- global earthquake distribution; current global earthquake activity;
- different seismotectonic regions; examples of earthquake activity in different tectonic settings.

Lecture notes
Course notes will be made available on a designated course web site. Most of the topics discussed in the course are available in the book mentioned below.

Literature

Prerequisites / notice
Basic knowledge of continuum mechanics and rock mechanics, as well as notion of tensor analysis is strongly suggested. We recommend to have taken the course Continuum Mechanics (generally taught during the Fall semester).

This course will be taught in fall 2017 and it will be followed by Earthquakes 2: Source Physics in Spring 2018.

The course will be evaluated in a final written test covering the topics discussed during the lectures.

The course will be worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS.

The course will be given in English.

Earthquake Seismology: Compulsory Courses

One additional elective course of at least 3KP has to be completed for this Module according to prior agreement with the Subject Advisor (Autumn or Spring Semester).

Geographic Information Systems

The courses of this module are offered by UZH and must be registered at UZH.

Abstract
Reconstruction of time scales is critical for all Quaternary studies in both Geology and Archaeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture, we focus on the last 50 ka and the methods that are most frequently used for dating Quaternary sediments and landforms in this time range.

Objective
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

Content
1. Introduction: Time scales for the Quaternary, Isotopes and decay
2. Radiocarbon dating: principles and applications
3. Cosmogenic nuclides: 3He, 10Be, 14C, 21Ne, 26Cl, 36Cl
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology and ice cores chronologies
7. Cs-137 and Pb-210 (soil, sediments, ice cores)
8. Summary and comparison of results from several dating methods at specific sites

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, accelerator (AMS) facility.

Required: attending the lecture, visiting laboratories, handing back solutions for problem sets (Exercises)

Geomagnetics: Courses of Choice

The Courses of Choice are offered by UZH and must be approved by the subject advisor.
Additional elective courses of at least 6KP have to be completed for this Module according to prior agreement with the Subject Advisor (Autumn or Spring Semester).

</table>

**Abstract**
The course introduces the different components of the cryosphere - snow, glaciers, ice sheets, sea ice and lake ice, and permafrost - and their respective roles in the climate system. For each subsystem, essential physical aspects are emphasized, and their dynamics are described quantitatively and using examples.

**Objective**
Students are able to
- qualitatively explain relevant processes, feedbacks and relationships between the different components of the cryosphere,
- quantify and interpret physical processes, which determine the state of the cryospheric components, with simple calculations.

**Content**
The course provides an introduction into the various components of the cryosphere: snow, glaciers, ice sheets, sea ice and lake ice, permafrost, and their roles in the climate system. Essential physical aspects are emphasized for each subsystem: e.g. the material properties of ice, mass balance and dynamics of glaciers, or the energy balance of sea ice.

**Lecture notes**
Handouts will be distributed during the teaching semester

**Abstract**
Introduction to classic and modern literature of research in Glaciology. Active participation is expected and participants are mentored by PhD students of Glaciology.

**Objective**
In-depth knowledge of selected topics of research in Glaciology. Introduction to different types of scientific presentation. Improve ability of the discussion of scientific topics.

**Content**
Selected topics of scientific research in Glaciology

**Lecture notes**
Copies/pdf of scientific papers will be distributed during the course

**Prerequisites / notice**
Active participation is expected with presence at the sessions. Only a limited number of participants can be accepted. One of the following courses should be taken as preparation:
- 651-3561-00L Cryosphäre
- 101-0289-00L Applied Glaciology
- 651-4101-00L Physics of Glaciers

**Abstract**
Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

**Objective**
Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

**Content**
Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff. Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).

**Lecture notes**
Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

**Literature**
references in skript
Physics of Glaciers

**Abstract**
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

**Objective**
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

**Content**
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

**Lecture notes**
A list of relevant literature is available on the class web site.

---

**ECTS**
3 credits

---

**Prerequisites / notice**
High school mathematics and physics knowledge required.

---

Applied Glaciology

**Abstract**
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

**Objective**
The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

**Content**
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glacier and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

**Lecture notes**
Digital lecture handouts will be distributed prior to each class.

**Literature**
Links to relevant literature will be provided during the classes.

**Prerequisites / notice**
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

**Lithosphere Structure and Tectonics**

**Number**
651-3521-00L

**Title**
Tectonics

**Type**
W+

**ECTS**
3 credits

**Hours**
2V

**Lecturers**
W. Behr, S. Willett

**Abstract**
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.

**Objective**
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.
Content  
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longlifey and growth of continents, supercontinents.  
Rheology of layered lithosphere and upper mantle.  
Obduction systems  
Collisions systems  
Extensional systems  
Basin evolution  
Passive and active continental margin evolution

<td>This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and rock engineering (e.g. tunnelling, rock slope stability). The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e. the conditions under which the rock formed) will be clearly established. The student shall understand basic principles of rock mechanics and rock engineering. In addition, the student shall learn how to apply the results from lab and field investigations to simple engineering problems. This knowledge is required for subsequent integration courses (Landslide Analysis and Hazard Mitigation; Engineering Geology of Underground Excavations). This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and generic rock engineering. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses. Written course documentation available on our homepage: <a href="https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock_mechanics.html">https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock_mechanics.html</a></td>

<td>The course provides an introduction into quantitative analysis of groundwater flow and solute transport. It is focussed on understanding, formulating, and solving groundwater flow and solute transport problems. a) Students understand the basic concepts of groundwater flow and solute transport processes, and boundary conditions. b) Students are able to formulate simple, practical groundwater flow and solute transport problems. c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems. 1. Introduction to groundwater problems. Concepts to quantify properties of aquifers. 2. Flow equation. The generalised Darcy law. 3. The water balance equation and basic concepts of poroelasticity. 4. Boundary conditions. Formulation of flow problems. 5. Analytical solutions to flow problems 6. Finite difference scheme solution for simple flow problems. 7. Numerical solution using finite difference scheme. 8. Concepts of transport modelling. Mass balance equation for contaminants. 9. Boundary conditions. Formulation of contaminant transport problems in groundwater. 10. Analytical solutions to transport problems. 11. Fractured and karst aquifers. 12. The unsaturated zone and capillary pressure. 13. Examples of applied hydrogeology from Switzerland and around the world. (Given by Dr. Beatrice Marti from Hydrosolutions Ltd.) Handouts of slides.</td>
</tr>
</tbody>
</table>
Lecture notes will be available for download 1-2 days before each class.

In this course, students will gain hands on experience performing laboratory and index tests commonly used in Rock and Soil Mechanics.

### Geotechnical Site Investigations

**Number**: 651-4065-00L  
**Title**: Geological Site Investigations  
**Type**: O  
**ECTS**: 3 credits  
**Hours**: 3G  
**Lecturers**: M. Ziegler

**Abstract**: This course introduces students to the methods used in characterising, developing or monitoring geotechnical engineering project sites. Measurements, tools and analyses are described that are relevant to determining the geologic conditions at a site as well as deformations that occur under natural or construction conditions.

**Objective**: This course aims at introducing the general procedures taken during an engineering geological site investigation. Students who complete the course should be able to design a site investigation program of measurements based on information from initial desk studies, and to analyse, integrate and interpret data from the measurement program.

**Content**: The methods that are routinely employed in site investigations will be described focusing on their applicability in different geologic environments. The limitations of the data in constraining the parameters of interest will be addressed together with problems of interpretation and cost-versus-information value. Specific topics addressed include drilling, coring, sampling, borehole testing, geophysical methods used in engineering geology, satellite, air- and ground-based surface and displacement monitoring (photogrammetry, LIDAR and Radar), and in-situ deformation measurement methods.

**Lecture notes**: Lecture notes will be available for download 1-2 days before each class.

**Literature**:  

**Courses for this Module take place in spring semester.**

### Rock and Soil Mechanical Lab Practical

**Number**: 651-4125-00L  
**Title**: Rock and Soil Mechanical Lab Practical  
**Type**: O  
**ECTS**: 3 credits  
**Hours**: 2P  
**Lecturers**: L. de Palézieux dit Falconnet, O. Moradian

**Abstract**: In this course, students will gain hands on experience performing laboratory and index tests commonly used in Rock and Soil Mechanics. The course is divided into two modules, with half the semester devoted to rock mechanic testing, and half to soil mechanics testing.

**Objective**: This course introduces the fundamentals of laboratory testing of rock and soil. Students will learn how to interpret laboratory data, the expected accuracy and limitations of common laboratory tests and the most appropriate testing method(s) for a given problem.

**Content**: In the Rock Mechanics lab, the following laboratory tests are performed: Ultrasonic velocity measurements, Point load test, Brazilian tensile test, Uniaxial compression test, Triaxial compression test. Through performing these experiments, students will get familiar with stress-strain curves, tensile, unconfined, and confined strength of rocks, Young's modulus and Poisson ratio, and finally cohesion and friction angle of intact rocks.

In the Soil Mechanics Lab, the following seven laboratory tests are performed: Sieve Analysis, Hydrometer Analysis, Atterberg Limits, Proctor Compaction, Direct Shear Test, Falling Head Permeability and Consolidation Test. Through performing these tests, students gain an understanding of the relationship between index properties and soil behavior, as well as the strength, deformability and hydraulic characteristics of soils.

**Lecture notes**: Course materials are available in: https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock-and-soil-mechanical-lab-practical.html

### Engineering Geology: Integration

Courses for this Module take place in spring semester.

### Engineering Geology: Industrial Internship

**Number**: 651-4071-00L  
**Title**: Industrial Internship  
**Type**: O  
**ECTS**: 12 credits  
**Hours**: external organisers

**Abstract**: The industry practical is supervised both from the industry partner and ETH and consists of technically and/or scientifically challenging work in the engineering geology domain. The regular duration of the practical is 10 weeks. The practical is pre-defined in a work plan and concluded with a report written by the student.

**Objective**: The goals of the industry practical are to become familiar with technical, economic, legal and communication issues of real-life work in private industry or technical administration.

### Major in Geophysics

### Compulsory Modules Geophysics

### Geophysics: Methods I

Data: 06.09.2022 12:51  
Autumn Semester 2021  
Page 858 of 2159
The class follows no single book. A list of relevant texts will be given in class. Lecture notes will be made available for download from the website of the course.

C. V. Cauzzi

Analog-digital conversion: dynamic range and resolution; Dirac-impulse, step function; Laplace transformation; Z-transformation; Frequency selective filters: example Butterworth filters; Digital filters: impulse invariance and bilinear transformation; Inverse filters; Response spectra.

Lecture notes will be made available for download from the website of the course.

The class follows no single book. A list of relevant texts will be given in class.

Assumed existing knowledge:

(a) time series, discrete systems, Fourier transform, convolution, power spectrum, correlation, stochastic time series (a course dealing with these topics is "Analysis of Time Series in Environmental Physics and Geophysics");

(b) Matlab.

