majoring in Atmospheric and Climate Sciences, and remaining open spaces will be offered to the following groups:**
  - PhD student Environmental sciences
  - MSc in Atmospheric and climate science
  - MSc in Environmental sciences

- **All participants will be on the waiting list at first. Enrollment is possible until September 19th, 2021. The waiting list is active until October 1st, 2021. All students will be informed on September 16th, if they can participate in the lecture. The lecture takes place if a minimum of 5 students register for it.**

### Abstract

Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

### Notice

- **Number of participants limited to 16.**
- **Priority is given to PhD students majoring in Atmospheric and Climate Sciences, and remaining open spaces will be offered to the following groups:**
  - PhD student Environmental sciences
  - MSc in Atmospheric and climate science
  - MSc in Environmental sciences

- **All participants will be on the waiting list at first. Enrollment is possible until September 19th, 2021. The waiting list is active until October 1st, 2021. All students will be informed on September 16th, if they can participate in the lecture. The lecture takes place if a minimum of 5 students register for it.**

### Notice

- **Priority is given to PhD students majoring in Atmospheric and Climate Sciences, and remaining open spaces will be offered to the following groups:**

### 701-1251-00L Land-Climate Dynamics

**Number of participants limited to 36.**

*Priority is given to the target groups:*
- Master Environmental Science,
- Master Atmospheric and Climate Science and
- PhD D-USYS

*Waiting list will be deleted September 27th, 2021.*

**Abstract**
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

**Objective**
The students can understand the role of land processes and associated feedbacks in the climate system.

### Lecture notes

Powerpoint slides will be made available

### Prerequisites / notice

Prerequisites: Introductory lectures in atmospheric and climate science

and/or

### Atmospheric Composition and Cycles

**Abstract**
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

**Objective**

**Physical and chemical principles:**
The students...
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

**Experimental methods:**
The students...
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

**Environmental impacts:**
The students...
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- know the most important climate impacts of atmospheric aerosols.
- are aware of the health impacts of atmospheric aerosols.

**Lecture notes**
materiel is distributed during the lecture

### 701-1233-00L Stratospheric Chemistry

**Abstract**
The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects, especially the ozone depletion caused by FCKW in mid-latitude and polar regions as well as the coupling with the greenhouse effect.
Objective
The students will understand the gas phase reactions in the stratosphere as well as reactions and processes in aerosol droplets and polar stratospheric clouds.
The students will understand the most important aspects of stratospheric dynamics and the greenhouse gas effect in troposphere and stratosphere.
The students will also acquire a good understanding of the coupling between stratospheric ozone and climate change.
Furthermore, they will practise to explain fundamental concepts in stratospheric chemistry by means of scientific paper presentations.

Content
Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and termolecular reactions, photo-dissociation.
Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxides, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles, Methane destruction and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chlorine activation.

Lecture notes
Documents are provided in the contact hours.

Literature

Prerequisites
Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.

Climate History and Paleoclimatology

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
651-4057-00L | Climate History and Palaeoclimatology | W | 3 credits | 2G | H. Stoll, I. Hernández Almeida, H. Zhang

Abstract
Climate history and paleoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

Objective
The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmosphere circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators and geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitude and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

Hydrology and Water Cycle

701-1251-00L | Land-Climate Dynamics | W | 3 credits | 2G | S. I. Seneviratne, R. Padrón Flasher

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks in the climate system.

Prerequisites
Powerpoint slides will be made available

701-1253-00L | Analysis of Climate and Weather Data | W | 3 credits | 2G | C. Frei

Abstract
An introduction into methods of statistical data analysis in meteorology and climatology. Applications of hypothesis testing, extreme value analysis, evaluation of deterministic and probabilistic predictions, principal component analysis. Participants understand the theoretical concepts and purpose of methods, can apply them independently and know how to interpret results professionally.

Objective
Students understand the theoretical foundations and probabilistic concepts of advanced analysis tools in meteorology and climatology. They can conduct such analyses independently, and they develop an attitude of scrutiny and an awareness of uncertainty when interpreting results. Participants improve skills in understanding technical literature that uses modern statistical data analyses.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 133 of 2140
For complementary reading:

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on
P. Molnar

Title
Watershed Modelling

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport
Boundary Layer Meteorology, P. Calanca

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications.

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course
Type
4G

Lecturers

Overall goals of this course are given below. Focus is on the theoretical background and idealized concepts.

Documentation and supporting material:
- slides used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for workshop sessions

All material is made available via the lecture web-page.

Prerequisites / notice
Prerequisites: Basics in exploratory data analysis, probability calculus and statistics (incl linear regression) (e.g. Mathematik IV: Statistik (401-0624-00L) and Mathematik VI: Angewandte Statistik für Umweltwissenschaften (701-0105-00L)). Some experience in programming (ideally in R). Some elementary background in atmospheric physics and climatology.

Prerequisites / notice

Data: 20.09.2021 12:40
Autumn Semester 2021
Page 134 of 2140

Electives

The students are free to choose individually from the entire course offer of ETH Zürich and the universities of Zürich and Bern.

Weather Systems and Atmospheric Dynamics

Courses are only offered in Spring Semester.

Climate Processes and Feedbacks

Two additional courses are offered in Autumn Semester by University of Berne.
The student will be able to describe the natural factors leading to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

Atmospheric Composition and Cycles

The lecture provides an overview of atmosphere change in Europe, from a physical and atmospheric science perspective. It covers the following topics:

- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

At the end of this course, participants should:

- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.

Contents:

- global context
- observational data sets, analysis of climate trends and climate variability in Europe
- global and regional climate modeling
- statistical downscaling
- key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects
- projections of European and Alpine climate change

Lecture notes

Slides and lecture notes will be made available at http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html

Prerequisites / notice

Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

Dynamics of Large-Scale Atmospheric Flow

This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

Understanding the dynamics of large-scale atmospheric flow

Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Air Pollution Control

The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these pollutants and their transport. The lecture will then describe the fundamental equations of motion in the atmosphere and the different types of air pollution sources. Students will become familiar with the scientific fundamentals of air pollution control. The students gain general knowledge of the technical processes resulting in air pollution and study the methods used for air pollution control. The students can identify major air pollution sources and understand the methods for measuring pollutants, collecting and analyzing data. The students can suggest and evaluate possible control methods and equipment, design control systems and estimate their efficiency and costs. The students know the different strategies of air pollution control and are familiar with their scientific fundamentals. They are able to incorporate goals concerning air quality into their engineering work.

European Climate Change

The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:

- overview of elements of the climate system and earth energy balance
- the Carbon cycle - long and short term regulation and feedbacks of atmospheric CO2. What regulates atmospheric CO2 over long time scales of millions of tens of millions of years? What are the drivers and feedbacks of transient perturbations like at the latest Palocene? What drives CO2 variations over glacial cycles and what drives it in the Anthropocene?
- ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequence on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? When is the most recent time of sea level higher than modern, and by how much? What lessons do these have for the future?
- atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems? Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?
- the ocean heat transport - How stable or fragile is the ocean heat conveyor, past and present? When did modern deepwater circulation develop? Will Greenland melting and shifts in precipitation bands, cause the North Atlantic Outturning Circulation to collapse? When and why has this happened before?

Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.
Critical Thinking
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud
particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the
kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).

Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes
Brigitte Buchmann, Air pollution control, Part I
Jing Wang, Air pollution control, Part II
Lecture slides and exercises

Literature
List of literature included in script

Prerequisites / notice
College lectures on basic physics, chemistry and mathematics.
Language of instruction: In German or in English.

701-1235-00L Cloud Microphysics W 4 credits 2V+1U U. Lohmann, N. Shardt

Number of participants limited to 16.

Priority is given to PhD students majoring in Atmospheric and Climate Sciences, and remaining open spaces will be offered to the following groups:
- PhD student Environmental sciences
- MSc in Atmospheric and climate science
- MSc in Environmental sciences

All participants will be on the waiting list at first. Enrollment is possible until September 19th, 2021. The waiting list is active until October 1st, 2021. All students will be informed on September 16th, if they can participate in the lecture. The lecture takes place if a minimum of 5 students register for it.

Abstract
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective
The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles (field forces, impaction and diffusion processes) and the modelling of these mechanisms.

Content
see: http://www.iac.ethz.ch/edu/courses/master/modules/cloud-microphysics.html
and: https://moodle-app2.let.ethz.ch/course/view.php?id=15424

Lecture notes
This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Literature
Lamb and Verlinde: PHYSICS AND CHEMISTRY OF CLOUDS, Cambridge University Press, 2011

Prerequisites / notice

651-4053-05L Boundary Layer Meteorology W 4 credits 3G M. Rotach, P. Calanca

Abstract
The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth’s surface. Theory on transport processes in the PBL and their dynamics is provided. The course starts by providing the theoretical background and reviewing idealized concepts. These are contrasted to real world applications and discussed in the context of current research issues.

Objective
Overall goals of this course are given below. Focus is on the theoretical background and idealized concepts. Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

Content
- Introduction
- Turbulence
- Statistical tratment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions
Quaternary Dating Methods

Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, critically read and evaluate the application of dating methods in scientific publications.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

Content
1. Introduction: Time scales for the Quaternary, Isotopes and decay
2. Radiocarbon dating: principles and applications
3. Cosmogenic nuclides: 3He, 10Be, 14C, 21Ne, 26Cl, 36Cl
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology and ice cores chronologies
7. Cs-137 and Pb-210 (soil, sediments, ice core)
8. Summary and comparison of results from several dating methods at specific sites

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, accelerator (AMS) facility.

Optional (individual): 1-5 days hands-on radiocarbon dating at the C14 lab at ETH Hoenggerebg

Required: attending the lecture, visiting laboratories, handing back solutions for problem sets (Exercises)
The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from Groundwater River Basin Erosion Lecturers

**Abstract**

The course provides an introduction into quantitative analysis of groundwater flow and solute transport. It is focussed on understanding, formulating, and solving groundwater flow and solute transport problems.

**Objective**

a) Students understand the basic concepts of groundwater flow and solute transport processes, and boundary conditions.

b) Students are able to formulate simple, practical groundwater flow and solute transport problems.

c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems.

1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.
2. Flow equation. The generalised Darcy law.
3. The water balance equation and basic concepts of poroelasticity.
5. Analytical solutions to flow problems
6. Finite difference scheme solution for simple flow problems.
10. Analytical solutions to transport problems.
11. Fractured and karst aquifers.
12. The unsaturated zone and capillary pressure.
13. Examples of applied hydrogeology from Switzerland and around the world. (Given by Dr. Beatrice Marti from Hydrosolutions Ltd.)

**Lecture notes**

Handouts of slides.

de Marsily G., Quantitative Hydrogeology, Academic Press, 1986
Week 1: Introduction, soil and vadose zone, units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil water content; soil structure; particle size distributions;

Week 2: Pore scale consideration, pore sizes, shapes and connectivity, coordination number, continuity and percolation, surface area, soil structure

Week 3: Capillarity – capillary rise, surface tension, Young-Laplace equation; Washburn equation; numerical lab

Week 4: Soil Water Potential - the energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillarity rise); units and calculations and measurement of equilibrium soil water potential components

Week 5: Soil water characteristics - definitions and measurements; parametric models, fitting and interpretation, hysteresis; demo lab

Week 6: Saturated water flow in soils - laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts (Kozeny-Carman)

Week 7: Unsaturated water flow in soils - unsaturated hydraulic conductivity models and applications; Richards equation, approximations of Richards equation for steady state; approximate solutions to infiltration (Green-Ampt, Philip); outlook on unstable and preferential flow

Week 8: Numerical solution of Richards equation – using Hydrus1D for simulation of unsaturated flow; choosing class project

Week 9: Energy balance and land atmosphere interactions - radiation and energy balance; evapotranspiration, definitions and estimation; evaporation stages and characteristic length; soil thermal properties; steady state heat flow; non-steady heat flow

Week 10: Root water uptake and transpiration

Week 11: Solute and gas transport in soils; transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application; parameter estimation; salt balance.

Week 12: Summary of lectures; solution of old exam

Week 13: Written semester-end exam

Week 14: Short presentations of Hydrus class projects; discussion of written exam

This seminar focuses on the technical, economic, and political challenges of dealing with water allocation and pollution problems in large international river systems. It examines ways and means through which such challenges are addressed, and when and why international efforts in this respect succeed or fail.

Objective

Ability to (1) understand the causes and consequences of water scarcity and water pollution problems in large international river systems; (2) understand ways and means of addressing such water problems; and (3) analyse when and why international efforts in this respect succeed or fail.

Content

Based on lectures and discussion of scientific papers and reports, students acquire basic knowledge on contentious issues in managing international water resources, on the determinants of cooperation and conflict over international water issues, and on ways and means of mitigating conflict and promoting cooperation. Students will then, in small teams coached by the instructors, carry out research on a case of their choice (i.e. an international river basin where riparian countries are trying to find solutions to water allocation and/or water quality problems associated with a large dam project). They will write a brief paper and present their findings towards the end of the semester.

Lecture notes

Slides and reading materials will be distributed electronically.

Literature

The UN World Water Development Reports provide a broad overview of the topic: http://www.unesco.org/new/en/natural-sciences/environment/water/wwap/

Prerequisites / notice

ISTP students who take this course should also register for the course 860-0012-01L - Cooperation and conflict over international water resources; In-depth case study.

Prerequisites

The definition of prerequisites is part of the admission procedure for the master studies. You are informed by the admission office as to what courses of the section «prerequisites» you have to catch up with. You are accredited for these courses in the electives block of the master studies.

Abstract

The lecture provides an introduction to atmospheric chemistry at bachelor level. It introduces the fundamentals of gas phase reactions, the concept of solubility and reactions in aerosols and in clouds. It explains the chemical and physical processes responsible for global (e.g. stratospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

Objective

The students will understand the basics of gas phase reactions and of reactions and processes in aerosols and clouds. The students will understand the most important chemical processes in the troposphere and the stratosphere. The students will also acquire a good understanding of atmospheric environmental problems including air pollution, tropospheric ozone formation, stratospheric ozone destruction and the relationship between air pollution and climate change.

Lecture notes

Assessed

notice

Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture.

Origin and properties of the atmosphere: composition (gases and aerosols), structure, large scale dynamics, UV radiation

Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termmolecular reactions.

Tropospheric photochemistry: Photolysis reactions, photochemical O3 formation, role and budget of HOx, dry and wet deposition

Aerosols and clouds; chemical properties, primary and secondary aerosol sources, solubility of gases, hygroscopicity, kinetics of gas to particle transfer, NOx chemistry, SO2 oxidation, secondary organic aerosol formation

Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends

Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol

Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.

Weather Systems

W

3 credits

2G

M. A. Sprenger, F. Scholder-Aemisegger

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

The students are able to

- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context

701-0475-00L

Atmospheric Physics

W

3 credits

2G

U. Lohmann

This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation especially prediction of thunderstorm development, aerosol physics as well as artificial weather modification.

Students are able to

- to explain the mechanisms of thunderstorm formation using knowledge of thermodynamics and cloud microphysics.
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

The course starts with introducing selected concepts of thermodynamics for atmospheric processes. The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to classify radiosondes with the help the thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in them. Atmospheric mixing processes are introduced for fog formation. The concept of the air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation formation (convective vs. stratiform) is discussed as well as the formation and different stages of severe convective storms.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=15367

50% of the time we use the concept of "flipped classroom" (en.wikipedia.org/wiki/Flipped_classroom), which we introduce at the beginning.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

|                  | - global and regional climate modeling  
|                  | - statistical downscaling  
|                  | - key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects  
|                  | - projections of European and Alpine climate change |
| Lecture notes   | Slides and lecture notes will be made available at http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html |
| Prerequisites / notice | Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology. |
| 701-1281-00L    | Self-Learning Course on Advanced Topics in Atmospheric and Climate Science (HS) | W    | 3    | 6A    | Supervisors |
| Abstract        | This course offers an individual pathway to deepen knowledge and understanding of a specific advanced topic in atmospheric and climate science in one of these fields:  
|                  | - atmospheric chemistry  
|                  | - atmospheric dynamics  
|                  | - atmospheric physics  
|                  | - climate modeling  
|                  | - climate physics  
|                  | - land-climate dynamics  
|                  | - atmospheric circulation |
| Objective       | The learning goals of this course are threefold: 1) obtain novel insight into an advanced scientific topic, 2) train the self-study competences in particular related to reading of advanced textbooks and writing a concise summary, and 3) gain experience in the scientific interaction with experts. The format of the course is complementary to other types of teaching (lectures and seminars) and addresses skills that are essential for a wide range of professional activities (including a PhD). |
| Content         | The course has the following elements:  
|                  | Week 1: Selection of specific topic and decision about reading material (textbook chapters and maybe 1-2 review papers)  
|                  | Week 2: General discussion about self-study skills (how to read scientific literature and write summaries; specifics of scientific writing; how to prepare efficient meetings). For the scientific writing, students are encouraged to participate in an online training course offered by Stanford University: https://www.coursera.org/learn/sciwrite?action=enroll  
|                  | Weeks 6 and 9: Meetings with supervisor to clarify scientific questions  
|                  | Week 12: Hand-in of written summary (4 pages maximum)  
|                  | Week 14: Supervisor provides written feedback to the summary document  
|                  | Week 16: Oral exam about the scientific topic |
| Literature      | Literature (including book chapters, scientific publications) will be provided by the responsible supervisor in coordination with the student. |
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective

The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content

The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes

Digital lecture handouts will be distributed prior to each class.

Literature

Links to relevant literature will be provided during the classes.

Prerequisites / notice

Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

Domain C - Social Competencies
- Project Management: not assessed
- Communication: not assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: not assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: assessed

Abstract

Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

Objective

After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content

The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

A list of relevant literature is available on the class web site.
### 651-1581-00L Seminar in Glaciology

**Type:** W  **ECTS:** 3 **Hours:** 2S  **Lecturers:** A. Bauder

**Prerequisites / notice:**

- Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes
- Active participation is expected with presence at the sessions. Only a limited number of participants can be accepted. One of the following courses should be taken as preparation:
  - 651-3561-00L Kryosphäre
  - 101-0289-00L Applied Glaciology
  - 651-4101-00L Physics of Glaciers

**Abstract:**

Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

**Objective:**

Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

**Content:**

- Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff.
- Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluxion, permafrost creep/rock glaciers, debris flows).

**Lecture notes/Literature:**

- Copies/pdf of scientific papers will be distributed during the course
- A list of relevant books and papers will be provided

<td>2G</td>
<td>C. Schubert, R. Kipfer</td>
</tr>
</tbody>
</table>

**Abstract:**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective:**

The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochronological tracers and biomarkers, their potential and limitations and get familiar with important applications.

**Content:**

- Geogenic and cosmogenic radionuclides (sources, decay chains);
- Stable isotopes in biogeochemistry (natural abundance, fractionation);
- Geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes/Literature:**

- Copies/pdf of scientific papers will be distributed during the course
- A list of relevant books and papers will be provided

**Prerequisites / notice:**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent).

</tr>
</tbody>
</table>

**Abstract:**

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

**Objective:**

The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

**Content:**

(i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

**Lecture notes/Literature:**

- Selected handouts (lecture notes, literature, exercises) will be distributed during the course.
- Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

**Prerequisites / notice:**

The lecture 701-1315-00L Biogeochemistry of Trace Elements is a prerequisite for attending the laboratory course 701-1331-00L, Trace Elements Laboratory, or students must be concurrently enrolled in 701-1315-00L, Biogeochemistry of Trace Elements in the same semester.

</table>

**Abstract:**

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

**Objective:**

The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore, legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally, unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection, etc.) will be presented and discussed.

The course is structured as follows:
- overview of rationale, objectives, concepts and origins of sustainable development (approx. 15%)
- overview of the concept of social justice as guiding principle of the social dimension of sustainability (approx. 20%)
- analysis of a selection of concepts and methodologies to assess sustainable development in a variety of contexts (approx. 65%)
Selected scientific articles and book-chapters

Prerequisites / notice

Students of this course may also be interested in the course transdisciplinary case study (tdCS) in the Spring semester (701-1502-00L)

Power Market I - Portfolio and Risk Management

This seminar focuses on the technical, economic, and political challenges of dealing with water allocation and pollution problems in large international river systems. It examines ways and means through which such challenges are addressed, and when and why international efforts in this respect succeed or fail.

Objective

Ability to (1) understand the causes and consequences of water scarcity and water pollution problems in large international river systems; (2) understand ways and means of addressing such water challenges; and (3) analyse when and why international efforts in this respect succeed or fail.

Content

Based on lectures and discussion of scientific papers and reports, students acquire basic knowledge on contentious issues in managing international water resources, on the determinants of cooperation and conflict over international water issues, and on ways and means of mitigating conflict and promoting cooperation. Students will then, in small teams coached by the instructors, carry out research on a case of their choice (i.e. an international river basin where riparian countries are trying to find solutions to water allocation and/or water quality problems associated with a large dam project). They will write a brief paper and present their findings towards the end of the semester.

Literature

The UN World Water Development Reports provide a broad overview of the topic: http://www.unesco.org/new/en/natural-sciences/environment/water/wwap/

Lecture notes

Slides and reading materials will be distributed electronically.

Prerequisites / notice

The course is open to Master and PhD students from any area of ETH.

ISTP students who take this course should also register for the course 860-0012-01L - Cooperation and conflict over international water resources; In-depth case study.

Minor in Sustainable Energy Use

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
227-0731-00L | Power Market I - Portfolio and Risk Management | W | 6 credits | 4G | D. Reichelt, G. A. Koeppel

Abstract

Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.

Objective

Content

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes

Handouts of the lecture

Prerequisites / notice

1 excursion per semester, 2 case studies, guest speakers for specific topics.

Course Moodle: https://moodle-app2.let.ethz.ch/enroll/index.php?id=11636

151-0209-00L | Renewable Energy Technologies | W | 4 credits | 3G | A. Steinfeld, E. I. M. Casati

Abstract

Renewable energy technologies: solar PV, solar thermal, biomass, wind, geothermal, hydro, waste-to-energy. Focus is on the engineering aspects.

Objective

Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.
The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

</table>
New master students are introduced to the atmospheric and climate research field through keynotes given by the programme's professors. In several self-assessment and networking workshops they get to know each other and obtain general information and guidance about the organisation of the MSc programme.

**Objective**
The aims of this course are i) to welcome all students to the master program and to ETH, ii) to acquaint students with the faculty teaching in the field of atmospheric and climate science at ETH and at the University of Bern, iii) that the students get to know each other and iv) to assess needs and discuss options for training and eduction of soft-skills during the Master program and to give an overview of the study options in general.

**Laboratory and Field Courses**
*The course in the category «lab and field work» are only offered in spring semester.*

**Master's Thesis**

</table>

**Abstract**
The master thesis is supervised by a professor of the D-ERDW or of the Institute for Atmosphere and Climate (IAC, D-USYS), a professor who teaches in the module subjects or a senior scientist who is on the list of "competent leaders of master theses" of the D-ERDW or of the D-USYS (associated with the IAC).

**Objective**
The master programme will be completed by a master thesis on a topic selected from the subject range of the chosen major programme. Students are to prove their skills in working autonomously on a scientific project.

**Course Units for Additional Admission Requirements**
The courses below are only available for MSc students with additional admission requirements.

<table>
<thead>
<tr>

</tbody>
</table>

**Abstract**
Introduction of the most important components of the climate systems and their interactions.

**Objective**
Students have a basic understanding of the global energy balance, radiation budget, boundary, layer, atmosphere, ocean, biosphere, land-surface coupling, cryosphere, carbon cycle, climate variability, climate of the past and anthropogenic climate change, and they are able to apply this to solve simple quantitative problems and answer qualitative questions.

**Lecture notes**
Copies of the slides are provided in electronic form.

**Literature**
A comprehensive list of references is provided in the class. Two books are particularly recommended:

**Prerequisites / notice**
Teaching: Reto Knutti, several keynotes to special topics by other professors
Course taught in german, slides in english

**Abstract**
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

**Objective**
The learning target of this lecture is a general overview on the most important processes of atmospheric chemistry and the various problems of the anthropogenic change in the structure of Earth's atmosphere.

**Content**
- Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical O3 formation, role and budget of H2O, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources, phase transfer kinetics, solubility and hygroscopicity, NOx chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

**Prerequisites / notice**
Basic courses in chemistry and physics are expected

**Abstract**
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.
| Objective | Students are able - to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics. - to evaluate the significance of clouds and aerosol particles for climate and artificial weather modification. |
| Content | Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate and weather modification, clouds and precipitation |
| Lecture notes | Powerpoint slides and script will be made available |
| 701-0473-AAL Weather Systems | 3 credits |
| 701-0461-AAL Numerical Methods in Environmental Sciences | 3 credits |
| 701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III | 3 credits |
| 701-0071-AAL Mathematics III: Systems Analysis | 4 credits |
| Abstract | The students learn about the dynamical features of the Earth's atmosphere. They interpret satellite imagery and learn about basic concepts in dynamical meteorology. The global circulation is briefly discussed, before introducing the Eulerian and the Lagrangian perspective, which are used to study air streams in extratropical cyclones and to investigate basic aspects in mountain meteorology. |
| Objective | The students are able to - explain basic measurement and analysis techniques that are relevant in atmospheric dynamics - to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena - to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features - to explain how mountains influence the atmospheric flow on different scales - basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context |
| Content | Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer |
| Lecture notes | Lecture notes and slides |
| 701-0473-AAL Weather Systems | Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit. |

</table>
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

**851-0242-11L Gender Issues In Education and STEM**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

**Abstract**
In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

**Objective**
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher's work.

**Content**
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice
Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

**Abstract**
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

**Objective**
The main goals are:
1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2) You have a basic understanding about psychological research methods.
3) You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

**Abstract**
Students learn and practice techniques and skills for coping with psychosocial demands of teaching.
### Objective

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions; crisis intervention).
3. They know stress coping strategies to prevent burnout (e.g., psychosocial support) and are familiar with relevant institutions.

### Content

Major themes:
- counseling and counseling techniques
- conflict management and mediation
- classroom management
- supporting students in a psychological crisis
- preventing stress and burnout

### Forms of learning

Theoretical foundations will be taught in workshops which contain different means of activation and interaction such as group work, panel discussions, and individual work. Subsequently, this knowledge will be transferred and applied in different school-relevant situations by means of role plays, discussing of cases and video sequences, as well as reflections of practical experiences.

### Literature

Slides of the lecturer's presentations, supplementary materials, and materials for further reading are made available on Moodle.

### Prerequisites / notice

Der erfolgreiche Abschluss von EW1 und EW2 stellt eine wünschenswerte, jedoch nicht obligatorische Voraussetzung dar.

<td>Abstract</td>
<td>The event includes a block seminar as well as an assistance period in a primary or secondary school. It is part of a project with the goal of an exchange of expertise: ETH LD students assist primary and secondary school teachers in STEM lessons.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for LD students. The assistantship provides didactic experience and exposure to a different school level (more heterogeneous groups such as for example low-performing to very high-performing Children, language problems etc.)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content
LD students learn more about potentials and deficits of students. They get to know better the early stages of knowledge as well as the formation of misconceptions of students in their subject area. The seminar with assistantship includes three phases: In the block seminar misconceptions in the own subject as well as theoretical inputs from developmental and cognitive psychology are discussed (takes place partially in English). During the assistantship, a teaching task defined by the primary and secondary teachers is actively taken on in a class. At the end there is the writing of a final report, which includes the description of the knowledge level of the students. This seminar is only suitable for LD students who can flexibly adapt to the needs of students from lower grades.

Abstract
"The Vocational Schools as Sites of Teaching and Learning - Teaching Structure" sets out and discusses how to implement the specifications in the framework curriculum. This module is aimed at teachers in high schools awarding vocational school-leaving certificates (Berufsmatura) and all types of vocational schools. It also covers the link established with the company as a learning location.

Objective
- Formulating learning objectives at different levels, and implementing and monitoring these.
- Steering tuition in terms of content and method to fit in with the objectives.
- Formulating examination questions and assignments on the basis of the learning objectives set out in the curriculum and the teaching given.
- Selectively deploying different examination types and procedures/structuring selected learning contents logically in terms of the subject matter and learning process (from the concrete to the abstract, from the simple to the complex) and implementing these with different didactic visual aids.

Content
In der Veranstaltung werden die Rahmen- und Schullehrpläne der Berufsmaturität (alle Richtungen) analysiert und deren Fachinhalt in Übungen und Hospitationen didaktisch umgesetzt. Der Unterricht an der Berufsmaturität wird im Hinblick auf die Herausforderung "Viel Stoff-wenig Zeit" erarbeitet.

Abstract
The module "vocational schools as sites of teaching and learning: providing encouragement and support for apprentices" aims to provide teachers at VET and professional baccalaureate institutions with ways of dealing with learners problems, particularly in connection with their being fed up with school, with job-seeking, school-to-work transition, or continuing education.

Objective
- To be able to perceive the special situation of the vocational learners in their double burden of occupation and school and to take it into account pedagogically.
- Know the transfer topic with regard to performance motivation. Be able to deal with conflicts, disorders and generally difficult situations in BM lessons in a solution-oriented way.
- Know the forms of company learning and make them usable for teaching.
- Diagnose crisis developments and take supportive measures.
- Know the essential aspects of a support-oriented teaching management.
- Finding role security as a teacher and defining its limits.
- Gain insights into the concrete training situation of vocational learners.
- Understand research methods used in the empirical educational sciences
- Berufsmauritii: Entwicklung von Kernkompetenzen für die Wirtschaft?
- "Verakademisierung" der Berufsbildung?
- Sozialisations- und Lernprozesse im beruflichen Umfeld / Führungsverständnis im Umgang mit Jugendlichen an Berufsschulen.
- Konfliktmanagement I: Wahrnehmungsinstrumente und Interventionssstrategien, Konfliktprevvention und niederschwelliges Konfliktmanagement.

**Data: 20.09.2021 12:40 Autumn Semester 2021 Page 155 of 2140**
In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering, and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

**Objective**
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher’s work.

**Content**
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

**Prerequisites / notice**
Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

---

### The Science of Learning From Failure

**Number of participants limited to 60.**

**Prerequisites:**
- Successful participation in 851-0240-00L Human Learning (EW1).

**Objective**
1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.
2. Determining and promoting a successful work process.
3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.

**Content**
We learn from failure. But, what does “failure” mean? And, what, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects thinking, knowledge, creativity, problem-solving, and motivation.

By the end of the course, the students should be able to:
- Critically read and analyze articles on research that addresses failure in learning
- Participate in in-class problem-solving activities around research in failure
- Discuss and reflect upon topics in both online and face-to-face formats
- Engage in activities through the online platform
- Complete a final paper on a subtopic related to failure in learning

We learn from our mistakes, or rather, we hope that we do. Another way to say this is that we can learn from failure. But, what does “failure” mean? What, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects development of knowledge, creativity, problem-solving, and general thinking and learning. More specifically, they will have the opportunity to question and evaluate the potential relationships between the facets around failure within individual, interactional, cultural, societal, and global contexts through seminal readings and problem-solving activities. Students from any discipline are welcome to this course to learn more about how failure can be harnessed to improve our knowledge, capabilities, innovations, teamwork, and contribute to the larger global world.

**Prerequisites / notice**
This seminar is an interactive course, thus attendance and classroom participation are required. Processing of online tasks is a requirement for obtaining credit points.

The course is held as 2 separate courses with each a maximum of 30 students: one course in German and one course in English.

**Abstract**
Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

**Objective**
Learn about recent research results in structural engineering.

**Abstract**
The Institute for Geotechnical Engineering invites distinguished speakers from research and practice, nationally and internationally. The colloquia are directed towards staff and students from Universities as well as engineers and scientists working in industry. Details can be obtained from www.igt.ethz.ch by following Events & Public Events. Some colloquia are available via webcast.

**Objective**
Learn about recent research results in geotechnics.

### 851-0703-03L Private Construction Law
- **W** 2 credits
- **2V** T. Ender, E. Rüegg

**Abstract**
This course introduces students to the basics of construction and real estate law.

**Objective**
Teaching the principles of law, particularly private law. Introduction to law.

**Content**
Introduction (most important sources of construction and real estate law), SIA (Swiss Society of Engineers and Architects) Design Engineering Services Contract, SIA-Norm 118 (SIA General Terms and Conditions for Construction Services), liability of designers/civil engineers, construction insurance, property law for civil engineers, sale of land, contaminated sites, statutory mortgage for contractors, public procurement, litigation in construction and real estate, the civil engineer as expert.

**Lecture notes**
There are “Lecture Notes” (in German) for this course.

### 851-0709-00L Introduction to Civil Law
- **W** 2 credits
- **2V** H. Peter

**Abstract**
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**
Teaching the principles of law, particularly private law. Introduction to law.

**Content**
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

**Literature**
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des bibliothèques.

Sont indispensables:
- le Code civil et le Code des obligations;
- estimabili:
  - Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Boillod, J.-P.: Manuel de droit, éd Statkine, Genève

**Prerequisites / notice**
Remarques
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalents des cours “Recht I” et “Recht II” en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.
- Con assunto in italiano. E possibile sostenere l’esame in italiano.