Students must bring their own laptop in class for Matlab exercises.

In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasise a hands-on learning approach rather than extensive theory.

A provisional week-by-week schedule (subject to change) is as follows:

Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 12: Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

### Content
1. Fundamentals of fluid mechanics.
2. Ideal inviscid fluids.
3. Incompressible viscous fluids.
4. Advanced topics, one of the following:
   - Elements of thermal convection.
   - Rotating fluids.
   - Stratified fluids.
   - Instabilities and turbulence.

### Lecture notes
The slides of last year presentations will be made available at the beginning of the semester, they may be subject to changes during the lectures.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 860 of 2159
The aim of the course is to obtain a basic understanding of the physical process behind earthquakes and their basic mathematical description. By the conclusion of this course, we hope that you will be able to:

- explain the statistical behaviour of global earthquakes
- address earthquakes in the context of different tectonic settings;
- explain earthquake source representations of varying complexity;
- explain earthquake source characteristics and their role in seismic hazard assessment.

This course will be taught in Fall 2017 and will be followed by Earthquakes 2: Source Physics in Spring 2018. The course will be evaluated in a final written test covering the topics discussed during the lectures.

The course will be worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS.

The course will be given in English.

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.
Abstract
This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective
The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

Lecture notes
Slides and scripts will be posted on Moodle.

Literature
It is recommended but not mandatory to buy one of these books:

►►► Applied Geophysics

►►►► Applied Geophysics: Compulsory Courses
The compulsory courses take place in spring semester.

►►►► Applied Geophysics: Courses of Choice
The compulsory courses take place in spring semester.

►► Major in Mineralogy and Geochemistry

►► Compulsory Module in Analytical Methods in Earth Sciences
Students have to complete 6 credits in part A (microscopy courses), and 6 credits in part B (methods).

►► Microscopy Courses
Compulsory Module in Analytical Methods in Earth Sciences: Microscopy Courses

►► Analytical Methods Courses
Compulsory Module in Analytical Methods in Earth Sciences: Analytical Methods Courses

►► Restricted Choice Modules Mineralogy and Geochemistry
A minimum of two restricted choice modules must be completed in the major Mineralogy and Geochemistry.

►►► Mineralogy and Petrology

►►►► Mineralogy and Petrology: Compulsory Courses

Number Title Type ECTS Hours Lecturers
651-4028-00L Physical Properties of Minerals W+ 3 credits 2G S. Petitgirard, G. Spiekermann

Abstract
Physical properties of minerals, e.g. electrical properties, elasticitcal properties are discussed. The effect of the crystal symmetry on the symmetry of physical properties as well as the mathematical formulation of the physical properties are major topics.

651-4039-00L Thermodynamics Applied to Earth Materials W+ 3 credits 2G J. Connolly

Abstract
This course develops the thermodynamic concepts necessary to predict phase equilibria and to compute physical properties from thermodynamic data.

Objective
To provide students with the conceptual and practical skills necessary to implement thermodynamic models and data as provided in the earth science literature. The computer software package Maple is relied upon to allow students to solve realistic problems without the distraction of mathematical details.

Content
Elementary concepts (1st and 2nd Laws; composition, state and extent); stability criteria; Legendre transforms; Maxwell relations and other manipulations of thermodynamic functions; calculation of Gibbs energy for a pure solid; simple solution models; order-disorder solution models; reciprocal solution models; equations of state for molecular fluids; free energy minimization.

This course is neither an introduction to computer methods for calculating petrological phase equilibria nor an introduction to phase diagram methods.

Prerequisites / notice
The grade for the course is based on exercises assigned as homework.

Some familiarity with elementary thermodynamics (phase rule, reactions) and mathematics (differentiation, integration) is assumed. Experience with Maple or comparable programs such as Mathematica is helpful.

►►►► Mineralogy and Petrology: Courses of Choice

Number Title Type ECTS Hours Lecturers
651-4063-00L X-Ray Powder Diffraction W 3 credits 2G M. Plötze

Abstract
Number of participants limited to 18.

In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

Objective
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

Content
Fundamental principles of X-ray diffraction
Setup and operation of X-ray diffractometers
Interpretation of powder diffraction data

Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

Lecture notes
Selected handouts will be made available in the lecture.
**Literature**

**Prerequisites / notice**
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data. Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. Software will be provided for future use on own Laptop.

---

**651-4233-00L**
Geotectonic Environments and Deep Global Cycles

W 3 credits 2V M. W. Schmidt. P. Ulmer

Does not take place this semester.

**Abstract**
This course addresses master students interested in in integral view of processes operating in various tectonic environments, most specifically divergent and convergent plate margins

**651-4097-00L**
Applied Mineralogy and Non-Metallic Resources I

W 3 credits 2G R. Kündig

**Abstract**
Geological and mineralogical aspects to important non-metallic mineral resources. Industrial use of specific mineral resources as well as economic, strategic and environmental aspects are discussed. Examples from all over the world with a specific focus on the non-mineral mineral resources potential in Switzerland.

**Objective**
Students will learn to understand the use of non-metallic mineral resources from a geological and mineralogical point of view as well as from industrial, technical and strategic (political) point of view. Environmental aspects on the worldwide use of non-metallic mineral resources are discussed. A special focus will be given on the situation in Switzerland.

**Content**
Teaching, case-studies and excursions (e.g. raw-material industry).

Course "Applied mineralogy and non-metallic resources I" (autumn/winter semester):
Non-metallic resources. Occurrences, geology, extraction, properties, fabrication and use. Industrial aspects, (new) technologies, market, stock, situation, reserves & resources, trends and development, environmental aspects, law.

Chapters: e.g. coal/uran (coal, graphite, diamond, fullerene); oil/gas (oil- and tarsands, oil-shits); phosphates/nitrates; aluminium (bauxite, corundum); salt; carbonates; titanium; clay and clay minerals; sulphur; gypsum/anhydrite; fluoride; asbestos; talc; micas; rare earth elements.

Course "Applied mineralogy and non-metallic resources II" (fall/summer semester):

Chapters: e.g. Stone industry - technical aspects of building stones, properties, weathering, treatment, quarries, products. Crushed stones - quarries, products, planning, environment. Gravel an sand - resources/reserves, environment (protection/law), alternative products (substitution). Cement and concrete (geological resources, prospection, fabrication, environment).

**Lecture notes**
Will be given according to the lessons. Partially integration of e-learning tools.

**Literature**

651-4037-00L | Mineral Resources I | W+ | 3 credits | 2G | C. Chelle-Michou, P. Tollan

Can be chosen as an elective course within the Bachelor. Prospective MSC-Students attending the module "Mineral Resources" should attend Mineral Resources I and II in the first year of their MSC studies.

Abstract
Principles of hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of geological, chemical and physical factors from global scale to sample scale. Introduction to orthomagmatic ore formation (mostly Cr, Ni, PGE). Introduction to supergene residual deposits (Ni, Al).

Objective
Understanding the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognising and interpreting mineralised rocks in geological context.

Content
(a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types
(b) Mineral solubility and ore deposition, principles & thermodynamic prediction using activity diagrams. Driving forces and structural focussing of hydrothermal fluid flow
(c) Introduction to supergene residual deposits with emphasis on Ni laterites and bauxites

Lecture notes
Notes handed out during lectures

Literature
Extensive literature list distributed in course

Prerequisites / notice
2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 866 of 2159
It is recommended but not mandatory to buy one of these books:

1. The goal of the course is to discuss advanced topics in geochemistry based on the critical reading of research papers. Themes include hydrothermal geochemistry, isotopes in meteorites, low temperature geochemistry and biogeochemistry.

2. The Carbon cycle - long and short term regulation and feedbacks of atmospheric CO2. What regulates atmospheric CO2 over long timescales and what drives it in the Anthropocene? What drives CO2 variations over glacial cycles and what does it in the preindustrial period?

3. Ice sheets and sea level - What do expansionist glaciers want? What is the nature of range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? When is the most recent time of sea level higher than modern, and by how much? What lessons do these have for the future?

4. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems? Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?

5. The Ocean heat transport - How stable or fragile is the ocean heat conveyor, past and present? When did modern deepwater circulation develop? Will Greenland melting and shifts in circulation bands, cause the North Atlantic Overturining Circulation to collapse? When and why has this happened before?

Objective

The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

Abstract

This course will present and discuss advanced topics in geochemistry based on the critical reading of research papers. Themes include hydrothermal geochemistry, isotopes in meteorites, low temperature geochemistry and biogeochemistry.

Objective

The main topics covered are: Orbital dynamics and Tides, Solar heating and Energy transport, Planetary atmospheres, Planetary surfaces, Planetary interiors, Asteroids and Meteorites, Comets, Planetary rings, Magnetic fields and Magnetospheres, The Sun and Stars, Planetary formation, Exoplanets and Exobiology.

Content

1. Overview of elements on the solar system and the Earth's formation.
2. The evolution of the Earth's atmosphere and oceans.
3. The role of the Earth's hydrosphere in the development of life.
4. The Earth's internal processes and plate tectonics.
5. Earthquakes and volcanic activity.

Lecture notes

Slides and scripts will be posted on Moodle.

Literature

It is recommended but mandatory to buy one of these books:

Introduction and overview, Data visualization and statistics in IsoplotR, Principles of U-Pb geochronology

1. Introduction and overview, Data visualization and statistics in IsoplotR, Principles of U-Pb geochronology
2. In situ U-Pb geochronology 1 (LA-ICPMS/SIMS principles, zircon)
3. In situ U-Pb geochronology 2 (calcite, garnet, other minerals)
4. High-precision ID-TIMS U-Pb geochronology (principles and applications)
5. High-precision U-series geochronology (carbonates, silicates)
6. In situ U-series geochronology (zircon, garnet etc.)
7. K-Ar and 40Ar/39Ar geochronology, Principles and Applications
8. Fission Track dating
9. U-Th-Hf dating
10. Thermochronology applications/lab visit
11. Noble gases - basics, reservoirs, geo/cosmochem. applications: mainly chronology
12. Cosmogenic nuclides (stable and radionuclides) - basics, geo/cosmochem. applications, C14

Script (for part of the lecture), partly power point presentations (in the web)
Electron Microprobe Course - Practice
Cooperation and Teamwork

This colloquium comprises geophysical research presentations by invited leading scientists from Europe and overseas, advanced ETH students, and new and established ETH scientists with specific new work to be shared with the institute. Topics cover the field of geophysics and related disciplines, to be delivered at the level of a well-informed M.Sc. graduate/early Ph.D. student.

Invited speakers typically present recent work: Attendees following this colloquium for multiple terms will thus be able to trace new research directions, trends, potentially diminishing research areas, controversies and resolutions thereof, and thus build a solid overview of state and direction of geophysical research. Moreover, the diverse content and delivery style shall help attendants in gaining experience in how to successfully present research results.

651-1851-00L  Introduction to Scanning Electron Microscopy

Abstract

Introduction to Scanning Electron Microscopy and Microanalysis including Practical training.

Objective

Introduction in scanning electron microscopy and microanalysis. Obtain practical experience in operating a SEM.

Content

Functional principles and operation modes of a scanning electron microscope. Methods and application fields for - imaging (SE, BSE, FSE, AE, CL)

- X-ray spectroscopy (EDX)

- Electron diffraction (EBSD, Channeling, Orientation Imaging).

Methods for sample preparation

Practical exercises.

Lecture notes

Scripts and operation manuals are provided during the course.

Prerequisites / notice

Full day block course after the end of HS

651-3541-00L  Exploration and Environmental Geophysics

Abstract

Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical

and electromagnetic methods, Refraction and reflection seisms, Georadar. Discussion of survey design, sources and receivers and data

processing.

Objective

Overview and understanding of the most important geophysical methods. Proposed solutions to assess and observe problems relevant to exploration and environmental geophysics in soil, ice and lithosphere at different scales. Getting familiar with measuring- and interpretation procedures. Pointing out the possibilities and limitations of geophysical methods.

Content

Lecture notes

Available through eDoz/ILIAS.

Additional material will be provided by the lecturers.

Literature

651-4086-00L  Experimental Methods in Petrology

Overview of the most common experimental methods employed in petrology to determine thermodynamic and physical properties and phase equilibria of minerals, mineral assemblages, magmas and fluids. The basic principals of low, moderate, high and ultrahigh pressure devices are discussed combined with an introduction into the synthesis of starting materials and the evaluation of run products.
Objective

This course shall provide the basics of experimental petrology. The principal goals are the acquisition of basic knowledge about experimental equipment employed in petrology and the design and setup of an experimental study targeted to obtain quantitative data on phase relations, thermodynamic, kinetic and rheologic properties of earth materials as well as the examination, analysis and evaluation of experiments. At the end of the course, the participants should be able to evaluate experimental data independently and design appropriate experiments on their own.

Content

The course 'Experimental methods in petrology' covers the following subjects:

1. Introduction and historical summary of experimental petrology
2. Experimental methods at ambient pressure (1 bar) with practical exercise to determine the free energy of formation of wustite (FeO)
3. Experimental buffering techniques (phase rule, buffering of partial pressures of gases and supercritical fluids, buffering of mixed volatile phases at elevated pressures, buffering of activities and solid-solid solutions in solid phases
4. Experimental methods at moderate pressures: externally (cold seal) and internally (IHPV) heated gas-pressure apparatus with practical demonstration/exercise
5. High-pressure solid-media experimental techniques (piston cylinders)
6. Ultrahigh-pressure experimental techniques (multi-anvil apparatus, diamond-anvil-cells (DAC)
7. Evaluation of petrologic experiments (preparation of run products, analytical and spectroscopic methods of examination and quantification)

The practical work in the laboratories is conducted (with the exception of exercise #1) on a small research project where the various techniques and equipment are demonstrated and the practical use is trained.

Lecture notes

A summary of the material presented in the lectures are distributed weekly.

Literature

Currently, there is no comprehensive book available that summarizes the most important aspects of experimental petrology; publications relating to individual subjects are referred during the lectures.

Prerequisites / notice

This course addresses to a public (master and PhD students) that is interested in an introduction to experimental research in petrology, but does not require basic knowledge in experimental methods. However, basic knowledge in petrology and physical chemistry (thermodynamics) is required to follow the course.

651-4114-00L Illustrations in Natural History (University of Zürich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO271

Mind the enrolment deadlines at UZH:

https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

Abstract

We offer the opportunity to develop drawing skills which can be applied for scientific studies and publications. We emphasis the reproduction of natural objects with and without interpretations. Technical and 3D-drawings as well as descriptive geometry are not dealt with in this course.

Objective

- the most important drawing techniques common applied in science
- accurate observation
- basic knowledge in image processing with Photoshop

Content

In this course, both classic and computer-based drawing and illustration-techniques are presented. We begin with sketches with the pencil and continue with Indian ink which we use for drawings using hatchings and dots. Finally, one drawing is carried out in detail with a pencil. This drawing will then be scanned and processed in Photoshop. The emphasis is on practicing the methods.

Lecture notes

- not mandatory!

Recommended:

Prerequisites / notice

Please bring pencils (HB and 2H) as well as Indian ink-pens or fine black markers. In the second half of the semester, the students may bring their own laptops with PhotoShop because usually, we do not have enough computers in the lecture hall for all.

651-4273-00L Numerical Modelling in Fortran

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective

Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes

See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html

Fostered competencies

Subject-specific Competencies
Techniques and Technologies assessed
Method-specific Competencies
Media and Digital Technologies assessed
Problem-solving assessed

651-4273-01L Numerical Modelling in Fortran (Project)

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience.

Objective

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience.

Content

The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student's Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

Lecture notes

See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranProject.html

651-1392-00L Palaeontological Colloquium (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
After the course the students are able to understand and interpret measurements of ice flow, subglacial water pressure and ice temperature.

**Abstract**
Talks and discussion on current topics in Palaeontology (Palaeobotany, Palaeozoology and Micropalaeontology).

**Objective**
Spezielle Vertiefung paläontologischer Kenntnisse.

**Content**
Vorträge von Institutsangehörigen und eingeladenen Gästen aus dem In- und Ausland über aktuelle Themen aus dem Gesamtgebiet der Paläontologie (Paläobotanik, Paläozoologie und Mikropaläontologie) mit anschliessender Diskussion.

**651-4101-00L**  
**Physics of Glaciers**  
**Abstract**
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

**Objective**
After the course the students are able to understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

**Content**
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulic. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

**Lecture notes**
http://people.ee.ethz.ch/~luethim/teaching.html

**Literature**
A list of relevant literature is available on the class web site.

**Prerequisites / notice**
High school mathematics and physics knowledge required.

**651-0254-00L**  
**Seminar Geochemistry and Petrology**  
**Abstract**
Seminar series with external and occasional internal speakers addressing current research topics. Changing programs announced via D-ERDW homepage (Veranstaltungskalender)

**Objective**
Presentations on isotope geochemistry, cosmochemistry, fluid processes, economic geology, petrology, mineralogy and experimental studies. Mostly international speakers provide students, department members and interested guests with insight into current research topics in these fields.

**Content**
Wöchentliches Seminar mit Fachvorträgen eingeladener oder interner Wissenschafter, vornehmlich zu Themen der Geochemie, Isotopengeologie, Hydrothermalgeochemie, Lagerstättenbildung, Petrologie, Mineralogie und experimentelle Studien.

**651-1692-00L**  
**Seminar in Applied and Environmental Geophysics**
**Abstract**
Invited speakers from the entire range of Earth Sciences.

**Objective**
Selected themes in sedimentology, tectonics, paläontology, geophysics, geochemistry, mineralogy, paleoclimate and engineering geology on a regional and global scale.

**Content**
According to variable program.

**Lecture notes**
Autographieblätter

**Literature**
Empfehlungen

**Subject-specific Competencies**
Concepts and Theories assessed

**Techniques and Technologies** assessed

**Analytical Competencies** assessed

**Decision-making** assessed

**651-1091-00L**  
**Colloquium Department Earth Sciences**
**Abstract**
Invited speakers from the entire range of Earth Sciences.

**Objective**
According to variable program.

**Content**
Selected themes in sedimentology, tectonics, paläontology, geophysics, geochemistry, mineralogy, paleoclimate and engineering geology on a regional and global scale.

**Lecture notes**
No

**Literature**
No

**651-2613-00L**  
**Humangeography III (Geographies of Difference)**
**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**Objective**
University lecturers

**Prerequisites / notice**
Recommended prerequisite: Human Geography II (UZH)
<table>

</tr>
</tbody>
</table>

**Abstract**
This re-search-oriented course enables students to think through and about difference in a geographically (multi-scalar, critical, space-bound) manner, by elaborating on multiple concepts from postcolonial, intersectional and other disciplinary debates, and by applying these to specific topical domains.

**Objective**

- **Knowledge**
  - Understand basic concepts and empirical manifestations of difference in human geography
  - Deepen knowledge on how difference works in one specific topic of human geography

- **Skills**
  - Learn to independently digest, assess, and present basic academic texts
  - Conduct discussions in English or German (online and offline) - Be able to write a short research paper about a human geography topic

Data: 06.09.2022 12:51
Autumn Semester 2021
Page 872 of 2159
This course focuses on the Earth's magnetic field and the magnetization recorded in rocks as a way to study its past. In addition to mineral magnetism, the course also covers palaeomagnetism, data analysis and statistics, and the use of 14C in oceanic, atmospheric and terrestrial studies.

Prerequisites / notice

Only for excursions outside of the Bachelor excursions 2.-6. semester program. The program varies from year to year, details published on https://www.conference.ethz.ch/erdw/

651-2001-00L  Semester Research Project  

Abstract

Small individual research project done by a student and supervised by a Professor/Dozent/Oberassistent of D-ERDW. The content of each project is unique and is defined by the supervisor. The project consists of producing new scientific results and/or data. Short scientific report/paper is written by the student, which serves as a basis for project grading.

Objective

- To learn logic, content and methodology of research aimed at producing new scientific results and/or data.
- To familiarize with research procedures in a selected scientific area.
- To obtain experience in writing scientific reports/papers.

Content

The content of each project is unique and not related to the BSc or MSc Thesis. This content is defined by the supervisor and discussed with the student, who agrees to take the project. The project should mainly consist of research activity aimed at producing new scientific results and/or data and cannot be limited to a literature work. Short scientific report is written by the student at the end of the project, which serves as a basis for the project grading.

651-4191-00L  Radionuclides as Environmental Tracers

Abstract

Radionuclides stemming from natural and artificial sources are powerful tools that allow gaining a better understanding of a large range of environmental processes. This course will focus on cosmogenic and anthropogenic radionuclides and will provide a general overview about common applications and the use of tracers in the environment, e.g. to understand past climatic changes and ocean currents.

Objective

Students learn the basic facts about sources and fate of natural and artificial long-lived radionuclides (e.g. 14C, 26Al, 10Be, 129I 236U, Pu- isotopes, etc.). They gain insights into the different detection techniques, with special focus on accelerator mass spectrometry (AMS). A selection of the numerous applications of the different radionuclides in oceanic, atmospheric and terrestrial processes will be studied.

Content

The course will include lectures, practical exercises and two excursions, namely the opportunity to visit the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) and the AMS facilities at ETH (Laboratory of Ion Beam Physics). Lectures will cover:
- an introduction to natural and artificial radionuclides;
- a general overview of radionuclide detection, in particular AMS will be studied including a tour to the Laboratory of Ion Beam Physics;
- applications of long-lived radionuclides in the different environmental compartments (oceans, atmosphere and terrestrial environments):
  - The use of 14C in oceanic, atmospheric and terrestrial studies including a tour to the WSL labs;
  - applications of 10Be in ice cores and marine sediments;
  - applications of nuclear waste from nuclear accidents (e.g. Fukushima);
  - controlled releases from nuclear reprocessing plants and their role in understanding oceanic processes.
Exercise classes will include an introduction to the Ocean Data View and basic course in applying box models to describe transport and mixing processes. As an evaluation, students will have to hand in a series of exercises related to the different topics of the lecture.