### Optional Colloquia

#### Number
**Title**

- **151-0501-02L** Mechanics 1: Kinematics and Statics (Colloquium)

**Abstract**
Basics: Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power

**Objective**
The understanding of the fundamentals of Statics for engineers and their application in simple settings.

**Content**
Basics: Position of a material point; velocity; kinematics of rigid bodies; translation, rotation, planar motion; forces, action-reaction principle, internal and external forces, distributed forces; mechanical power. Statics: equivalence and reduction of groups of forces; rest and equilibrium; basic theorem of statics; kinematic and static boundary conditions, applications to supports and clamps of rods and beams; procedures for determination of forces at supports and clamps; parallel forces and centre of gravity; statics of systems, solution using basic theorem and using the principle of virtual power, statically indeterminate systems; statically indeterminate truss structures, ideal truss structures, nodal point equilibrium, methods for truss force determination; friction, static friction, sliding friction, friction at joints and supports, rolling resistance; forces in cables; beam loading, force and moment vector.

### Compulsory Courses 3. Semester

#### Examination Block 1

#### Number
**Title**

- **401-0243-00L** Analysis III

**Abstract**
We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

**Objective**
Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

**Content**
Classification of partial differential equations

Study of the Heat equation general diffusion/parabolic problems using the following tools through Separation of variables as an introduction to Fourier Series.

Systematic treatment of the complex and real Fourier Series

Study of the wave equation and general hyperbolic problems using Fourier Series, D’Alembert solution and the method of characteristics.

Laplace transform and it's uses to differential equations

Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.

Application of Laplace transform for beam theory will be discussed.

Time permitting, we will introduce the Fourier transform.
Lecture notes will be provided

large part of the material follow certain chapters of the following first two books quite closely.

The course material is taken from the following sources:

Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers

Prerequisites / notice

Analysis I and II, insbesondere, gewöhnliche Differentialgleichungen.

Lecture notes

Lecture notes and exercise sheets will be distributed via Moodle

Literature

101-0203-01L  Hydraulics I O 5 credits 3V+1U  R. Stocker

Abstract

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective

Familiarization with the basics of hydromechanics of steady state flows

Content

Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall

Lecture notes

Script and collection of previous problems

Literature

Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

151-0503-00L  Dynamics O 6 credits 4V+2U  D. Kochmann

Abstract

Dynamics of particles, rigid bodies and deformable bodies: Motion of a single particle, motion of systems of particles, 2D and 3D motion of rigid bodies, vibrations, waves

Objective

This course provides Bachelor students of mechanical and civil engineering with fundamental knowledge of the kinematics and dynamics of mechanical systems. By studying the motion of a single particle, systems of particles, of rigid bodies and of deformable bodies, we introduce essential concepts such as kinematics, kinetics, work and energy, equations of motion, and forces and torques. Further topics include the stability of equilibria and vibrations as well as an introduction to the dynamics of deformable bodies and waves in elastic rods.

Throughout the course, the basic principles and application-oriented examples presented in the lectures and weekly exercise sessions help students acquire a proficient background in engineering dynamics, learn and embrace problem-solving techniques for dynamical engineering problems, gain cross-disciplinary expertise (by linking concepts from, among others, mechanics, mathematics, and physics), and prepare students for advanced courses and work on engineering applications.
1. Motion of a single particle: kinematics (trajectory, velocity, acceleration), forces and torques, constraints, active and reaction forces, balance of linear and angular momentum, work-energy balance, conservative systems, equations of motion.
2. Motion of systems of particles: internal and external forces, balance of linear and angular momentum, work-energy balance, rigid systems of particles, particle collisions, mass accretion/loss.
3. Motion of rigid bodies in 2D and 3D: kinematics (angular velocity, velocity and acceleration transfer, instantaneous center and axis of rotation), balance of linear and angular momentum, work-energy balance, angular momentum transport, inertial vs. moving reference frames, apparent forces, Euler equations.
5. Introduction to waves and vibrations in deformable elastic bodies: local form of linear momentum balance, waves and vibrations in slender elastic rods.

Autumn Semester 2021

1. Theory of Structures I
   - Introduction to structural mechanics, statically determinate beams and frame structures, trusses, stresses and deformations, statically indeterminate beams and frame structures (force method)
   - Objective
     - Understanding the response of elastic beam and frame structures
     - Ability to correctly apply the equilibrium conditions
     - Understanding the basics of continuum mechanics
     - Computation of stresses and deformations of elastic structures
     - Ability to apply the force (flexibility) method for statically indeterminate structures
   - Content
     - Equilibrium, reactions, static determinacy
     - Internal forces (normal and shear forces, moments)
     - Arches and cables
     - Elastic trusses
     - Influence lines
     - Basics of continuum mechanics
     - Stresses in elastic beams
     - Deformations in Euler-Bernoulli and Timoshenko beams
     - Energy theorems
     - Statically indeterminate systems (Force method)
   - Lecture notes
     - Bruno Sudret, “Einführung in die Baustatik” (2018)
     - Additional course material will be available on the web page: https://sudret.ibk.ethz.ch/education/baustatik.html
   - Literature

2. Geotechnical Engineering
   - The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
     - Recognition of the basic consequences of the ground construction;
     - Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
     - Independent analysis of the basic geotechnical problems.
   - Objective
     - The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
     - Recognition of the basic consequences of the ground construction;
     - Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
     - Independent analysis of the basic geotechnical problems.
   - Content
     - Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Soil improvement; Safety considerations.
The lecture Steel Structures II complements the knowledge acquired in part I by providing students with additional theoretical and practical knowledge, e.g., on the design of steel and composite structures against fatigue, plate buckling, as well as on the structural modelling and analysis of more complex building and bridge structures. These more theoretical topics will be exemplified and illustrated by applications to real problems in the design of bridges and multi-storey building structures. Finally, the course will provide detailed insight into aspects pertaining to structural detailing, fabrication, erection and cost estimation for constructional steelwork.

Content overview:
- Structural forms, analysis techniques and modelling of multi-storey buildings and bridges.
- Structural analysis (deformations, internal forces, stresses and strains) in steel-concrete composite girders considering the effects of creep, shrinkage and shear deformations.
- Elastic and plastic longitudinal shear transfer mechanisms and effects
- Plate buckling of unstiffened and stiffened panels
- Fatigue resistance and safe life assessment; phenomenon and design approaches
- Special topics of steel connection design
- Detailing, drafting, fabrication and erection, cost determination in constructional steelwork
- Fatigue resistance and safe life assessment: phenomenon and design approaches
- Plate buckling of unstiffened and stiffened panels
- Fatigue resistance and safe life assessment
- Special topics of steel connection design
- Detailing, drafting, fabrication and erection, cost determination in constructional steelwork

Requirements:
- The content of steel structures I is a prerequisite

Slides, in English, are made available some days before each lecture.

Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur: System- und Netzplanung
The weekly lectures are structured as follows:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems. A high-level overview of the main principles of System Engineering.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. Analysis – 1/5 – The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, display, weighting, and expected value.
6. Analysis – 2/5 – The idea behind the supply and demand curves and revealed preference methods.
7. Analysis – 3/5 – The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. Analysis – 4/5 – The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Marginal rates of return and internal rates of return.
9. Analysis – 5/5 – How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Evaluation of solutions – Regardless how sophisticated an analysis is, it requires that decision makers stand back and critically evaluate the results. This week we discuss the aspects of evaluating the results of an analysis.
11. Operations research – 1/4 – Once qualitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. This week we discuss linear programming and the simplex method.
13. Operations research – 3/4 – How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
14. Operations research – 4/4 – How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches. The quantitative analyses requires the use of Excel. An introduction to Excel will be provided in one of the help sessions.

The lecture materials consist of a script, the slides and example calculations in Excel.

The lecture materials will be distributed via Moodle two days before each lecture.

Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

This course has no prerequisites.

### Systems Engineering

**101-0031-01L**

| Abstract |
| --- | --- | --- | --- | --- |
| **Systems Engineering** is a way of thinking that helps engineer sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long terms. | 
| This course provides an overview of the main principles of Systems Engineering, and includes an introduction to the use of operations research methods in the determination of optimal systems. | 
| The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified. | 
| The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems. | 
| More specifically upon completion of the course, you will have gained insight into: | 
| how to structure the large amount of information that is often associated with attempting to modify complex systems | 
| how to set goals and define constraints in the engineering of complex systems | 
| how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking | 
| how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future | 
| how to assess values of benefits to stakeholders that are not in monetary units | 
| how to assess whether it is worth obtaining more information in determining optimal solution | 
| how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture | 
| the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses. | 

**Objective**

The weekly lectures are structured as follows:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems. A high-level overview of the main principles of System Engineering. An introduction to the example that we will be working with through most of the course. The expectations of your efforts throughout the semester.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. Analysis – 1/5 – The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, display, weighting, and expected value.
6. Analysis – 2/5 – The idea behind the supply and demand curves and revealed preference methods.
7. Analysis – 3/5 – The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. Analysis – 4/5 – The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Marginal rates of return and internal rates of return.
9. Analysis – 5/5 – How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Evaluation of solutions – Regardless how sophisticated an analysis is, it requires that decision makers stand back and critically evaluate the results. This week we discuss the aspects of evaluating the results of an analysis.
11. Operations research – 1/4 – Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. This week we discuss linear programming and the simplex method.
13. Operations research – 3/4 – How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
14. Operations research – 4/4 – How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches. The quantitative analyses requires the use of Excel. An introduction to Excel will be provided in one of the help sessions.

The lecture materials consist of a script, the slides and example calculations in Excel.

The lecture materials will be distributed via Moodle two days before each lecture.

Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

This course has no prerequisites.
The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and

Knowledge of the materials concrete and reinforcing steel and understanding their interaction;

Analytical Competencies

The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

Structural Concrete I

The hydrological cycle: global water resources, water balance, space and time scales of hydrological processes.

Precipitation: mechanisms of precipitation formation, precipitation measurements, variability of precipitation in space and time, precipitation regimes, point/basin precipitation, isochetinal method, Thiessen polygons, storm rainfall, design hyetograph.

Interception: measurement and estimation.

Evaporation and evapotranspiration: snow and ice hydrology: snow characteristic variables and measurements, estimation of snowmelt processes by the energy budget equation and conceptual melt models (temperature index method and degree-day method), snowmelt runoff.

Domain A - Subject-specific Competencies

Domain B - Method-specific Competencies

Domain C - Social Competencies

Domain D - Personal Competencies

Evaporation and evapotranspiration: energy balance method, empirical methods.

Infiltration: measurement, Horton's equation, empirical and conceptual models, phi-index and percentage method, SCS-CN method.

Surface runoff and subsurface flow: Hortonian and Dunnian surface runoff, streamflow measurement, streamflow regimes, annual hydrograph, flood hydrograph analysis – baseflow separation, flow duration curve.

Basin characteristics: morphology, topographic and phreatic divide, hypsometric curve, slope, drainage density.

Rainfall-runoff models (R-R): rationale, linear model of rainfall-runoff transformation, concept of the instantaneous unit hydrograph (IUH), linear reservoir, Nash model.

Flood estimation methods: flood frequency analysis, deterministic methods, probabilistic methods (e.g. statistical regionalisation, indirect R-R methods for flood estimation, rational method).

Erosion and sediment transport: watershed scale erosion, soil erosion by water, estimation of surface erosion, sediment transport.

Lecture notes

The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

Literature

Prerequisites / notice

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters).

Frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.

Hydrology

The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

Prerequisites / notice

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters).

Frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.

Examination Block 4

Number 101-0125-00L

Title Structural Concrete I

Type O

ECTS 5 credits

Hours 4G

Lecturers W. Kaufmann

Abstract Contents: Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing, basic aspects of membrane elements.

Objective Knowledge of the materials concrete and reinforcing steel and understanding their interaction;

Understanding the response of typical structural members;

Knowledge of elementary models and ability to apply them to practical problems;

Ability to correctly dimension and detail simple structures.

Content Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing.
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

Introduction into the basic and practical knowledge of important building materials and testing methods.

**Abstract**

This course is designed to lay down the foundation of the different concepts, techniques, and tools for successful project management of construction projects.

**Objective**

The goal is that at the end of this course students should have a good understanding of the different project management knowledge areas, the phases required for successful project management, and the role of a project manager. To demonstrate this, students will work in groups in different case studies to apply the concepts, tools and techniques presented in the class.

Two 3 to 4 hours sessions towards the end of the lecture series will introduce a practical project to allow the teams to demonstrate the tools and techniques learned during the semester.

The course will have a final quiz that will be graded.

**Content**

The main content of the course is summarized in the following topics:

- Project and organization structures
- Project scheduling
- Resource management
- Project estimating
- Project financing
- Risk management
- Project Reporting
- Interpersonal skills

**Lecture notes**

The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

**Literature**

The recordings of the lectures are available on the MAP under the link [https://map.arch.ethz.ch](https://map.arch.ethz.ch) (book symbol at the top right).

**Project Management for Construction Projects**

Enrolment after agreement with the lecturer only.

Prerequisites / notice

The students will be randomly assigned to teams. Students will be graded as a team based on the final Project report and the in-class oral presentation of the Project Proposal as well as a final exam (50% exam and 50% project report and presentation).

**Civil Engineering Master**

**Major Courses**

**Major in Construction and Maintenance Management**

**Abstract**

Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

**Objective**

The students will acquire in the following fields:

- Indoor and outdoor climate and driving forces.
- Hygrothermal properties of building materials.
- Building envelope solutions and their construction.
- Hygrothermal performance and durability.

**Content**

Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

**Lecture notes**

Handouts, supporting material and exercises are provided online via Moodle.

**Design and Building Process MIBS**

ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE. ZoomLink: [https://etzh.zoom.us/j/66588100789](https://etzh.zoom.us/j/66588100789)

**Abstract**

“Design and Building Process MIBS” is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on twelve compact aspects gaining importance in a increasingly specialised, complex and international surrounding.

**Objective**

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties’ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients’ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

**Content**

“Design and Building Process MIBS” is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Twelve compact aspects regarding the establish building culture are gaining importance in an increasingly specialised and these surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering and construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the provided services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studies as well as the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

**Lecture notes**

The recordings of the lectures are available on the MAP under the link [https://map.arch.ethz.ch](https://map.arch.ethz.ch) (book symbol at the top right).

**Abstract**

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
Basics for line transport systems and networks Passenger/Supply requirements for line operations Objectives of system and network planning, from different perspectives and users, design dilemmas Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport Planning process, from demand evaluation to line planning to timetables to operations Matching demand and modes Line planning techniques Timetabling principles Allocation of resources Management of operations Measures of realized operations Improvements of existing services

Lecture notes
Lecture slides are provided.

Self-direction and Self-management not assessed

101-0509-00L Infrastructure Management 1: Process O 6 credits 3G B. T. Adey
Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.
The weekly lectures are structured as follows:

There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will

• understand the main tasks of an infrastructure manager and the complexity of these tasks,
• understand the importance of setting goals and constraints in the management of infrastructure,
• be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
• be able to develop and evaluate simple management strategies for individual infrastructure assets,
• be able to develop and evaluate intervention programs that are aligned with their strategies,
• understand the principles of guiding projects and evaluating the success of projects,
• be able to formally model infrastructure management processes, and
• understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

• understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.
This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated general basics, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.

### Content
- Codes SIA 196, SIA 197, SIA 198, SIA 118/198
- Knowledge of the tunneling methods
- Decision-making principles for the selection of the tunneling method
- Construction site logistics (transport, ventilation, cooling, water, material management)
- Construction materials

#### Conventional tunneling
- Excavation methods (full breakout / partial breakout)
- rock support
- Impermeabilisation
- Inner lining

#### Mechanical tunneling
- Open TBM (Gripper TBM), rock support concepts
- Shield TBM’s in rock and loose ground

#### Inner lining
- Impermeabilisation and drainage
- Inner lining
- Cable ducts

### References to the usual specialist literature will be made in the course of the lecture
The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects. HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g. colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects. For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, takt time planning, production tracking, and target value design. For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and “5D and 6D” models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

If possible due to COVID restrictions, students will be expected to attend a half-day workshop on the Last Planner System. The date of this workshop will be provided at a later point in time.

A full list of required readings will be made available to the students via Moodle.

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict.

This course provides an introduction to the notion of sustainable development when applied to our built environment.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focusing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Methods

- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

### Forensic Geotechnical Engineering

**101-0369-00L**

**W** 3 credits 2G  A. Puzrin

**Prerequisites:** Successful participation in “Geotechnical Engineering” (101-0315-00L) or an equivalent course.

**Abstract**
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

**Objective**
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

**Content**
- Failure due to the loading history
- Failure due to excessive settlements
- Failure due to the leaning instability
- Bearing capacity failure
- Excavation failure
- Failure in the creeping landslides
- Failure evolution in submarine landslides
- Construction in the landslide influence zone
- Delayed failure in snow avalanches

**Construction Management for Tunneling**

**101-0517-10L**

**W** 3 credits 2G  H. Ehrbar

**Abstract**
- Construction methods for conventional tunneling in loose material and in hard rock conditions (tunnel, shaft and cavern construction)
- Construction methods for mechanical excavation
- Decision criteria for the selection of tunneling method
- Construction facilities, logistics and construction management

**Objective**
Transfer of practical knowledge regarding
- Selection of tunneling methods
- Execution and working cycles in conventional and mechanical tunneling
- Management of the muck and of materials
- Quality control and monitoring during construction
- Occupational health and safety requirements and environmental requirements
- Maintenance

The students will be enabled to work on an underground construction project in the preliminary and final design phase as a planner (taking into account contractor's considerations).

#### Abstract
This course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures, may be addressed time-permitting.

#### Objective
After passing this course students will be able to:
1. Explain the equilibrium of continuous structural elements.
2. Formulate mechanical models of continuous prismatic structural elements.
3. Analyze the axial, shear, bending and torsion load-deformation response of prismatic structural elements and structures assembled using these elements.
4. Determine the state of forces and deformations in rods, beams, frame structures, arches, cables and rings under combined mechanical and thermal loading.
5. Use the theory of continuous structures to design structures and understand the basis for structural design code provisions.

#### Content
This is the third course in the ETH series on theory of structures. Building on the material covered in previous courses, this course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures may be addressed if time permits. The course provides the theoretical background and engineering guidelines for practical structural analysis of modern structures.

#### Lecture notes
Electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions. Lectures are streamed live and recorded on the ETH Video Portal.

#### Literature

#### Prerequisites / notice
Working knowledge of theory of structures, as covered in ETH course Theory of Structures I (Baustatik I) and Theory of Structures II (Baustatik II) and ordinary differential equations. Basic knowledge of structural design of reinforced concrete, steel or wood structures. Familiarity with structural analysis computer software and computer tools such as Matlab, Mathematica, Mathcad or Excel.
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be able to choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design are highlighted. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre- and post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQ-Tool software dedicated to real world structural reliability analysis.

Course content:

101-0137-00L Steel Structures III: Advanced Steel and Composite Structures

Abstract

Expand the theoretical background and practical knowledge in the design of steel and composite structures. Special composite construction and detailing: partial connection, serviceability. Fire design. Cold-formed steel design. Crane girders; masts; tanks & silos. Structural glazing and lightweight cable-supported structures.

Objective

In Steel Structures III, students will deepen and expand their theoretical background and practical knowledge of the design and construction of steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. Students will learn how to solve complex structural engineering tasks in larger building projects, e.g. through the use and correct design of large-span slim-floor girders and ultra-slim composite columns, or the use of glazing and cable structures as principal load-carrying components. They learn how steel structures behave under fire conditions and how they can be protected and designed accordingly. Finally, students learn about the fundamental aspects governing the design of specialty steel structures, such as thin-walled cold-formed sections, crane girders, masts and storage tanks.

Content

Steel Structures III provides in-depth theoretical background and practical knowledge on advanced design topics in steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. The course discusses the use and design of large-span slim-floor girders and ultra-slim composite columns, as well as the use of glazing and cable structures as principal load-carrying components. The design of steel structures under elevated temperatures (fire conditions) is treated, as well as special topics of design for serviceability. In addition, fundamental concepts of the design of cold-formed steel framed structures are discussed. Finally, the course will give an overview on the design of specialty steel structures, such as crane girders, masts and storage tanks.

Lecture notes: Slides and lecture notes. Worked examples. Handouts and formula collections.

Literature: Stahlbaukalender (various editions), Ernst + Sohn, Berlin

Prerequisites / notice: Prerequisites: Steel Structures I and II
1. Introduction

The class will be taught mainly on the blackboard.

- Basic knowledge of moisture transport and related degradation processes in porous materials

Prerequisites / notice

Basic course on probability theory and statistics

101-0157-01L Structural Dynamics and Vibration Problems W 3 credits 2G M. Vassiliou, V. Ntertimanis

Abstract

Fundamentals of structural dynamics are presented. Computing the response of elastic single and multiple DOF structural systems subjected to harmonic, periodic, pulse, and impulse is discussed. Practical solutions to vibration problems in flexible structures under diverse excitations are developed.

Objective

After successful completion of this course the students will be able to:

1. Explain the dynamic equilibrium of structures under dynamic loading.
2. Use second-order differential equations to theoretically and numerically model the dynamic equilibrium of structural systems.
4. Compute the dynamic response of structural systems to harmonic, periodic, pulse, and impulse excitation using time-history and response-spectrum methods.
5. Use dynamics of structures to identify the basis for structural design code provisions related to dynamic loading.

Content

This is a course on structural dynamics, an extension of structural analysis for loads that induce significant inertial forces and vibratory response of structures. Dynamic responses of elastic and inelastic single-degree-of-freedom and multiple-degree-of-freedom structural systems subjected to harmonic, periodic, pulse, and impulse excitation are discussed. Theoretical background and engineering guidelines for practical solutions to vibration problems in flexible structures caused by humans, machinery, wind or explosions are presented.

Lecture notes

The class will be taught mainly on the blackboard.

Handouts, supporting material and exercises are provided online via Moodle.

151-8015-00L Moisture Transport in Porous Media W 3 credits 2G J. Carmeliet, L. Fei, J. Huang, J. Zhao

Abstract

Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

Objective

- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Knowledge of pore network model and application to two-phase invasion percolation simulation
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

Content

1. Introduction
   - Moisture damage: problem statement, durability
   - Applications: building materials, soil science, geoscience

Lecture notes

Handouts, supporting material and exercises are provided online via Moodle.

101-0167-01L Fibre Composite Materials in Structural Engineering W 3 credits 2G M. Motavalli

Abstract

1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

Objective

At the end of the course, you shall be able to

1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessray testing and SHM techniques for FRP structures,
3) Continue your education as a phd student in this field.

Content

Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.

3) fib bulletin 19, Externally applied FRP reinforcement for concrete structures, technical report, 2019

4) SIA166 (2004) Klebieweberhungen (Externally bonded reinforcement), Schweizerischer Ingenieur- und Architektenverein SIA.

1) Laboratory Tours and Demonstrations: Empa Structural Engineering Laboratory including FRP Composites, Shape Memory Alloys, Timber Elements, Large Scale Testing of Structural Components

2) Working with Composite Materials in the Laboratory (application, testing, etc)

### 101-0637-01L Timber Structures I

**Abstract**
Conceptual design, detailing and structural analysis of multi-storey timber buildings as well as timber roof structures and halls.

**Objective**
Comprehension and application of basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing.

**Content**
Field of application of timber structures; Timber as building material (wood structure, physical and mechanical properties of wood and wood-based products); Durability; Principles of design and dimensioning; Connections (dowels, nails, screws, glued connections); Timber components and assemblies (mechanically jointed beams, trusses); Design and detailing of multi-storey timber buildings as well as timber roof structures and halls.

**Lecture notes**
Autography Timber Structures

**Literature**
Timber design tables HBT 1, Lignum
Swiss Standard SIA 265
Swiss Standard SIA 265/1
Eurocode 5

### 052-0609-00L Energy- and Climate Systems I

**Abstract**
The first semester of the annual course focuses on physical principles, component and systems for the efficient and sustainable heating, cooling and ventilation of buildings on different scales and the interaction of technical systems with architectural and urban design.

**Objective**
After this lecture, students can identify relevant physical principles, active and passive approaches, technical components and systems for efficient and sustainable supply of buildings with heat, cold and fresh air. Students are aware of the implications and interactions of such technical systems on urban and architectural design, construction and operation of buildings. Using simplified methods of analysis and quantification, students are able to estimate the relevant qualities and quantities to supply a building. students are able to estimate the relevant qualities and quantities to supply a building.

**Content**
1. Introduction and overview
2. Heating and cooling systems in buildings
3. Ventilation

**Lecture notes**
TheSlides from the lecture serve as lecture notes and are available as download.

**Literature**
A list of relevant literature is available at the chair.

### 101-0617-02L Computational Science Investigation for Material Mechanics

**Abstract**
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage and failure with advanced finite element methods.

**Objective**
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. Starting from the failed state, we will investigate potential causes and find the conditions that resulted in failure. For doing so, you will learn how to predict it with the Finite Element Method (FEM). To correctly assess failure, plastic behavior and size effects, originating from the underlying material microstructure, need to be considered. You will learn how to deal with plasticity in FEM and how you can get information from the heterogeneous material scale into your FEM framework.

**Content**
1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM, Comsol)
5 On the nature of failure - Physics of damage and fracture
6 Cracks and growth in structures (LEFM and beyond)
7 A practical approach to LEFM with FEM (Abaqus)
8 Introduction to metal plasticity
9 Damage and fracture in heterogeneous materials
10 Mechanics of fatigue
11 Visco-elastic failure
12 Student -Project presentation

**Lecture notes**
Will be provided during the lecture via moodle.

**Literature**
Will be provided during the lecture.

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective

Public transport is a key driver for making our cities more liveable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content

Basics for line transport systems and networks Passenger/Supply requirements for line operations Objectives of system and network planning, from different perspectives and users, design dilemmas Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations Matching demand and modes Line planning techniques Timetabling principles Allocation of resources Management of operations Measures of realized operations Improvements of existing services

Lecture notes

Ceder, Avi: Public Transit Planning and Operation, CRC Press, 2015, ISBN 978-1466563919 (English)

Critical Thinking assessed
Integrity and Work Ethics not assessed
Self-awareness and Self-reflection not assessed
Self-direction and Self-management not assessed

101-0437-00L Traffic Engineering O 6 credits 4G A. Kouvelas

Abstract
Fundamentals of traffic flow theory and control.

Objective
The objective of this course is to fully understand the fundamentals of traffic flow theory in order to effectively manage traffic operations. By the end of this course students should be able to apply basic techniques to model different aspects of urban and inter-urban traffic performance, including congestion.

Content
Introduction to fundamentals of traffic flow theory and control. Includes understanding of traffic data collection and processing techniques, as well as data analysis, traffic modeling, and methodologies for traffic control.

Lecture notes
The lecture notes and additional handouts will be provided during the lectures.

Literature
Additional literature recommendations will be provided during the lectures.
Topics covered in this course include:

- Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. It introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

151-0227-00L Basics of Air Transport (Aviation I)  W  4 credits  3G  P. Wild

Abstract
In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation. The program is taught in English and we provide 11 different experts/lecturers.

Objective
The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport. Ideal foundation for Aviation II - Management of Air Transport.

Content
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Aviation Law; Maintenance & Manufacturers; Airport Operations & Planning; Aviation Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Aviation.

Technical visit: This course includes a guided tour at Zurich Airport and Dubendorf Airfield (baggage sorting system, apron, Tower & Radar Simulator at Skyguide Dubendorf).

Lecture notes
Preparation materials & slides are provided prior to each class

Literature
Literature will be provided by the lecturers, respectively there will be additional Information upon registration (normally available in Moodle)

Prerequisites / notice
The lecture is planned as class teaching with live-streaming and recordings.

227-0523-00L Railway Systems I  W  6 credits  4G  M. Meyer

Abstract
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance

Objective
- Overview of the technical characteristics of railway systems
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
EST I (Herbstsemester) - Begriffen, Grundlagen, Merkmale

1  Einführung:
1.1 Geschichtete und Struktur des Bahnsystems
1.2 Fahrdynamik

2  Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebsysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3  Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4  Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
Betriebsszentrale SBB, Zürich Flughafen
Reparatur und Unterhalt, SBB Zürich Altstetten
Fahrzeugfertigung, Stadler Bussnang

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice
Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

Domain B - Method-specific Competencies
Analytical Competencies

Domain D - Personal Competencies
Critical Thinking

Abstract
Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.

Objective
There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completon of the course, students will
• understand the main tasks of an infrastructure manager and the complexity of these tasks,
• understand the importance of setting goals and constraints in the management of infrastructure,
• be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
• be able to develop and evaluate simple management strategies for individual infrastructure assets,
• be able to develop and evaluate intervention programs that are aligned with their strategies,
• understand the principles of guiding projects and evaluating the success of projects,
• be able to formally model infrastructure management processes, and
• understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.
This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and how they evolve over time. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Domain A - Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

363-1047-00L Urban Systems and Transportation

This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems. The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.
Content

The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong microfoundations and allow for precise policy recommendations.

Lecture notes

Course slides will be made available to students prior to each class.

Literature

Course slides will be made available to students.

Abstract

Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design with regard to economy and safety are provided.

Objective

Knowledge of hydraulic structures and their function within hydraulic systems. Skills for the layout and design of hydraulic structures with regard to economy and safety.

Content

Weirs: Weir stability, gates, inflatable dams, appurtenant structures, fish up- and downstream passages.
Conduits: Design of headraces, pressure shafts, and penstocks, constructive details and construction.
Pumps: Power houses and turbine types, design, structure, construction.
Dams: Types, appurtenant structures (temporary diversions, spillways, bottom and low-level outlets), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, measures in the foundation, mass concrete, RCC dams, reservoir siltation and sediment management, dam surveillance.
Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.

Lecture notes

manuscript and further documentation

Literature

is specified in the lecture and in the manuscript

Prerequisites / notice

Information: Because Hydraulic Structures II is strongly based on Hydraulic Engineering (101-0206-00L) it is strongly recommended to have taken this course (101-0206-00L) or a similar one previously.

Information: Enrollment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

Abstract

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

Lecture notes

Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river revitalization project at the Alpine Rhine in Austria and Switzerland.

Handouts and powerpoint presentations shown in the lecture can be downloaded via Moodle.

Recommended lectures:
1. «Flussbau» lecture notes of fall semester 2020 by Dr. Gian Reto Bezzola (available only in German at VAW teaching assistance)
2. Erosion and Sedimentation; Pierre Y. Julien
3. River Mechanics; Pierre Y. Julien

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course documents that allow independent work.

Recommended lectures:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.

<td>102-0468-10L</td>
<td>Watershed Modelling</td>
<td>W 6</td>
<td>4G</td>
<td>W. M. Molnar</td>
</tr>
<tr>
<td>Abstract</td>
<td>Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with practical exercises (exercises).</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The main goal of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 5 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 60% by performance in the graded exercises and 40% by a semester-end oral examination (30 mins) on watershed modelling concepts.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focused on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns. The final part (D) of the course provides open classroom discussion and simulation of a round-table discussion between modellers and clients about using watershed models in a case study.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.</td>

#### Abstract
Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

#### Objective
- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Knowledge of pore network model and application to two-phase invasion percolation simulation
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

#### Content
1. Introduction
   - Moisture damage: problem statement, durability
   - Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application
   - Description of moisture transport
   - Determination of moisture transport properties
   - Liquid transport in cracked materials, flow and transport in deformable porous media

3. Pore network model: theory and application
   - Single- and two-phase pore network model: quasi-static and dynamic
   - Exercise on quasi-static two-phase pore network model: invasion pattern, capillary pressure curve
   - Application of pore network model in two-phase transport

#### Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

#### Literature

#### Abstract
Focus is on laminated fibre reinforced polymer composites. The courses treats aspects related to micromechanics, elastic behavior of unidirectional and multidirectional laminates, failure and damage analysis, design and analysis of composite structures.

#### Objective
To introduce the underlying concept of composite materials and give a thorough understanding of the mechanical response of materials and structures made from fibre reinforced polymer composites, including elastic behaviour, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

#### Content
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics aspects
- Classical Lamine Theory (CLT)
- Failure hypotheses and damage analysis
- Analysis and design of composite structures
- Variable stiffness structures

#### Lecture notes
Script, handouts, exercises and additional material are available in PDF-format on the CMASLab webpage resp on moodle.

https://moodle-app2.let.ethz.ch/course/view.php?id=2610

#### Literature
The lecture material is covered by the script and further literature is referenced in there.

101-0617-01L Advances in Building Materials

Abstract
The course on Advances in Building Materials provides an introductory overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

Objective
In this course, the students will gain a broad overview of the use of materials in the building sector, with a particular focus on concrete and wood. Current limitations and in particular sustainability related challenges will be detailed with the objective of laying the grounds to discuss future developments anticipated in this field.

Content
This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course of the specialization on Numerical Mechanics of Materials. The course also addresses master students in Materials Science and other study programs interested in deepening their understanding of application-relevant properties of engineering materials and sustainability related challenges.

The following topics are covered:
1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

Lecture notes
Handouts will be provided for each lecture.

101-0617-02L Computational Science Investigation for Material Mechanics

Abstract
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage and failure with advanced finite element methods.