651-4105-00L  Paleomagnetism

Abstract

This course focuses on the Earth's magnetic field and the magnetization recorded in rocks as a way to study its past. In addition to mineral magnetism, field and laboratory methods, and data analysis are covered, as well as the wide range of applications of magnetic methods in Earth sciences, e.g. magnetostratigraphy, studies of the early Earth, geodynamics or structural and tectonic studies.

Objective

Gain an understanding of how paleomagnetism can be used to study the Earth

Content

1. Earth's magnetic field
2. Mineral magnetism
3. Magnetic remanence
4. Paleomagnetic sampling and tests of stability
5. Data analysis and statistics
6. Paleomagnetic poles and paleogeography
7. Laboratory measurements
8. Topics requested by course participants (anisotropy, magnetostratigraphy, magnetotaxis,...)

Lecture notes

Slides will be provided during the lecture

Literature

Paleomagnetism: Magnetic Domains to Geologic Terranes by R.F. Butler
http://www.geo.arizona.edu/Paleomag/
Essentials of Paleomagnetism by L. Tauxe
https://earthref.org/MagIC/books/Tauxe/Essentials/

651-4906-00L  Radiocarbon Dating

Number of participants limited to 6. Please contact the lecturer for details immediately after subscription.

Abstract

Radiocarbon (14C) dating is the most eminent dating tool for carbon containing samples younger than ~50 kyr and a useful tracer of the carbon cycle. Within this lab course, the sample preparation and 14C analysis of wood samples (or upon agreement other samples) will be performed.
In this hands-on block course, students will have the opportunity to perform radiocarbon analysis of wood samples. This will include understanding the theoretical background of radiocarbon dating and its importance within Earth Sciences and related fields. Participants will gain know-how on the preparation of wood samples for AMS analysis. They will learn about the importance of suitable reference materials when performing AMS analysis. Data evaluation for C-14 measurements will be performed and discussed.

Sampling of tree ring layers.
Preparation of reference materials and samples for AMS measurement, including chemical pre-treatment and graphitisation.
Assisting the AMS measurement.
Data evaluation and interpretation of results.

This is a block course for D-ERDW or D-USYS master or PhD students.

Recommended (but not a prerequisite 651-4191-00L Radionuclides as Environmental Tracers (in Autumn Semester)
OR
651-4901-00L Quaternary Dating Methods (in Autumn Semester)

The Precambrian Earth experienced several environmental states—all drastically different from today—that are recorded in sedimentological, fossil, and genetic records. We will review "classic" and more recent scientific literature on the evolution of chemical and biological processes to critically evaluate what we do and don't know about how our planet's biogeochemistry has changed through time.

For decades, researchers have attempted to reconstruct Precambrian environmental states and their relative timing using tracers recorded in the sedimentological, fossil, and genetic records. Here, by reading and discussing "classic" and more recently published scientific papers, students will learn about influential discoveries related to Earth history within the fields of geobiology and geochemistry.

In completing the course, students will specifically learn:

- Why Earth's surface chemical composition evolved from anoxic to oxic environments
- How life evolved from simple prokaryotic metabolisms to multicellular eukaryotes
- The importance of geological, chemical, and biological feedback mechanisms
- How to discern between biologic innovation and environmental importance
- How to summarize, interpret, and discuss current evidence for what is and isn’t known about Earth’s geochemical and geological evolution
- How to assess opposing scientific viewpoints and outstanding questions in the literature

Each lecture period will consist of a presentation and discussion—to be led by 1-2 students (depending on class size)—covering a given paper or set of papers. All students are expected to read the relevant papers before class and come prepared for discussion. Lecture periods will be divided between "review" presentations aimed at introducing the background and fundamentals of each topic and "debate" or "comparison"-style presentations, in which two (sometimes opposing) views of a given topic will be discussed and assessed.

Where available, presentations and notes will be provided online during the course.

All required and recommended scientific publications will be provided online during the course.

Choice of courses from the complete offerings in Earth Sciences MSc

see Science in Perspective: Language Courses ETH/UZH

see Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended Science in Perspective (Type B) for D-ERDW.

In completing the course, students will specifically learn:

- How to summarize, interpret, and discuss current evidence for what is and isn't known about Earth's geochemical and geobiological evolution
- How to discern between biologic innovation and environmental importance
- The importance of geological, chemical, and biological feedback mechanisms
- How life evolved from simple prokaryotic metabolisms to multicellular eukaryotes
- Why Earth's surface chemical composition evolved from anoxic to oxic environments

In completing the course, students will specifically learn:

- How to summarize, interpret, and discuss current evidence for what is and isn't known about Earth's geochemical and geobiological evolution
- How to discern between biologic innovation and environmental importance
- The importance of geological, chemical, and biological feedback mechanisms
- How life evolved from simple prokaryotic metabolisms to multicellular eukaryotes
- Why Earth's surface chemical composition evolved from anoxic to oxic environments

In completing the course, students will specifically learn:

- How to summarize, interpret, and discuss current evidence for what is and isn't known about Earth's geochemical and geobiological evolution
- How to discern between biologic innovation and environmental importance
- The importance of geological, chemical, and biological feedback mechanisms

**Fundamentals of Geophysics**  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.  
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.  

Abstract: Self-study course. This course is only available for those who got it as an additional requirement in their MSc admission.

Objective: The course is intended to let the student learn fundamentals of geochemistry that were found lacking in his/her studies prior to entering the MSc in Earth Sciences at ETH. Contents of the course will be defined based on text books and/or scientific papers.

Literature:  

651-3070-AAL  
**Fundamentals of Geology**  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.  
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Chemistry I and II**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

**Objective**

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

### 406-0603-AAL

**Stochastics (Probability and Statistics)**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

**Content**

From "Statistics for research" (online)

Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"

Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

**Lecture notes**

M. Kalisch

**651-3525-AAL Introduction to Engineering Geology**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

This introductory course starts from a description of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

**Objective**

Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

**Content**

**Lecture notes**

Lecture Material as defined in German PPT Slides of the German Course “651-3525-00L Ingenieurgeologie”.
Moodle Course Materials available.

**Literature**

For English speakers study chapters 1-3 of Part I of the book “Geological Engineering” (Gonzalez de Vallejo & Ferrer 2011, CRC Press), without groundwater flow, consolidation time, geophysical methods, details of triaxial tests in soils and rocks, details of clay mineralogy.

**Prerequisites / notice**

Participate on all exercises of “651-3525-00L Ingenieurgeologie”, Tuesday 13-14 pm.
Participate in Written Exam together with students of the German Course.

### Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

### Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

### Content
- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

### Lecture notes
Folien werden zur Verfügung gestellt.

### Literature

### Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

---

| 851-0238-01L | Support and Diagnosis of Knowledge Acquisition Processes (EW3) | W | 3 credits | 3S | P. Edelsbrunner, J. Maue, C. M. Thurn |

### Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

### Objective
The main goals are:
1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2. You have a basic understanding about psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

### Data: 06.09.2022 12:51  Autumn Semester 2021  Page 879 of 2159
Students are able to characterize and to discuss the model of outcomes based education.

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.
- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.
- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
- The students can use different forms of examination for monitoring performance.
- They are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.
- They can assess and develop the didactic module. They can also develop appropriate learning assignments.
- The students can use different forms of examination for monitoring performance.
- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

1V
Students conduct a series of “classical” biological school experiments and therefore gain practice and experience in this area.

2U
Course imparts fundamental didactic concepts that are relevant to teaching science in a Higher Education context.

- Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
- Application of teaching methods and techniques from educational science in biology classes.
- Planning and preparation of lessons.

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.

**Information for UZH students:**
Enrolment to this course unit only possible at ETH. No enrolment to module CHE406 at UZH.

Examination Registration only at ETH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

**Abstract**

Selected topics in general chemistry:

1. The language of chemistry
2. Chirality and stereochemistry
3. Oxidation of water
4. Chemistry of the atmosphere

**Objective**

In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

**Content**

Content of the four modules:

1. The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
2. Chirality and stereochemistry: Selected aspects, origin of biomolecular chirality, inorganic chemistry
3. Cosmochemistry
4. Chemistry of the atmosphere

**Lecture notes**

Foliend und ausgewählte Literatur werden zur Verfügung gestellt.

**Literature**

Ausgewählte Artikel aus der Primärliteratur werden vorgestellt, kommentiert und zur Lektüre empfohlen.

- E. Rossa: Chemie-Didaktik, Cornelsen Verlag, 2015

</tbody>
</table>

**Abstract**

Simultaneous enrolment in Introductory Internship Chemistry - course 529-0962-00L - is compulsory.

**Objective**

The students have basic subject didactic knowledge for teaching chemistry at a secondary school. They are able to design lessons that are effective for learning, actively involve students in lessons, explain challenging concepts simply, use experiments for theory and reflect on teaching.

**Content**

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnasiumsrelevanter Lerninhalte
- Didaktische Vereinfachung
- Modell und chemischen Formeln zur Beschreibung von Aufbau und Umwandlung der Substanzen
- Wechselbeziehungen zwischen Beobachtung in der realen Welt und Deutung auf Modell-Ebene
- Skizzen entwerfen und zur Erklärung von Reaktionen nutzen
- Chemie im 8. Schuljahr: Das Teihenmodell erklärt viele Phänomene im Anfangsunterricht
- Atommodelle und chemische Bindung
- Radioaktivität und Kernspaltung
- Struktur und Eigenschaft
- Auswahl, Konzeption, Vorbereitung, Durchführung, Einbettung und Auswertung von Demonstrations-Experimenten

**Lecture notes**

**Literature**

- E. Rossa: Chemie-Didaktik, Cornelsen Verlag, 2015
- H.-J. Bader et al: Konkrete Fachdidaktik Chemie, Oldenbourg Verlag, 2002

**Prerequisites / notice**

Der Chemieunterricht am Gymnasium soll einerseits grundlegende chemische Kenntnisse für den Alltag vermitteln und andererseits auf ein naturwissenschaftlich orientiertes Hochschulstudium vorbereiten. Diese beiden Ziele sind im Unterricht gleichermaßen zu berücksichtigen.

Da viele Lerninhalte sequentiell und einander benützend strukturiert sind, ist dem logischen Aufbau des Unterrichts besonderes Augenmerk zu schenken. Dies bedingt eine feine Abstimmung von fachlichen Inhalten und didaktischen Methoden auf die kognitive Leistungsfähigkeit der Lernenden.