Objective
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. Starting from the failed state, we will investigate potential causes and find the conditions that resulted in failure. For doing so, you will learn how to predict it with the Finite Element Method (FEM). To correctly assess failure, plastic behavior and size effects, originating from the underlying material microstructure, need to be considered. You will learn how to deal with plasticity in FEM and how you can get information from the heterogeneous material scale into your FEM framework.

Content
1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM, Comsol)
5 On the nature of failure - Physics of damage and fracture
6 Cracks and growth in structures (LEFM and beyond)
7 A practical approach to LEFM with FEM (Abaqus)
8 Introduction to metal plasticity
9 Damage and fracture in heterogeneous materials
10 Mechanics of fatigue
11 Visco-elastic failure
12 Student - Project presentation

Lecture notes
Will be provided during the lecture via moodle.

Literature
Will be provided during the lecture.

</tbody>
</table>
The course will follow two main objectives and a third optional objective, depending on the design projects the students choose. At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and environmental aspects.

Prerequisite for this course is course Project Management: Pre-Tender to Contract Execution number 101-0517-01 G, unless otherwise approved by the lecturer.

101-0608-00L Design-Integrated Life Cycle Assessment

Abstract
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process. The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

Objective
The course will follow two main objectives and a third optional objective, depending on the design projects the students choose. At the end of the course, the students will:

1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

Content
The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand
The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:

1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Part II: Project-based learning
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:

1) Introduction to Rhino6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis

As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Lecture notes
Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
Prerequisite: Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.

The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.

101-0577-00L An Introduction to Sustainable Development in the Built Environment

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict. What does it mean for the built environment?

This course provides an introduction to the notion of sustainable development when applied to our built environment.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Abstract
Building materials with a special focus on regenerative materials: earth, bio-based and reuse.

Objective
Special focus on regenerative materials: earth, bio-based and reuse.

The students will acquire knowledge in the following fields:
- Fundamentals of material performance
- Introduction to durability problems of building facades
- Materials for the building envelope:
  - Overview of structural materials and systems: concrete, steel, wood and bamboo, earth
  - Insulating materials (bio-based vs conventional)
  - Air barrier, vapour barrier and sealants
  - Interior finishing
- Assessment of materials and components behaviour and performance
- Solutions for energy retrofitting of (historical) buildings
- Aspects of sustainability and durability

Abstract
Deepen the knowledge on selected topics of underground construction as well as learning working out conceptual solutions of complex problems.

Objective
Lecture: Deepen the knowledge on selected topics of underground construction.
Exercises: Conceptual solutions of complex problems.

Content
Caverns: Geometry, construction methods, support.
Shafts: Construction methods, support.
Urban tunneling: Boundary conditions, system choice, alignment, design.
Field measurements: Principles, monitoring layout, applications, interpretation.
Cut and cover tunnels: Modelling, design.
Exercising conceptual solution of complex tunnelling problems based upon discussion of current tunnel cases with particularly demanding problems in small groups.

Abstract
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.
Introduction in landfill design and engineering with focus on barrier- and drainage systems and lining materials, evaluation of geotechnical problems, e.g. stability

Objective
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.
Introduction in landfill design and engineering with focus on barrier- and drainage systems as well as lining materials, evaluation of geotechnical problems, e.g. stability
Content
Definition of contaminated sites, site investigation methods, historical research and technical investigation, risk assessment, contamination transport, remediation, clean-up and retaining techniques (e.g. bioremediation, incineration, retaining walls, pump-and-treat, permeable reactive barriers), monitoring, research projects and results

Prerequisites / notice
waste, waste disposal, treatment and management, multi-barrier-systems, site investigation, lining systems and recovering systems of landfill (e.g. materials, drainage systems, geosynthetics), stability, research projects and results

101-0367-00L Geotechnical Engineering in Transportation W 3 credits 2G D. Hauswirth

Abstract
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

Objective
Aim of the course is to teach students the most important aspects of the road structure, its building and design methods. An essential part of the course is devoted to understand the influence of the insitu conditions: soil, underground, climate, water, as well as of the characteristics of building materials and of road surface on the durability of the pavement.

Content
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

| 101-0129-00L | Non Destructive Evaluation & Rehabilitation of Existing Structures | W    | 3    | 2G    | E. Chatzi, B. Herraiz Gómez, G. Kocur |
| Abstract    | Introduction to non destructive evaluation tools and quantitative structural analyses and verifications for condition assessment of existing structures and subsequent decisions on their rehabilitation. The goal is for students to familiarize themselves with the handling of assessment and rehabilitation of existing structures from the perspective of a consulting engineer, following a systematic approach as described in current codes and to further learn how to use new nondestructive evaluation technologies. |
| Objective   | This course is organized in two main pillars. The first pillar describes the technologies that are available for non destructive evaluation of structures and delves into description of the principle of operation of such methods (e.g. wave propagation, acoustic emission analysis, tomography). The second pillar, overviews the current implementation of condition assessment processes in codes and standards. Complementary to the topic of structural evaluation, the topic of interventions, rehabilitation and retrofitting of existing structures for different construction materials is next addressed. |
| Content     | The course covers the practical aspects of non destructive evaluation and gives an overview of the state of the art. The course is divided into two main parts: non destructive evaluation techniques and current standards and codes. |
| Lecture notes | Lecture notes                       |      |      |       |                           |
This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Useful (optional) Reading:

Prerequisites:
- 101-0158-01. Method of Finite Elements I (FS)
- A good knowledge of Python is necessary for attending this course.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

101-0159-00L Method of Finite Elements II

Abstract
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

Objective
This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

101-0189-00L Seismic Design of Structures II

Abstract
The following topics are covered: behavior and non-linear response of structural systems under earthquake excitation; seismic behavior and design of moment frame, braced frame, shear wall and masonry structures; fundamentals of seismic response modification; and assessment and retrofit of existing buildings. They are discussed in the framework of risk-informed performance-based seismic design.

Objective
After successfully completing this course the students will be able to:
1. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply them in seismic design of structural systems.
2. Explain the seismic behavior of moment frame, braced frame and shear wall structural systems and successfully design such systems to achieve the performance objectives stipulated by the design codes.

Content
This course completes the series of two courses on seismic design of structures at ETHZ. Building on the material covered in Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame and shear wall structures; 3) fundamentals of seismic response modification; and 4) assessment and retrofit of existing buildings. These topics will be discussed from the standpoint of risk-informed performance-based design.

Lecture notes
Electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions. Lectures are streamed and recorded on the ETH Video Portal.
After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.
3. Conceptual basis of seismic isolation, seismic isolation types, mechanical characteristics of isolators.
5. Design approaches and code requirements

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes: reading material, and (optional) exercise problems and solutions.

**Literature**

Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Yousef Borzorgnia and Vitelmo Bertero, Eds., CRC Press, 2004

Prerequisites / notice

ETH Seismic Design of Structures I course, or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom systems to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures. Familiarity with structural analysis software, such as SAP2000, and general-purpose numerical analysis software, such as Matlab, is expected.

**101-0191-00L Seismic and Vibration Isolation**

**Abstract**

This course will cover the analysis and design of isolation systems to mitigate earthquakes and other forms of vibrations. The course will cover:

1. Conceptual basis of seismic isolation, seismic isolation types, mechanical characteristics of isolators.
3. Design approaches and code requirements

**Objective**

After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.

**Content**

1. Introduction: Overview of seismic isolation; review of structural dynamics and earthquake engineering principles. Viscoelastic behavior.
2. Linear theory of seismic isolation
3. Types of seismic isolation devices - Modelling of seismic isolation devices – Nonlinear response analysis of seismically isolated structures in Matlab
4. Behavior of rubber isolators under shear and compression
5. Behavior of rubber isolators under bending
6. Buckling and stability of rubber isolators
7. Code provisions for seismically isolated buildings

**Lecture notes**

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes: reading material, and (optional) exercise problems and solutions.

**Literature**

- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017

- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011
- 101-0157-01 Structural Dynamics and Vibration Problems course, or equivalent, or consent of the instructor. Students are expected to know basic modal analysis, elastic spectrum analysis and basic structural mechanics.

**101-0123-00L Structural Design**

**Abstract**

The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form of a structure and the forces within it by promoting the development of designed projects.

**Objective**

After successfully completing this course the students will be able to:

1. Critically question structural design concepts of historical and contemporary references
2. Use graphic statics and strut-and-tie models based on the Theory of Plasticity to describe the load bearing behavior of structures
3. Understand different construction technologies and have an awareness of their potential for structural design
4. Use contemporary digital tools for the design of structures in equilibrium
5. Design an appropriate structural system for a given design task taking into account architectural considerations
The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester: a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

Theory:
Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the classical boundary theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project:
Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students’ ability to integrate architectural considerations into their structural design.

Content
The course starts with a discussion on the importance of fatigue and fracture in different engineering disciplines such as mechanical, aerospace, civil and material engineering domains. The preliminary topics that are covered in this course are:

I) Fatigue of materials:
- Crack initiation under uniaxial high-cycle fatigue (HCF) loadings: Wöhler (S-N) curves, constant life diagram approach (mean-stress effects), rainflow analysis and Miner’s damage rule.
- Crack initiation under multi-axial HCF loadings: multi-axial fatigue mechanisms, critical plane approach (critical distance theory), equivalent stress approach, proportional and non-proportional loading.
- Fatigue crack growth (FCG): FCG models, Paris’ law, cyclic plastic zones, crack closure effects. This also includes FE modeling of the FCG and laboratory tests at (Empa).

II) Fracture mechanics:
- Elastic-plastic fracture mechanics (LEFM): limits of LEFM, stress intensity factors, crack opening displacement, mixed-mode fracture, etc.
- Elastic-plastic fracture mechanics: Irwin and Dugdale models, plastic zone shapes, crack-tip opening displacement and J-integral.
- Fatigue crack growth (FCG): FCG models, Paris’ law, cyclic plastic zones, crack closure effects. This also includes FE modeling of the FCG and laboratory tests at (Empa).

III) Introduction to cohesive zone models (CZMs):
- Advantages and disadvantages of CZMs compared to fracture mechanics.
- Different bond-slip models for the bonded joints/interfaces.

IV) Computer laboratory to simulate cracks and debonding problems:
- Finite Element (FE) modeling of complex details with cracks.
- FE simulations of debonding problems using CZMs.
- Computer laboratory: FE training and exercises using the student edition of the ABAQUS FE Package.

V) Introduction to fatigue and fracture design in civil structures. Different methods for fatigue strengthening will be discussed.

VI) Visits to the Empa (Swiss Federal Laboratories for Materials Science and Technology) in Dübendorf, and “Laboratory Competition”. The students will:
- Visit different small-scale and large-scale fatigue testing equipment.
- Get to know different ongoing fatigue- and fracture-related projects.
- Witness and help to conduct a fatigue test on a steel plate with a pre-crack and a fracture test on an adhesively-bonded joint.
- Compare the experimental results with their own calculations (from the fracture theories).
- “Laboratory Competition” at Empa: the students with the closest predictions will win the “Empa Laboratory Competition” and will be awarded by a prize.

Lecture notes
Lectures are based on the lecture slides and the handouts, which will be given to the students during the semester.

Literature
Prerequisites / notice
Note 1: A basic knowledge on mechanics of structures and structural analysis (i.e., stress-strain analysis and calculations of internal deformations, strains and stresses within structures) is recommended and will be helpful in the course.

Note 2: Laboratory demonstrations and fatigue/fracture tests at the Structural Engineering Research Laboratory of Empa in Dübendorf. This includes laboratory tours and showcasing the Empa large-scale 7-MN fatigue testing machine for bridge cables, different fatigue and fracture testing equipment for structural components, etc.

101-0169-00L Structural Glass Design and Facade Engineering W 3 credits 2G A. Frangi, R. Jockwer, M. Klippel, R. Steiger
Prerequisite: Timber Structures I (101-0168-00L)

Students who have not completed Holzbau I require a special permission from the lecturer.

Abstract
Consolidation and supplementation of the basic knowledge acquired in Timber Structures I + II. Treatment of current topics and innovations in timber engineering. Structural design and refurbishment of complex timber structures with high requirements for earthquake resistance, sound insulation and fire protection. Description, analysis and discussion of an existing timber structure in groups.

Objective
In-depth understanding of the theoretical and design aspects of timber construction. Dimensioning, structural design, optimisation and refurbishment of complex timber structures with high requirements for earthquake resistance, sound insulation and fire protection.

Content
Multi-storey timber buildings (general, cross laminated timber, high-rise buildings, fire protection, sound insulation), Post-tensioned timber constructions, building with hardwood, robustness of timber structures, earthquake-resistant timber structures, maintenance and renovation of structures.

Lecture notes
Autography Timber Structures

101-0120-00L Structural Glass Design and Facade Engineering W 3 credits 3G V.-A. Silvestru

Abstract
The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

Objective
After successful completion of the course, students will be able to:

- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

Content
This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:

The lectures will cover the following contents:

- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

Design exercises:

The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Design project:

The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

Lecture notes

The lectures are based on lecture slides and handouts.

Literature
Recommended and supplementary literature:

101-0139-00L Scientific Machine and Deep Learning for Design and Construction in Civil Engineering W 3 credits 4G M. A. Kraus, D. Griego

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.
This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.

Upon completion of the course, the students will be able to:
1. understand main ML background theory and methods
2. assess a problem and apply ML and DL in a computational framework accordingly
3. Incorporating scientific domain knowledge in the SciML process
4. Define, Plan, Conduct and Present a SciML project

The topics to be covered are:
1. Fundamentals of Machine and Deep Learning (ML / DL)
2. Incorporation of Domain Knowledge into ML and DL
3. ML training, validation and testing pipelines for academic and research projects

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Familiarity with MATLAB and / or Python is advised.

Content

The course is based on the following questions:

How do we deal with complex issues in planning?
- Forms of knowledge, half-knowledge and not knowing
- Occurrence and explanation patterns for irrational behaviour
- Spatial research and planning practice
- Planning maxims
- Mapping complex topics in research questions

How do we generate knowledge about complex issues?
- Methods for scientific data generation
- Applied handling of quantities and probabilities
- Estimating despite uncertainties
- Opportunities of digitisation in planning (Participation, BigData)

How do we react to complex questions in planning?
- Methods of scientific data analysis
- Making decisions despite incomplete information
- Dealing with robustness and fragility

More specifically, the lectures focus on the following topics (NB: Some content units will be presented in English, they are marked with *asterisk below)
- (Half-) knowledge/behaviour/irrationalities
- Initial situation: Solving complex problems
- Forms of knowledge, knowing of not knowing something, not knowing of not knowing something
- Behavioural patterns, occurrence and explanation patterns for irrational behaviour
- Methods for solving complex tasks in planning practice
- Spatial research and planning practice - connections, differences, overlaps
- Challenges in the solution of complex tasks: System delimitation, interdisciplinarity, retrospective vs. prospective approach (descriptive vs. action-oriented, *reflected scenario building*)
- Planning maxims
- *Methodology in spatial research
- *Research design
- *Research questions (types of research questions; research questions, hypotheses and theories); justification of research question
- Data generation methods (interviews and questionnaires, ethnography and observation, documents, official statistics)
- Dealing with quantities, estimations, anchor effect
- Importance of scales and key figures in planning
- Estimation methods
- Danger of the anchor effect
- Digitalization in planning
- New data sources and sizes
- Opportunities and challenges through digitisation in planning
- Data analysis methods (quantitative and qualitative data; quantitative analysis of survey data; qualitative analysis - content analysis, discourse analysis, case study, comparative research)
- *Research ethics
- Decisions based on incomplete information
- Dealing with complex systems/roughness
- *Role of science in planning - the perspective of both research and practice

101-0491-00L Agent Based Modeling in Transportation W 6 credits 4G M. Balac

Abstract
This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in teams.

Objective
At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform practical transportation studies
This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model enclosure, where different statistical methods used in the process will be introduced and explained
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).

Agent-based modeling in general

MATSim

Additional relevant readings, primarily scientific articles, will be recommended throughout the course.

101-0492-00L Microscopic Modelling and Simulation of Traffic Operations

Abstract
The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end. The students will familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun. Microscopic modelling and simulation concepts will include:

1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students.

The course will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. It consists of weekly 2-hour lectures. The students work in pairs on a project group that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The lecture notes and additional handouts will be provided before the lectures.

Additional literature recommendations will be provided at the lectures.

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

101-0367-00L Geotechnical Engineering in Transportation

Abstract
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

Objective
The aim of the course is to teach students the most important aspects of the road structure, its building and design methods. An essential part of the course is devoted to understand the influence of the in-situ conditions: soil, underground, climate, water, as well as of the characteristics of building materials and of road surface on the durability of the pavement.

Content
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

Lecture notes as indicated in the course

In den Vorlesungen und Übungen werden verschiedene Demonstrationsmaterialien verwendet.

Voraussetzungen: Grundlagenkenntnisse in "Bodenmechanik/Grundbau" sowie in "Projektierung von Verkehrsanlagen"

101-0507-00L Infrastructure Management 3: Optimisation Tools

Abstract
Does not take place this semester.
Abstract This course will provide an introduction to the methods and tools that can be used to determine optimal inspection and intervention strategies and work programs for infrastructure.

Objective Upon successful completion of this course students will be able:
- to use preventive maintenance models, such as block replacement, periodic preventive maintenance with minimal repair, and preventive maintenance based on parameter control, to determine when, where and what should be done to maintain infrastructure
- to take into consideration future uncertainties in appropriate ways when devising and evaluating monitoring and management strategies for physical infrastructure
- to use operation research methods to find optimal solutions to infrastructure management problems

Content Part 1:
Explanation of the principal models of preventative maintenance, including block replacement, periodic group repair, periodic maintenance with minimal repair and age replacement, and when they can be used to determine optimal intervention strategies

Part 2:
Explanation of preventive maintenance models that are based on parameter control, including Markovian models and opportunistic replacement models

Part 3:
Explanation of the methods that can be used to take into consideration the future uncertainties in the evaluation of monitoring strategies

Part 4:
Explanation of how operations research methods can be used to solve typical infrastructure management problems.

Lecture notes A script will be given out at the beginning of the course. A copy of the slides will be handed out at the beginning of each class.

Prerequisites / notice Successful completion of IM1: 101-0579-00 Evaluation tools is a prerequisite for this course.

101-0419-02L Railway Infrastructures 2 W 2 credits 2G U. A. Weidmann, P. Güldenapfel, M. Kohler, M. J. Manhart

Abstract Track geometry including calculation and measuring as well as related data systems; clearance profiles; interaction between track and vehicles; vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; environmental aspects in track construction; track diagnostics and forecast; track maintenance and related methods

Objective The lecture gives a deeper insight into track geometry including clearance profile, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content 1 - Track geometry
Track geometry including calculation and measuring as well as related data systems; clearance profiles

2 - Interaction
Interaction between track and vehicles, vehicle dynamics

3 - Railway Track
Stress; track construction including special features of railway bridges and tunnels

4 - Environmental aspects in track construction
Fundamentals; noise protection; vibration protection

5 - Diagnostics, maintenance strategies
Track diagnostics and forecast; maintenance strategies

6 - Track maintenance
Fundamentals of track maintenance and related methods

Lecture notes The slides will be made available.

Literature A list with related technical literature will be handed out.

Prerequisites / notice Prerequisite: 101-0419-01 Railway Infrastructures 1 (FS)

Major in Hydraulic Engineering and Water Resources Management

Number Title Type ECTS Hours Lecturers
101-0249-00L Hydraulic Engineering: Selected Topics W 3 credits 2S R. Boes

Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.

Abstract The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective The overarching goal of the course is to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

Content Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, materials in dam building, possible problems at reservoirs like natural hazards by impulse waves, the hydraulics of spillways and intake structures at dams and weirs and the area of conflict between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects at the national and international level.

Lecture notes Lecture notes will be specified in the lecture

Literature External speakers will be involved to present current topics and projects in Switzerland and abroad.

101-0289-00L Applied Glaciology W 4 credits 2G D. Farinotti, A. Bauder, M. Werder

Abstract The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Digital lecture handouts will be distributed prior to each class.

Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Hydraulics of Engineering Structures

Wastewater hydraulics are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower.

1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stilling basin
5. Backwater curves
6. Weirs & End overfall
7. Sidewir & Side channel
8. Bottom opening, Venturi & Culverts, Restrictors, Inverted siphons
9. Fall manholes & Vortex drop
10. Supercritical flow & Special manholes
11. Aerated flows & Low level outlets
12. Hydraulics of sediment bypass tunnels
13. Vegetated flows - Introduction & Application
14. Summary

Written material will be available digital.

Prerequisite: Introduction to Urban Water Management
Management of Hillslope and Channel Processes

**Abstract**

**Objective**
To recognise and understand channel and hillslope processes and their interactions. To learn about methods of hazard analysis and of technical and bioengineering protection measures and their assessment. Determination of critical loads and design of protective structures. Assessment of spatial and future developments with and without protective measures.

**Content**

**Lecture notes**
see "Literatur"

**Literature**

**Prerequisites**
- Essentials of Construction Analysis
- Hydraulics
- Geology and Petrography
- Soil Physics
- Soil Mechanics and Geotechnics

**Taught competencies**
- Domain A - Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Project Management
- Domain B - Method-specific Competencies
  - Communication
  - Cooperation and Teamwork
  - Leadership and Responsibility
  - Self-presentation and Social Influence
- Domain C - Social Competencies
  - Adaptability and Flexibility

**Abstract**
The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.
Objective

Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties.

Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with,
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
- explain the major deterioration mechanisms in natural stone and how this relates to durability,
- analyze material combinations and appraise their application in future products as well as integration in existing constructions,
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Content

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of vitrification. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW).

Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Lab1: Durability of natural stone (FW/TW)

Lab2: Fracture of glass (FW/TW)

Will be handed out in the lectures

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.

Domain A - Subject-specific Competencies

| Concepts and Theories | assessed |
| Techniques and Technologies | assessed |

Domain B - Method-specific Competencies

| Analytical Competencies | assessed |
| Decision-making | assessed |
| Problem-solving | assessed |
| Project Management | assessed |

Domain C - Social Competencies

| Communication | assessed |
| Self-presentation and Social Influence | assessed |

Domain D - Personal Competencies

| Creative Thinking | assessed |
| Critical Thinking | assessed |
| Self-direction and Self-management | assessed |

101-0659-01L Durability and Maintenance of Reinforced Concrete

W 4 credits 2V U. Angst, Z. Zhang

Abstract

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.
After this course you will have profound understanding about:
- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:
- current engineering approaches for durability design (according to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies

Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.
This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be stressed and explained.

Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of internal curing, the students will become familiar with internal water curing by means of saturated lightweight aggregates and superabsorbent polymers.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, which are needed for the calculations of self-induced stresses and risk of cracking.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g. chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time.

As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

Concrete is generally viewed as a long-lasting construction material. However, the durability of a concrete structure can be jeopardized by shrinkage-induced cracking. In addition to being unsightly, cracks have the potential to act as weak planes for further distress or as conduits for accelerated ingress of aggressive agents that may reduce durability.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to cracking at early ages, unless special precautions are taken. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions.

Specific topics covered by the course:
- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Creep and relaxation
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregates and superabsorbent polymers
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability
- Self-healing of cracks

Lecture notes
For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

Literature
Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

Prerequisites / notice
A basic knowledge of concrete technology is preferable.

101-0637-20L Fundamentals of Wood Elaboration and Woodmachining

Abstract
The course Wood processing conveys knowledge on technological properties of wood and wood-based materials as well as on industrial processes for the fabrication of a vast variety of wood products and covers new developments in the field of digital technologies.

Objective
Learning target is a fundamental understanding of the dominating wood machining processes, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products. Finally, the digital transformation process, which will affect all sectors of the wood industry with impact on the entire value chain and business models will be covered. It will be illustrated how production processes will become more flexible, efficient and less resource demanding.

Content
The general introduction shows the economic relevance of the resource wood in a global, European and Swiss context and reflects aspects of sustainability in wood production and certification. In terms of bulk wood products, specific focus is laid on sawn timber production and drying processes. With regard to wood veneer production, steaming, veneer cutting and assembly to veneer lumber products are presented. Further the common technologies for the production of particle boards and fibre boards as well as paper will be discussed. In the following, the topics are related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence and their impact on the wood industry on the basis of illustrative examples. At the end of the lecture an excursion to a Swiss wood manufacturer is planned, in order to facilitate practical experience.

101-0637-10L Wood Structure and Function

Abstract
The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective
Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro- and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

101-0159-00L Method of Finite Elements II

Abstract
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

*This course offers no introduction to commercial software.
Objective

This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture, a dominant failure phenomenon for structural systems.

See the class webpage for more information:

Lecture notes

The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Useful (optional) Reading:

Prerequisites / notice

Prerequisites:
- 101-0158-01 Method of Finite Elements I (FS)
- A good knowledge of Python is necessary for attending this course.

This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.

### Objective

By the end of the course, students will be able to plan and manage the lean, integrated, and digital project delivery of a construction project.

Students will know how to achieve this overall course goal when they can:

1. Apply the fundamental theories of lean production to the context of construction management. This includes the ability to describe the three views of production: transformation, flow and value generation; evaluate the benefits of a pull production system compared to push production systems; evaluate how production variability and uncertainty contributes to work-in-process and ‘waste’; and apply the concepts of lean production to several construction management tools including the Last Planner System, Pull Planning, Target Value Design, and Takt Planning.

2. Understand the fundamentals of Virtual Design and Construction and Building Information Modeling. This includes the ability to prepare a model breakdown structure capable of integrating project information for all stakeholders; describe the upcoming transition to a common data environment for BIM that will use platforms such as Autodesk Forge; and describe the barriers to successful implementation of BIM within construction and design firms.

3. Plan and schedule an integrated ‘SD’ scope schedule cost model using the Tri-Constraint Method. This includes the ability to understand the TCM algorithm, apply parametric logic to the creation of a virtual model for construction production; and evaluate the limitations of the critical path method when compared to resource- and space-constrained scheduling.

4. Evaluate benefits of integrated project governance compared to the organization of traditional construction project delivery systems. This includes the ability to evaluate the risks, benefits and considerations for integrated teams using multi-party relational contracts that cross disciplinary and firm boundaries; and explain to others the ‘elements’ of integrated projects (e.g. colocation, early involvement of key stakeholders, shared risk/reward, collaborative decision making).

### Content

The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g. colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects. For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, takt time planning, production tracking, and target value design.

For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and “5D and 6D” models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

### Literature

- A full list of required readings will be made available to the students via Moodle.
- Lecture Presentation slides will be available for viewing and download the day before each lecture.

### Prerequisites / notice

- A full list of required readings will be made available to the students via Moodle.
- Project Management for Construction Projects (101-0007-00L) is a recommended but not required prerequisite for this course.

Autumn Semester 2021
Page 205 of 2140
Abstract

Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective

The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content

Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

Lecture notes

S. Marelli, R. Schöbi, B. Sudret, UQlab user manual - Structural reliability (rare events estimation), Report UQLab-V0.92-107.

Prerequisites / notice

Basic course on probability theory and statistics
The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

### Objective

At the end of the course, the students should:

1. have an understanding of preventive maintenance models that are based on parameter control, including Markovian models and opportunistic replacement models
2. have practical experience of using MATLAB to perform practical transportation studies
3. have an understanding of the process needed to set up an agent-based study
4. Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
5. Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
6. Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained.
7. Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.
8. During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).

### Literature

- MATSim

### Prerequisites / notice

There are no strict preconditions in terms of which lectures the students should have previously attended. However, knowledge of basic statistical theory is expected, and experience with at least one high-level programming language (Java, R, Python, or other) is recommended.
Method of Finite Elements II

The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students the skills to perform nonlinear FEM simulations using coding in Python.

This course offers no introduction to commercial software. Instead, we focus on understanding the algorithms used in software through theory, numerical examples, and computer labs in Python (starting Fall 2021).

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators, and computer labs in Python.

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g., ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

### 101-0185-01L CAD for Civil Engineers (W)

**Abstract**
Introduction to computer aided design and drafting in 2D and 3D with examples from structural engineering. Point in time of enrolment of course is decisive.

**Objective**
- Having followed the course, students are able to develop a 2D-structure (formwork drawing) and they know the principle of a reinforcement module. They have also got an introduction to a 3D program (reinforcement in 3D).
- They are therefore better prepared for the bachelor thesis in the 6th semester.
- an eventual internship between bachelor and master course.
- the project works in the master course.
- the master thesis.

Above all they practice spatial sense and acquire contextual knowledge as future superiors of draftsmen and designers.

**Prerequisites / Literature**
CAD für Bauenieure

**Prerequisites / notice**
Familiarity with MATLAB and / or Python is advised.

**Expected learning outcomes**
- Apply your new skills in a final project;
- Learn about main simulation performance limiters.
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Implement efficient iterative algorithms;
- Implement wave propagation (or more advanced physics);

**Content**
**Part 1** - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

**Part 2** - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

**Part 3** - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

**Lecture notes / Literature**
- Digital lecture notes, interactive Julia notebooks, online material.
- Links to relevant literature will be provided during classes.

**Prerequisites / notice**
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

### 101-0250-00L Solving Partial Differential Equations in parallel on GPUs (W)

**Abstract**
This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

**Objective**
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

**Content**
**Part 1** - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

**Part 2** - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

**Part 3** - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

**Lecture notes / Literature**
- Digital lecture notes, interactive Julia notebooks, online material.
- Links to relevant literature will be provided during classes.

**Prerequisites / notice**
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

### 101-0139-00L Scientific Machine and Deep Learning for Design and Construction in Civil Engineering (W)

**Abstract**
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

**Objective**
This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.

Upon completion of the course, the students will be able to:
1. understand main ML background theory and methods
2. assess a problem and apply ML and DL in a computational framework accordingly
3. Incorporating scientific domain knowledge in the SciML process
4. Define, Plan, Conduct and Present a SciML project

**Content**
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
1. Fundamentals of Machine and Deep Learning (ML / DL)
2. Incorporation of Domain Knowledge into ML and DL
3. ML training, validation and testing pipelines for academic and research projects

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

**Lecture notes / Literature**
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course and master thesis.

Suggested Reading:
- Marc Peter Deisenroth, A Aldo Faisal, and Cheng Soon Ong Mathematics for Machine Learning
- S. Guido, A. Müller: Introduction to machine learning with python. O'Reilly Media, 2016

**Prerequisites / notice**
Familiarity with MATLAB and / or Python is advised.

### 101-0120-00L Structural Glass Design and Facade Engineering (W)

**Abstract**
Point in time of enrolment of course is decisive.

**Objective**
Above all they practice spatial sense and acquire contextual knowledge as future superiors of draftsmen and designers.

**Prerequisites / Literature**
- CAD für Bauenieure

**Prerequisites / notice**
Familiarity with MATLAB and / or Python is advised.
After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and choose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
- The lectures will cover the following contents:
  - Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
  - Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
  - Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
  - Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
  - Typologies and design of structural systems for transparent façades;
  - Requirements and functions for transparent façades.

Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design are used for the design of glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Design project:
The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

Lecture notes
The lectures are based on lecture slides and handouts.

Prerequisites / notice
Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

101-0509-00L Infrastructure Management 1: Process
W 6 credits 3G B. T. Adey

Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.

There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will
- understand the main tasks of an infrastructure manager and the complexity of these tasks,
- understand the importance of setting goals and constraints in the management of infrastructure,
- be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
- be able to develop and evaluate simple management strategies for individual infrastructure assets,
- be able to develop and evaluate intervention programs that are aligned with their strategies,
- understand the principles of guiding projects and evaluating the success of projects,
- be able to formally model infrastructure management processes, and
- understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.
The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.

2. Positioning infrastructure management in society. As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.

3. Setting goals and constraints – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.

4. Predicting the future – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.

5. Help session 1

6. Determining and justifying general interventions - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.

7. Determining and justifying monitoring - Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.

8. Converting programs to projects / Analysing projects – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.

9. Help session 2

10. Ensuring good information – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.

11. Ensuring a well-run organization – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.

12. Describing the IM process – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.

13. Evaluating the IM process – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.

14. Help session 3 and submission of project report.

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least the use of Excel. Some students, however, prefer to use Python or R.

The lecture materials consist of handouts, the slides, and example calculations in Excel.

The lecture materials will be distributed via Moodle two days before each lecture.

Appropriate literature will be handed out when required via Moodle.

This course has no prerequisites.

### Literture

- Appropriate literature will be handed out when required via Moodle.

### Prerequisites

This course has no prerequisites.

### Content

- The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.
Infrastructure Management 1: Process Hours

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:

- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content

In this course, the students will first learn some microscopic modeling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun. Microscopic modelling and simulation concepts will include:

1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Objective

After successfully completing this course the students will be able to:

1. Critically question structural design concepts of historical and contemporary references
2. Use graphic statics and strut-and-tie models based on the Theory of Plasticity to describe the load bearing behavior of structures
3. Understand different construction technologies and have an awareness of their potential for structural design
4. Use contemporary digital tools for the design of structures in equilibrium
5. Design an appropriate structural system for a given design task taking into account architectural considerations

Content

The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form of a structure and the forces within it by promoting the development of designed projects.

Theory:

Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project:

Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students' ability to integrate architectural considerations into their structural design.

Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.
Objective

There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will
- understand the main tasks of an infrastructure manager and the complexity of these tasks,
- understand the importance of setting goals and constraints in the management of infrastructure,
- be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
- be able to develop and evaluate simple management strategies for individual infrastructure assets,
- be able to develop and evaluate intervention programs that are aligned with their strategies,
- understand the principles of guiding projects and evaluating the success of projects,
- be able to formally model infrastructure management processes, and
- understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.

Content

The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.
2. Positioning infrastructure management in society: As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.
3. Setting goals and constraints – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.
4. Predicting the future – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.
5. Help session 1
6. Determining and justifying general interventions - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.
7. Determining and justifying monitoring - Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.
8. Converting programs to projects / Analysing projects – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.
9. Help session 2
10. Ensuring good information – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.
11. Ensuring a well-run organization – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.
12. Describing the IM process – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.
13. Evaluating the IM process – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.
14. Help session 3 and submission of project report.

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least the use of Excel. Some students, however, prefer to use Python or R.

In this course, we will provide both the lecture notes and the slides, which contain all the necessary information. The lecture notes consist of handouts, the slides, and example calculations in Excel.

The lecture materials will be distributed via Moodle two days before each lecture.

Appropriate literature will be handed out when required via Moodle.

This course has no prerequisites.
The course will be structured into two parts, each making up about half of the semester.

### 101-0249-00L Hydraulic Engineering: Selected Topics

**Prerequisites:** 101-0247-01L Hydraulic Engineering II or equivalent course.

**Abstract**
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

**Objective**
The overarching goal of the course is to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

**Content**
Different selected topics in hydraulic engineering will be focused on, e.g., dam safety, materials in dam building, possible problems at reservoirs like natural hazards by impulse waves, the hydraulics of spillways and intake structures at dams and weirs and the area of conflict between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects at the national and international level.

**Lecture notes**
Lecture notes will be available online.

**Literature**
External speakers will be involved to present current topics and projects in Switzerland and abroad.

### 101-0608-00L Design-Integrated Life Cycle Assessment

**Prerequisites:** Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.

**Abstract**
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

**Objective**
The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

**Content**
The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:

1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

**Lecture notes**
As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

**Literature**
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

**Prerequisites / notice**
Prerequisite: Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.

The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master’s programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.
Abstract

Deepen the knowledge on selected topics of underground construction as well as learning working out conceptual solutions of complex problems.

Objective

Lecture: Deepen the knowledge on selected topics of underground construction.

Exercises: Conceptual solutions of complex problems.

Content

Caverns: Geometry, construction methods, support.

Shafts: Construction methods, support.

Urban tunnelling: Boundary conditions, system choice, alignment, design.

Field measurements: Principles, monitoring layout, applications, interpretation.

Cut and cover tunnels: Modelling, design.

Exercising conceptual solution of complex tunnelling problems based upon discussion of current tunnel cases with particularly demanding problems in small groups.

101-0200-10L Research-Focused Project Work ■ W 11 credits 24A Supervisors

Abstract

Working on a concrete task as preparation for the master's thesis

Objective

Promote independent, structured and scientific work; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content

The project work is supervised by a professor. The topic is going to be continued as master's thesis.

101-0139-00L Scientific Machine and Deep Learning for Design and Construction in Civil Engineering

Abstract

This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Upon completion of the course, the students will be able to:

1. understand main ML background theory and methods
2. assess a problem and apply ML and DL in a computational framework accordingly
3. Incorporating scientific domain knowledge in the SciML process
4. Define, Plan, Conduct and Present a SciML project

Content

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:

1. Fundamentals of Machine and Deep Learning (ML / DL)
2. Incorporation of Domain Knowledge into ML and DL
3. ML training, validation and testing pipelines for academic and research projects

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Prerequisites / notice

Familiarity with MATLAB and / or Python is advised.

101-0357-00L Theoretical and Experimental Soil Mechanics ■ W 6 credits 4G I. Anastasopoulos, R. Herzog, E. Korre, A. Marín, M. Schneider

Abstract

The number of participants is limited to 60 due to the existing laboratory equipment! Students with major in Geotechnical Engineering have priority. Registrations will be accepted in the order they are received.

Overview of soil behaviour

Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples

Consolidation theory and typical applications in practice

Triaxial & direct shear tests: consolidation & shear, drained & undrained response

Plasticity theory & Critical State Soil Mechanics, Cam Clay

Application of plasticity theory

Objective

Extend knowledge of theoretical approaches that can be used to describe soil behaviour to enable students to carry out more advanced geotechnical design and to plan the appropriate laboratory tests to obtain relevant parameters for coupled plasticity models of soil behaviour.

A further goal is to give students the wherewithal to be able to select an appropriate constitutive model and set up insitu stress conditions in preparation for subsequent numerical modelling (e.g. with finite elements).
The course will give Engineering students a comprehensive overview and enduring understanding of the techniques, processes, tool and
Consolidation theory for incremental and continuous loading oedometer tests and typical applications in practice
Triaxial & direct shear tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory

Lecture notes
Printed script with web support
Exercises

Literature
http://geotip.igt.ethz.ch/

Prerequisites / notice
Lectures will be conducted as Problem Based Learning within the framework of a case history
Virtual laboratory in support of 'hands-on' experience of selected laboratory tests

Pre-requisites: Basic knowledge in soil mechanics as well as knowledge of advanced mechanics
Laboratory equipment will be available for 60 students. First priority goes to those registered for the geotechnics specialty in the Masters,
2nd year students then first year students, doctoral students qualifying officially for their PhD status and then 'first come, first served'.

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost

### Literature

Recommended and supplementary literature:

### Prerequisites

Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

|--------------|----------------------------------------------------------|---|----------|----|---------------------------|

**Abstract**

This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

**Objective**

When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

**Content**

**Part 1 - Discovering a modern parallel computing ecosystem**
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

**Part 2 - Developing your own parallel algorithms**
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allowed, distributed memory parallelisation (multi-GPUs/GPUs);
- Learn about main simulation performance limiters.

**Part 3 - Final project**
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

**Lecture notes**

Digital lecture notes, interactive Julia notebooks, online material.

**Literature**

Links to relevant literature will be provided during classes.

**Prerequisites / notice**

Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

<thead>
<tr>
<th>101-0659-01L</th>
<th>Durability and Maintenance of Reinforced Concrete</th>
<th>W</th>
<th>4 credits</th>
<th>2V</th>
<th>U. Angst, Z. Zhang</th>
</tr>
</thead>
</table>

**Abstract**

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.

**Objective**

After this course you will have profound understanding about:
- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:
- current engineering approaches for durability design (according to standards) and their limitations
- refined models for durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies
- socio-economic challenges related to ageing infrastructures
- Fundamentals of corrosion and durability: Corrosion in concrete (chlorides, carbonation), Passivity and pitting corrosion, Cracking and influence of cracks.
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

**Excursion**

- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

**Lecture notes**

The course is based on the book Corrosion of steel in concrete - prevention diagnosis repair (WILEY 2013) by L. Bertolini, B. Elsener, P. Pedeleferi and R. Polder

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed
The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

Concrete Technology

W 2 credits 2G F. Constandopoulou, M. Bäuml, G. Martinola, T. Wangler

Abstract
Opportunities and limitations of concrete technology. Commodity and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as self compacting concrete
- fiber reinforced concrete
- fast setting concrete
- fair faced concrete
- recycled concrete
- new research in digital fabrication with concrete

Lecture notes
Slides provided for download.

Public Transport Design and Operations

W 6 credits 4G F. Corman, F. Leutwiler

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view. At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
Basics for line transport systems and networks Passenger/Supply requirements for line operations Objectives of system and network planning, from different perspectives and users, design dilemmas Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport Planning process, from demand evaluation to line planning to timetables to operations Matching demand and modes Line planning techniques Timetabling principles Allocation of resources Management of operations Measures of realized operations Improvements of existing services

Lecture notes
Lecture slides are provided.

Abstract
Lean, Integrated and Digital Project Delivery
This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.
Objective

By the end of the course, students will be able to plan and manage the lean, integrated, and digital project delivery of a construction project.

Students will know they are able to achieve this overall course goal when they can:
1. Apply the fundamental theories of lean production to the context of construction management. This includes the ability to describe the three views of production: transformation, flow and value generation; evaluate the benefits of a pull production system compared to push production systems; evaluate how production variability and uncertainty contributes to work-in-process and ‘waste’; and apply the concepts of lean production to several construction management tools including the Last Planner System, Pull Planning, Target Value Design, and Takt Planning.
2. Understand the fundamentals of Virtual Design and Construction and Building Information Modeling. This includes the ability to prepare a model breakdown structure capable of integrating project information for all stakeholders; describe the upcoming transition to a common data environment for BIM that will use platforms such as Autodesk Forge; and describe the barriers to successful implementation of BIM within construction and design firms.
3. Plan and schedule an integrated ‘5D’ scope schedule cost model using the Tri-Constraint Method. This includes the ability to understand the TCM algorithm, apply parametric logic to the creation of a virtual model for construction production; and evaluate the limitations of the critical path method when compared to resource- and space-constrained scheduling.
4. Evaluate benefits of integrated project governance compared to the organization of traditional construction project delivery systems. This includes the ability to evaluate the risks, benefits and considerations for integrated teams using multi-party relational contracts that cross disciplinary and firm boundaries; and explain to others the ‘elements’ of integrated projects (e.g. colocation, early involvement of key stakeholders, shared risk/reward, collaborative decision making).

Content

The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g. colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects.

For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, takt time planning, production tracking, and target value design.

For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and “5D and 6D” models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

Lecture notes

Lecture presentation slides will be available for viewing and download the day before each lecture.

If possible due to COVID restrictions, students will be expected to attend a half-day workshop on the Last Planner System. The date of this workshop will be provided at a later point in time.

Literature

A full list of required readings will be made available to the students via Moodle.

Prerequisites / notice

Project Management for Construction Projects (101-0007-00L) is a recommended but not required prerequisite for this course.

101-0492-00L Microscopic Modelling and Simulation of Traffic Operations

W 3 credits 2G M. Makridis

Abstract

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.
Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:

- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology
4) Specific tasks for the project will include:
   1) Building a model with the traffic simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
   2) Calibrating and validating the simulation model.
   3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students.

It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taken place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Literature

Additional literature recommendations will be provided at the lectures.

Prerequisites / notice

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

Materials and Constructions

W 3 credits 2G G. Habert, D. Sanz Pont

Abstract

Building materials with a special focus on regenerative materials: earth, bio-based and reuse.
Sourcing, properties and performance, building envelope integration and detailing, sustainable building construction

Objective

Special focus on regenerative materials: earth, bio-based and reuse
The students will acquire knowledge in the following fields:
Fundamentals of material performance
Introduction to durability problems of building facades
Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, wood and bamboo, earth
- Insulating materials (bio-based vs conventional)
- Air barrier, vapour barrier and sealants
- Interior finishing
Assessment of materials and components behaviour and performance
Solutions for energy retrofitting of (historical) buildings
Aspects of sustainability and durability

Workshop on Sustainable Building Certification

W 3 credits 2G D. Kellenberger

Number of participants limited to 25

Abstract

Building labels are used to certify buildings and neighbourhoods in term of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, Minergie, 2000-Watt-Sites). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

This alternance of working session on one specific criteria for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus point (operation energy, mobility, daylight, indoor air quality).

Lecture notes

The slides from the presentations will be made available.

Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.
The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form of a structure and the forces within it by promoting the development of designed projects.

After successfully completing this course the students will be able to:

1. Critically question structural design concepts of historical and contemporary references
2. Use graphic statics and strut-and-tie models based on the Theory of Plasticity to describe the load bearing behavior of structures
3. Understand different construction technologies and have an awareness of their potential for structural design
4. Use contemporary digital tools for the design of structures in equilibrium
5. Design an appropriate structural system for a given design task taking into account architectural considerations

The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester: a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

Theory:

Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams. The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project:

Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students’ ability to integrate architectural considerations into their structural design.

101-0267-01L Numerical Hydraulics

Abstract
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use
given in lecture

Content
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their
applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and
finite difference methods are introduced. The infinite volume method as well as the method of characteristics are used for the solution of the
shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the
students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

Lecture notes
Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

101-0010-10L Project on Construction Engineering

Abstract
Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen specialisations and has to be completed within 18 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 222 of 2140
Objective
Promote independent, structured and scientific work; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content
The project work is supervised by a professor. Students can choose from different subjects and tasks.

Prerequisites / notice
The project work requires normally 250 to 300 hours of work.

Objective
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Content
To work independently and to produce a scientifically structured work.

Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Electives ETH Zurich

Recommended Electives of Master Programme

Objective
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Information and application: http://sparklabs.ch/
Objective

During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders (empathy).
- Engage in collaborative ideation with a multidisciplinary team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Content

The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validate them through quick iterations of prototyping and testing using different tools and materials.

The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way of incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Prerequisites / notice

For more information and the application visit: http://sparklabs.ch/

Open mind, ability to manage uncertainty and to work with students from various background. Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session.

Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Please note that the class is designed for full-time MSc students. Interested MAS students need to send an email to Linda Armbruster to learn about the requirements of the class.

<tbody>
<tr>
<td>Objective</td>
<td>The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems. In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks. In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today's economic geography. Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention. In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.</td>

<tr>
<td>Abstract</td>
<td>Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content

Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational models within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where these have been tested and become understood. Most of them have been taken from European landscapes, most of which have taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The learning material, available via https://moodle-app2.let.ethz.ch/ is comprised of:

- Toolbox ‘Reader’ with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

101-0193-00L Systemic Design Labs: RE:GENERATE Alpine-Urban  W  4 credits  2S  T. Luthe

Abstract

Systemic design (SD) optimizes an entire system as a whole, rather than its parts in isolation. SD is iterative, recursive and circular, requires creative, curious, informed and critical systems thinking and doing, yielding radical resource efficiency. It systems mapping, design thinking, footprint assessment, network analysis, test planning, prototyping, fabrication, social experiments.

Objective

The teaching purpose of Systemic Design Labs (SDL) is to better tackle the complexity of today’s sustainability challenges. Often, in current education we learn to disassemble design challenges into their bits and parts for individual optimization. While being useful for developing topical expertise, this reductionism to parts with less emphasis on their interaction does not match with the growing complexity of today’s challenges. In contrast, systemic design approaches a task from a holistic perspective, zooming out of a system to reveal its structure and connections between its parts—to zoom in on the hub of influence that matters most.

The objectives of the course are to introduce students to Systemic Design as theory, methodology and practice. This includes whole systems thinking, circularity, cross-scale design, Gigamapping, and many more. The course stimulates overall reflective eco-social thinking in design, planning and engineering disciplines.

Content

Design Challenge: How to re-design alpine-urban circularity? How to revive mountain livelihoods, focusing on local identity, resilient landscapes and a regenerative economy? What is a regenerative relation between the alpine and the urban? Covid has accelerated and intensified a traditionally challenging relation of the alpine (mountain livelihoods) and the urban. Both depend on each other, but there are as well many unsustainable elements in this relation, especially for the alpine.

The specific design challenge is to identify and layout a holistic, partly quantified and visualized systems strategy for building a resilient community economy in relation to the actual Covid driven pressure factors in the relation of the alpine with the urban.

We build upon former ETH SDL students who developed a systems maps for the community of Ostana, Italy, that embraces local identity, revitalizes cultural and landscape biodiversity, and creates alpine-urban circularity.

This course will extend this systems map to more clearly understand the urban component, the source market, and design in new opportunities of urban-alpine regeneration, for circularity, for new ways of tourism, of mobility, in a creative economy.

Recap of former SDL courses:

In Ostana, a clear connection is between the local identity (culture, traditions, visions) which is formed by Occitan culture (food, music, dance, language), traditional stone building architecture which is under pressure to carefully evolve with new needs for carbon-neutral and net-positive buildings, and the Monte Viso landscape. How does a re-growing economy that should be regenerative and circular by design, correlate with innovation in architecture, with population growth and associated challenges in mobility, waste systems and supplies, with growing tourism, new agro-forestry practices like industrial hemp and Paulownia, while impacts of climate change are clearly visible? How does the community design a vision that is based on cooperation on different governance scales, balancing local identity and urgently needed international innovation?

Deliverables & output: This SDL course RE:GENERATE builds upon related work from former courses hosted and lead by the MonViso Institute (i.e. on social innovation, mobility, architecture and local identity, tourism, circular economy, land use change) to develop and design foundations for an extension of the existing, visualized and partly quantified systems map, that will support ongoing and future innovation processes in this community. The focus now is on the urban integration into new, regenerative business models of the alpine, and in regenerative relation between both as a model for the future. This course will thus develop an extended graphical systems map from the alpine to the urban, backed up by a technical report, and connected with the existing systems maps of Ostana and the surrounding valley.

Program: Mathematics and Computer Science

Domain A - Subject-specific Competencies

551-0125-00L Fundamentals of Biology I: From Molecules to the Biochemistry of Cells

Objective
- Introduction to biochemistry, molecular biology and evolutionary principles
- The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

Literature
- The newly conceived lecture is supported by scripts.
- The lecture is supported by scripts.
- Further reading suggestions will be indicated during the lecture.

Domain B - Method-specific Competencies

401-0271-00L Mathematical Foundations I: Analysis A

Objective
- Introduction to calculus in one dimension. Building simple models and analysing them mathematically. Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Content
- Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Literature
- G. B. Thomas, M. D. Weir, J. Hass: Analysis 1, Lehr- und Übungsbuch, Pearson-Verlag
- R. Sperb/M. Akveld: Analysis I (vdf)
- L. Papula: Mathematik für Ingenieure und Naturwissenschaftler (3 Bände), Vieweg
- Further reading suggestions will be indicated during the lecture.

Domain C - Social Competencies

529-0001-00L Introduction to Computer Science

Objective
- Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content
- Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation; Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.

Literature
- See: www.csms.ethz.ch/education/infol

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 228 of 2140
Prerequisites / notice

Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam (compulsory performance component, 12% of the exam mark; in case of repetition of the exam, the exercise marks from a previous semester can be kept).

Lecture notes

Recommended reading:

- Der Titel des Buches, Autor (2000);
- The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drug classes. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

529-0016-00L BCB III: Organic Chemistry • O 8 credits 12P J. W. Bode

Abstract
Laboratory course in Organic Chemistry for students of "Biochemistry - Chemical Biology"

Objective
Introduction into basic techniques used in the organic laboratory. Understanding organic reactions through experiments.

Content
Part I: Basic operations such as the isolation, purification, and characterization of organic compounds: distillation, extraction, chromatography, crystallization, IR (UV/1H-NMR)-spectroscopy for the identification of the constitution of organic compounds.

Part II: Organic reactions: preparative chemistry. From simple, one-step to multi-step syntheses. The syntheses include classic Organic Chemistry as well as methods widely used in a Chemical Biology context;

**Abstract**

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Objective**

The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level.

**Content**

1) Human Neuroanatomy I&II  
2) Comparative Neuroanatomy  
3) Building a central nervous system I&II  
4) Synapses I&II  
5) Glia and more  
6) Excitability  
7) Circuits underlying Emotion  
8) Visual System  
9) Auditory & Vestibular System  
10) Somatosensory and Motor Systems  
11) Learning in artificial and biological neural networks

**Prerequisites / notice**

For doctoral students of the Neuroscience Center Zurich (ZNZ).

**Abstract**

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Objective**

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Content**

The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

**Lecture notes**

Handouts during the class

**Literature**

Recommendations for text books will be covered in the class

**Prerequisites / notice**

Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

<td>2V+1U</td>
<td>M. Dettling</td>
</tr>
</tbody>
</table>

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student’s own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**

A script will be available.

551-1619-00L Structural Biology Z Dr 1 credit 1K R. Glockshuber, F. Allain, N. Ban, K. Locher, M. Pilhofer, E. Weber-Ban, K. Wüthrich

Abstract
The course consists of a series of research seminars on Structural Biology, Biochemistry and Biophysics, given by both scientists of the National Center of Competence in Research (NCCR) in Structural Biology and external speakers. Information on the individual seminars is provided on the following websites:
http://www.structuralbiology.uzh.ch/educ002.asp
http://www.biol.ethz.ch/dbiol-cal/index

Objective
The goal of this course is to provide doctoral and postdoctoral students with a broad overview on the most recent developments in biochemistry, structural biology and biophysics.

851-0180-00L Research Ethics Z Dr 2 credits 2G G. Achermann, P. Emch

Number of participants limited to 40

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will

• Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
• Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;
I. Introduction to Moral Reasoning

1. Ethics - the basics

1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics

2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma

3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities

1. Integrity in research and research misconduct

1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management

2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing

3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities

1. Research involving human subjects

1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity 1.5 Selection of study participants – the concept of vulnerability 1.6 Favorable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility

2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research

3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice

What are the requirements?

First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):

1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!)
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…)
4. Voluntary participation, connected with your active participation during class, e.g., taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
5. The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. The role of personalized cancer treatment. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Taught competencies

Domain A - Subject-specific Competencies

- Concepts and Theories assessed

Domain B - Method-specific Competencies

- Analytical Competencies assessed
- Decision-making assessed
- Problem-solving assessed

Domain C - Social Competencies

- Communication assessed
- Cooperation and Teamwork assessed

Domain D - Personal Competencies

- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection assessed

376-1581-00L Cancer: Fundamentals, Origin and Therapy

Z 2 credits 2G H. Nägeli

Abstract

Objective

Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

Content

The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Participants will be able to discuss and understand sustainability in the context of plant science research. A special focus will be on research on agro-ecological systems and farming system research.

The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Participants will be able to discuss and understand sustainability in the context of plant science research. A special focus will be on research on agro-ecological systems and farming system research. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

(1) Review issues of sustainability in the context of plant science research and literature on sustainable agriculture and the food system.

(2) Analyze and interact on several case studies in agro-ecology and the food system.

(3) Use SDGs in your case studies as a target and assessment system for sustainability in agriculture and in the food system.

The course will be organized with two workshops (half days, 14:00 - 18:00) and an intensive, well-structured self-study/ group work phase in between the workshops. Online learning material in provided on for example: http://www.plantsciences.uzh.ch/en/teaching/masters/sustplantsys.html

The course will be organized as an intensive, well-structured self-study/ group work phase in between the workshops. Online learning material is provided on for example: http://www.plantsciences.uzh.ch/en/teaching/masters/sustplantsys.html

NMR Methods for Studies of Biological Macromolecules

This seminar series is targeted at Master students and PhD students conducting research projects in the field of biomolecular NMR in solution.

This seminar series is targeted at Master students and PhD students conducting research projects in the field of biomolecular NMR in solution.
### Current Topics in Molecular Health Sciences

**Z**

0 credits

2S

I. Zanini, further lecturers

**Abstract**

This course is a seminar series on current research topics within the Institute of Molecular Health Sciences.

**Objective**

The course introduces the participants to recent developments in the fields of molecular health sciences.

**Prerequisites / notice**

Approval of the responsible lecturer necessary for participation

### Lecture Series: Space Research and Exploration

**Dr, Z**

1 credit

2V

S. P. Quanz

**Abstract**

Lecture Series about topics of space research and exploration consisting of individual talks giving by different leading experts from industry and academia.

**Objective**

Attending students will

- experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more
- be familiarized with the Swiss space research and industry sector
- improve their communication skills by broadening their research horizon
- have the opportunity for direct learning by posing questions to experts

**Content**

The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The 'Lecture Series: Space Research and Exploration' aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lecture, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers include:

- 21.09.: Prof. Sascha P. Quanz (ETH Zürich); Professor for Exoplanets
- 28.09.: Dr. Anna Kubik (ETH Zürich); Senior Scientist for Orbital Dynamics
- 12.10.: Dr. Andrea Fortier (University of Bern); CHEOPS Instrument Scientist
- 19.10.: Prof. Volker Gass (EPFL Lausanne); Director of Space Innovation
- 26.10.: Dr. Hendrik Kolvenbach (ETH Zürich); Postdoctoral Researcher for Space Robotics
- 02.11.: Deborah Müller (RUAG Space); Director of Innovation & Business Development
- 23.11.: Dr. Adrian Glauser (ETH Zürich); Senior Scientist for Astronomical Instrumentation
- 30.11.: Prof. Louise Harra (ETH Zürich); Professor of Solar Astrophysics
- 17.12.: Prof. Didier Queloz (ETH Zürich / Cambridge); Professor for Exoplanets

Abstract

The lecture provides an introduction to the basics of biochemistry and molecular biology as well as evolutionary principles. The focus is on bacteria and archaea under consideration of universal concepts.

Objective

The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

Lecture notes

The newly conceived lecture is supported by scripts.

Literature

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed

**Abstract**

Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics and elements of quantum mechanics

**Objective**

Students know and understand the basic ideas of the scientific description of nature. They understand the fundamental concepts and laws of mechanics and they are able to apply them in practical problems. They know the concepts of quantization and quantum numbers.

**Content**

1. Description of Motion
2. The laws of Newton
3. Work and energy
4. Collision problems
5. Wave properties of particles
6. The atomic structure of matter

**Abstract**

Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**

Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.
## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsräte
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integration (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen: Beschränkt, Logistisch, Gompertz
- Stationäre Lösungen
- Lineare DGL 1. Ordnung
- Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

**Lecture notes**
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:
* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

Register in myStudies as early as possible, because the fire protection courses take place separately before the internship starts.

Abstract
Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the most fundamental chemical reaction types.

Objective
- Knowledge of the basic chemical laboratory methods
- Basic knowledge of the scientific approach in experimenting
- Observation and interpretation of chemical processes
- Keeping of a laboratory journal
Content
- Simple chemical working techniques/methods
- Separation techniques
- Physical measurements: mass, volume, pH
- Ionic solids (salts)
- Acid/base chemistry, buffers
- Redox reactions
- Metal complexes
- Titration methods and quantitative spectrometry
- Introduction to qualitative analysis

Lecture notes
Course manual in German (is handed out to the students at the begin of the lessons)
Language: German, English upon request

Literature
Wiley

is a suitable textbook.

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi, plants, and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi, plants, and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals, and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Campbell ‘Biology’, 11th Edition

Prerequisites / notice
Some lecture are held in English.

Abstract
The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective
For each of the techniques covered in the course, the students will be able to explain:

a) the physical, chemical and biological principles underlying the technique,
b) the requirements for the sample,
c) the type of raw data collected by the technique,
d) the assumptions and auxiliary information used in the interpretation of the data and e) how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content
The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:
- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes
The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.
Taught competencies

Domain A - Subject-specific Competencies

529-0015-00L Statistics II

Abstract
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptuelle Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective

Not assessed:

529-0015-00L Physical Chemistry

Abstract
Thermodynamic foundations of phase equilibria, intermolecular interactions, and molecular self-assembly; kinetics of chemical reactions and transport processes

Objective
This course teaches physical-chemical foundations of important processes in living cells and organisms as well as of working techniques in biochemistry and molecular biology. Students learn:

1. Evaluation of chemical equilibria based on chemical potential
2. Interpretation of phase diagrams
3. Which interactions between molecules are important in living cells
4. Why molecules self-organize into aggregates
5. Which physical-chemical basics determine behavior of biomembranes
6. What determines the rate of chemical reactions, in particular also of enzymatically catalyzed reactions
7. What determines the transport rate of matter and heat

Content
Chemical potential, prediction of the direction of processes, phase equilibria, phase rule, phase diagrams of pure substances, colligative properties, osmosis, dialysis, surface tension, intermolecular interactions, hydrophobic effect, hydrophilic effect and denaturation, amphiphiles, basics of self-association, micelles, packing parameter, double layers, vesicles, membranes, elementary reactions, parallel reactions, consecutive reactions, Eyring theory, enzyme kinetics, diffusion, heat conduction, active transport

Lecture notes
A lecture script is provided
In addition to the lecture script, the following two books can be used to gain deeper understanding:

**Taught competencies**

**Domain A - Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Domain B - Method-specific Competencies**

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Domain C - Social Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

**Domain D - Personal Competencies**

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Negotiation
- Self-direction and Self-management

**529-0229-00L**

**Practical Course Organic Chemistry (for Students of Biology and Pharmaceutical Sciences)**

- **O** 8 credits
- 12P
- C. Thilgen, Y. Yamakoshi

**Abstract**

Students who did not pass the first-year examinations need the lecturers’ written permission to take this course.

**Objective**

Learn the basic techniques for the preparation and purification of organic compounds. Learn to take accurate notes of the experiments and to write reports. Deepen the understanding of reaction mechanisms.

**Content**

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses) from the following classes of reactions: 1. nucleophilic substitution at C(sp3), 2. elimination or electrophilic addition to C=C, 3. electrophilic aromatic substitution, 4. oxidation, 5. reduction, 6. Grignard reaction, 7. synthesis of a carboxylic acid derivative, 8. Aldol-, Claisen-, Mannich-, Michael reaction or Robinson annulation. Introduction to database searches (Reaxys, SciFinder).

**Lecture notes**

- Documentation will be handed out at the beginning of the course.

**Literature**

1) P. Wörfel, M. Bitzer, U. Claus, H. Felber, M. Hübel, B. Vollenweider; *Laborpraxis* (Bd. 1: Einführung, allgemeine Methoden; Bd. 2: Messmethoden; Bd. 3: Trennungsmethoden; Bd. 4: Analytische Methoden); Birkhäuser Verlag; Basel; 1990

**Prerequisites / notice**

As a prerequisite, all participants need to pass the "Safety Test HCI Chemie_V2 English" (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

Autumn Semester 2021

Page 244 of 2140
Methods of Biological Analysis

Objectives:
The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometry analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

Content:
The course will consist of lectures covering the theoretical and technical base of the respective analytical methods and of exercises where typical applications of the methods in modern experimental biology are discussed.

Lecture notes:
Materials supporting the lectures and exercises will be made available via Moodle.

Statistics II

Abstract:
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective:

Fundamentals of Biology II: Biochemistry and Molecular Biology

Abstract:
The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Objective:
Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis of and breakdown of amino acids, glycans, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

Fundamentals of Biology II: Cell Biology

Abstract:
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective:
The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Prerequisites / notice:
Some of the lectures are given in the English language.

Physical Chemistry I (for Biology and Pharmacy)

Abstract:

Objective:
Understanding the fundamental thermodynamic properties of chemical and biological systems.

Content:
Systematic Biology: Zoology  
**O** 3 credits  2V+2P  **O. Y. Martin, M. Greeff**

*Does not take place this semester.*

**Abstract**
Lecture: The lecture provides an overview of animal diversity. Using key selected groups, phylogenetic, morphological and ecological aspects are addressed. Two priority topics are the arthropods and the vertebrates (including vertebrate fauna of Switzerland).

**Objective**
Lecture: The systematic classification of animals and the characteristics of the most important animal groups, basic animal body plans.

Practical: Knowledge of selected animal groups and their characteristics (supplementing the lecture) and of the basic methods.

**Content**
Lecture: Body plans, characteristics, diversity and phylogenetic position of the main groups of Protozoa, Invertebrates, and Vertebrates, with a special focus on Arthropods and Vertebrates (including vertebrate fauna of Switzerland).

Practical: Macroscopic and microscopic study of selected Protozoa, Invertebrates (especially insects) and Vertebrates: morphology and anatomy; behaviour, mainly locomotion, feeding, and reproduction.

**Lecture notes**
Scripts can be downloaded from Moodle, and additional material will be handed out (particularly in the practical).

**Literature**
No further literature required, the script contains suggestions for further reading.

Communication

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics, and ecological genetics. The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Prerequisites / notice

As a prerequisite, all participants need to pass the "Safety Test HCI Chemie V2 English" (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

- Y. Barral, T. Städler; Molecular and Structural Biology I: Protein Structure

---

### Objective

The course aims to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

The course "Molecular Life of Plants" will cover the following topics:

- Scripts and additional material will be provided during the semester.
- Updated handouts will be provided during the class.
- Current literature references will be provided during the lectures.

551-0311-00L Molecular Life of Plants W 6 credits 4V S. C. Zeeman, K. Bomblies, A. Rodríguez-Villalón, C. Sánchez-Rodríguez, O. Voinnet

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

551-0313-00L Microbiology (Part I) W 3 credits 2V W.-D. Hardt, L. Eberl, J. Piel, M. Pilofer

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This course will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and central carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses
- Senescence

551-0319-00L Cellular Biochemistry (Part I) W 3 credits 2V U. Kutay, G. Neurohr, M. Peter, K. Weis, I. Zemp

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.bio.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Content
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Lecture notes
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Literature
Mainly based on original literature, a detailed list will be distributed during the lecture

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Abstract
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Abstract
This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.
Objective

The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge through interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Block Courses

Registration for Block courses is mandatory. Please register under https://www.uzh.ch/zoolmed/ssl-dir/Blockkurse_UNIETH.php. Registration period: from 26.07.2021 to 13.08.2021

Please note the ETH admission criteria for the admission of ETH students to ETH block courses on the block course registration website under "allocation".

Block Courses in 1st Quarter of the Semester

Abstract

This laboratory course has a focus on current research topics in our laboratory related to metabolic engineering, the general understanding of metabolism, and is partially focused on one carbon metabolism. Projects will be conducted in small groups.

Objective

The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

Content

The course will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab.

Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

Lecture notes

None

Literature

Will be provided at the beginning of the course.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pili by electron microscopy.

Objective
The course should enable students to understand concepts of protein expression, purification and the characterisation of biomolecular interactions. In addition, students will learn some basic principles of X-ray crystallography and electron microscopy.

Content
The students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:
- Purification, biophysical characterisation and structure determination of pilins
- Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:
- Cloning and mutagenesis
- Recombinant or endogenous protein production in E. coli or Legionella
- Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
- Protein crystallisation and crystal optimisation
- Visualisation of bacterial pili by electron microscopy (negative stain or cryo electron microscopy)
- DNA binding experiments
- Enzymatic activity measurements
- In silico structural analyses using PyMOL and Chimera

Literature
Any required reading of literature will be discussed at the beginning of the course.

Prerequisites / notice
There are no special requirements for this course.

Image-Based Drug Screening in Human Blood for Personalized Medicine

Announcement
The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Image based screening allows to measure in high throughput the phenotype of millions of individual cells to external perturbations. We have recently shown that image-based screening in human blood can help to find active treatments for patients with blood cancers. In this course we will take the students through the entire workflow (to the extent that biosafety regulations allow it).

Objective
Take the students through the entire workflow from experimental design, to screen, to imaging and analysis.
- Learn to design an image-based screening experiment
- Observe human blood sample handling
- Perform immuno-fluorescence & automated confocal microscopy
- Image analysis and result interpretation
- Result presentation

Cell Biology of the Nucleus

Announcement
The enrolment is done by the D-BIOL study administration.

Number of participants limited to 18.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 251 of 2140
General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course.
  Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Introduction to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems.

Objective
The aim of our course is to introduce the students to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems. Emphasis is given to:
- Establishment of nuclear identity and nuclear-cytoplasmic communication
- Reorganization of the nucleus in aging
- Animal cells during the generation of cell diversity and neuronal differentiation

By the end of the course, based on lectures, literature reading and practical lab work, the students will be able to formulate open questions concerning the function of the nucleus. Thus, the students will know about the mechanisms and consequences of nuclear-cytoplasmic compartmentalization, nuclear positioning, DNA clustering in the nucleus and cytoplasm during cell divisions and aging.

Content
During this block-course, the students will:
- learn how organelles establish and maintain identity with a focus on the nucleus
- discover the evolutionary and functional plasticity of the nucleus
- design, apply, evaluate and compare experimental strategies

Students - in groups of 2 or max. 3 - will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lectures and technical notes will be given and informal discussions held to provide you with the theoretical background.

Literature
Documentation and recommended literature (review articles) will be provided during the course.

Block Courses in 2nd Quarter of the Semester

- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective
Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current lab techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Content
Research projects on the model pathogen Salmonella.

Lecture notes
none.

Literature
Literature will be selected with reference to the assigned research project.
551-0421-00L  
Biology and Ecology of Fungi in Forests  
Number of participants limited to 10.  
W 6 credits 7P  
S. Prospero, I. L. Brunner, M. Peter Baltensweiler  
The enrolment is done by the D-BIOL study administration.  

551-0351-00L  
Membrane Biology  
Number of participants limited to 15.  
W 6 credits 7P  
V. Korkhov, U. Kutay, A. Rodriguez-Villalon, G. Schertler  
The enrolment is done by the D-BIOL study administration.  

Abstract  
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Objective  
Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.

Content  
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Lecture notes  
Unterlagen zum Kurs werden abgegeben.

Literature  

Prerequisites / notice  
Erreichbarkeit mit Tram 14 bis Triemli, danach PTT-Bus 220 oder 350 bis Birmensdorf Sternen/WSL, oder mit S9 bis Birmensdorf SBB und mit PTT-Bus eine Station in Richtung Zürich bis Birmensdorf Sternen/WSL.

551-0351-00L  
Membrane Biology  
Number of participants limited to 15.  
W 6 credits 7P  
V. Korkhov, U. Kutay, A. Rodriguez-Villalon, G. Schertler  
The enrolment is done by the D-BIOL study administration.  

Abstract  
The course will introduce the students to the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

Objective  
The aim of the course is to expose the students to a wide range of modern research areas encompassed by the field of membrane biology.

Content  
Students will be engaged in research projects aimed at understanding the biological membranes at the molecular, organellar and cellular levels. Students will design and perform experiments, evaluate experimental results, analyze the current scientific literature and understand the relevance of their work in the context of the current state of the membrane biology field.

Lecture notes  
No script

Literature  
The recommended literature, including reviews and primary research articles, will be provided during the course

Prerequisites / notice  
The course will be taught in English. All general lectures will be held at ETH Hoenggerberg. Students will be divided into small groups to carry out experiments at ETH or at the Paul Scherrer Institute. Travel to the Paul Scherrer Institute will be by public transportation.

551-1201-00L  
Computational Methods in Genome and Sequence Analysis  
Number of participants limited to 7.  
W 6 credits 7P  
A. Wutz  
The enrolment is done by the D-BIOL study administration.
General safety regulations for all block courses:  The COVID certificate is mandatory at ETH Zurich. Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance. - Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed. - The installation and activation of the Swiss Covid-App is highly encouraged. - Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
This course aims to provide students with a comprehensive overview of computational methods for sequence analysis and assist with developing skills for application of computational approaches by experimental scientists in the life sciences.

Objective
Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Students will have the opportunity to advance their knowledge in programming by focusing on algorithms for genome and gene sequence analysis. A major goal of the course will be to lead the student to an independent and empowered attitude towards computational problems. For reaching this goal the students will work on an implementation of a solution for a set real-world problem in genome and sequence analysis under guided supervision.

Content
- Understanding the information in biological sequences and quantifying similarity
- Introduction to algorithms for sequence comparison and searches
- Implementation of sequence comparisons and searches in Python
- Accessing data formats associated with genome sequence analysis tasks
- Understanding the anatomy of a real world sequence analysis project
- Applying tools for sequence alignment and estimating error rates
- Ability to implement a solution to a problem in sequence analysis using Python
- Accessing genome annotation and retrieving relevant information in Pandas
- Application of Genomic intervals and arrays for sequence analysis with HTSeq

The course will consist of a series of lectures, assignments for implementing elementary tasks in Python, project development and discussion workshops, and a half week of practical work implementing a Python script as a solution to a real world problem associated with sequence analysis. At the end of the course students will explain their solutions and demonstrate the functionality of their implementations, which will then be discussed and commented on by the group. It is expected that students will be able to apply the knowledge to improve on concrete problems.

Prerequisites / notice
- It is recommended to bring your own computer with a Python installation to the course
- Simple computers can be provided
- Programming basics with Python

551-0359-00L Plant Biochemistry

Number of participants limited to 15.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses: The COVID certificate is mandatory at ETH Zurich. Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected.

- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Students actively participate in ongoing research projects on the analysis of human T and B cell response to pathogens and vaccines. They will be tutored in small groups by doctoral students and postdocs. In a lecture series, the theoretical background for the projects will be provided and the students will have the opportunity to present their projects and discuss recent publications.

Objective
To learn current methodologies in human immunology through experimental work in the lab. To learn current concepts through lectures and discussion of original papers. Requirement for obtaining the credit points: oral presentation of the research project in a PPT format.
entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged

-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
In this block course, students actively participate in ongoing research projects on plant metabolism and are tutored by doctoral students and postdocs. The theoretical background of the projects is provided in a lecture series. Finally, students discuss their projects and results during an interactive poster session.

Objective
Through supervision in small groups (either individually or in groups of two) students learn to conduct experiments in molecular plant biology, interpret the results, record them and communicate them to peers. Students also gain an insight into the larger context of their projects and how they are planned in the longer term.

Content
Participation in a project from the following list is possible: 1) Photosynthesis: How is photosynthesis regulated and how is photoassimilated carbon distributed in plants? 2) Biology of chloroplasts: How do chloroplasts develop and how is their function coordinated with that of the whole cell? 3) Starch biosynthesis and degradation: How are complex, semi-crystalline starch granules produced from monosaccharides and how are they broken down again to release energy?

Lecture notes
No script

Literature
Descriptions of the possible projects including individual reading suggestions will be handed out beforehand.

Abstract
Fundamentals (theoretical and practical) in phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases

Objective
Insight into ongoing research projects

Content
Practical courses:
Experiments within ongoing phytopathological research projects
Macro- and microscopic diagnostic of plant diseases

Theoretical courses:
Fundamentals of phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases

529-0739-01L Biological Chemistry B: New Enzymes from Directed Evolution Experiments
Number of participants limited to 12.
A script will be distributed to the participants on the first day of the course. The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions. Concepts and Theories

Methods in Cellular Biochemistry

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:

- Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.

- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions.

The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

A script will be distributed to the participants on the first day of the course.

Further literature will be indicated in the distributed script.

Safety concepts: https://chab.ethz.ch/studium/bachelor1.html

Abstract

Students will learn about biochemical approaches to analyze cellular functions. The course consists of practical projects in small groups, lectures and literature discussions. The course concludes with the presentation of results at a poster session.
Objective

Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

Literature

Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

This course will be taught in English.

**551-1515-00L Insulin Signaling**

Number of participants limited to 15.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
- The COVID certificate is mandatory at ETH Zurich. Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

**Abstract**

Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

**Objective**

The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally. In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

**552-4020-00L Experimental Food Microbiology for Biologists**

Number of participants limited to 12.

Prerequisites: It is recommended to attend the course Lebensmittel-Mikrobiologie (752-4005-00L) as a preparation.

The course can only be booked via the Biology Student secretariat.

General safety regulations for all block courses:
- Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

**Abstract**

Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of food borne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

**Objective**

Introduction of methods and techniques of food microbiology.

**Content**

Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

**Lecture notes**

Handouts were provided at the start of the course.

**Literature**

- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)
- Süssmuth et al.: "Mikrobiologisch-Biochemisches Praktikum" (Thieme)

**Prerequisites / notice**

Important information!

During the course we will work with the food-borne pathogen Listeria monocytogenes. Listeria monocytogenes represents a particular threat to pregnant women. Due to biosafety reasons participation is not allowed in case of pregnancy.

**551-1517-00L Protein Change in Adaptive Evolution**

Number of participants limited to 7.

The enrolment is done by the D-BIOL study administration.

Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

**Literature**

Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

This course will be taught in English.

Abstract
Proteins that seem to have evolved to help stabilize meiosis to temperature and/or polyploidy in plants.

Objective
To learn techniques in protein structure prediction, functional prediction and evolutionary analyses (bioinformatic), as well as protein purification from e. coli, insect cell, and/or cell-free systems, and analysis of e.g. interactions with DNA, thermostability, etc…

Content
Guided research projects to study the biochemical consequences of adaptive evolution in a variety of proteins. Mostly the focus is on proteins that seem to have evolved to help stabilize meiosis to temperature and/or polyploidy in plants.

Lecture notes
Will be provided, as appropriate, during the course.

Literature
Will be provided during course.

551-1119-00L Microbial Community Genomics
Number of participants limited to 10.
Prerequisite: Basic knowledge in [R] (e.g. introductory course) and/or UNIX is required. Participants should bring their own laptop computer.
The enrolment is done by the D-BIOL study administration.

Abstract
Introduction to current research methods in the analysis of microbial communities using Next Generation Sequencing approaches - metagenomics. Practical experience of work in a computational laboratory and an introduction to scientific programming.

Objective
Gain skills in data analysis and presentation for oral and written reports. Lectures introducing state-of-the-art in respective research areas and community microbiology, which is the target of ongoing research. Start to assess current literature.

Prerequisites / notice
Basic knowledge in [R] (e.g. introductory course) and/or UNIX is required. Participants should bring their own laptop computer.

551-1147-00L Bioactive Natural Products from Bacteria
Number of participants limited to 8.
The enrolment is done by the D-BIOL study administration.

Abstract
Introduction to current research methods in the analysis of microbial communities using Next Generation Sequencing approaches - metagenomics. Practical experience of work in a computational laboratory and an introduction to scientific programming.

Objective
Gain skills in data analysis and presentation for oral and written reports. Lectures introducing state-of-the-art in respective research areas and community microbiology, which is the target of ongoing research. Start to assess current literature.

Prerequisites / notice
Basic knowledge in [R] (e.g. introductory course) and/or UNIX is required. Participants should bring their own laptop computer.
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

Objective
Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

Content
Research project on bacteria that produce bioactive natural products (e.g., Streptomycetes, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g. PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.

Lecture notes
none.

Literature
Will be provided for each of the projects at the beginning of the course.

Abstract
Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes; field trip.
Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss fern species; field trips.

Objective
Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes.
Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss fern species.

Content
Bryophytes: Systematics and morphology of hornworts, liverworts and mosses and special themes such as ecology, biogeography, diversity and endangerment of bryophytes; one full-day field trip.
Ferns: Life cycle and morphology; evolutionary groups of ferns and lycopods; mating systems, micro- and macroevolution; ecology; full-day and half-day field trips.

Lecture notes
Hand-outs will be distributed.

Literature

Prerequisites / notice
Students have to present a poster on a special theme.

Grade according to poster presentation and contributions during the course.

Requirements: first and second year courses in Botany and Evolution.
Abstract
Introduction to the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells.

Objective
The students will obtain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Literature
Documentation and recommended literature will be provided at the beginning and during the course.

Prerequisites / notice
The course will be taught in English.

551-1511-00L Parallels Between Tissue Repair and Cancer
Number of participants limited to 20.
The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer.

Objective
To learn the cellular and molecular principles underlying tissue repair processes, in particular in the skin and in the liver, and the parallels and differences to cancer. To learn modern technologies in Molecular and Cellular Biology as well as Histology and to use these technologies to study questions related to mechanisms underlying tissue repair and cancer.

Content
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cells, as well as analysis of murine and human tissues.
The course combines practical work with lectures, discussions, project preparations and presentations.

551-0371-00L Growth Control and Aging
Number of participants limited to 8.
The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Organisms have to control their growth in accordance with environmental conditions. Interestingly, the pathways regulating growth often also affect aging. This course focuses on the analysis of growth regulation in yeast, Drosophila, and mammalian cells and on its connection to aging. The participants will perform experiments to study insulin/TOR signaling as a key regulator of growth and aging.
**Objective**

The aims of the block course are that participants

(I) understand the function and evolution of insulin/TOR signaling

(II) learn how genetic approaches in different organisms contribute to the understanding of complex processes such as aging and cancer in humans

(III) will get familiarized with reading and discussing research articles

(IV) get a first exposure to current research.

**Content**

The block course consists of

(I) experiments:

Teams of two students each will join research labs to work on current projects focusing on aging and growth regulation in budding yeast, Drosophila and mammalian cells. The students will present their projects and results to their colleagues.

(II) lectures on growth regulation and aging in yeast, Drosophila and mammals.

(III) journal clubs to discuss recent literature.

**Lecture notes**

Lecture handouts

**Literature**

Original research articles will be discussed during the course.

**Abstract**

**551-1403-00L** Imaging Bacterial Cells in a Native State by Electron Cryotomography

The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to macromolecular resolution. In a small group, students will perform wet lab experiments, data collection with stat-of-the-art equipment, data processing and analyses. The key method and its application in bacterial cell biology will be introduced by lectures

https://www.mol.biol.ethz.ch/groups/pilhofer_group/

**Objective**

Students will acquire the skills to cultivate bacteria, plunge-freeze samples for cryotomography, collect data using an electron cryomicroscope, process raw data, analyze tomograms, perform subtomogram averaging, model structures of interest, and generate movies for visualization.

**Abstract**

Motor proteins convert chemical energy into mechanical motion. In this block course, we study dynein motor proteins in cilia. Dynein causes conformational change upon ATP hydrolysis and finally generate ciliary bending motion. Participants will analyze cryo-EM data of cilia and visualize in vivo 3D structure of dynein to learn how motor proteins function in the cell.
Objective

The goal of this course is to be familiar with structural biology techniques of cryo-electron tomography and single particle cryo-EM studies on motor proteins. The main focus is 3D image analysis of cryo-EM datasets acquired by highest-end microscopes. Participants will learn structure-function relationship at various scales: how the conformational change of motor proteins causes mechanical force and generates cellular motility.

Content

Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins; how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyzes localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion.

In this course, we study dynein in cilia. Cilia are force-generating organelles, made of nine microtubules and thousands of dyneins. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics.

The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneins, microtubes and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance of cilia preparation from green algae, cryo-EM data collection using an electron microscope in PSI and site-visit of highest-end electron microscope facility in ETH.

701-2437-01L

Mechanisms of Bacterial Pathogenesis

Number of participants limited to 9 in the 2nd semester quarter of the autumn semester.

Number of participants limited to 6 in the 4th semester quarter of the autumn semester.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:

- The COVID certificate is mandatory at ETH Zurich.
- Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been -Whenever possible the distance rules have to be respected
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged
- Any additional rules for individual courses have to be respected
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract

Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective

Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current lab techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Content

Research projects on the model pathogen Salmonella.

Lecture notes

none.

Literature

Literature projects will be selected with reference to the assigned research project.

Block Courses in the 1st Half of the Semester

From 21.9.2021 to 5.11.2021

This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with rivers, groundwater and lakes.

**Objective**

During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat and how the interactions (e.g. food web) between organisms work. During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge. After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates and freshwater algae) in Switzerland and the most important identification traits.

**Content**

The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

**Lecture:**

The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems; important aspects regarding ecosystem metabolism and habitat properties of freshwaters; applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

**Practical part:**

The practical part includes an excursion to Greifensee and a 3-day-excursion to the river Glatt in Niederuzwil, where you independently perform small research projects. Additionally, you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

**Prerequisites / notice**

The maximal participating number of biology students is 14.

The course includes a field trip to Greifensee (23.09.2021) and a 3-day-excursion to the river Glatt in Niederuzwil from 29.09. to 01.10.2021.

- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

**Abstract**

This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in contemporary research and prepares for future studies in the course of semester and master projects.

**Objective**

- Understanding mammalian development
- Introduction to stem cells systems
- Working with cultured cells
- Translational aspects of mammalian cell biology

**Content**

The course will consist of a series of lectures, essay assignments, project development and discussion workshops, and 2 and a half week of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to concrete problems.

**ECTS**  European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, - Understanding of research methods used in the empirical human sciences

**Objective**
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

**Prerequisites / notice**
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

---

**Cognitively Activating Instructions in MINT Subjects**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Abstract**
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Objective**
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.

**Prerequisites / notice**
Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

---

**Research Methods in Educational Science**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Abstract**
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**
- To understand research methods used in the empirical educational sciences
- To understand and critically examine information from scientific journals and media
- To understand pedagogically relevant findings from the empirical educational sciences

---

**Gender Issues In Education and STEM**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

**Abstract**
In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the underrepresentation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

**Objective**
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher’s work.

**Content**
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

**Prerequisites / notice**
Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

---

**Using Outdoor Education**

Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.

**Abstract**
In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures. Under supervision, they compile tuition materials enabling effective learning and/or analyse and reflect on certain topics from a subject-based and pedagogical perspective.

**Objective**

The objectives for the students are:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics, pedagogical, and potentially social perspective.

- to prove that they can independently compile a tuition sequence and develop it to deployment.

**Content**

Thematische Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Lecture notes

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Literature

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice

Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach Erfüllung allfälliger fachwissenschaftlicher Auflagen.

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

**Subject Didactics in Biology**

- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

- They can use different forms of examination for monitoring performance.

- They are in a position to select learning objectives and formulate these on the basis of specific topics covered in school biology.

- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.

- The students can use different forms of examination for monitoring performance.

- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

- Application of teaching methods and techniques from educational science in biology classes.

- Planning and preparation of lessons.

- Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.

- Teaching methods and techniques from educational science in biology classes.

- Application of teaching methods and techniques from educational science in biology classes.

- Planning and preparation of lessons.

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.

- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.

- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.

- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.

- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.

- The students can use different forms of examination for monitoring performance.

- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Literature Wird von der Praktikumslehrperson bestimmt.

---

### Professional Training

**Important:** You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Selected biological topics, with a special focus on evolution, are dealt with under consideration of the special needs of persons involved in Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons.

Students can perform, off the cuff, 12 school experiments (which they have tested themselves), from the different subject areas, and conduct these correctly in technical terms. They can incorporate these experiments in their tuition in a didactically meaningful manner.

Comments:
By contrast to the Subject Specialisation 1 and 2 course units, these are "basic tests" and do not involve the implementation of current research topics. The students' compilations are available in a data archive.

Content
2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will
- Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
- Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;
I. Introduction to Moral Reasoning

1. Ethics - the basics
   1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
   2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
   3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
   1. Integrity in research and research misconduct
      1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
   2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
   3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
   1. Research involving human subjects
      1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity
      1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

   2. Social responsibility
      2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

   3. Dual use research
      3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!), connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…).

701-0015-00L Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement

W 2 credits 2S M. Stauffacher, C. E. Pohl, B. Vienis Baptista

Priority is given to PhD students D-USYS.

All participants will be on the waiting list at first. Enrollment is possible until 15 September 2021. The waiting list is active until 17 September. All students will be informed on 19 September, if they can participate in the lecture. The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, how to secure broader impact of research? They learn to critically reflect their own research project in its societal context and on their role as scientists.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 269 of 2140
The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature

The following open access article builds a core element of the course:

Further, this collection of tools will be used
https://naturalosciences.ch/topics/co-producing_knowledge

Prerequisites / notice

Participation in the course requires participants to be working on their own research project.
Dates (Wednesdays, 8h15-12h00): 29 September, 27 October, 10 November, 24 November, 8 December

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.</td>

701-1551-00L Sustainability Assessment

| Number of participants limited to 35. |
| Waiting list will be deleted October 1st, 2021. |
| No enrollment possible after October 1st, 2021. |

Abstract

The course teaches concepts and methodologies of sustainability assessment. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability. The format of the course is seminar-like, interactive.
At the end of the course, students:
- know core concepts of sustainable development, main features of social justice in the context of sustainability, a selection of methods and methodologies for the assessment of sustainable development
- have a deepened understanding of the challenges of trade-offs between the different dimensions of sustainable development and their respective impacts on individual and societal decision-making

The course is structured as follows:
- overview of rationale, objectives, concepts and origins of sustainable development (approx. 15%)
- overview of the concept of social justice as guiding principle of the social dimension of sustainability (approx. 20%)
- analysis of a selection of concepts and methodologies to assess sustainable development in a variety of contexts (approx. 65%)

The course is structured as follows:
- overview of rationale, objectives, concepts and origins of sustainable development (approx. 15%)
- overview of the concept of social justice as guiding principle of the social dimension of sustainability (approx. 20%)
- analysis of a selection of concepts and methodologies to assess sustainable development in a variety of contexts (approx. 65%)

Handouts are provided

Students of this course may also be interested in the course transdisciplinary case study (tdCS) in the Spring semester (701-1502-00L)

This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

To facilitate your planning, the course is organized in terms of weekly units.

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle. You can announce a few weeks ahead of the respective course unit.

This course will take place fully online. Course units have three components:
1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

To facilitate your planning, the course is organized in terms of weekly units.

Abstract
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, the sensory organs, the neuro-muscular system, the cardiovascular system and the respiratory system.

Objective
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Content
The lecture series provides a short overview of human anatomy and physiology

Anatomy and Physiology I (fall term):
Basics of cytology, histology, embryology; nervous system, sensory organs, muscles, cardiovascular system, respiratory system

Anatomy and Physiology II (spring term):
Digestive tract, endocrine organs, metabolism and thermoregulation, skin, blood and immune system, urinary system, circadian rhythm, reproductive organs, pregnancy and birth.

Prerequisites / notice
Requirements: 1st year, scientific part.
Part of the course is read and checked in English.

752-4001-00L | Microbiology                  | E-   | 2 credits | 2V    | M. Ackermann, M. Schuppler, J. Vorholt-Zambelli |

Abstract
Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Content

Lecture notes
Wird von den jeweiligen Dozenten ausgegeben.

Literature
Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms

551-0127-01L | Plants and Fungi              | O    | 4 credits | 3G    | S. C. Zeeman, M. Künzler, O. Y. Martin |

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi and plants.

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.

2. Students can explain how the internal and external structures of fungi and plants function to support survival, growth, behavior, and reproduction.

3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).

Content
The lecture introduces the structural and functional specialization in fungi and plants. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi and plants have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Campbell “Biology”, 11th Edition

Prerequisites / notice
Some lecture are held in English.

Biology Teaching Diploma - Key for Type

O  Compulsory  E-  Recommended, not eligible for credits
W+ Eligible for credits and recommended  Z  Courses outside the curriculum
W  Eligible for credits  Dr  Suitable for doctorate

Key for Hours

V  lecture  P  practical/laboratory course
G  lecture with exercise  A  independent project
U  exercise  D  diploma thesis
S  seminar  R  revision course / private study
K  colloquium

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.

**Abstract**
The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics; neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

**Abstract**
This course presents the theoretical and empirical approaches used to understand the ecological processes structuring communities. Central problems in community ecology including the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.

**Objective**
Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes, and how this predictive science informs conservation and management decisions.

Upon completing the course, students will be able to:

Understand the factors determining the outcome of species interactions in communities, and how this information informs management.

Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions.

Understanding the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity.

Use population and community models to predict the stability of interactions between predators and prey and between different competitors.

Understand the conceptual basis of predictions concerning how ecological communities will respond to climate change.

Discuss the types of conceptual advances ecology as a science can realistically achieve, and how these relate to the applications of the discipline.

Lectures supplemented with readings from the primary literature and occasional computer exercises will focus on understanding central processes in community ecology. Topics will include demographic and spatial structure, consumer resource interactions, food webs, competition, mutualism, invasion, the maintenance of species diversity, and species effects on ecosystem processes. Each of these more conceptual topics will be discussed in concert with their applications to the conservation and management of species and communities in a changing world.

**Taught competencies**

**Domain A - Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

**Domain B - Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: not assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

**Domain C - Social Competencies**

- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed

**Domain D - Personal Competencies**

- Negotiation: not assessed
- Adaptability and Flexibility: not assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

<th>3 credits</th>
<th>2V</th>
<th>A. Gessler, C. Grossiord</th>
</tr>
</thead>
</table>

**Number of participants limited to 35.**

**Waiting list will be deleted October 3rd, 2021.**

**Abstract**

This course provides the ecological systems' knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

**Objective**

At the end of the course...

- ...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.

- ...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).

- ...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.

- ...you understand the importance of ecosystem services for society.

- ...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.

- ...you have reflected on ecology as a young discipline at the heart of significant applied questions.

**Content**

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

**Lecture notes**

Case descriptions, commented glossary and a list of literature and further resources per case.

**Literature**

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

**Prerequisites / notice**

Schulze et al. (2005) Plant Ecology; Springer.

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-D52-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

**401-6215-00L Using R for Data Analysis and Graphics (Part I)**

<table>
<thead>
<tr>
<th>W</th>
<th>1.5 credits</th>
<th>1G</th>
<th>M. Mächler</th>
</tr>
</thead>
</table>

**Abstract**

The course provides the first part an introduction to the statistical software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**

The students will be able to use the software R for simple data analysis and graphics.
Content

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice

The course resources will be provided via the Moodle web learning platform.

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice

Basic knowledge of R equivalent to "Using R .. (part 1)" (= 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Objective

The students will be able to use the software R efficiently for data analysis, graphics and simple programming

Content

The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice

Basic knowledge of R equivalent to "Using R .. (part 1)" (= 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Content

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pistatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

636-0017-00L

Computational Biology  W  6 credits  3G+2A  T. Vaughan

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyldynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
The focus is on primary literature, but for some parts the following text books provide good background information:

1. Identify common macroparasites in invertebrates.
2. Experimental evolution is a powerful and increasingly prominent approach to investigating evolutionary processes. Students will analyze Experimental Evolution for Infectious Diseases, A. Hall
3. Ecological Parasitology, C. Vorburger
4. Evolutionary Dynamics
5. Evolutionary Medicine for Infectious Diseases, J. Jokela

Students will analyze experimental evolution literature covering a wide range of questions, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal.

### Course objectives:

1. Become familiar with a diverse sample of experimental evolution literature.
2. Gain understanding of the strengths and limitations of experimental evolution for addressing evolutionary questions relative to other forms of evolutionary analysis, and
3. Gain the ability to effectively design and analyze evolution experiments that address fundamental or applied questions in evolutionary biology.

### Literature

Primary research papers and review articles.

### Course focuses on the ecology and evolution of macroparasites and their hosts.

Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

### Content

#### Lectures:

1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
4. Evolution and ecology of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

#### Practical exercises:

1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

### Prerequisites / notice

The three practicals will take place at the 05.10.2021, the 19.10.2021 and the 09.11.2021 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture.

### Experimental Evolution

W 4 credits 2S  G. Velicer, A. Hall

This course explores the underlying principles and mechanisms of infectious diseases. Through lectures, discussion, and reading, students will develop an understanding of infectious diseases and, ultimately, our ability to treat them effectively.

### Evolutionary Medicine for Infectious Diseases

W 3 credits 2G  A. Hall

This course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

### Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

### Data: 20.09.2021 12:40  Autumn Semester 2021  Page 278 of 2140
The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

### Literature

### Prerequisites / notice
- Prerequisites: Basic mathematics (linear algebra, calculus, probability)
- The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

### Abstract
- Advanced class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- This advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

### Objective
- Advanced class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- This advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

### Notice
- Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.
- Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html
Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**Abstract**

This course provides a detailed understanding of:
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

**Objective**

Obtain a detailed understanding of:
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

**Content**

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

**Literature**

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581

**Prerequisites / notice**

Immunology I and II recommended but not compulsory

**551-0512-00L**

Current Topics in Molecular and Cellular Neurobiology

_Does not take place this semester._

*Number of participants limited to 8._

**Abstract**

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

**Objective**

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

**Content**

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance. You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

**Lecture notes**

Presentations will be made available after the seminars.

**Prerequisites / notice**

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

---

Cutting Edge Topics: Immunology and Infection Biology

_Information for UZH students:__

*Enrolment to this course unit only possible at ETH. No enrolment to module BIO636 at UZH._

*Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html*

**Abstract**

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Objective**

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

**Content**

Immunology and infection biology.

The specific topics are variable and depend each semester on the list of invited experts.

**Lecture notes**

Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

**Literature**

Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.
## Taught competencies

### Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

### Domain B - Method-specific Competencies
- Analytical Competencies: not assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed

### Domain C - Social Competencies
- Communication: assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

### Domain D - Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: assessed

---

### Systems Biology of Metabolism

**Number of participants limited to 15.**

**Abstract**

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective**

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Content**

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant theoretical and methodical approaches.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

---

### Immunology: From Milestones to Current Topics

**Number of participants limited to 20.**

**Abstract**

Milestones in immunology: on old concepts and modern experiments

**Objective**

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

**Content**

Milestones and current topics of innate immunity, antigen presentatin0, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

**Lecture notes**

Script and original publications will be supplied during the course.

**Literature**

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

---

### Cellular Biochemistry of Health and Disease

**Number of participants limited to 20.**

**Abstract**

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

**Objective**

Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

**Content**

Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

**Literature**

The literature will be provided during the course

**Prerequisites / notice**

The course will be taught in English.

---

### Molecular Biology of Foodborne Pathogens

**Abstract**

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.
Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break!
Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack mechanisms and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pesticides and chemical defenses. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10 Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12 Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13 Cultural control methods: fertilizers, crop rotations.

Week 14 Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

636-0017-00L

Computational Biology  W  6 credits  3G+2A  T. Vaughan

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylogeography, the aim of which is to understand and quantify population dynamics across species' geographic ranges (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Data: 20.09.2021 12:40
Autumn Semester 2021
Page 285 of 2140
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and central carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses
- Senescence

Analytical Competencies, M. Gstaiger, Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and growth. The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and trafficking; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biolog.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology and medicine. The student should be able to grasp what the authors wanted to learn i.e. their hypothesis and their goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides him/her with practice in public speaking.

Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance.

Every participant is expected to take part in the discussion and to ask questions. At each meeting, all students are expected to read and prepare the paper beforehand. Each paper presented will be announced one week in advance of the presentation.

Lecture notes
Presentations will be made available after the seminars.

Literature
Students will be guided to choose their papers base on recent literature published less than 1 year prior in a relevant journal.

---

### Elective Major: Cell Biology

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemical, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**551-1299-00L Introduction to Bioinformatics**

**Abstract**
This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

**Objective**
The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

**Content**
**Ethics:**
Case studies to learn about applying ethical principles in human genomics research

**Genomics:**
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

**Metagenomics:**
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

**Network bioinformatics:**
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

**Imaging:**
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

**Prerequisites / notice**
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

*Does not take place this semester. Number of participants limited to 8.*
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

**Objective**
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

**Content**
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be made available after the seminars.

**Lecture notes**

**Prerequisites / notice**
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

---

**Abstract**
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

**Objective**
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

**Key skills:**
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

---

**Abstract**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Objective**
The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

**Content**
Immunology and infection biology.

The specific topics are variable and depend each semester on the list of invited experts.

**Lecture notes**
Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

**Literature**
Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes: Script and original publications will be supplied during the course.

Prerequisites / notice: The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Milestones in Immunology: on old concepts and modern experiments

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Lecture notes: Original review articles will be distributed by the respective lecturer.