Anhand der Diskussion bewährter Beispiele und dem Entwurf eigener Unterrichtsbausteine soll die zukünftige Lehrperson befähigt werden, einen den spezifischen Rahmenbedingungen angepassten Unterricht zu entwickeln, der diesem hohen Qualitätsanspruch genügt.

**Abstract**

This course imparts fundamental didactic concepts that are relevant to teaching science in a Higher Education context.

**Objective**

Students are able to characterize and to discuss the model of outcomes based education.

Students are able to transfer the basic concepts of this model (ILC, TLA, assessment, constructive alignment) to science education.

**Lecture notes**

keines
### Physical Direction

#### Specialised Courses

#### Introductory Courses

**Selection of courses will be agreed with the course coordinator.**

#### Spec. Courses in Respective Subject with Educational Focus

</tr>
</tbody>
</table>

**Objective**
Why is energy important for life and our society?
How did energy use change over time? Which effects did these changes have on the environment?
What are the physical basics of energy technologies?
When, why and how did technology and science of energy come together?
What are the limits and benefits of all the various energy technologies?
How can different energy technologies be compared?
Can we understand the changes in the current energy systems?
How will the energy systems of the future look like?
How fast can we and should we alter the current energy transition?
Which could be the overall guidelines for a working energy system of the future?

**Content**
- Physical basics of energy, thermodynamics and life. Introduction to self-organisation, and systems.
- Energy and making use of it - a short history and overview on energy technologies
- Coal, oil and natural gas – fossil fuels
- Hydro, Wind- & Solarpower (Geothermal- and Tidal power) – the quest for renewable energy
- Nuclear power, radioactivity and ultimate storage – the quest for a safe technology
- Breeding and Nuclear Fusion – can it work at all?
- Energy storage – available technologies and a technology outlook
- Climate change, decarbonisation – how much time do we have?
- Energy efficiency, recycling and other resource conservation measures
- Energy systems – how everything can play together
- Buildings and Mobility – new technologies, new Ways of life?
- Life cycle assessment of Energy Technologies – problems and possibilities
- Economics of energy, learning curves, technology assessments and Innovation.
- The energy transition and decarbonisation – How is your 2040, 2050?

**Lecture notes**
Web page:
http://ihp-ix2.ethz.ch/energy21/index.html

**Literature**
The Physics of Energy, R.L. Jaffe, W. Taylor, 2018
Clean Disruption of Energy and Transportation, T. Seba 2014
Energy and Civilization: A History, V. Smil, 2018

**Prerequisites / notice**
Basics of Physics applied to Energy and Energy Technology.
Investigation on current problems (and possible solutions) related to the energy system and the environmental interactions.
Training of scientific and multi-disciplinary methods, approaches and their limits in the exercises and discussions.

402-0091-00L Teaching Science in Higher Education

Abstract
This course imparts fundamental didactic concepts that are relevant to teaching science in a Higher Education context.

Objective
Students are able to characterize and to discuss the model of outcomes based education. Students are able to transfer the basic concepts of this model (ILO, TLA, assessment, constructive alignment) to science education.

Literature

Weeks

Abstract
Provides a basic introduction into Earth Sciences, emphasizing different rock-types and the geological rock-cycle, as well as introduction into geophysics and plate tectonic theory.

Objective
Understanding basic geological and geophysical processes

Content
Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to crystals and minerals and different rock-types. Lectures include processes in the Earth's interior, physics of the earth, planetology, introduction to magmatic, metamorphic and sedimentary rocks. Exercises are conducted in small groups to provide more in depth understanding of concepts and content of the lectures.

Lecture notes
werden abgegeben.

Literature

Prerequisites / notice
Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth science problems and solutions relevant for modern society (e.g. building materials, water resources). Working in small groups will allow for discussion and examination of actual earth science themes.

### ECTS

- European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
Cognitively Activating Instructions in MINT Subjects

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Human Intelligence

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Research Methods in Educational Science

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Gender Issues In Education and STEM

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

Objective
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher’s work.

Content
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice
Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).
**Objective**
Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

**Content**
- Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf: 
  - Dendrochronology: What annual rings tell
  - Photosynthesis/Climate change: The tracks in the forest
  - Forest Soil: The soil in the focus of the climate

---

**Subject Didactics in Geography**

*Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.*

**651-4118-00L Geography Didactics of Geography Teaching III**

*University of Zurich*

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090GG3

Limited number of participants. In addition to the course enrollment a registration by email is required no later than September 1 for autumn semester, February 1 for spring semester. Further details see UZH module.

**Abstract**

Working with medias in Geography teaching:

**Prerequisites / notice**

Geography Didactics III may be completed in parallel with Geography Didactics II, but only after successful completion of Geography Didactics I.

---

**651-2519-01L Introductory Internship (University of Zürich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090BPEP

**Abstract**

The Introductory Internship belongs to the practical expertise education of the teacher training for Upper Secondary Schools and must be completed at the beginning of studies.

**Prerequisites / notice**

The Introductory Internship must be completed together with the practice lessons for didactics.

The Introductory Internship can only be completed together with an accredited internship teacher of ETH Zurich (separate list).

---

**651-2519-02L Practice Lessons for Didactics (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090BPUE

**Abstract**

The practice lessons help students to gain first experiences in teaching and is completed together with the didactics courses.

**Prerequisites / notice**

The practice lessons for didactics must be completed within the didactics courses.

Students register for the module at UZH ideally together with didactics II. ECTS will be assigned after having handed in all relevant documents to the lecturers, at the earliest upon completion of didactics II.

The Practice Lessons can only be completed together with an accredited internship teacher of ETH Zurich (separate list).

---

**651-2517-00L Teaching Internship I Geography (University of Zürich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter and didactic skills they have acquired in the course of their training.

**Title**

The Introductory Internship can only be completed together with an accredited internship teacher of ETH Zurich (separate list).

### 651-2520-01L Examination Lesson I Geography

**Type**

O 1 credit 2P

**Prerequisites / notice**

To be completed together with Examination Lesson II 651-2520-02.

**Abstract**

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter and didactic skills they have acquired in the course of their training.

**Objective**

- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- the basis of a specified topic, the candidate shows that they are in a position

**Content**

Die Studierenden erfahren das Lektionsthema in der Regel 14 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie spätestens 2 Tage vor der Prüfung (bis 18 Uhr) den beiden Prüfungsexperten ein.

**Lecture notes**

Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

**Prerequisites / notice**

Takes place at the end of the studies, prerequisites: successful completion of the program.

The examination lessons I and II must be enrolled and completed together with the examination didactics.

### 651-2520-02L Examination Lesson II Geography

**Type**

O 1 credit 2P

**Prerequisites / notice**

To be completed together with Examination Lesson I 651-2520-01.

**Abstract**

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter and didactic skills they have acquired in the course of their training.

**Objective**

- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- the basis of a specified topic, the candidate shows that they are in a position

**Lecture notes**

Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

**Prerequisites / notice**

Takes place at the end of the studies, prerequisites: successful completion of the program.

The examination lessons I and II must be enrolled and completed together with the examination didactics.

### 651-4137-00L Semester Paper Within the 1st Teaching Internship Geography (University of Zurich)

**Type**

O 2 credits 4P

**Prerequisites / notice**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**Abstract**

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html

**Prerequisites / notice**

For students of the Geography Teaching Diploma.

The semester paper must be completed together with the first teaching internship, the registration is therefore in the same semester.

*Data: 06.09.2022 12:51  Autumn Semester 2021  Page 888 of 2159*
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodology-sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

Lecture notes
Assigned reading materials and slides will be available via Moodle.

Literature
Assigned reading materials and slides will be available via Moodle.
This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Mind the enrolment deadlines at UZH:

Abstract
Das Modul bietet eine kurze Einführung in einige Komponenten und Prozesse des hydrologischen Kreislaufs. Dabei werden einzelne Wasserspeicher (Schnee-, Boden und Grundwasser) und Flüsse zwischen den Speichern (Verdunstung, Niederschlag und Abfluss) betrachtet. Übungen ergänzen die Vorlesung.

Abstract
Exercises to the course Introduction Remote Sensing.

103-0214-00L | Cartography Fundamentals | W | 5 credits | 4G | L. Hurni |

Abstract
Basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.

Objective
Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics. Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

Content
Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analog and digital map production technology, prepress technology, printing technology, topographic maps, map critics.

Lecture notes
Will be distributed module by module.

**Abstract**
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

**Objective**
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

**Content**
The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

| 103-0137-00L | Engineering Geodesy          | O    | 4    | 3G    | A. Wieser, J. Qiao         |
| **Abstract** | Introduction to Engineering Geodesy: methods, instruments, and applications. |
| **Objective** | The students will be introduced to the methods, instruments and applications in Engineering Geodesy with a focus on end-to-end quality assessment, sensor and multi-sensor-systems, setting out, and monitoring of engineering objects. They will be able to acquire enhanced knowledge and fundamental competences in high-precision angle, distance and height measurements. They will be introduced to aspects of interdisciplinary work in particular related to construction processes and civil engineering. |
| **Content** | - Introduction: Definition, methods, and tasks |
| | - Planning and realizing geodetic networks |
| | - High precision distance, angle and height measurements |
| | - Sensors and multi-sensor-systems |
| | - Calibration and testing |
| | - Engineering Geodesy in construction above and below ground |
| | - Tunnel surveying |
| | - Building Information Modeling (BIM) |
| | - Deformation monitoring: Models, methods, and applications |
| **Lecture notes** | The slides and additional documents will be provided in electronic form. |
| **Prerequisites / notice** | Fundamental knowledge in geodetic metrology (applied geodesy), physical geodesy, reference systems, GNSS and parameter estimation is required for this course. This knowledge can for instance been acquired within the appropriate courses of the bachelor studies in Geomatics and Planning. |

| 103-0267-01L | Photogrammetry and 3D Vision Lab | W    | 3    | 2G    | C. Albl                    |
| **Prerequisites:** It is suggested that students take the course "Photogrammetrie" at bachelor level before this course |
| **Abstract** | The aim of the course is to provide a hands-on experience with close-range photogrammetry. The students will go through all aspects of 3D reconstruction starting with the image acquisition, camera calibration, automatic sparse geometry reconstruction, and eventually produce a final textured 3D model. |
| **Objective** | The aim of the course is to familiarize the students with both the practical aspects of close-range photogrammetric reconstruction and the theoretical foundations behind them. After passing the course, the students should be able to plan the image acquisition, perform the camera calibration, build a structure-from-motion pipeline using modern open-source libraries, produce a 3D model, and improve its quality. |
| **Content** | This course builds in part on the courses "Photogrammetrie" and "Bildverarbeitung" from the Bachelor program. It focuses on the particular challenges of automated close-range photogrammetry. The students will obtain their own images using their own cameras/smartphones, learn how to perform the camera calibration, implement some key and interesting parts of the automatic reconstruction pipeline and learn how to avoid and address common issues in 3D reconstruction. |
| **Lecture notes** | Presentation slides, necessary publications and complementary learning materials will be provided through a dedicated course web-site. |
| **Literature** | Recommended textbooks: |
| | - T. Luhmann, Nahbereichsphotogrammetrie (also available in English) |
| | - R. Hartley and A. Zisserman. Multi-view geometry in computer vision |
| | - R. Szelski. Computer Vision |
| **Prerequisites / notice** | A recommended prerequisite for taking this course are the Bachelor courses "Photogrammetrie" and "Bildverarbeitung". If you have not passed them, please contact the main lecturer of the course before enrolling. The course will include both practical work with commercial software, and programming in Python. |