Literature: Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. Historical milestone papers will be allocated. Students will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes: No special notes are provided, as the literature will be provided during the course.

Literature: The literature will be provided during the course.

During this seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. The content of the course will be determined by the literature of the current term. The focus will be on experimental and computational methods in systems biology.

Lecture notes: Script and original publications will be supplied during the course.

Prerequisites / notice: Number of participants limited to 15.

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation. The students should obtain an understanding of these processes, which are at work during gene expression. A script will not be handed out. In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

**RNA Biology Lecture Series I: Transcription & Processing & Translation**
*W* 4 credits 2V  F. Allain, N. Ban, U. Kutay, further lecturers

**RNA Biology Lecture Series II: Non-coding RNAs:**
*W* 4 credits 2V  J. Hall, M. Stoffel, further lecturers

**Immunology III**

**Cell Biophysics**
*W* 6 credits 4G  T. Zambelli

---

### Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

### Lecture notes
A script will not be handed out.

### Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.
Content

• Basics of theory of probability
• Boltzmann's law
• Entropy maximization and Gibbs free energy minimization

• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns
• Sequences and evolution

Lecture notes

Theory and corresponding exercises are merged together during the classes.

Lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Literature

Prerequisites / notice

Participants need a good command of

• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Taught competencies

Domain A - Subject-specific Competencies

Concepts and Theories
Techniques and Technologies

Domain B - Method-specific Competencies

Analytical Competencies
Decision-making
Media and Digital Technologies
Problem-solving
Project Management

Domain C - Social Competencies

Communication
Cooperation and Teamwork
Customer Orientation
Leadership and Responsibility
Self-presentation and Social Influence
Sensitivity to Diversity
Negotiation

Domain D - Personal Competencies

Adaptability and Flexibility
Creative Thinking
Critical Thinking
Integrity and Work Ethics
Self-awareness and Self-reflection
Self-direction and Self-management

Neural Systems for Sensory, Motor and Higher Brain Functions

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO343 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract

The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective

The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content

The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

376-1305-00L

Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Mind the enrolment deadlines at UZH:

Abstract

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

Data: 20.09.2021 12:40   Autumn Semester 2021   Page 293 of 2140
Objective
On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development
- apply principles of molecular, cellular, and developmental biology
to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

Key skills
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

Content
The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz as BIC344

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
Auxiliary tools:
None. Bring something to write and your student ID

551-1423-00L Current Topics in Metabolism and Disease
Type: Elective Major: Molecular Health Sciences
ECTS: 2 credits
S: 1S
Lecturers: M. Gstaiger, W. Vayena, C. von Mering, A. Kahles, G. Rätsch, B. Snijder, O. Voinnet

Abstract
The course is a literature seminar or “journal club”. Each Friday a student, or a member of the Stoffel Lab in the Institute of Molecular Health Sciences, will present a comprehensive presentation of a recent paper published in a top ranking international peer reviewed journal that relates to metabolism and disease.

Objective
The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology and medicine. The student should be able to grasp what the authors wanted to learn i.e. their hypothesis and their goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides him/her with practice in public speaking.

Content
Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance.

Every participant is expected to take part in the discussion and to ask questions. At each meeting, all students are expected to read and prepare the paper beforehand. Each paper presented will be announced one week in advance of the presentation.

Lecture notes
Presentations will be made available after the seminars.

Literature
Students will be guided to choose their papers base on recent literature published less than 1 year prior in a relevant journal.

Elective Compulsory Concept Courses
See D-BIOL Master Studies Guide

551-0309-00L Concepts in Modern Genetics
Type: Elective Compulsory Concept Courses
ECTS: 6 credits
S: 4V
Lecturers: Y. Barral, D. Bopp, A. Hajnal, O. Voinnet

Abstract
Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIC348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/undergraduate-degrees/courses/special-students-university-of-zurich.html

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

551-1299-00L Introduction to Bioinformatics
Type: Elective Compulsory Concept Courses
ECTS: 6 credits
S: 4G

Abstract
This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

Objective
The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.
Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Elective Compulsory Master Courses
See D-BIOL Master Studies Guide

</tbody>
</table>
Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation). A contribution based on your active participation in discussion of other presentations (10%).

Lecture notes
Presentations will be made available after the seminars.

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the seminar. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-1153-00L Systems Biology of Metabolism

Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them in a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

551-1171-00L Immunology: From Milestones to Current Topics

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content
Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Lecture notes
Original and review articles will be distributed by the respective lecturer.

Literature
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-appp2.let.ethz.ch/course/view.php?id=15568

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: not assessed
- Communication: assessed

Domain C - Social Competencies
- Self-presentation and Social Influence: not assessed

Domain D - Personal Competencies
- Critical Thinking: assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

Domain E - Problem-specific Competencies
- Project Management: not assessed
- Problem-solving: not assessed

752-6105-00L Epidemiology and Prevention

Abstract
The module Epidemiology and Prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

Objective
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

Content
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Problem-solving: not assessed

Domain C - Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: not assessed

Domain D - Personal Competencies
- Creative Thinking: not assessed
- Critical Thinking: assessed

752-4009-00L Molecular Biology of Foodborne Pathogens

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture.
Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break!

752-6101-00L  Dietary Etiologies of Chronic Disease  W  3 credits  2V  M. B. Zimmermann
Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.
Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.
Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.
Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.
Literature
To be provided by the individual lecturers, at their discretion.
Prerequisites / notice
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

376-0300-00L  Translational Science for Health and Medicine  W  3 credits  2G  J. Goldhahn, C. Wolfrum
Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.
Objective
After completing this course, students will be able to understand:
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)
- What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

701-1703-00L  Evolutionary Medicine for Infectious Diseases  W  3 credits  2G  A. Hall
Number of participants limited to 35.
Abstract
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.
Objective
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.
Content
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.
Literature
Schmid Hempel 2011 Evolutionary Parasitology
Steams & Medzhitov 2016 Evolutionary Medicine
Prerequisites / notice
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

636-0108-00L  Biological Engineering and Biotechnology  W  4 credits  3V  M. Fussenegger
Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.
Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.
Content
Lecture notes
Handout during the course.

551-1407-00L  RNA Biology Lecture Series I: Transcription & Processing & Translation  W  4 credits  2V  F. Allain, N. Ban, U. Kutay, further lecturers
Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.
Objective
The students should obtain an understanding of these processes, which are at work during gene expression.
551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs: Biology and Therapeutics

**Content**

- RNA to RNAs: computational approaches to miRNAs; micro RNAs function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology.

**Abstract**

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**

The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**

- RNA to RNAs: computational approaches to miRNAs; micro RNAs function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology.

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

551-1423-00L Current Topics in Metabolism and Disease

**Abstract**

This course will cover the latest research topics in cellular biochemistry focusing on the role of non-coding RNAs in metabolism and disease.

**Objective**

The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and place recent discoveries in the broader context of biology, physiology, and medicine. The student should be able to grasp what the authors wanted to learn, i.e., their hypothesis and their goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides them with practice in public speaking.

**Content**

Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance.

**Lecture notes**

Presentations will be made available after the seminars.

**Literature**

Students will be guided to choose their papers based on recent literature published less than 1 year prior in a relevant journal.
Molecular and Structural Biology I: Protein Structure and Function

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalysis.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

Concepts in Modern Genetics

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Enzymes

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

Systems Biology of Metabolism

Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Computational Systems Biology

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

**Domain A - Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation
- Adaptable and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**Domain B - Method-specific Competencies**
- Assessed

**Domain C - Social Competencies**
- Assessed

**Domain D - Personal Competencies**
- Not assessed

**Prerequisites / notice**
- The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.
- In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

**Taught competencies**
- Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.
- Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation.
- Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging.
- Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

**Lecture notes**
- Lecture notes will be made available online.

**Literature**
- Montgomery et al. (2006): Introduction to Linear Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

4 credits

T. Zambelli

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to

Biological Engineering and Biotechnology

RNA Biology Lecture Series I: Transcription & Communication

The students should obtain an understanding of these processes, which are at work during gene expression.

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is
derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding
experimental data in the literature.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles
from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the
perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs
free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action
potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive
a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding
available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Lecture notes

Theory and corresponding exercises are merged together during the classes.

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!!

Literature

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Abstract

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature

Basics:

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIOC348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html
Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

551-0313-00L  Microbiology (Part I)  W  3 credits  2V  W.-D. Hardt, L. Eberl, J. Piel, M. Pilhofer

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Prerequisites / notice
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-0317-00L  Immunology I  W  3 credits  2V  M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Prerequisites / notice
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

Abstract
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Content
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Lecture notes
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Literature
Mainly based on original literature, a detailed list will be distributed during the lecture.
Taught competencies

Abstract
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

Objective
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

Content
The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and central carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses
- Senescence

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and evolutionary genetics. The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. Students should gain an appreciation for the fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Enrolment to this course unit only possible at ETH. Enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicja Smith for assistance with the learning materials. (alicja.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract
The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory. Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem. Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address communication.

**System-Oriented Management of Herbivore Insects**

*Number: 751-4801-00L*

**Title:** System-Oriented Management of Herbivore Insects

**Type:** W

**ECTS:** 2 credits

**Hours:** 2G

**Lecturers:** to be announced

**Abstract:** The focus is on the potential to assess strategies and tactics of pest management, in view of the demands from the economy, environment and society. Significant management measures will be explained using practical examples, such as surveillance and forecasting, resistance management, biological control as well as the use of plant protection products, incl. regulatory aspects and ecotoxicology.

**Objective:** The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will be able to assess options for action in view of requirements from the economy, environment and society. Further, they will learn to elaborate on current issues in pest management, and to critically evaluate case studies.

**Literature:**

General:

Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

**Lecture notes:** No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

**Prerequisites / notice:**

Number of participants limited to 15.

**Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.**

**Domain C - Social Competencies**

Communication assessed

Cooperation and Teamwork assessed

**Domain D - Personal Competencies**

Self-awareness and Self-reflection assessed

Self-direction and Self-management assessed

---

**Elective Compulsory Master Courses**

551-1153-00L | Insect Ecology | W | 2 credits | 2V | C. De Moraes, M. Mescher, N. Stanczyk

**Abstract:**

*The number of participants is limited to 30.*

This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes lectures, small group discussions and outside readings.

**Objective:**

The aim of the course is to gain an understanding of how insects have specialised and adapted to occupy diverse environmental niches and become vital to ecosystem processes. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions and examining insect ecology in an evolutionary context.

**Lecture notes:** Provided to students through Moodle.

**Literature:**

Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

**Prerequisites / notice:**

Number of participants limited to 15.

**Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.**

551-1153-00L | Systems Biology of Metabolism | W | 4 credits | 2V | U. Sauer, N. Zamboni, M. Zampieri

**Abstract:**

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective:**

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content:**

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Lecture notes:** Script and original publications will be supplied during the course.

**Prerequisites / notice:**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.**

751-4504-00L | Plant Pathology I | W | 2 credits | 2G | B. McDonald

**Abstract:**

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective:**

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

---
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria triticl blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histiological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

W 4 credits 2V F. Allain, N. Ban, U. Kutay, further lecturers

Does not take place this semester.

551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs: Biology and Therapeutics

W 4 credits 2V J. Hall, M. Stoffel, further lecturers

Does not take place this semester.

551-0307-00L Molecular and Structural Biology I: Protein Structure and Function

W 3 credits 2V R. Glockshuber, K. Locher, E. Weber-Ban

D-BIOL students are obliged to take part I and part II (next semester) as a two-semester course.

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalysis.

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
Concepts in Modern Genetics

**Information for UZH students:**
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

**Please mind the ETH enrolment deadlines for UZH students:**

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

**Abstract**
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Lecturers**
U. Kutay, G. Neurohr, M. Peter, K. Weis, I. Zemp

**Elective Major: Systems Biology**

**Elective Compulsory Concept Courses**

See D-BIOL Master Studies Guide
Introduction to Bioinformatics

This course focuses on the concepts of classical and modern genetics and genomics. The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of developmental processes; epigenetics and RNA interference.

Lecturers

- C. von Mering
- O. Voigt

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover principles of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lectures will be taught in English.

Abstract

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective

This course focuses on the concepts of classical and modern genetics and genomics.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover principles of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

Scripts and additional material will be provided during the semester.

Microbiology (Part I)

W 3 credits

Objective

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover principles of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Introduction to Bioinformatics

W 6 credits

Objective

This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

Content

Ethics:

Case studies to learn about applying ethical principles in human genomics research

Genomics:

Genetic variant calling

Analysis and critical evaluation of genome wide association studies

Metagenomics:

Reconstruction of microbial genomes

Microbial community compositional analysis

Quantitative metagenomics

Network bioinformatics:

Inference of molecular networks

Use of networks for interpretation of (gen)omics data

Imaging:

High throughput single cell imaging

Image segmentation

Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice

Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Evolutionary Dynamics

Objective

By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

Abstract

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.

Content

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental data in the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Prerequisites

- Basic mathematics (linear algebra, calculus, probability)

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

Literature

Cell Biophysics

Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Content

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

- Basics of theory of probability
- Boltzmann’s law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

Literature

Prerequisites / notice

Participants need a good command of:
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: assessed

Domain C - Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

Elective Compulsory Concept Courses

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.
Microbiology (Part I)  

**Abstract**  
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**  
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea.

**Content**  
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Literature**  
Mainly based on original literature, a detailed list will be distributed during the lecture.

**Taught competencies**  
Domain A - Subject-specific Competencies  
- Concepts and Theories  
- Techniques and Technologies  
Domain B - Method-specific Competencies  
- Analytical Competencies  
- Problem-solving  
Domain C - Social Competencies  
- Communication  
- Cooperation and Teamwork  
Domain D - Personal Competencies  
- Self-awareness and Self-reflection  
- Self-direction and Self-management

**551-0313-00L** Microbiology (Part I)  

**Prerequisites / notice**

</tbody>
</table>

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

A script will be available.

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

The course provides the first part of an introduction to the statistical software R for scientists. Topics covered are

- Rudimentary introduction to R
- Using the graphical user interface RStudio
- R basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

Part I of the course covers the following topics:

- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

The course resources will be provided via the Moodle web learning platform.

As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=11397

Information about relevant literature will be available in the lecture & in the lecture notes.
The students should get familiar with the wide array of roles non-coding RNAs play in cellular functions. By applying two fundamental principles of thermodynamics—entropy maximization and Gibbs energy minimization—an analytical model is not assessed. The students should obtain an understanding of these processes, which are at work during gene expression. This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

### Prerequisites / notice

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: not assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

Domain C - Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: not assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

### 551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

- **W** 4 credits 2V - F. Allain, N. Ban, U. Kutay, further lecturers

**Abstract**
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Objective**
The students should obtain an understanding of these processes, which are at work during gene expression.

**Content**
- Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

### 551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs:

- **W** 4 credits 2V - J. Hall, M. Stoffel, further lecturers

**Abstract**
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**
- Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

### 227-0939-00L Cell Biophysics

- **W** 6 credits 4G - T. Zambelli

**Abstract**
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

**Objective**
Objectives of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

**Content**
- By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular Motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.
ELECTIVE MAJOR: BIOLOGICAL CHEMISTRY

ELECTIVE COMPULSORY MASTER COURSES

**Lecture notes**

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

**Literature**

**Prerequisites / notice**

Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

**Notions of vectors in 2D and 3D are beneficial.**

**Note for BSc Biology students:** Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

**Abstract**

Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antibiotic approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Objective**

Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antibiotic approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Content**

Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antibiotic approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Lecture notes**

No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

**Literature**

Mainly based on original literature, a detailed list will be distributed during the lecture.

**Taught competencies**

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 317 of 2140
529-0004-01L  Classical Simulation of (Bio)Molecular Systems  W  6 credits  4G  P. H. Hünenberger, J. Dolenc, S. Riniker

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: handwritten computer exercises for learning progressively how to perform an analytic classical simulations (using the package GROMOS).

Objective
Introduction to classical (atomic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: handwritten computer exercises for learning progressively how to perform an analytic classical simulations (using the package GROMOS).

Lecture notes
The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS

529-0233-01L  Organic Synthesis: Methods and Strategies  W  6 credits  3G  E. Carreira

Abstract
The complex relation between structural analysis, methods leading to desired transformations, and insight into reaction mechanisms is exemplified. Relations between retrosynthetic analysis of target structures, synthetic methods and their combination in a synthetic strategy.

Objective
Extension and deepening of the knowledge in organic synthesis and the principles of structure and reactivity.

529-0243-01L  Transition Metal Catalysis: From Mechanisms to Applications  W  6 credits  3G  B. Morandi

Abstract
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint

Objective
Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

Content
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

Lecture notes
Lecture slides will be provided online. A handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

Prerequisites / notice
Slides will be uploaded 1-2 days before each lecture on http://morandi.ethz.ch/education.html

Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACIII

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.
Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture.

529-0240-00L
Chemical Biology - Peptides

Abstract
An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

Objective
Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

Content
Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.

Lecture notes
Citations from the original literature relevant to the individual lectures will be assigned weekly.

Literature

Biological Engineering and Biotechnology

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

529-0241-10L Advanced Methods and Strategies in Synthesis  
W  6 credits  3G  J. W. Bode

Abstract
Advanced Modern Methods and Strategies in Synthesis

Objective
Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; cross coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primary literature including identification of trends, key precendents, and emerging topics will be emphasized.

Content

will be provided in class and online

Literature

527-0939-00L Cell Biophysics  
W  6 credits  4G  T. Zambelli

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content

•  Basics of theory of probability
•  Boltzmann’s law
•  Entropy maximization and Gibbs free energy minimization
•  Ligand-receptor: two-state systems and the MWC model
•  Random walks, diffusion, crowding
•  Electrostatics for salty solutions
•  Elasticity: fibers and membranes
•  Molecular motors
•  Action potential: Hodgkin-Huxley model
•  Photosynthesis and vision
•  Gene regulation
•  Development: Turing patterns
•  Sequences and evolution

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o’clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

Literature

Prerequisites / notice

Participants need a good command of
•  differentiation and integration of a function with one or more variables (basics of Analysis),
•  Newton’s and Coulomb’s laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.
Adaptability and Flexibility

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of proteins and in protein folding, detailed understanding of biophysics and physical compartmentalisation of biochemical processes.

In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cell division & growth, and cell migration. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. They will be able to access and analyse DNA sequence information, construct and interpret networks that emerge through interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.
Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will
• Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
• Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles); and their ability to use these skills in assessing other people's arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;

Content
I. Introduction to Moral Reasoning
1. Ethics - the basics
1.1 What ethics is not... 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism), 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity
1.5 Selection of study participants – the concept of vulnerability
1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.
Prerequisites / notice

What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more...)

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

Prerequisites / notice

227-0311-00L

Qubits, Electrons, Photons

W 6 credits 3V+2U T. Zambelli

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Literature

Supplementary material will be uploaded in Moodle.

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I.", 2015, Springer

+ (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

Taught competencies

Domain A - Subject-specific Competencies

Concepts and Theories: assessed
Techniques and Technologies: not assessed

Domain B - Method-specific Competencies

Analytical Competencies: assessed
Decision-making: assessed
Media and Digital Technologies: not assessed
Problem-solving: assessed
Project Management: assessed

Domain C - Social Competencies

Communication: not assessed
Cooperation and Teamwork: not assessed
Customer Orientation: not assessed
Leadership and Responsibility: not assessed
Self-presentation and Social Influence: not assessed
Sensitivity to Diversity: assessed
Negotiation: not assessed

Domain D - Personal Competencies

Adaptability and Flexibility: assessed
Creative Thinking: assessed
Critical Thinking: assessed
Integrity and Work Ethics: assessed
Self-awareness and Self-reflection: assessed
Self-direction and Self-management: assessed

227-0385-10L

Biomedical Imaging

W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.
### Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

### Lecture notes
Lecture notes and handouts

### Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

### Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

### 227-0386-00L Biomedical Engineering
**W 4 credits 3G**
- J. Vörös, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong

#### Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

#### Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

#### Content

#### Lecture notes
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

https://lbb.ethz.ch/education/biomedical-engineering.html

### 227-0393-10L Bioelectronics and Biosensors
**W 6 credits 2V+2U**
- J. Vörös, M. F. Yanik

#### Abstract
The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

#### Objective
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

#### Content
- L1. Bioelectronics history, its applications and overview of the field
  - Volta and Galvani dispute
  - BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
  - Fundamentals of biosensing
  - Glucometer and ELISA
- L2. Fundamentals of quantum and classical noise in measuring biological signals
- L3. Biomasurement techniques with photons
- L4. Acoustics sensors
  - Differential equation for quartz crystal resonance
  - Acoustic sensors and their applications
- L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes
- L6. Optical biosensors
  - Differential equation for optical waveguides
  - Optical sensors and their applications
  - Plasmonic sensing
- L7. Basic notions of molecular adsorption and electron transfer
  - Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
  - Electron transfer: Marcus theory, Gerischer theory
- L8. Potentiometric sensors
  - Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
  - Principles of operation of ion-selective electrodes
- L9. Amperometric sensors and bioelectric potentials
  - Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
  - Principles of operation of amperometric sensors
  - Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)
- L10. Channels, amplification, signal gating, and patch clamp Y4
- L11. Action potentials and impulse propagation
- L12. Functional electric stimulation and recording
  - MEA and CMOS based recording
  - Applying potential in liquid - simulation of fields and relevance to electric stimulation
- L13. Neural networks memory and learning

#### Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)
Prerequisites / notice

The course requires an open attitude to the interdisciplinary approach of bioelectronics.

In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electronic circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, Michaelis-Menten equation, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).

227-0427-00L Signal Analysis, Models, and Machine Learning

Does not take place this semester.

This course was replaced by "Introduction to Estimation and Machine Learning" and "Advanced Signal Analysis, Modeling, and Machine Learning".

Abstract

Mathematical methods in signal processing and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.

II. Learning linear and nonlinear functions and filters: neural networks, kernel methods.

III. Structured statistical models: hidden Markov models, factor graphs, Kalman filter, Gaussian models with sparse events.

Objective

The course is an introduction to some basic topics in signal processing and machine learning.

Content

Lecture notes

Lecture notes.

Prerequisites / notice

- Prerequisites:
  - local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
  - others: solid basics in linear algebra and probability theory

227-1037-00L Introduction to Neuroinformatics

Abstract

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the engravings and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

376-1714-00L Biocompatible Materials

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.

2. The concept of biocompatibility.

3. Introduction into methodology used in biomaterials research and application.

4. Introduction to different material classes in use for medical applications.

Content

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Lecture notes

Handouts are deposited online (moodle).

402-0674-00L Physics in Medical Research: From Atoms to Cells

Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
The lecture series is motivated by an overview over analog devices (continuous-time and discrete-time), signal-processing systems, and sigma-delta modulation. As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied by using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination of a molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanosurface structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often qualitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetric and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and the roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism, and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

### Recommended Elective Courses

These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

<tr>
<td><strong>Content</strong></td>
<td>This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements this lecture very well in that respect.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/aswiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

227-0981-00L Cross-Disciplinary Research and Development in Medicine and Engineering

A maximum of 12 medical degree students and 12 (biomedical) engineering degree students can be admitted, their number should be equal.

W 4 credits 2V+2A V. Kurtcuoglu, D. de Julien de Zelicourt, M. Meboldt, M. Schmid Daners, O. Ullrich

Abstract

Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

Objective

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content

After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will team up with medical students to find solutions to a biomedical challenge. In the process, they will be supervised both by lecturers from ETH Zurich and the University of Zurich, receiving coaching customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Lecture notes

Handouts and relevant literature will be provided.

Prerequisites / notice

IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Literature

Prerequisites / notice
- Participants need a good command of
  - differentiation and integration of a function with one or more variables (basics of Analysis),
  - Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).
- Notions of vectors in 2D and 3D are beneficial.
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silonic neuron, silicon retina, silicon cochlea) and an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silonic neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Physical Modelling and Simulation  

W 6 credits  4G  J. Smajic

Abstract  

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective  

Understanding of the physical characteristics of neuromorphic circuit elements.

Content  

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Microscale Acoustofluidics  

W 4 credits  3G  J. Dual

Abstract  

In this lecture the basics, as well as practical aspects (from modelling to design and fabrication) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective  

Understanding acoustophoresis, the design of devices and potential applications.

Content  

Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microirobots to surface acoustique wave devices

Lecture notes  

Prerequisites / notice  

Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

Taught competencies  

Domain A - Subject-specific Competencies  

Concepts and Theories  

Techniques and Technologies  

Domain B - Method-specific Competencies  

Analytical Competencies  

Decision-making  

Media and Digital Technologies  

Problem-solving  

Project Management  

Domain C - Social Competencies  

Communication  

Cooperation and Teamwork  

Customer Orientation  

Leadership and Responsibility  

Self-presentation and Social Influence  

Sensitivity to Diversity  

Negotiation  

Domain D - Personal Competencies  

Critical Thinking  

Integrity and Work Ethics  

Self-direction and Self-management

Medical Technology Innovation - From Concept to Clinics  

W 4 credits  3P  I. Herrmann

Abstract  

Project-oriented learning on how to develop technological solutions to address unmet clinical needs.

Objective  

After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 332 of 2140
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers. The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging materials, novel technologies and new methods to address major medical challenges.

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Literature

Prerequisites / notice

Target Group: Students of higher semesters and PhD students of - D-MAVT, D-ITET, D-INFK, D-HEST - Biomedical Engineering, Robotics, Systems and Control - Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

Abstract

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.
Communication assessed

Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic

Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Specific topics covered in the course include, but are not limited to:

- Analytical Competencies
  - Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.
  - Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

- Biomicrofluidic Engineering
  - Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

- Point-of-Care Diagnostics
  - Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

- Microscale DNA Amplification
  - Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

- Small volume Molecular Detection
  - Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

- Droplets and Segmented Flows
  - Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

- Single Cell Analysis
  - Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   - Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   - Basic principles of conventional lithography of rigid materials, ‘soft’ lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrophoresis
   - Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrophoretic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   - Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   - Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   - Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   - Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   - Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   - Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    - Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    - Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

Prerequisites / notice

The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

529-0837-01L  Biomicrofluidic Engineering  W  6 credits  3G  A. de Mello

Number of participants limited to 25.

Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic devices enable physical and chemical processes to be controlled with exquisite precision and in an fast and efficient manner. This course introduces the underlying concepts, features and applications of microfluidic systems in the chemical and life sciences.

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. 227-0976-00L Computational Psychiatry & Computational Psychosomatics

Number of participants limited to 24.

Information for UZH students:
Enrolment to this course unit only possible at ETH Zurich. No enrolment to module BMT20002.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Abstract

This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

Objective

Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their application to problems in psychiatry and psychosomatics.

Content

This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to psychiatry and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters.

Literature

Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at https://www.tnu.ethz.ch/en/teaching

Prerequisites / notice

Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed the course “Computational Psychiatry” (Course number 227-0971-00L).

Biology Courses

227-0399-10L Physiology and Anatomy for Biomedical Engineers I

W 3 credits 2G M. Wyss

Abstract

This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance Imaging.

Objective

To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content

- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

Literature

Silbernagl S., Despopoulos A. Color Atlas of Physiology; Thieme 2008

Netter F. Atlas of human anatomy; Elsevier 2014

227-0945-00L Cell and Molecular Biology for Engineers I

W 3 credits 2G C. Frei

This course is part I of a two-semester course.

Abstract

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content

Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication.

These written documents will be graded and count as 40% for the final grade.

Lecture notes

Scripts of all lectures will be available.

Biological Methods for Engineers (Basic Lab)

Number of participants limited to 10.

Abstract
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Prerequisites / notice
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Available online

Literature

Abstract
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transition photons and LASER; quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.
Content
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Literature

Supplementary material will be uploaded in Moodle.

Prerequisites / notice
The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET “Physics II”.

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

IMPORTANT: Wed 22.9, 29.9, and 22.12 are lectures (NOT exercises!). Please, look at the details in moodle!

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: assessed

Domain C - Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

227-0421-00L Deep Learning in Artificial and Biological Neuronal Networks

W 4 credits 3G B. Grewe

Abstract
Deep-Learning (DL) a brain-inspired weak for of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Objective
The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience.

These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today’s neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to “error backpropagation” in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Autumn Semester 2021

Data: 20.09.2021 12:40
Page 339 of 2140
Content

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing video games deep ANNs outperform humans (Mnih et al., 2015; Silver et al., 2018). ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g., recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes

The lecture slides will be provided as a PDF after each lecture.

Prerequisites / notice

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

Autumn Semester 2021
Page 340 of 2140
Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding of the characteristics of neuromorphic circuit elements.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductors of Neuromorphic architectures, often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Objective

Familiarize students with basic science and engineering principles governing the nano domain.

Content

The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately. Familiarity with basic concepts of quantum mechanics is expected.

Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Literature

Prerequisites / notice

Course format:

Lectures and Mini-Review presentations: Thursday 10-13

Homework: Mini-Review
(compulsory continuous performance assessment)

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

252-0543-01L Computer Graphics W 8 credits 3V+2U+2A

Abstract

This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

Objective

At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content

This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling, geometry representation and texture mapping, we will move on to the physics of light transport, acceleration structures, appearance modeling and Monte Carlo integration. We will apply these principles for computing light transport of direct and global illumination due to surfaces and participating media. We will end with an overview of modern image-based capture and image synthesis methods, covering topics such as geometry and material capture, light-fields and depth-image based rendering.

Lecture notes

Literature

Books:
- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Physically Based Rendering: From Theory to Implementation

Prerequisites / notice

Prerequisites:
- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

402-0674-00L Physics in Medical Research: From Atoms to Cells W 6 credits 2V+1U B. K. R. Müller

Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
K. Stephan
Lecturers

Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at

- The Human Body: nomenclature, orientations, tissues
- Lecture notes and handouts

This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and biostatistics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 343 of 2140
This course is part I of a two-semester course.

**Abstract**
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

**Objective**
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

**Content**
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

**Lecture notes**
Scripts of all lectures will be available.

**Number of participants limited to 10.**

**Abstract**
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

**Objective**
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

**Content**
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

**Prerequisites / notice**
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

**Abstract**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.
Introduction to Biomedical Engineering

M. Stampanoni

Micro and Nano-Tomography of Biological Tissues

Image Analysis and Computer Vision

Biomedical Engineering

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

W 4 credits 3G

J. Vörös, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Image Analysis and Computer Vision

W 6 credits 3V+1U

L. Van Gool, E. Konukoglu, F. Yu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites:
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

The course language is English.

227-0965-00L

Micro and Nano-Tomography of Biological Tissues

W 4 credits 3G

M. Stampanoni, F. Marone Welford

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Multiscale Bone Biomechanics

W 6 credits 4S

R. Müller, X.-H. Qin

Number of participants limited to 30

Abstract
Imaging and computing methods are key to advances and innovation in medicine. This course introduces established fundamentals as well as modern techniques and methods of imaging and computing in medicine.
Objective
1. Understanding and practical implementation of biosignal processes methods for imaging
2. Understanding of imaging techniques including radiation imaging, radiographic imaging systems, computed tomography imaging, diagnostic ultrasound imaging, and magnetic resonance imaging
3. Knowledge of computing, programming, and simulation fundamentals
4. Learning to write computer programs as well as scripting and programming skills
5. Understanding and practical implementation of emerging computerized methods and their application in medicine including artificial intelligence, deep learning, big data, and complexity
6. Understanding of the emerging concept of personalised and in silico medicine
7. Encouragement of critical thinking and creating an environment for independent and self-directed studying

Content
Imaging and computing methods are key to advances and innovation in medicine. This course introduces fundamentals as well as modern techniques and methods of imaging and computing in medicine. For the imaging portion of the course, biosignal processing, radiation imaging, radiographic imaging systems, computed tomography imaging, diagnostic ultrasound imaging, and magnetic resonance imaging are covered. For the computing portion of the course, computing, programming, and modelling and simulation fundamentals are covered as well as their application in artificial intelligence and deep learning; complexity and systems medicine; big data and personalised medicine; and computational physiology and in silico medicine.

The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup: in the first part (TORQUEs: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will form small groups to acquire additional knowledge using online, python-based activities via JupyterHub or additionally distributed material and discuss their findings in teams. Learning outcomes will be reinforced with weekly Moodle assignments, to be completed during the flipped classroom portion.

Lecture notes
Stored on Moodle.

Prerequisites / notice
Lectures will be given in English.

151-0601-00L | Theory of Robotics and Mechatronics                 | W    | 4 credits | 3G   | P. Korba, S. Stoeter |

These courses are particularly recommended for the Biomechanics track. Please consult your track advisor if you wish to select other subjects.
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

The objective of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

The lecture will be taught in English.

From molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Special emphasis on the emerging field of molecular electronic devices.

Elegant solution - interdisciplinary team work and effective communication play a key role.

Problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

Course format:
- Lectures and Mini-Review presentations: Thursday 10-13
- Homework: Mini-Review (compulsory continuous performance assessment)

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

Project-oriented learning on how to develop technological solutions to address unmet clinical needs.

You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

The lecture slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

The lecture will be taught in English.

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Special emphasis on the emerging field of molecular electronic devices.

Topics are treated in 2 blocks:
(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

### 376-1103-00L Frontiers in Nanotechnology

**Objective**
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

### Content
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

### Lecture notes
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

### 376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

**Objective**
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

### Content
Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  - Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 348 of 2140
Introduction to different material classes in use for medical applications.