| 103-0787-00L | Project Parameter Estimation | W    | 3    | 3P    | J. A. Butt, T. Medic       |
| **Abstract** | Solving engineering problems with modern methods of parameter estimation for network adjustment in a real-world scenario; choosing adequate mathematical models, implementation and assessment of the solutions. |
| **Objective** | Learn to solve engineering problems with modern methods of parameter estimation in a real-world scenario. |
| **Content** | Analysis of given problems, selection of appropriate mathematical models, implementation and testing using Matlab: Kriging; system calibration of a terrestrial laser scanner. |
| **Lecture notes** | The task assignments and selected documentation will be provided as PDF. |
| **Prerequisites / notice** | Prerequisite: Statistics and Probability Theory, Geoprocessing and Parameterestimation, Geodetic Reference Systems and Networks |

| 102-0617-00L | Basics and Principles of Radar Remote Sensing for Environmental Applications | W    | 3    | 2G    | I. Hajnsek                |
| **Abstract** | The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation. |
| **Objective** | The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of |
| | 1. SAR basics and principles, |
| | 2. SAR polarimetry, |
| | 3. SAR interferometry and |
| | 4. environmental parameter estimation from multi-parametric SAR data |

---

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 893 of 2159
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

**Lecture notes**
Handouts for each topic will be provided.

**Literature**
First readings for the course:
Complete literature listing will be provided during the course.

Abstract
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Objective
Overview of the legal norms of land registry and surveying law.

Content
Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal problems of surveying, the reform of official surveying, liability of the geom-eter.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 897 of 2159
This lecture mainly treats the semantic interoperability of GIS, which describes a system-independent and model-driven approach for communication technologies and OGC Web services. Methods: Conceptual schema languages (UML and INTERLIS), data formats (ITF, XML), tools (ILI-Checker, Python, UMLT, FME, ModelBaker).

- Explain and apply the model-driven approach based on standards
- Describe and use interoperability types
- Describe transfer formats and reformat them by one-to-one processors
- Explain object-oriented modeling (based on graphical and textual representation)
- Describe and use communication technologies and OGC Web services
- UML, EBNF, INTERLIS, ITF, XML, Python, FME, ModelBaker (QGIS), and PostgreSQL
- Apply appropriate software tools

Content
This lecture mainly treats the semantic interoperability of GIS, which describes a system-independent and model-driven approach for transforming geodata with the same content but different structure from one format into another (and vice versa). The list of topics entails the reality selection, conceptual modeling, flexible standard formats, one-to-one processors, and semantic transformation. In addition to introducing important concepts for semantic interoperability in theory, two popular workflows are presented and trained over several weeks, which include the conceptual schema languages UML and INTERLIS, the flexible transfer formats ITF and XML, the ILI-Checker, Python as parser, and UMLT with FME vs. ModelBaker (QGIS) with PostgreSQL for the semantic transformation.

Prerequisites / notice
Condition for participation: Successful bachelor course GIS II (old) or Geoinformationstechnologien und -analyse (new)
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.

In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

103-0337-00L  Site and Project Development  W  3 credits  2G  A. Gonzalez Martínez, M. Sudau, J. Van Wezemael
The focus of the lecture Site & Project Development is on larger contiguous areas or sites and their urban, open space and infrastructural development. In this course, students work on a semester exercise in which they "develop" a specific large-scale project from practice and evaluate it economically, strategically and in terms of feasibility.

Students in this course will pursue the following learning objectives:

- Investigate and understand a given concrete project area and identify, evaluate and articulate the current problems and relevant issues within this area.
- Consolidate their knowledge in the essential topics of site & project development and apply this in a well-founded, argued and creative manner to address the task at hand.
- Organize and structure themselves while acquiring responsibilities in their interdisciplinary project teams. The teams consist of three to five fellow students that must develop innovative, viable and resilient concepts for a real project development in a given area. Their considerations should be presented in written form (project report) and in linguistic-visual form (final presentation). At the end of the course, the students critically reflect on their experiences with the group work process together with the course instructors.
- Acquire methodological knowledge in location & market analysis, 3D visualization of a project as well as in the financial assessment of a large-scale real estate project and use this knowledge to justify their considerations and evaluate their proposal.
- Development and strengthening of their individual position as planners (spatial, urban, transport planners, etc.) in relation to the questions formulated in the proposed project within the field of Site & Development as well as within their own discipline.

The lecture is divided into several thematic sections analogous to the essential topics of Site & Project Development. The students are accompanied both in the semester exercise and in the individual lectures by a large number of external guest speakers from the praxis-field, which means that the lecture will not only thematically examine the relevant areas of Site & Project Development, but also will offer the students exclusive, practice-oriented insights. The relevant methodological knowledge for the semester exercise is imparted and, due to the proximity to practice, the students gain exclusive insights into possible professional fields of activity. In this lecture, students apply their already acquired and newly learned skills, especially in interdisciplinary teams, and work on an exciting, motivating and relevant question from the practice.

Major topics covered in the lecture include:
- Urban planning
- Location and market analysis
- Real estate development, financing and valuation
- Project development and decision-making from the perspective of investors
- Open space design and landscape architecture
- Sustainable building and sustainability certification
- Mobility, parking issues, travel models
- Cooperative planning and participation processes, mediation
- Gendered planning in project development
- Inner development & urban quality

Parallel to the lecture series, students work in interdisciplinary teams on a real-life task. In the course of the semester exercise, the lecture material is deepened and what has been learned is applied. The students visit the project area at the beginning of the semester as part of an excursion. Specific large-scale projects such as the Gaswerkareal Bern, the Sihl-Manegg Areal Zurich (Greencity) or the Areal Alter Pilatusmarkt (Nidfeld) Lucerne will be dealt with. For the possible development of the given site, visions are developed by the students on the basis of a comprehensive location and market analysis and a utilization concept is developed. In the process, the students are accompanied by experts and regularly discuss their ideas and proposed solutions with their supervisors.

Objective

Spatial development deals with the development, formation and arrangement of our environment. In order to be able to mediate between the different demands, interests and projects of multiple actors, a forward-looking, action-oriented and robust planning is necessary. It is committed - in the sense of a sustainable spatial development - to the economical handling of resources, in particular of the non-replicable resource soil.

The lecture introduces necessary basic knowledge and is based on the following main topics:

– Inward development and challenges of spatial transformation
– Planning approaches and The (political) steering of spatial development
– Interplay of formal and informal processes and processes across different scales of spatial development
– Methods of action-oriented planning in situations of insecurity
– Integrated space and infrastructure development
– Different types of participation in spatial development

By taking up the lecture, the students are able to recognize cross-scale, complex tasks of spatial development and transformation and to use their theoretical, methodical and professional knowledge to clarify them.

Content

- Planning approaches and political organization in Switzerland
- Tasks of spatial relevance
- Key figures and ratios
- Drivers of spatial development
- Steering spatial development I: Policy
- Steering spatial development II: Formal and informal instruments
- Organizing spatial development I: Governance
- Organizing spatial development II: Processes and organization
- Methods in spatial planning I
- Methods in spatial planning II
- Planning in complex situations
- Participation in spatial development
- Present and future core tasks of spatial development

Methodology of Planning Research and Practice

Only for master students, otherwise a special permission by the lecturer is required.

Abstract

This course deals with scientific and applied methods and the ways of thinking that are useful in planning practice as well as in scientific research. Students are offered interdisciplinary knowledge from planning practice and research, behavioural economics and social sciences. New perspectives on planning are opened up, which can lead to better results in future projects and research.

Objective

Keeping the general aim of exploring the basic methodologies in spatial planning research and practice, the specific course learning objectives are as follows:

- to address complex real-world spatial problems in adequate ways
- to know relevant theories and maxims that are subject to specific methods of problem solving
- to identify key questions and key concepts in contemporary planning research
- to select appropriate research methods to properly address the research questions

In practical terms, students:

- learn to deal with uncertainties and estimate quantities
- improve their ability to take decisions based on incomplete data and information
- are informed about different (qualitative and quantitative) methods and techniques for spatial research
- learn about different types of research (theoretical, empirical, action-oriented, qualitative, quantitative)
- get skilled for writing simple research essays
- are urged to question their own knowledge and challenge the course of action taken in planning processes
The course is based on the following questions:

How do we deal with complex issues in planning?
- Forms of knowledge, half-knowledge and not knowing
- Occurrence and explanation patterns for irrational behaviour
- Spatial research and planning practice
- Planning maxims
- Mapping complex topics in research questions

How do we generate knowledge about complex issues?
- Methods for scientific data generation
- Applied handling of quantities and probabilities
- Estimating despite uncertainties
- Opportunities of digitisation in planning (Participation, BigData)

How do we react to complex questions in planning?
- Methods of scientific data analysis
- Making decisions despite incomplete information
- Dealing with robustness and fragility

More specifically, the lectures focus on the following topics (NB: Some content units will be presented in English, they are marked with *asterisk below)
- (Half-) knowledge/behaviour/irrationalities
- Initial situation: Solving complex problems
- Behavioural patterns, occurrence and explanation patterns for irrational behaviour
- Methods for solving complex tasks in planning practice
- Spatial research and planning practice - connections, differences, overlaps
- Challenges in the solution of complex tasks: System delimitation, interdisciplinarity, retrospective vs. prospective approach (descriptive vs. action-oriented, "reflected scenario building")
- Planning maxims
- *Methodology in spatial research
- *Research design
- *Research questions (types of research questions; research questions, hypotheses and theories); justification of research question
- Data generation methods (interviews and questionnaires, ethnography and observation, documents, official statistics)
- *Research ethics
- Decision-making despite incomplete information
- Dealing with complex systems/roughness
- *Role of science in planning - the perspective of both research and practice

Learning materials: available online (Moodle) before corresponding lecture.

Literature

101-0427-01L Public Transport Design and Operations W 6 credits 4G F. Corman, F. Leutwiler

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view
At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport
Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes
Lecture slides are provided.

Abstract
The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

Objective
- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool
The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab sessions take place regularly to guide and support students with the applied part of the course.