3. Introduction into methodology used in biomaterials research and application.

2. The concept of biocompatibility.

1. Introdcution into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.

Abstract

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

Abstract

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and how they can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of topics. For each lecture, a historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Content

Mostly formal lectures (2 × 45 min), with a 2 hour visit of the Binnig and Rohrer Nanotechnology Center (Rueschlikon) and introduction to cleanroom and micro/nanotechnology instruments, last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 10 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- hobby electronics, making a device for 10$ and controlling it using a smartphone.

Prerequisites / notice

The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

376-1720-00L Application of MATLAB in the Human Movement

Abstract

Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective

Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content

Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and integration in MATLAB.

Literature

During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice

A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1974-00L Colloquium in Biomechanics

Abstract

Current topics in biomechanics presented by speakers from academia and industry.

Objective

Getting insight into actual areas and problems of biomechanics.

376-2017-00L Biomechanics of Sports Injuries and Rehabilitation

Abstract

This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Objective

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Content

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Lecture notes

Handouts will be made available.

Literature

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

402-0674-00L Physics in Medical Research: From Atoms to Cells

Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus is on physiology and anatomy for biomedical engineers I. Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultraviolet to infra-red light. Anisotropies and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

Biological Methods for Engineers (Basic Lab) (227-0949-00L)

**Number of participants limited to 10.**

**Abstract**
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

**Objective**
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

**Content**
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

---

**Medical Physics**

**Track Core Courses**

During the Master programme, a minimum of 12 CP must be obtained from track core courses.

**Abstract**
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

**Content**
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener
The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for understanding differences in the radiation response of normal tissue versus tumor tissue, understanding factors which underpin the differing radiosensitivities of different tumors, interpreting the 5 Rs of radiation oncology in the context of the hallmarks of cancer, and understanding different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy.

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

IMPORTANT: Wed 22.9, 29.9, and 22.12 are lectures (NOT exercises!). Please, look at the details in moodle!

The course is designed to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk. By the end of this course the participants will be able to:

a) interpret the 5 Rs of radiation oncology in the context of the hallmarks of cancer
b) understand factors which underpin the differing radiosensitivities of different tumors
c) follow rational strategies for combined treatment modalities of ionizing radiation with targeted agents
d) understand differences in the radiation response of normal tissue versus tumor tissue
e) understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).

Einführung in die Strahlenbiologie ionisierender Strahlen: Allgemeine Grundlagen und Begriffsbestimmungen; Mechanismen der biologischen Strahlenwirkung; Strahlenwirkung auf Zellen, Gewebe und Organe; Modifikation der biologischen Strahlenwirkung; Strahlenzytogenetik: Chromosomenveränderungen, DNA-Defekte, Reparaturprozesse; Molekulare Strahlenbiologie: Bedeutung inter- und intrazellulärer Signalübermittlungsprozesse, Apoptose, Zellzyklus-Checkpoints; Strahlenrisiko: Strahlensyndrome, Krebsinduktion, Mutationseinschätzung, pränatale Strahlenbelastung; Strahlenbiologische Grundlagen des Strahlen Schutzes; Nutzen-Risiko-Abwägungen bei der medizinischen Strahlenanwendung; Prädiktive strahlenbiologische Methoden zur Optimierung der therapeutischen Strahlenanwendung.

Supplementary material will be uploaded in Moodle.

---

**Lecture notes**
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

**Literature**

Supplementary material will be uploaded in Moodle.

---

**227-0943-00L Radiobiology**

**Abstract**
The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.

**Objective**
By the end of this course the participants will be able to:

a) interpret the 5 Rs of radiation oncology in the context of the hallmarks of cancer
b) understand factors which underpin the differing radiosensitivities of different tumors
c) follow rational strategies for combined treatment modalities of ionizing radiation with targeted agents
d) understand differences in the radiation response of normal tissue versus tumor tissue
e) understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).

**Content**
Einführung in die Strahlenbiologie ionisierender Strahlen: Allgemeine Grundlagen und Begriffsbestimmungen; Mechanismen der biologischen Strahlenwirkung; Strahlenwirkung auf Zellen, Gewebe und Organe; Modifikation der biologischen Strahlenwirkung; Strahlenzytogenetik: Chromosomenveränderungen, DNA-Defekte, Reparaturprozesse; Molekulare Strahlenbiologie: Bedeutung inter- und intrazellulärer Signalübermittlungsprozesse, Apoptose, Zellzyklus-Checkpoints; Strahlenrisiko: Strahlensyndrome, Krebsinduktion, Mutationseinschätzung, pränatale Strahlenbelastung; Strahlenbiologische Grundlagen des Strahlen Schutzes; Nutzen-Risiko-Abwägungen bei der medizinischen Strahlenanwendung; Prädiktive strahlenbiologische Methoden zur Optimierung der therapeutischen Strahlenanwendung.

**Lecture notes**
Beilagen mit zusammenfassenden Texten, Tabellen, Bild- und Grafikdarstellungen werden abgegeben
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Prerequisites / notice

The former number of this course unit is 465-0951-00L.

402-0341-00L Medical Physics I

W 6 credits 2V+1U P. Manser

Abstract

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the excercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be covered in order to understand the physical and radiobiological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes

A script will be provided.

Recommended Elective Courses

These courses are particularly recommended for the Medical Physics track. Please consult your track advisor if you wish to select other subjects.

Number Title Type ECTS Hours Lecturers

402-0674-00L Physics in Medical Research: From Atoms to Cells W 6 credits 2V+1U B. K. R. Müller

Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocye behaviour. As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

227-0941-00L Physics and Mathematics of Radiotherapy Planning (University of Zurich)

W 6 credits 3G

Abstract

This lecture will provide a detailed introduction to radiotherapy treatment planning. The course considers the physical interactions of radiation in tissue, the mathematical aspects of treatment planning and additional aspects of central importance for radiotherapy planning.

Objective

Students shall develop a thorough understanding of the foundations of radiotherapy from a physics and mathematics perspective, focusing on algorithmic components. After completing the course students should be able to implement the main components of a radiotherapy treatment planning system.
Content

Radiotherapy is one of the main treatment options against cancer. Today, more than 50% of cancer patients receive radiation as part of their treatment. Modern radiotherapy is a highly technology driven field.

Research and development in medical physics has improved the precision of radiotherapy substantially. Using intensity-modulated radiotherapy (IMRT), radiation can be delivered precisely to tumors while minimizing radiation exposure of healthy organs surrounding the tumor. Thereby, medical physics has provided radiation oncologists with new curative treatment approaches where previously only palliative treatments were possible. This lecture will provide a detailed introduction to radiotherapy treatment planning and will consists of three blocks:

1. The first part of the course considers the physical interactions of radiation in tissue. The physical interactions give rise to dose calculation algorithms, which are used to calculate the absorbed radiation dose based on a CT scan of the patient.

2. The second part considers the mathematical aspects of treatment planning. Mathematical optimization techniques are introduced, which are used in intensity-modulated radiotherapy to determine the external radiation fields that optimally irradiate the tumor while minimizing radiation dose to healthy organs.

3. The third part deals with additional aspects of central importance for radiotherapy planning. This includes biomedical imaging techniques for treatment planning and target delineation as well as image registration algorithms.

The lectures are followed by computational exercises where students implement the main components of a radiotherapy treatment planning systems in two dimensions in Matlab.

Lecture notes
Lecture slides and handouts.

Prerequisites / notice
Basic programming skills in Matlab (or willingness to learn) are needed for the exercises. Basic knowledge of calculus is needed, approximately corresponding to the 3rd year of a bachelor degree in physics, mathematics, computer science, engineering or comparable discipline.

</tbody>
</table>

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

The course language is English.

<td>Micro and Nano-Tomography of Biological Tissues</td>
<td>W</td>
<td>4 credits</td>
<td>3G</td>
<td>M. Stampanoni, F. Marone Welford</td>
</tr>
</tbody>
</table>

Objective
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

Synchrontron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The course includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Abstract
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

227-0945-00L Cell and Molecular Biology for Engineers I
This course is part I of a two-semester course.

Abstract
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

Lecture notes
Scripts of all lectures will be available.

376-1714-00L | Biocompatible Materials | W | 4 credits | 3V | K. Maniura, M. Rottmar, M. Zenobi-Wong |
The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics.

- **Objective:**
  1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
  2. The concept of biocompatibility.
  3. Introduction into methodology used in biomaterials research and application.
  4. Introduction to different material classes in use for medical applications.

- **Content:**
  - Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.
  - Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.
  - A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

- **Lecture notes**
  - Handouts are deposited online (moodle).

- **Literature**
  - Comprehensive Biomaterials, Ducheyne P. et al., 1st Edition, 2011 (available online via ETH library)

- **Handouts and literature**
  - Handouts and references therin.

!!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 358 of 2140
Supplementary material will be uploaded in Moodle.

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer

+ (as account of those formidable years) G. Gamow, “Thirty Years that Shook Physics”, 1985, Dover Publications Inc.

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

IMPORTANT: Wed 22.9, 29.9, and 22.12 are lectures (NOT exercises!). Please, look at the details in moodle!

INTRODUCTION TO MEDICAL IMAGING

- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Biomedical Imaging

227-0385-10L

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlining X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Supplementary material will be uploaded in Moodle.

Prerequisites / notice

Biomedical Engineering

227-0386-00L

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

https://lbb.ethz.ch/education/biomedical-engineering.html

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 359 of 2140
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

V. Kurtcuoglu
M. Stampanoni

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques provide the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

2V+2U

During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonances
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

The course requires an open attitude to the interdisciplinary approach of bioelectronics.

Lecture notes / Literature
Available online

Abstract
The lecture introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

Objective
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

Content
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonances
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

The course requires an open attitude to the interdisciplinary approach of bioelectronics.

In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, Michaelis-Menten equation, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
Objective
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content
After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will team up with medical students to find solutions to a biomedical challenge. In the process, they will be supervised both by lecturers from ETH Zürich and the University of Zurich, receiving coaching customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Prerequisites / notice
IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.

327-0505-00L Surfaces, Interfaces and their Applications I

Abstract
After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of tribology (friction, lubrication, and wear) and corrosion.

Objective
To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems.

Content
Introduction to Surface Science
Physical Structure of Surfaces
Surface Forces (static and dynamic)
Adsorbates on Surfaces
Surface Thermodynamics and Kinetics
The Solid-Liquid Interface
Electron Spectroscopy
Vibrational Spectroscopy on Surfaces
Scanning Probe Microscopy
Introduction to Tribology
Introduction to Corrosion Science

Lecture notes

327-1101-00L Biomineralization

Abstract
The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization.

Objective
The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.

Content
Biomineralization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biotechnology, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biomineralization (BM) / types of biominerals and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phase / modern experimental methods for studying BM phenomena / classical, infra- and epipelicular BM / organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / communication to flavins, radiolaria and plants / calcium and iron storage / impact of BM on lithosphere and atmosphere / evolution / taxonomy of organisms.

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biomineralization
4. Control of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. Silica
11. Iron storage and mineralization
Lecture notes
Script with more than 600 pages with many illustrations will be distributed free of charge.

Literature
3) P. M. Dove, J. J. De Yoreo, S. Weiner (Eds.) Biominalerisation, Reviews in Mineralogy & Geochemistry Vol. 54, 2003

Prerequisites / notice
No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected.

376-1622-00L
Practical Methods in Tissue Engineering

Abstract
The goal of this course is to teach MsC students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Objective
Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Prerequisites / notice
A Windows laptop (or Windows on Mac) is required for certain of the lab modules.

402-0341-00L
Medical Physics I

Abstract
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons and electrons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes
A script will be provided.

529-0240-00L
Chemical Biology - Peptides

Abstract
An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

Objective
Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

Content
Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.

Lecture notes
Citations from the original literature relevant to the individual lectures will be assigned weekly.

Literature

529-0615-01L
Biochemical and Polymer Reaction Engineering

Abstract

Objective
The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics will be discussed: Overview on the different polymerization processes; Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and evaluation of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes
Scripts are available on the web page of the Aroso-group: http://www.arosogroup.ethz.ch/education.html

Additional handouts and slides will be provided during the lecture.

535-0423-00L
Drug Delivery and Drug Targeting

Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students dispense of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

Literature

Further references will be provided in the course.
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover current literature references will be provided during the lectures. Handouts during course

### 636-0507-00L Synthetic Biology II

*Does not take place this semester.*

**Abstract**

7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

**Objective**

The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

**Content**

Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external,) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

**Lecture notes**

Updated handouts will be provided during the class.

**Prerequisites / notice**

The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

### Other Elective Courses

These courses may be suitable for the Molecular Bioengineering track. Please consult your track advisor.

**Abstract**

This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

**Objective**

To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

**Content**

- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

Abstract
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

Lecture notes
Scripts of all lectures will be available.

Abstract
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Prerequisites / notice
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.
Objective

Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content

* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the "in this paper" paragraph, the scientific part, the summary, Equations, Figures).
* Topic 2: Power Point Presentations.
* Topic 3: Citation Rules and Citation Software.
* Topic 4: Guidelines for Research Integrity.

Literature

ETH "Citation Etiquette", see www.plagiate.ethz.ch.

Prerequisites / notice

Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

227-1772-10L Semester Project O 12 credits 20A Professors

Registration in myStudies required!

Abstract

The semester project is designed to train the students in solving specific biomedical engineering problems. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor.

Objective see above

Additional Projects and Laboratory Courses (ONLY for Progr. Reg. 2020)

Abstract
This course provides an overview of modern concepts of bioengineering across different levels of complexity, from single molecules to systems, microscaled reactors to production environments, and across different fields of applications.

Objective
Students will be able to recognize major developments in bioengineering across different organisms and levels of complexity and be able to relate it to major technological and conceptual advances in the underlying sciences.

Content
Molecular and cellular engineering; Synthetic biology; Engineering strategies in biology; from single molecules to systems; downscaling bioengineering; Bioengineering in chemistry, pharmaceutical sciences, and diagnostics, personalized medicine.

Lecture notes
Handouts during class

Literature
Will be announced during the course

Taught competencies
- Domain A - Subject-specific Competencies: Concepts and Theories assessed
- Domain D - Personal Competencies: Critical Thinking assessed

►► Research Project and Industry Internship

Students can choose between Research Project OR Industry Internship. Duration: 12 weeks full-time min.
Must be carried out in a different research group/company than the master's thesis.

Abstract
- Research Project: In a research project students extend their knowledge in a particular field, get acquainted with the scientific way of working, and learn to work on an actual research topic. Research projects are carried out in a core or optional subject area as chosen by the student. Research Project duration: 12 weeks, completed with a written report.
- Industry Internship: Industry internship of at least 12 weeks, completed with a written report.

Objective
Students get acquainted with scientific working methods and deepen their knowledge in a particular research area

Prerequisites / notice
The students look for a placement themselves.

►► Master’s Thesis

Students can only start with their master's thesis if
a. The BSc programme has been completed successfully
b. Assigned additional requirements for the admission to
the master's degree programme have been passed
c. At least 64 ECTS have been acquired for the master’s degree programme, including 22 ECTS in the core course category and the 16 ECTS in the research projects and internships category

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out under the supervision of a professor in a research group of the D-BSSE, usually at the D-BSSE. Students are free to choose the area.

Objective
In the Master thesis students prove their ability to independent, structured and scientific working.

► Master Studies (Programme Regulations 2017)

★★ Practical Training

All listed lab courses are mandatory.

For Students in Biotechnology Master, Programme Regulation 2021: 16 ECTS in this category are mandatory.

For Students in Biotechnology Master, Programme Regulation 2017: 14 ECTS in this category are mandatory.
The course Methods in Cell Analysis and Laboratory Automation introduces students to high-end cell analysis and sample preparation methods including image analysis. Students will be taught theoretical aspects and skills in Flow Cytometry, Light Microscopy, Image Analysis, and the use of Laboratory Automation.

**Objective**
- to understand the technical and physical principles of light microscopes and flow cytometers
- to have hands-on experience in the use of these technologies to analyze image real samples
- to be able to run a basic analysis of the data and images obtained with flow cytometers and microscopes
- to get introduced to liquid handling (pipetting) robotics and learn how to implement a basic workflow

**Content**
The practical course will have five units at 2 days each (total 10 days):

1. **Flow Cytometry**
   - Introduction to Flow Cytometry
   - Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
   - Flow cytometry sample preparation
   - Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells

2. **Light microscopy**
   - Learn how to build a microscope and understand the underlying physical principles
   - Learn how to use a modern automated wide field fluorescence microscope
   - Use this microscope to automatically acquire images of a cell culture assay to analyze the dose-dependent effect of a drug treatment

3. **Image Analysis**
   - Introduction to the fundamentals of image analysis
   - Learn the basics of the image analysis software Fiji/ImageJ
   - Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise

4. **Laboratory Automation**
   - Introduction to the basics of automated liquid handling/ lab robotics
   - See examples on using lab automation for plasmid library generation and cell cultivation
   - Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems

5. **Presentations**
   - Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.
   - Presentations and discussion in form of a Colloquium

**Prerequisites / notice**
The following knowledge is required for the course:
- basic laboratory methods
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic biology of cells (cell anatomy and physiology)

---

### Lab Course: Microsystems and Microfluidics in Biology

**The lab course is open for MSc Biotechnology students only.**

**Abstract**
This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of microsystem design, fabrication, and assembly into an experimental setup. Biological applications include a variety of measurements of cellular and tissue signals and subsequent analysis.

**Objective**
The students are introduced to the basic principles of microsystems technology. They get acquainted with practical scientific work and learn
- to understand the technical concept behind the experiment
- plan the experiment
- engineer the devices
- execute the experiments and acquire data
- evaluate and analyze the data
- report and discuss the results

A good quality of the final report will be expected and be an important criterion.

**Content**
The practical course will consist of a set of 4 experiments.

- **Microscopy:**
  - Learn how to use a modern automated wide field fluorescence microscope
  - Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise

- **Flow Cytometry:**
  - Introduction to Flow Cytometry
  - Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
  - Flow cytometry sample preparation
  - Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells

- **Laboratory Automation:**
  - Introduction to the basics of automated liquid handling/ lab robotics
  - See examples on using lab automation for plasmid library generation and cell cultivation
  - Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems

- **Image Analysis:**
  - Introduction to the fundamentals of image analysis
  - Learn the basics of the image analysis software Fiji/ImageJ
  - Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise

**Prerequisites / notice**
The following knowledge is required for the course:
- basic laboratory methods
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic biology of cells (cell anatomy and physiology)

---

### Lab Course: Lab Course: Microbial Biotechnology

**The lab course is open for MSc Biotechnology students only.**

**Abstract**
This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of microsystem design, fabrication, and assembly into an experimental setup. Biological applications include a variety of measurements of cellular and tissue signals and subsequent analysis.

**Objective**
The students are introduced to the basic principles of microsystems technology. They get acquainted with practical scientific work and learn
- to understand the technical concept behind the experiment
- plan the experiment
- engineer the devices
- execute the experiments and acquire data
- evaluate and analyze the data
- report and discuss the results

A good quality of the final report will be expected and be an important criterion.
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

Literature

Prerequisites / notice
Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitiorium of fundamental physics and quantum theory at the semester beginning can be offered.

The information on the web can be updated until the beginning of the semester.

The list of advanced courses is a closed list, no other course can be added to this category.

Advanced Courses

Students need to acquire a total of 24 ECTS in this category. The list of advanced courses is a closed list, no other course can be added to this category.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 370 of 2140
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI Imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes
Hand out will be given to students at lecture.

Literature
Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

Prerequisites / notice
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

636-0105-00L Introduction to Biological Computers W 4 credits 3G Y. Benenson

Abstract
Biological computers are man-made biological networks that interrogate and control cells and organisms in which they operate. Their key features, inspired by computer science, are programmability, modularity, and versatility. The course will show how to rationally design, implement and test biological computers using molecular engineering, DNA nanotechnology and synthetic biology.

Objective
The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms
* Introduce basic theories of computation
* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include
- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly

* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations
* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Note: the exact subjects can change, the details below should only serve for general orientation

Lecture 1. Introduction: what is molecular computation (part I)?

* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines

1st hour

* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour

* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation

* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing

* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly

* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes

* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits

* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I

* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II

* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I

* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II

* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits

* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics

* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
The goal of the field of data mining is to find patterns and statistical dependencies in large databases, to gain an understanding of the underlying system from which the data were obtained. In computational biology, data mining contributes to the analysis of vast experimental data generated by high-throughput technologies, and thereby enables the generation of new hypotheses.

In this course, we will present the algorithmic foundations of data mining and its applications in computational biology. The course will feature an introduction to popular data mining problems and algorithms, reaching from classification via clustering to feature selection. This course is intended for both students who are interested in applying data mining algorithms and students who would like to gain an understanding of the key algorithmic concepts in data mining.

Tentative list of topics:

1. Distance functions
2. Classification
3. Clustering
4. Feature Selection

The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

Introduction to biomacromolecules; Measurement techniques for characterisation of biomacromolecules; Fundamentals of molecular recognition; Recombinant DNA; Protein engineering; Directed evolution; Protein folding; Polymers; Elastin-like polypeptides; Intelligent materials; Spatially localized hydrogels; Mechanical properties of proteins and macromolecules; Single-molecule force spectroscopy

The course notes are available online and will feature selected parts of textbooks and original scientific publications and reviews.

**636-0117-00L Mathematical Modelling for Bioengineering and Systems Biology**

**Abstract**
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

**Objective**
The course enables students to formulate, analyse, and simulate mathematical models of biochemical networks. To this end, the course covers basic mathematical concepts and tools to explore biochemical reaction dynamics as well as basic concepts from dynamical systems theory. The exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

**Content**
Biochemical Reaction Modelling

**Literature**

**Prerequisites**
Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors). Matlab programming.

**636-0118-00L Introduction to Dynamical Systems with Applications to Biology**

**Abstract**
Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and qualitative features of this change is the topic of dynamical systems theory. Dynamical systems arise naturally in virtually all scientific disciplines including physics, biology, chemistry and engineering. This course is a broad introduction to the topic dynamical systems and is suitable for students from all disciplines including physics, biology, chemistry and engineering.

**Objective**
The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using matlab will be used to demonstrate various concepts.

**Content**
A dynamical view of the world; the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; linear stability analysis; classification of linear systems; Liapunov functions and nonlinear stability; cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts.

**Lecture notes**
Will be provided as needed.

**Literature**

**Prerequisites**
Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors). Matlab programming.

**636-0109-00L Stem Cells: Biology and Therapeutic Manipulation**

**Abstract**
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

**Objective**
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

**Content**
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

**Topics will include:**
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

**636-0123-00L Problem-Based Approach to Spatial Biology**

**Abstract**
This course entails lectures in tissue physiology, spatial methodologies and grantsmanship. In the project part, small working groups will perform the entire scientific process around formulating a research proposal with the aid of tutors.

**Objective**
The students will understand the current state of research and novel methodologies in spatial biology and tissue physiology. They will obtain the necessary toolkits to independently identify open research problems in various areas of spatial biology, to address these problems with suitable experimental strategies, and to formulate their approach in a research proposal.

**Content**
We will use a problem-based approach to explore the way in which single cells collaborate within tissues to achieve their common functions. A thorough comprehension of these tissue components is crucial for advancing our knowledge of normal homeostasis and pathophysiology; disrupted cellular interactions can lead to decreased tissue function or even carcinogenesis.

The project work will be conducted in small groups in guidance of tutors. Each group will focus on a different topic in spatial biology and will review the corresponding literature. They will identify open problems of interest in this area and will summarize their findings in a short, written review. The students will then develop an appropriate experimental strategy to address a question of interest and write a research proposal that features their approach. The final stage of the project work enable the students to practice the presentation of their research proposals and critical evaluation.
Introduction to Microtechnology, Semiconductors, and Microelectromechanical Systems (MEMS)

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

**Content**
- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectromechanical processing and fabrication sequence
- Optional: Packaging

**Lecture notes**
Handouts in English

**Literature**

**Prerequisites / notice**
Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

**Taught competencies**
Domain A - Subject-specific Competencies  Concepts and Theories  assessed
Domain B - Method-specific Competencies  Analytical Competencies  assessed
Domain C - Social Competencies  Communication  assessed
Domain D - Personal Competencies  Critical Thinking  assessed

**Biophysical Methods**

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

**Objective**
Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

**Content**
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:
- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunnelling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

**Lecture notes**
Hand out will be given to students at lecture.

**Literature**

**Prerequisites / notice**
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.
Abstract

Biological computers are man-made biological networks that interrogate and control cells and organisms in which they operate. Their key features, inspired by computer science, are programmability, modularity, and versatility. The course will show how to rationally design, implement and test biological computers using molecular engineering, DNA nanothechnology and synthetic biology.

Objective

The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms

* Introduce basic theories of computation

* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include:

- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly

* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations

* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Content

Lecture 1. Introduction: what is molecular computation (part I)?

* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines

1st hour

* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour

* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation

* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing

* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly

* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes

* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits

* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I

* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II

* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I

* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II

* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits

* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics

* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
The goal of the field of data mining is to find patterns and statistical dependencies in large databases, to gain an understanding of the underlying system from which the data were obtained. In computational biology, data mining contributes to the analysis of vast experimental data generated by high-throughput technologies, and thereby enables the generation of new hypotheses.

In this course, we will present the algorithmic foundations of data mining and its applications in computational biology. The course will feature an introduction to popular data mining problems and algorithms, reaching from classification via clustering to feature selection. This course is intended for both students who are interested in applying data mining algorithms and students who would like to gain an understanding of the key algorithmic concepts in data mining.

Tentative list of topics:

1. Distance functions
2. Classification
3. Clustering
4. Feature Selection

Lecture notes
Course material will be provided in form of slides.

Literature
Will be provided during the course.

Prerequisites
Basic understanding of mathematics, as taught in basic mathematics courses at the Bachelor's level.
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

**Problem-Based Approach to Spatial Biology**

This course entails lectures in tissue physiology, spatial methodologies and grantsmanship. In the project part, small working groups will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

**Stem Cells: Biology and Therapeutic Manipulation**

The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes with Applications to Biology. This course will teach students the tools and techniques for modeling and analyzing random phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.

**Electives**

The electives list in the ETH course catalogue is an open list, and the courses listed in the ETH course catalogue provide just examples for possible elective courses, e.g. a selection of eligible courses. Students are expected to look for relevant courses in the ETH and University of Basel course catalogue and ask their mentor for approval. Courses from the advanced course category may also be taken as electives.

We particularly recommend browsing the University of Basel course catalogue for elective courses of relevant master's degree programs (using the filter "program structure" on the course catalogue website), such as for example: Biomedical Engineering, Chemistry, Drug Sciences, Epidemiology, Infection Biology, Molecular Biology, Nanosciences.

**Literature**

**Prerequisites / notice**

Stem Cells: Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors). Matlab programming.
The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Literature
While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

- Spatio-Temporal Modelling in Biology
- The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Prerequisites / notice
The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

636-0017-00L
Computational Biology
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyloodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date.

For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&ansicht=KATALOGDATEN&lerneinheitId=123546&lang=d,
e, or working through the script provided as part of this R course.

Spatio-Temporal Modelling in Biology

W 4 credits

3G D. Iber

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.
Objective
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content
1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Dynamical Systems
4. Cell-cell Signalling (Dr Boareto)
5. Travelling Waves
6. Turing Patterns
7. Chemotaxis
8. Mathematical Description of Growing Biological Systems
9. Image-Based Modelling
10. Tissue Mechanics
11. Cell-based Tissue Simulation Frameworks
12. Plant Development (Dr Dumont)
13. Growth Control
14. Summary

Lecture notes
All lecture material will be made available online
https://www.bsse.ethz.ch/cobi/teaching/636-0706-00L_Spatial_Modelling_in_Biology.html

Literature
The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

Murray, Mathematical Biology; Springer
Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
Keener and Sneyd, Mathematical Physiology, Springer
Fall et al, Computational Cell Biology, Springer
Szallasi et al, System Modeling in Cellular Biology, MIT Press
Wolkenhauer, Systems Biology
Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice
The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

636-0510-00L Proteomics and Drug Discovery Research     W     2 credits    2V     external organisers

636-0119-00L Introduction to Statistics and R     W     6 credits    3G+2A    J. Kuipers

Abstract
This course offers a practical introduction to the fundamentals of data analysis and R

Objective
To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

Content
Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

Lecture notes
Lecture slides will be available

Prerequisites / notice
Access to Rstudio with some markdown and tidyverse packages installed.

636-0120-00L Introduction to Programming     Z     0 credits    1G    D. S. Roqueiro

Abstract
This is a voluntary programming course BEFORE the start of the semester (September 2021). It is addressed primarily at students of the MSc Biotechnology (and MSc CBB). Other students may send a request to participate to: student-admin@bsse.ethz.ch

Objective
To acquire the basic programming blocks needed to translate a problem, stated in textual form, into an algorithm that solves such problem. The course provides an introduction to the MATLAB programming language and covers Bash scripting and other programming languages such as R and Python.

Content
The course is structured in four main pillars:

• Logical thinking: Translating a problem into a conceptual sequence of computational steps. For example:
  [Problem] What is the GC content of a given DNA string?
  [Logical steps]
  i) Iterate through all nucleotides in the DNA string, one by one
  ii) Count the Cs or Gs
  iii) Divide the count of Cs or Gs by the length of the DNA string
  iv) Report the result.
  • Writing code: Full introduction to the MATLAB programming languages (R and Python will also be covered). Solutions to all exercises will be provided in MATLAB, R and Python. Creation of programming projects with an integrated development environment (IDE).
  • Primer of Unix commands: Command-line examples on how to access servers and computing resources at the D-BSSE. Submission of jobs to the EULER cluster.

Lecture notes

636-0551-00L Supramolecular Chemistry     W     3 credits    2V    K. Tiefenbacher

Abstract
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course.
Objective
After this course, the student is expected to understand and be able to apply the basics of supramolecular chemistry: host-guest interactions, host design, self-assembly and simple enzyme mimetics.

Content
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course. We will first cover the basic concepts of supramolecular chemistry: non-covalent interactions, host-guest chemistry, binding constant determination and binding strength. Subsequently, we will take a closer look at how to bind different species: cations, anions and neutral organic molecules. Towards the end of the semester, we will cover self-assembly processes and applications of supramolecular structures as simple enzyme mimetics.

Lecture notes
The lecture slides are provided online via ADAM. No additional literature is required. If additional information is desired, the book “Supramolecular Chemistry” by Jonathan W. Steed and Jerry L. Atwood (John Wiley & Sons) is recommended.