Literature

103-0347-01L  Landscape Planning and Environmental Systems (GIS W 3 credits 2U A. Grêt-Regamey, C. Brouillet, N. Klein

Abstract
The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Objective
- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Developing landscape planning measures for practical case studies

Content
- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

Lecture notes
A script and presentation slides for each exercise will be provided on Moodle.

Literature
Will be named in the lecture.

Prerequisites / noticed
Basic GIS skills are strongly recommended.

103-0569-00L  European Aspects of Spatial Development W 3 credits 2G A. Peric Momcilovic

Abstract
Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making
Content
- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

Lecture notes
The documents for the lecture will be provided at the moodle.

Does not take place this semester.
The objective of the course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials.

The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identity, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Please note that the class is designed for full-time MSc students. Interested MAS students need to send an email to Linda Armbruster to learn about the requirements of the class.

101-0193-00L
Systemic Design Labs: RE:GENERATE Alpine-Urban

Abstract
Systemic design (SD) optimizes an entire system as a whole, rather than its parts in isolation. SD is iterative, recursive and circular, requires creative, curious, informed and critical systems thinking and doing, yielding radical resource efficiency. It systems mapping, design thinking, footprint assessment, network analysis, test planning, prototyping, fabrication, social experiments.

Objective
The teaching purpose of Systemic Design Labs (SDL) is to better tackle the complexity of today’s sustainability challenges. Often, in current education we learn to disassemble design challenges into their bits and parts for individual optimization. While being useful for developing topical expertise, this reductionism to parts with less emphasis on their interaction does not match with the growing complexity of today’s challenges. In contrast, systemic design approaches a task from a holistic perspective, zooming out of a system to reveal its structure and connections between its parts – to zoom in on the hub of influence that matters most.

The objectives of the course are to introduce students to Systemic Design as theory, methodology and practice. This includes whole systems thinking, circularity, cross-scale design, Gigamapping, and more. The course stimulates overall reflective eco-social thinking in design, planning and engineering disciplines.

Content
Design Challenge: How to re-design alpine-urban circularity? How to revive mountain livelihoods, focusing on local identity, resilient landscapes and a regenerative economy? What is a regenerative relation between the alpine and the urban? Covid has accelerated and intensified a traditionally challenging relation of the alpine (mountain livelihoods) and the urban. Both depend on each other, but there are as well many unsustainable elements in this relation, especially for the alpine.

The specific design challenge is to identify and layout a holistic, partly quantified and visualized systems strategy for building a resilient community economy in relation to the actual Covid driven pressure factors in the relation of the alpine with the urban. We build upon former ETH SDL students who developed a systems maps for the community of Ostana, Italy, that embraces local identity, revitalizes cultural and landscape biodiversity, and creates alpine-urban circularity.

This course will extend this systems map to more clearly understand the urban component, the source market, and design in new opportunities of urban-alpine regeneration, for circularity, for new ways of tourism, of mobility, in a creative economy.

Recap of former SDL courses:
In Ostana, a clear connection is between the local identity (culture, traditions, visions) which is formed by Occitan culture (food, music, dance, language), traditional stone building architecture which is under pressure to carefully evolve with new needs for carbon-neutral and net-positive buildings, and the Monte Viso landscape. How does a re-growing economy that should be regenerative and circular by design, correlate with innovation in architecture, with population growth and associated challenges in mobility, waste systems and supplies, with growing tourism, new agro-forestry practices like industrial hemp and Paulownia, while impacts of climate change are clearly visible? How does the community design a vision that is based on cooperation on different governance scales, balancing local identity and urgently needed international innovation?

Deliverables & output: This SDL course RE:GENERATE builds upon related work from former courses hosted and lead by the MonViso Institute (i.e. on social innovation, mobility, architecture and local identity, tourism, circular economy, land use change) to develop and design foundations for an extension of the existing, visualized and partly quantified systems map, that will support ongoing and future innovation processes in this community. The focus now is on the urban integration into new, regenerative business models of the alpine, and in regenerative relation between both as a model for the future. This course will thus develop an extended graphical systems map from the alpine to the urban, backed up by a technical report, and connected with the existing systems maps of Ostana and the surrounding valley.

Lecture notes
see learning materials and https://systemicdesignlabs.ethz.ch/.

Literature
Depending on the Covid situation, some part of the course will be virtual via Zoom, using a Miro design board. If possible, we will do a field trip. Some travel costs may apply. Students need to be motivated to design in teams on the preparation of the deliverables, a systemic strategy map and a written report.

Mixed Reality

Abstract

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective

After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice

Prerequisites include:
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

</tbody>
</table>

Abstract

Introduction to general scientific working methods and skills in the core fields of geomatics. It includes a literature study, a review of one of the articles, a presentation and a report about the literature study.

Objective

Learn how to search for literature, how to write a scientific report, how to present scientific results, and how to critically read and review a scientific article.

Content

A list of topics for the literature study are made available at the beginning of the semester. A topic can be selected based on a moodle.

Prerequisites / notice

Agreement with one of the responsible Professors is necessary.

Abstract

Working on a concrete interdisciplinary task in Geomatics

Objective

Promote independent, structured and scientific work in an interdisciplinary context; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content

The project work is supervised by a professor. Students can choose from different subjects and tasks.

Prerequisites / notice

The project can be carried out in German upon mutual agreement between supervisor and student.

**Abstract**
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

**Objective**
To work independently and to produce a scientifically structured work.

**Content**
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

<td>A. Wieser</td>
</tr>
</tbody>
</table>

**Abstract**
Introduction to the most important sensors, operation and calculation methods of Geodetic Metrology

**Objective**
Getting to know the most important sensors, operation and calculation methods of Geodetic Metrology

**Content**
Overview on the different domains of geodetic metrology
- Geodetic instruments and sensors
- Determination of 3D-coordinates with GNSS, total station and levelling
- Calculation methods of geodetic metrology
- Survey and stake-out methods

**Lecture notes**
Slides and additional material used in the associated regular course Geodätische Messtechnik GZ (in German) are provided in electronic form.

**Literature**

**Prerequisites / notice**
The field course is part of this lecture. Practical exercises complete the subjects taught during the semester.

If evidence of equivalent practical experience in surveying cannot be provided by the student, participation in the field course during the respective next available period (i.e. 1 week in the beginning of the summer holidays) is required.

**Abstract**
The lecture course discusses the basic concepts, approaches and methods of transport planning in both their theoretical and practical contexts.

**Objective**
The course introduces the basic theories and methods of transport planning.

**Content**
- Basic theoretical links between transport, space and economic development
- Basic terminology
- Measurement and observation of travel behaviour
- Methods of the four stage approach
- Cost-benefit analysis

**Literature**

<tr>
<td>103-0153-AAL</td>
<td>Cartography II</td>
<td>E-</td>
<td>6</td>
<td>13R</td>
<td>L. Hurni</td>
</tr>
</tbody>
</table>

**Abstract**
Theory and mathematical basics of the cartographic visualisation of attributed geo-objects for static and interactive maps (with exercises).

**Objective**
The course offers first computer graphics and mathematical basics and concepts of cartography. The accompanying exercises introduce further cartographic and GIS software, programming libraries for cartographic visualisation purposes. It is shown how web browsers, text editors and scripting languages can be used to develop efficient tools for cartographic data processing, design, and visualisation.

**Content**
- Cartographic workflow, data types, data capturing, data sources and legal aspects.
- Introduction to QGIS, ArcGIS and OCAD for cartographic applications.
- Data types: Analytical and visualisation processes in cartography.
- Colour management and pre-press processes.
- Web maps using HTML, CSS, JavaScript, SVG and Canvas 2D.
- Interaction with diagrams and maps.
- Libraries and APIs for cartographic applications.

**Lecture notes**
Will be distributed module by module

**Literature**
References and other materials will be distributed by the supervisors.
- Students are requested to contact the supervisors in advance for detailed instructions.

**Prerequisites / notice**
Cartography Fundamentals or similar introduction courses in Cartography.
The basics of photogrammetry, its products and applications: the principle of image-based triangulation; digital aerial cameras and related sensors; projective geometry; mathematical modeling, calibration and orientation of cameras; photogrammetric reconstruction of points and lines, and stereoscopy; orthophoto generation; digital photogrammetric workstations; recording geometry and flight planning applications of image-based 3D measurement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Objectives
- Vector graphics, map projection, land use maps, printing technology, topographic maps, map critics.
- Further references and other materials will be distributed by the supervsors.
- Students are requested to contact the supervisors in advance for detailed instructions.

**Course Content**
- Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analogue and digital map production technology, prepress technology, printing technology, topographic maps, map critics.

**Literature**
- Further references and other materials will be distributed by the supervisors.
- Students are requested to contact the supervisors in advance for detailed instructions.

**103-0253-AAL Parameter Estimation**
- **Objective**: Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
- **Abstract**: This course provides basic knowledge on parameter estimation and data processing. The necessary mathematical and statistical methods are developed and are applied to actual examples in geomatics.
- **Content**: The students are capable of analysing measurements with with appropriate methods. They can optimally extract model parameters from real measurements and are able to analyse and to retrieve additional information from time series. They understand the underlying algorithms of different geodetic analysis tools and processing methods.

**103-0254-AAL Photogrammetry**
- **Objective**: The class conveys the basics of photogrammetry. Its aim is to equip students with an understanding of the principles, methods and applications of image-based 3D measurement.
- **Abstract**: The aim is an understanding of the principles, methods and possible applications of photogrammetry. The course also forms the basis for more in-depth studies and self-reliant photogrammetric project work in further photogrammetry-related courses.
- **Content**: The basics of photogrammetry, its products and applications: the principle of image-based triangulation; digital aerial cameras and related sensors; projective geometry; mathematical modeling, calibration and orientation of cameras; photogrammetric reconstruction of points and lines, and stereoscopy; orthophoto generation; digital photogrammetric workstations; recording geometry and flight planning applications of image-based 3D measurement.

**103-0274-AAL Image Processing**
- **Objective**: Introduction to basic concepts and methods of digital image processing.
- **Abstract**: Understanding core methods and algorithms in image processing and computer vision and the underlying signal processing foundations. Applying image processing algorithms to relevant problems in photogrammetry and remote sensing.
- **Content**: Properties of digital images, Sampling, quantisation and signal processing, Colour spaces and transformations, Geometric image transformations, Image morphology, Discrete convolution, Image filtering, Texture descriptors, 2D Fourier transform and the Fourier domain, Pattern recognition: corner and edge extraction, Image segmentation.

We suggest the following textbooks for further reading:
- ISBN: 013168728X
- ISBN: 0130038519

**103-0313-AAL Spatial Planning and Landscape Development**
- **Objective**: Acquisition of basic knowledge about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.
- **Content**: Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics. Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

**Literature**

Introduction to programming in Java. Procedural foundations of programming and outlook to object oriented programming. Variables, types.

Integrated Spatial Planning in Cities and Districts

To acquire basic knowledge of Linear Algebra and some aspects of related numerical methods and the ability to apply basic algorithms to spatial planning.