<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Managed data, semantics and file formats</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Module 3 we leave behind the negative images from the early days of automation. A gloomy and misanthropic image of automation - both a bliss and a curse. We get to know the positive sides and learn to apply them. How do we become a sustainable &quot;Formula 1&quot;?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>What does it take to be able to work together in a digitally networked environment? How many &quot;techie genes&quot; are needed to work efficiently and effectively with structured data? The third module gives an insight into the principles of data architectures, data formats, attributes and platform technology. Machine readability as an important requirement but also as a clear challenge e.g. to security requirements.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>The module offers the opportunity to prepare for the voluntary buildingSMART Professional Certification.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Scripts, documents, studies, dates and addresses are stored on the server of the program and accessible to students on the Miro Board.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Literature recommendations at <a href="http://www.bauprozess.arch.ethz.ch">www.bauprozess.arch.ethz.ch</a> and <a href="http://www.kompetenz.arch.ethz.ch">www.kompetenz.arch.ethz.ch</a></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>072-0104-00L</td>
<td>Module 4: Foundation of Value Creation</td>
<td>O</td>
<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Added value of digital transformation, distributed data management, digital twin, logistics and robotics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Using specific examples, Module 4 illustrates the foundations and versatility of building information modeling (BIM), enabling participants to deal with the concepts, applications and mechanisms involved.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>&quot;Highway to hell or highway to haven&quot; - the question of a clear and simple roadmap is always at the heart of a digital transformation. &quot;Value creation&quot; is a central goal. Digitalisation is often seen as a strategy from the productivity gap. The fourth module shows how strategic goals can be developed in a roadmap and implemented in practice and how the individual shareholders and stakeholders participate.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>We learn to consciously look at the topic of added value and digital transformation from different perspectives. Collision checking and quantity take-offs (QTO) are very useful. But they are only basics when it comes to real value creation.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Scripts, documents, studies, dates and addresses are stored on the server of the program and accessible to students on the Miro Board.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>072-0105-00L</td>
<td>Module 5: New Business Modelle</td>
<td>O</td>
<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Business models, cultural change, disruption, evolution, lean methods</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Module 5 focuses on cultural change, innovation, disruption or evolution? In this last model, we learn to question and discover what the 17 Sustainable Goals mean for our industry.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>As a final module, new business models are discussed and explored. Examples will be used to explore patterns and interfaces and to analyse what is needed today and in the future for a successful and sustainable development of the sector. How can innovative ideas move us forward? What can we learn from design thinking? Why is it important for people to have useful and understandable measurable values? How do the 17 Sustainable Goals influence our industry?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>We will analyse the topic on the basis of two concrete examples, familiarise ourselves with them and observe their further development as a result.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<tr>
<td>Objective</td>
<td>Production and disposal / reusability of building fabric, energy flows, pollutants</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Building and breaking off is understood as an energy and material flow. The total weight of all properties in Switzerland is estimated at around 1 billion tonnes. Every year around 10 million m3 of buildings are demolished and more than 60 million t of raw materials are used in new buildings. This module examines the cycle principle and its implications for selective decommissioning, disposal, landflling, recycling and reuse, as well as the importance of the gray matter energy of materials. Continuation, reuse, demolition / new construction - stakeholders, goals and conflicting goals.</td>

<td>Only for CAS ARC in Unternehmensführung and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Market, purpose and business model</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim is to use a snapshot in time to interpret one’s own company and become able to assess opportunities and risks.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The “company” module considers the role of organisations within the economic network of the markets and the nature of their identity. It presents the special aspects of planning offices as service providers, illustrates various types of company, and discusses companies’ life-cycle as they move from their founding to the period of planning for the succession. Both sector-specific development of management and organizational models and also the problems of obtaining access to international markets are also investigated. Alongside this, the foundations of a generally valid business model for service companies are described and key criteria are defined.</td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Competence, communication and network</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim is to become able to analyse and implement the processes and instruments used for acquisition in one’s own company.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Acquisition represents a separate project in entrepreneurial activity, since all the activities involved in obtaining a commission fall under this term. The “acquisition” module focuses on imparting basic knowledge of networking and professional dialogue. Both of these tools require an assessment of one’s own situation with regard to competence, resources and customer relations. The conversation is a direct interaction: everyone involved is both an addressee and also basically an equal interlocutor. Networking can be learned: situational “small talk,” social competence and a healthy ability to communicate can be learned.</td>

<tr>
<td>Abstract</td>
<td>Key terms: Planning, positioning and identity</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim is to become familiar with the tools used in marketing and able to use them in specific situations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Marketing means orienting company activities towards market demands. Communication between suppliers, clients and the competition plays the decisive role here. The “marketing” module illustrates the foundations of marketing planning for architects and engineers. The essential definitions are provided and the core tasks involved in marketing are described. On this basis, the way in which a marketing plan is developed is explained and strategic and operational marketing planning is described in detail. The topics of branding and the opportunities represented by press and public relations work for architects and planners round out the “marketing” module.</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim is to become able to analyse one’s own company’s financial resources in detail, interpret key parameters for the current situation and base them.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Financial management means achieving the target company output with costs that are as low as possible, and in the longer term to create secure asset and capital structures. The tasks involved in financial management in a planning office include establishing a well-structured accounting department, careful cost accounting, sound budgeting and an effective controlling system. On the basis of a practical financial structure for architecture and engineering offices, the “financial management” module presents the information needed to carry these tasks out in a professional and responsible way.</td>
<td></td>
<td></td>

<tr>
<td>Abstract</td>
<td>Key terms: Strategy, potentials and digital planning</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim is to become familiar with the current practical work involved in IT in planning offices and be able both to analyze the specific challenges it implies and also to infer one’s own prospects for development in this context. In addition, thought needs to be given to the way in which the value creation provided by digitalisation influences one’s own company.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>IT refers on the one hand to information and data processing in a company, and on the other to the hardware and software components needed for the purpose. This “information technology” module focuses on potential strategies for company management in the IT field. The focus is not on the use of any individual programme, but on taking conscious decisions for or against IT components in one’s own company in order to obtain helpful support in one’s everyday work. The strengths, weaknesses, opportunities and risk of this strategy suggest possible potentials. The participants will present their own theses on entrepreneurship and open them up for discussion in the plenary session.</td>

CAS Module in Advanced Materials and Processes

Only for CAS in Advanced Materials and Processes. The enrolment is done by the MaP executive office.

Abstract
CAS AMaP participants are offered a MaP professor as a mentor together with whom they design their study plan along an individually-specified focus area in 'Advanced Materials and Processes'. Building on the individual expertise, interests and needs of the participants, the customised CAS AMaP module consists of the elements (i) research project, ii) courses and lectures, (iii) knowledge transfer.

Objective
The CAS AMaP module is fully customisable, building on the expertise of technical specialist professionals and aims at:
- training skills at the frontiers of the current state of research in Advanced Materials and Processes,
- deepening technical know-how with state-of-the-art knowledge in the specified focus area, and
- advancing practical competencies in the impart of expertise and knowledge transfer across disciplines and educational levels.

Content
Depending on individual interests and needs of the technical specialist professionals, the CAS AMaP module consists of the elements:
I. conducting a research project in the mentor’s group, addressing fundamental, development or applied problems, considering theoretical and/or experimental aspects,
II. individual schedule of courses and lectures with state-of-the-art knowledge, and
III. sharing of know-how in, e.g. seminars and interactive formats, thereby enhancing bidirectional knowledge transfer.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 394 of 2140
### Prerequisites / notice

The exercises are done exclusively with the (free, open source) software "R" ([http://www.r-project.org](http://www.r-project.org)). A final exam will also happen at the computers, using R (and your brains!).

### 447-6273-00L Bayes Methods

**W** 2 credits 2G

- **Abstract**
  - conditional probability; bayes inference (conjugate distributions, HPD-areas; linear and empirical bayes); determination of the a-posteriori distribution through simulation (MCMC with R2Winbugs); introduction to multilevel/hierarchical models.

- **Content**
  - Bayes statistics is attractive, because it allows to make decisions under uncertainty where a classical frequentist statistical approach fails.
  - The course provides an introduction into bayesian methods. It is moderately mathematically technical, but demands a flexibility of mind, which should not underestimated.

- **Literature**
  - Kruschke, J.K., Doing Bayesian Data Analysis, Elsevier2011.

- **Prerequisites / notice**
  - Prerequisite: Basic knowledge of statistics; Knowledge of R.

### 447-6191-00L Statistical Analysis of Financial Data

**W** 2 credits 1G

- **Abstract**

- **Objective**
  - Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.

<td>L. E. Fässler</td>
</tr>
</tbody>
</table>

**Abstract**

The initial module offers a practical introduction to some basic concepts and techniques for information processing as well as practical applications of them. The programming language are Python and SQL.

**Objective**

Students learn:

- how to encode a problem into a program, test the program, and correct errors.
- to understand and improve existing code.
- to implement mathematical models as a simulation.

**Content**

The following programming concepts are introduced during this module:

1. Variables, data types
2. Condition check, Loops, logics
3. Arrays
4. Functions
5. Matrices
6. Data management (SQL)

The practical part of the course, students work on small programming projects with a context from natural sciences. Electronic tutorials are available as preparation.

**Prerequisites / notice**

No prior knowledge is required for this course. It is based on application-oriented learning. The students spend most of their time working through programming projects and discussing their results with teaching assistants. To learn the programming basics there are electronic tutorials available.

</table>

**Abstract**

In this module, basic paradigms and techniques in working with data will be discussed, especially towards data security, managing data decentrally, and learning from data.

**Objective**

Participants learn about some important computer science concepts necessary for data science. They understand some of these concepts in detail and see the mathematics behind them.

**Content**

Participants will get an introduction to key computer science concepts underlying current and upcoming technology. The module in particular covers cryptography and digital signatures, networking and distributed algorithms, distributed ledger technology, as well as machine learning (supervised and unsupervised learning). Each topic will be discussed in two different ways: (i) a hands-on and in-depth introduction that allows participants to gain a technical understanding of key ideas. This is supported by simple and concrete examples as well as programming assignments; (ii) a context part that addresses the challenges and limitations encountered in practical applications.

</table>

**Abstract**

This module offers practical knowledge in visual information processing and human computer interactions.

**Objective**

Participants understand basic concepts of visual recognition and human-computer interaction systems.

**Content**

The first part of the module will cover basic theoretical knowledge on visual recognition systems of the last two decades, mostly focusing on the most recent advancements in deep learning and convolutional neural networks. The theoretical knowledge will be supported with practical sessions that will allow participants to gain hands-on experience with most commonly used tools and deepen their understanding of the key concepts. The second part provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

</tbody>
</table>

**Abstract**

This integration module for CAS “Applied Information Technology” links technical understanding of technology with business strategy based on a set of case studies from practice.

**Objective**

Participants will learn how technology affects businesses and practical issues when using new technologies in incumbent organizations based on a set of case studies.

**Content**

Participants will explore how new information technologies change different aspects of a business, and learn how to evaluate specific risks, costs, and benefits of such technologies. The module will shed light on success factors and common pitfalls when implementing new technologies and respective business changes, and it will specifically address the communication between technical experts and business management. The studied cases are currently planned to focus on artificial intelligence, IoT including edge and cloud computing, blockchain and distributed ledger technologies, and cybersecurity and data protection regulations (subject to change).

| Abstract      | This course is composed of various sub-modules related to Cyber Security taught by experts on the relevant fields. |
| Objective     | Students are expected to see behind the curtain of current research and engineering activities related to Cyber Security. At the same time students are introduced to contemporary challenges in cyber security by renowned experts. |
| Content       | The lectures cover contemporary aspects and challenges in Cyber Security. The goal is to present current fields of research/engineering and the latest results. By way of example, Cyber Security Policy is one of sub-modules presented by researchers of the Center for Security Studies at ETH. Besides faculty members of the computer science department, there will be guest lecturers from industry presenting Cyber Security related challenges in their field of activity. |
| Literature    | Will be announced during the course. |

<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>This is the first knowledge module in the CAS ELTV. In this module we (1) introduce all participants to the CAS and ETH, (2) get to know in more detail the projects of the participants and how lean innovation plays a role, and (3) discuss important considerations of strategy formation in technology ventures.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This module enables participants:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To understand and select from commercialization strategies available to them (e.g., licensing, partnering, and vertical integration) and respective business model choices</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Assess and generate development options for key internal enabling factors such IP strategy and key resources and capabilities</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Understand different market research and developments tools (lean start-up vs. technology broadcasting) and select appropriate methods and related KPIs</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This module focuses on elements of entrepreneurial strategy formation and implementation in nascent markets and/or industries. Participants will study commercial options available to them, e.g., technology broadcasting, licensing and partnering, and vertical integration, which is complemented by a practical view on IP strategy, driven by business strategy rather than arbitrary choices. The module also includes the introduction to lean innovation methods incl. agile product development methods and core tools of the lean startup approach.</td>

Data: 20.09.2021 12:40  Autumn Semester 2021  Page 403 of 2140
This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches and startup mentors will interact regularly with the participants, offer guidance on how to strategize and implement compelling business cases, feedback on specific challenges, and participants' activities with the goal to strengthen the ability of the participant to garner needed resources for their undertakings.

**373-0201-00L Leadership Development I**

*Only for CAS in Entrepreneurial Leadership in Technology Ventures.*

**Abstract**
This is the first module of the Leadership Development & Coaching track of the CAS ELTV. In this module, participants take stock of their current situation and goals and develop specific action points. This process is supported by experienced leadership coaches.

**Objective**
This module enables participants:
- To identify current gaps in the personal management skills and competencies and develop meaningful goals and plans to fill those gaps
- To implement effective exercises and practices to improve the participants' leadership capacity
- To effectively communicate and manage key constituents, notably employees and key advisors in a venture project

**Content**
This module focuses on the development needs of participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach them along a personal development plan, and feedback participants on specific challenges and activities with the goal to strengthen the participants' leadership capability and people skills.

---

**373-0205-00L Final Business Project Defense**

*Does not take place this semester.*

*Only for CAS in Entrepreneurial Leadership in Technology Ventures.*

**Abstract**
This module focuses on the development needs for both the participants' presentation and resource mobilization skills. The participants are asked to bring all learnings from the CAS and defend in engaging manner their business projects. This defense is typically delivered in presence of external investors or venture stakeholders who will challenge the project and potentially offer future support.

**Objective**
This module enables participants:
- To reflect upon and integrate important and relevant elements from the CAS into the venture project
- To practice effective business communication and venture pitching skills
- To receive and handle challenging feedback from important venture constituents.

**Content**
This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches will interact regularly with the participants, offer guidance on how to strategize and implement compelling business cases, feedback on specific challenges, and participants' activities with the goal to strengthen the ability of the participant to garner needed resources for their undertakings.

**Skills & Ecosystem Immersion**

Courses are only offered in Spring Semester.
The course gives an introduction to the most important methods for rigorous impact analysis of development programs and projects. The course aims at strengthening the capacity in portfolio management for VET, skills development and active labor market policies. It deals with basic issues and challenges of Vocational Education and Training (VET) in Developing Countries. In view of the many of school leavers VET has to place itself between the contradicting intensions of quality education and short-term training interventions.

### Abstract
The course provides a deeper understanding of the methodological foundations of results-oriented planning and steering of development projects. Together with the participants, we reflect on the situation-specific application of instruments for project planning and the development of a monitoring system, which makes it possible to adapt and steer projects.

### Objective
- Basic concepts of result-oriented project management
- Instruments and resources for project planning, including the elaboration of a "logframe matrix" and results chain
- Instruments and resources for project monitoring, and for the development of a monitoring system, including indicators to assess objectives achievement and steer the Project
- 'Write' and structure results-oriented Project reports

### Content
- Basic concepts and terms
- Differences and commonalities between VET and neighboring systems
- Planning, assessment of VET interventions with different objectives: economic development, poverty alleviation, creation of self-employment or systems development
- VET as a cooperation system of stakeholders with different duties, interests and competencies
- Background, potential use and limitations of (national) qualification frameworks
- Background, potential use and limitations of (national) qualification frameworks
- Half-day visit to important actors of the Swiss VET landscape

### Prerequisites
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with NADEL secretariate.
The course conveys basic knowledge of methods and instruments for the financial management and the economic analysis of development projects. Case studies and exercises are used to make students familiar with methods and instruments of financial management.

**Abstract**
The course is designed to increase awareness of how cultural perceptions and power structures have influenced society and our understanding of and practice in aid. It promotes alternatives to aid as linear and progressive Eurocentric narrative. The course draws on different theoretical perspectives and scrutinizes practical examples of aid interventions and similar initiatives.

**Objective**
The course goes beyond awareness raising of personal cultural characteristics and recognizing cultural values within development concepts. It unfolds traces of colonialism and power structures in day to day live and the aid industry. It promotes searching and initiating alternatives to aid as a Eurocentric narrative. Participants get familiar with different theoretical perspectives on decoloniality and scrutinize practical examples of aid interventions and similar initiatives.

**Content**
- Decolonialism key terms and concepts
- Conceptions of and alternatives to development (cooperation)
- Cultural (self- )awareness, diversity
- The role of culture in aid / development cooperation
- Implications of decolonialism for aid policy making and practice

---

865-0064-00L

**Decolonizing Aid**
Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

865-0070-00L

**The Private Sector and Development Organizations: Building Successful Alliances**
Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

**Abstract**
The following topics will be discussed: The political economy of the Corporate Social Responsibility discourse, voluntary governance regimes and development: theory of change and effectiveness of soft law approaches, PPPs: introducing concepts and taking stock of experience, analysis of private sector strategies from selected governance actors, engaging with the private sector.

**Objective**
This course seeks to increase the participants’ understanding of the multifaceted and dialectic relationships between civil society, governments and private sector. It equips participants with knowledge and tools required for a strategic interaction between private sector organizations and development agencies. The course enables participants to contribute effectively to policy debates on the role of private sector actors and development.

---

865-0021-00L

**Fraud and Corruption: Prevent, Detect, Investigate, Sanction**
Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

**Abstract**
The course examines forms, causes and effects of fraud and corruption in developing countries. Participants receive an introduction to the main concepts and mechanisms of prevention, detection, investigation and sanctioning. By using practical examples, the course prepares participants for dealing with fraud and corruption related issues in the context of development projects.

**Objective**
Participants are able to describe and reflect on different forms, causes and effects of fraud and corruption in the context of development cooperation. Based on common concepts and mechanisms of the international community they are able to apply and differentiate prevention, detection, investigation and sanctioning of fraud.

---

865-0006-00L

**Leveraging Private Impact Investors in Development Cooperation**
Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

**Abstract**
This two-day course demystifies impact investing for people working in development cooperation. The course provides an introduction to understanding the terminology and instruments involved in impact investing and evaluating opportunities and trade-offs for development.
Objective
This two-day course demystifies impact investing for people working in development cooperation. Impact investing—the idea that it is possible to “do good” as well as make money with certain types of investment—is changing the landscape of development cooperation. Impact investing is growing rapidly and development agencies and non-governmental organizations increasingly seek to leverage private investor resources. But many development actors are not accustomed to working with private investors, and are uneasy about their profit motivation and modes of operation. The course provides an introduction to the terminology and instruments involved in impact investing and evaluates developmental opportunities and trade-offs.

Content
Key topics
- Defining impact investing and understanding its importance for development
- Different types of impact investor and their incentives
- Overview of instruments such as loans, equity investments, syndication and impact bonds
- How to define and measure “impact”
- Techniques used by development agencies to leverage private investor resources
- Considering what impact investing can and cannot achieve for development goals

865-0041-00L Natural Resource Governance and Development: W 3 credits 3S F. Brugger, further speakers
Policies and Practice
Only for CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

Abstract
First introductory, online phase of an advanced-level multi-stakeholder course with the main goal to introduce analytical tools of political economy to enhance understanding of the crucial impact of politics and power on policy outcomes.

Objective
The first phase of the course will be introductory, allowing participants to start interacting with their peers, access videos and other materials as well as engage in scheduled live sessions to refresh their knowledge and skills.

Content
Topics covered:
- Discovery and allocation of resource rights
- The political economy of natural resource extraction
- Fiscal regimes and taxation
- Managing natural resource revenues and investment
- State Owned Companies governance
- Environmental and social impacts of extraction
- Corruption and accountability

Prerequisites / notice
- Live Lecture September 27 2pm CET
- Live Lecture September 28 2pm CET
- Nov 8 - Nov 19 Live Phase (each live lecture 2pm CET and additional program sessions in the morning and/or afternoon CET).

### Concepts of Object-Oriented Programming

**Abstract**

Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection.

**Objective**

After this course, students will:

- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

**Content**

The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:

- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

**Literature**

Will be announced in the lecture.

**Prerequisites / notice**

Prerequisites:

- Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

---

### Wireless Networking and Mobile Computing

**Number** 252-0293-00L

**Title** Wireless Networking and Mobile Computing

**Type** W

**ECTS** 4 credits

**Hours** 2V+1U

**Lecturers** S. Mangold

**Abstract**

This course gives an overview about wireless standards and summarizes the state of art for Wi-Fi 802.11, Cellular 5G, and Internet-of-Things, including new topics such as contact tracing with Bluetooth, audio communication, cognitive radio, visible light communications. The course combines lectures with a set of assignments in which students are asked to work with a JAVA simulation tool. Students should have interest in wireless communication, and should be familiar with Java programming. Experience with GNU Octave or MATLAB will help too (not required).

**Objective**

The objective of the course is to learn about the general principles of wireless communications, including physics, frequency spectrum regulation, and standards. Further, the most up-to-date standards and protocols used for wireless LAN IEEE 802.11, Wi-Fi, Internet-of-Things, sensor networks, cellular networks, visible light communication, and cognitive radios, are analyzed and evaluated. Students develop and implement their own prototyping algorithms to improve the behavior of the systems, using a Java-based event-driven simulator. We also hand out embedded systems that can be used for experiments for optical communication.

**Content**

New: Starting 2020, we will address contact tracing, radio link budget, location distance measurements, and Bluetooth in more depth.

**Literature**

**Prerequisites / notice**

Students should have interest in wireless communication, and should be familiar with Java programming. Experience with GNU Octave or MATLAB will help too (not required).

---

### Randomized Algorithms and Probabilistic Methods

**Number** 252-0417-00L

**Title** Randomized Algorithms and Probabilistic Methods

**Type** W

**ECTS** 10 credits

**Hours** 3V+2U+4A

**Lecturers** A. Steger

**Abstract**

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshhev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

**Objective**

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

**Content**

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

**Literature**

---

### Security Engineering

**Number** 252-0463-00L

**Title** Security Engineering

**Type** W

**ECTS** 7 credits

**Hours** 2V+2U+2A

**Lecturers** S. Krstic

**Abstract**

Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.
Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include:

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Topics covered in the lecture include:

- Fundamentals: What is data?
- Bayesian Learning
- Computational learning theory
- Supervised learning: Ensembles; Bagging and Boosting
- Max Margin methods
- Neural networks
- Unsupervised learning: Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

The course requires solid basic knowledge in analysis, statistics, and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-0543-01L Computer Graphics

Objective
Does not take place this semester.

Abstract
This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling, geometry representation and texture mapping, we will move on to the physics of light transport, acceleration structures, appearance modeling and Monte Carlo integration. We will apply these principles for computing light transport of direct and global illumination due to surfaces and participating media. We will end with an overview of modern image-based capture and image synthesis methods, covering topics such as geometry and material capture, light-fields and depth-image based rendering.

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics, and numerical methods for CSE as well as practical programming experience for solving assignments.

The programming assignments will be in C++. This will not be taught in the class.

252-0546-00L Physically-Based Simulation in Computer Graphics

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

252-1407-00L Algorithmic Game Theory

Objective
Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

Abstract
Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Data: 20.09.2021 12:40 Autumn Semester 2021 Page 411 of 2140
This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes will be posted on the website shortly after each lecture.

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

Prerequisites / notice

Lectures will be usually posted on the website shortly after each lecture.

"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.

The first part of the lecture covers individual system's aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in Rd, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chazan Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Seminar-, Bachelor- and Master Thesis projects in the area.
### 227-2210-00L Computer Architecture

<table>
<thead>
<tr>
<th>Abstract</th>
<th>Computer architecture is the science &amp; art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), parallel computing systems (including multicore processors, coherence and consistency,GPUs), heterogeneous computing, processing-in-memory, interconnection networks, specialized systems for major data-intensive workloads (e.g., graph analytics, bioinformatics, machine learning), etc.</td>
</tr>
<tr>
<td>Content</td>
<td>The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).</td>
</tr>
<tr>
<td>Lecture notes</td>
<td>All the materials (including lecture slides) will be provided on the course website: <a href="https://safari.ethz.ch/architecture/">https://safari.ethz.ch/architecture/</a></td>

</table>
Objective
This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters; starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Literature
Large scale analytics and machine learning are outside of the scope of this course.

Prerequisites / notice
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2021

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs. interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

**Advanced Machine Learning**
https://ml2.inf.ethz.ch/courses/aml/

**Computational Intelligence Lab**
http://da.inf.ethz.ch/teaching/2019/CIL/

**Introduction to Machine Learning**
https://las.inf.ethz.ch/teaching/introml-S19

**Statistical Learning Theory**
http://ml2.inf.ethz.ch/courses/slt/

**Computational Statistics**
https://stat.ethz.ch/lectures/ss19/comp-stats.php

**Probabilistic Artificial Intelligence**
https://las.inf.ethz.ch/teaching/pai-f18

---

**263-3845-00L - Data Management Systems**

**Abstract**
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

**Objective**
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs. interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

**Content**
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

**Literature**
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed.
The list of papers will be provided at the beginning of the course.

**Prerequisites / notice**
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

**Taught competencies**
Domain A - Subject-specific Competencies
Concepts and Theories
Techniques and Technologies
assessed
assessed

**263-3850-00L - Informal Methods**

**Abstract**
Formal methods are increasingly a key part of the methodological toolkit of systems programmers - those writing operating systems, databases, and distributed systems. This course is about how to apply concepts, techniques, and principles from formal methods to such software systems, and how to get into the habit of thinking formally about systems design even when writing low-level C code.

**Objective**
This course is about equipping students whose focus is systems with the insights and conceptual tools provided by formal methods, and thereby enabling them to become better systems programmers. By the end of the course, students should be able to seamlessly integrate basic concepts form formal methods into how they conceive, design, implement, reason about, and debug computer systems.

The goal is not to provide a comprehensive introduction to formal methods - this is well covered by other courses in the department. Instead, it is intended to provide students in computer systems (who may or may not have existing background knowledge of formal methods) with a basis for applying formal methods in their work.

**Content**
This course does not assume prior knowledge of formal methods, and will start with a quick review of topics such static vs. dynamic reasoning, variants and invariants, program algebra and refinement, etc. However, it is strongly recommended that students have already taken one of the introductory formal methods course at ETH (or equivalents elsewhere) before taking this course - the emphasis is on reinforcing these concepts by applying them, not to teach them from scratch.

Instead, the majority of the course will be about how to apply these techniques to actual, practical code in real systems. We will work from real systems code written both by students taking the course, and practical systems developed using formal techniques, in particular the verified seL4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).

**263-4500-00L - Advanced Algorithms**

**Abstract**
This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

**Objective**
This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

The lectures will cover a range of topics, tentatively including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms, and derandomization.

**Lecture notes / Prerequisites / notice**
This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations, E.g., having passed the course Algorithms, Probability, and Computing (APC) is highly recommended, though not required formally. If you are not sure whether you’re ready for this class or not, please consult the instructor.
Some of today’s most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

Lecture slides will be made available at the course Web site.

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will cover challenges associated with using AI in student-facing settings.

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

This course will cover topics spanning four broad themes with a focus on the first two themes:

- network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
- network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
- analysis and inference topics such as traffic monitoring and network forensics; and
- new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

The course will introduce students to a range of topics spanning four broad themes with a focus on the first two themes:

263-5005-00L Artificial Intelligence in Education W 5 credits 2V+1U+1A M. Sachan, T. Sinha

Number of participants limited to 75.

Abstract
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

Objective
The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class discussion, b) work on problem sets exemplifying the use of educational data mining techniques, and c) undertake a final course project with feedback from instructors.

Content
The course will start with a general introduction to AI, where we will cover supervised and unsupervised learning techniques (e.g., classification and regression models, feature selection and preprocessing of data, clustering, dimensionality reduction and text mining techniques) with a focus on application of these techniques in educational data mining. After the introduction of the basic methodologies, we will continue with the most relevant applications of AI in educational technologies (e.g., intelligent tutoring and student personalization, scaffolding open-ended discovery learning, socially-aware AI and learning at scale with AI systems). In the final part of the course, we will cover challenges associated with using AI in student-facing settings.

Lecture notes
Lecture slides will be made available at the course Web site.

Literature
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

Prerequisites / notice
There are no prerequisites for this course. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Abstract
This course introduces techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.
Computational Biology

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks. The course targets M.S. students with strong research interests in reinforcement learning, optimization, and control.

Objective

This course aims to provide students with an advanced introduction of RL theory and algorithms as well as bring them near to the frontier of this active research field.

By the end of the course, students will be able to:

- Identify the strengths and limitations of various reinforcement learning algorithms;
- Formulate and solve sequential decision-making problems by applying relevant reinforcement learning tools;
- Generalize or discover “new” applications, algorithms, or theories of reinforcement learning towards conducting independent research on the topic.

Content

Basic topics include fundamentals of Markov decision processes, approximate dynamic programming, linear programming and primal-dual perspectives of RL, model-based and model-free RL, policy gradient and actor-critic algorithms, Markov games and multi-agent RL. If time allows, we will also discuss advanced topics such as batch RL, inverse RL, causal RL, etc. The course keeps strong emphasis on in-depth understanding of the mathematical modeling and theoretical properties of RL algorithms.

Lecture notes

Lecture notes will be posted on Moodle.

Literature

Dynamic Programming and Optimal Control, Vol I & II, Dimitris Bertsekas

Algorithms for Reinforcement Learning, Csaba Czepesvári

Prerequisites / notice

Students are expected to have strong mathematical background in linear algebra, probability theory, optimization, and machine learning.

Mixed Reality

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics, Computer Vision, and Human-Machine Interaction.

Objective

After attending this course, students will:

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:

- Introduction to Mixed Reality / Augmented Reality / Virtual Reality
- Introduction to 3D Computer Graphics
- 3D Computer Vision
- HoloLens in combination with C# and Unity3D
- Other platforms are also possible to use, such as tablets and phones

Prerequisites / notice

Prerequisites include:

- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

Computational Systems Biology

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of the course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Lecture notes

http://www.csb.ethz.ch/education/lectures.html

Literature

Computational Biology

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Learning outcomes

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition
Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylo-dynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- * Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course "Introduction to Programming", which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date http://www.cbb.ethz.ch/news-events.html
For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&ansicht=KATALOGDATEN&lerneinheitid=123546&lang=de, or working through the script provided as part of this R course.

Abstract
Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.

Objective
Participants understand the different viewpoints for IT-decisions in practice, including technical and business aspects, can effectively analyze IT questions from the different viewpoints and facilitate decision making.

Content
Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

Lecture notes
Methodologies to analyze the cases and create final presentations. Short overview of each case. Successful completion of Lecture "Case Studies from Practice".

Prerequisites / notice
Number of participants limited to 24.

Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.
This seminar is an opportunity to become familiar with current research in software engineering and more generally with the methods and

tools used in the field. The seminar provides an overview of the latest developments and challenges in software engineering research. The participants will attend lectures and presentation sessions, as well as participate in discussions and debates.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

The reading list will be published on the course web site.

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Lecture notes
no script

Literature
Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the seminar a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

The reading list will be published on the course web site.

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Objective
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

Abstract
The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Objective
The goal of this seminar is to gain experience with machine learning research and foster interdisciplinary thinking.

Content
The seminar will be divided into two parts. The first part summarizes the basics of statistical learning theory, game theory, causal inference, and dynamical systems in four lectures. This sets the stage for the second part, where distinguished speakers will present selected aspects in greater detail and link them to their current research.

Lecture notes
Further information will be published on the course website: https://beyond-iid-learning.xyz/

Prerequisites / notice
BS in computer science or related field (engineering, physics, mathematics). Passed at least one learning course, such as "Introduction to Machine Learning" or "Probabilistic Artificial Intelligence".

263-3713-00L Advanced Topics in Human-Centric Computer Vision W 2 credits 2S O. Hilliges

Abstract
In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modeling of detailed human activities.

Objective
The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

Content
The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

- **Presenter**: Give a presentation about the paper that you read in depth.
- **Reviewer**: Perform a critical review of the paper.
- **Students taking this seminar should have the necessary background in systems and low level programming.

Prerequisites / notice
Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

# CAS in Future Transport Systems: Technology Potential

The "CAS in Future Transport Systems: Technology Potential" takes place only in Autumn Semester

**Start of the next course:** Autumn Semester 2021  
**Course duration:** Six months part time  
**Periodicity:** Every two years

## Major Courses

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
<tbody>
<tr>
<td>166-0200-00L</td>
<td>Technology Potential: Powertrain, Systems and Energy Carriers</td>
<td>O</td>
<td>3.5 credits</td>
<td>3G</td>
<td>C. Onder</td>
</tr>
</tbody>
</table>
| **Abstract** | The module provides a foundation in the current situation and short- and middle-term development directions of powertrain and automotive engineering in the context of passenger & goods transport. Corresponding energy sources and resulting consequences for the energy system are addressed. Participants will be enabled to identify potentials of these technologies and apply them to concrete problems.  

**Objective**  
Familiarity with conventional and alternative powertrain and automotive systems for future sustainable mobility, and the ability to identify and deploy their potential to address concrete problems.

**Content**  
- Drive component efficiency rates and core fields  
- Drive and non-drive energy flow / Vehicle "driving resistance"  
- Energy chains (operating power only) and CO2 emissions to primary energy

**Lecture notes** Distributed at start of module  
**Literature** Distributed at start of module  
**Prerequisites / notice** Announced to students of the of the MAS / CAS at the beginning of the term

| 166-0201-00L | Potential of Spatial Information- and Communication Technologies | O    | 3 credits | 3G    | P. Kiefer |
| **Abstract** | The digital revolution, spatial information and communication systems in particular, have a significant influence on the development of new transport systems. Participants acquire an in-depth understanding of the functionality and application potential of spatial information systems and services and of communication technologies for deployment in future transport systems and applications.  

**Objective**  
Familiarity with information and communication technologies (ICT) and spatial information technologies, and the ability to identify and utilise their potential to address concrete problems.

**Content**  
- Functionality and application of geographic information systems (GIS) to represent and analyse transport systems (acquire, model, analyse and visualise geodata)  
- Deployment potentials of GIS and ICT for efficient transport solutions (tangible, non-tangible)  
- Functionality and application of mobile spatial information technologies in future transport systems  
- Methods of spatiotemporal analysis and geodata analysis  
- Technical aspects of information and communication technologies (ICT)  
- Modelling, simulation and assessment of traffic behaviour  
- Basics of autonomous driving  
- Legal aspects of geodata  
- Applications: Traffic behaviour in Switzerland; location based services for energy-efficient behaviour; GIS for the Zurich traffic system (multimodal)

**Lecture notes** Distributed at start of module  
**Literature** Distributed at start of module  
**Prerequisites / notice** Announced to students of the of the MAS / CAS at the beginning of the term.

| 166-0202-00L | Integrated Assessment of Technologies and Transport Systems | O    | 2 credits | 1G    | C. L. Mutel |
| **Abstract** | The module provides a solid introduction to integrated technology assessment with regard to economic, ecological and social criteria. It introduces life cycle assessment (LCA), cost assessment, risk assessment and multi-criteria decision analysis. It also presents scenario analyses based upon energy-economic models which explicitly represent transport and energy-supply technologies.