M. Akka Ginosar

The lecture introduces into the main-features of spatial planning. Attended will be the subjects of planning as a national responsibility, instruments of spatial planning, techniques for problem solving in spatial planning and the Swiss concept for regional planning.

Objective

- To get to know the interaction between the community and our living space and their resulting conflicts.
- Link theory and practice in spatial planning.
- To get to know instruments and facilities to process problems in spatial planning.

Prerequisites:

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The course aims to introduce students to the main features of spatial planning. It will cover subjects such as the national responsibility of planning, the instruments of spatial planning, and the Swiss concept for regional planning.

Objective

- To understand the interaction between the community and living space and their resulting conflicts.
- Link theory with practice in spatial planning.
- To become familiar with instruments and facilities for processing planning problems.

Content

The course will cover topics such as planning as a national responsibility, instruments of spatial planning, and the Swiss concept for regional planning.

- Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Abstract
Mathematical tools for the engineer

Objective
Mathematics as a tool to solve engineering problems. Mathematical formulation of technical and scientific problems. Basic mathematical knowledge for engineers.

Content
Complex numbers.
Calculus for functions of one variable with applications.
Simple Mathematical models in engineering.

Literature
Textbooks in English:
- M. Akveld, R. Sperb: Analysis I, vdf
- L. Papula: Mathematik für Ingenieure und Naturwissenschaftler, Vieweg Verlag
- L. Papula: Mathematik für Ingenieure 2, Vieweg Verlag

406-0603-AAL
Stochastics (Probability and Statistics)  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 4: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R" (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Literature
- "Statistics for research" by S. Dowdy et. al. (3rd edition); Print ISBN: 9780471267365; Online ISBN: 9780471477433; DOI: 10.1002/0471477435
From within the ETH, this book is freely available online under: http://onlinelibrary.wiley.com/book/10.1002/0471477435

103-0357-AAL
Environmental Planning  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
The lecture covers tools, methods and procedures of Landscape and Environmental Planning developed. By means of field trips their implementation will be illustrated.
Objective
Knowledge of the various instruments and possibilities for the practical implementation of environmental planning.
Knowledge of the complex interactions of the instruments.

Content
Topics of the Lectures
- forest planning
- inventories
- intervention and compensation
- ecological network
- agricultural policy
- landscape development concepts (LEK)
- parks
- swiss landscape concept
- riverine zone
- natural hazards

Note: there are several non-obligatory field trips as part of the lecture. It is recommended to participate at these to boost the in-depth understanding of the different topics.

Lecture notes
- lecture notes concerning the instruments
- handouts
- copies of selected literature

Ein Skript in englischer Sprache wird semesterbegleitend herausgegeben. Das Skript und die Folien werden auf der Vorlesungshomepage zum Herunterladen bereitgestellt.

Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

zum Herunterladen bereitgestellt. Die Konzepte der Vorlesung werden jeweils durch Algorithmen und Anwendungen motiviert und illustriert.

- The geomatics workflow
- Understanding the major observation techniques in space geodesy as modern methods applied in Earth system monitoring (geometry, rotation and gravity field of the Earth and the atmosphere), in national surveying and navigation.

Abstract
GPS, VLBI, Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations. Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters. Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enroll for this course unit.

Objective
Know the fundamentals in geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.
this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Advanced geoinformation technologies and analyses methods: Mobile GIS; Web-GIS & Geo-Web-Services; Spatial Big Data; Temporal aspects in GIS; Analysis of movement data; User interfaces

Objective
Knowing advanced topics of geoinformation technologies (Mobile GIS and Web-GIS) and spatio-temporal analysis methods for the realization, application and operation of Web-GIS in engineering projects.

Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Literature

<tr>
<td><strong>Abstract</strong></td>
<td>In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>By the end of this lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuromaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.</td>

**Eros: Athens, Rome, Vienna, Paris**

**W** 3 credits 2V G. Sissa

**Abstract**

Once upon a time there was natural law, the foundation of sexual relations between two people of different genders, in order to procreate. Today, new rights and new forms of life are profoundly transforming both national and global politics, and are changing the way we think about gender, love, and the body. This course presents some crucial moments of this distant past, in which knowledge, practices and representations have shaped disparate experiences of desire, pleasure and the body. Challenges for a fluid present, ideas for the near future.

**Objective**

This course presents some crucial moments of this distant past, in which knowledge, practices and representations have shaped disparate experiences of desire, pleasure and the body. Challenges for a fluid present, ideas for the near future.

**Content**

**The Modern City and Cultural Criticism. The “Knowledge of Life” in Reform Movements 1880-1933**

**W** 3 credits 2V S. S. Leuenberger

**Abstract**

Rapid industrialisation, urbanisation and the unique sociopolitical conditions of 19th century Germany led, from 1880 onwards, to radical changes in society. These changes were not only brought about by the bourgeoisie and youth. This lecture focuses on the theory and aesthetic practice of a wide range of reform movements, the so-called “Lebensreform” (life reform movement).

**Objective**

The lecture is part of the “Science in Perspective” course programme: students will learn about the precursors of today’s calls for reform and alternative concepts which propagated the “back-to-nature” lifestyle around the 1900s.

**Content**

The rapid industrialisation, mechanisation and urbanisation of 19th century Europe gave rise to a whole new set of challenges and problems. From 1880 onwards, the unique sociopolitical conditions in Germany resulted in anti-urban and cultural criticism by parts of the bourgeoisie and academic youth, culminating in the idea that the fanatical belief in progress would lead to disaster. Consequently, a wide array of reform movements sprang up, focusing on medical hygiene and sociopolitical, ideological, religious and spiritual concepts, which were intended to heal the mind and body. These movements were a wholly German and Swiss phenomenon and summarised under the term “Lebensreform” which also encompassed naturopathy, dress reforms, naturism, health and vegetarianism, youth and women’s movements, sexual liberation and intentional communities, organic farming, land reform, cooperative/free economy/garden city movements, nature conservation and homeland protection, progressive education and country boarding school movement, art education and Dalcroze eurhythmics, expressive dance, theatre reforms, regional literature and art, anthroposophy, the emergence of Germanic-German/Germanic Christian religious communities, religious socialism and the Jewish renaissance.

This movement was clearly politically diverse, and attracted all manner of advocates, for example, those with social anarchist, jingoistic or anti-Semitic beliefs. What made them kindred spirits was their rather negative experience of modernisation: their fantasies about the era merely confirmed that existing interpretations of the human existence (Dasein) were obsolete. Amongst the fantasies was, as described by Gert Mattenklott, the idea of a dramatic shift in current thinking and the creation of a new world, the emergence of a new mankind that embodied the characteristics of youth, and a new community. Strong dichotomies like light and darkness, hot and cold, the fears of dehumanisation and a propensity for vegetarianism were also typical of life reforms.

The lecture is part of the “Science in Perspective” course programme: students will learn about the precursors of today’s calls for reform and alternative concepts which propagated the “back-to-nature” lifestyle around the 1900s. Some of the key concepts used then are unknown today or have been disavowed due to exploitation by the totalitarian regimes of the 20th century. Nevertheless, some of the original topics and debates have once again become contemporary topics of discussion due to the debate about the future of society, the whole of mankind and the planet. Historization of present-day concepts is the condition on which plans for a possible future can be compared with previous attempts and experiences, and to identify alternatives and potential impasses, and provide objective evidence for debate.

**Literature**

The reading list includes literary texts and discursive texts, amongst others, from Gustav Landauer, Erich Mühsam, Else Lasker-Schüler, Paul Scheerbart, Heinrich and Julius Hart, Rudolf Steiner, Sebastian Kneipp, Max Bircher-Benner, Theodor Hertzka, Franz Oppenheimer, Lilien and Fidus (pseudonym Hugo Höppener).

---

851-0125-65L

**A Sampler of Histories and Philosophies of Mathematics**

**W** 3 credits 2V R. Wagner

**Abstract**

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

**Objective**

The course aims are:

1. To introduce students to the historiography of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices.

**Content**

Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

---

851-0197-00L

**Medieval and Early Modern Science and Philosophy**

**W** 3 credits 2V E. Sammarchi

**Abstract**

The course analyses the evolution of the relation between science and philosophy during the Middle Age and the Early Modern Period.

**Objective**

The course aims are:

- To introduce students to the philosophical dimension of science;
- To develop a critical understanding of scientific notions;
- To acquire skills in order to read and comment on scientific texts written in the past ages.

**Content**

The course presents some of the key figures in the history of science and philosophy and the development of the modern scientific method. Several case studies, taken from different scientific fields (especially algebra, astronomy, and physics) are presented in class in order to examine the relation between science and philosophy and the shift from medieval times to the early modern world.

---

851-0082-00L

**Literature and the Knowledge of the Social**

**W** 3 credits 2G A. Alon

**Abstract**

The course shows what extent "literature" from the 19th to the 21st century and the - often empirical - sciences of the social are mutually dependent. It is based on theoretical social science texts as well as literary genres that are used to model knowledge, primarily crime novels and spy novels, but also travelogues and city novels or genres such as the social science survey.

**Science in Society**

**Objective**
Not a few members of the elites argue that important issues in democracy like policies against climate change, free trade agreements, urban planning are too complicate for the people. Experts should have a stronger say in politics. Less democracy = more rationality? The course should give an answer to this question.

**Abstract**
Whose voice should count how much? On the authority of the sciences in democracy.

851-0096-00L

6 credits
2G
L. Wingert

**Basic Problems of Environmental Ethics**

**Objective**
Participants should become familiar with basic approaches to central problems in environmental ethics.

**Abstract**
Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distribution of the burdens in the struggle against the climate change? What is the responsibility and what is under nature? How should we run our economies?

**Literature**

851-0101-80L

6 credits
2G
L. Wingert

**From Cotton to Cocaine:**

**Objective**
Each course focuses on a particular commodity and explores how its production, trade and consumption was entangled with important political, social and cultural developments. Taken together, the case studies (ranging from agricultural crops, via chemically produced drugs to mechanical marvels such as the gramophone) provide a picture of major global transformations in the past 300 years.

**Abstract**
Each session aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants' understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and 'exotic' the inter-cultural sensitivity of the students will be enhanced.

**History Part One:**

**Objective**
On one level, the course aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants' understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and 'exotic' the inter-cultural sensitivity of the students will be enhanced.

**History Part One: Europe (The Cradle of Modernity, Britain, 1789-1914)**
J. Ghazoul

The philosopher Günther Anders characterized his monograph "Die Antiquiertheit des Menschen" as a "philosophical anthropology in the long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments today.

M. Hagner

**Günther Anders: The Antiquity of Man**

The goal of this seminar is a close reading of Günther Anders’s "Die Antiquiertheit des Menschen", reflect its main topics and hypotheses.

At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments today.

A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture course will provide students the opportunity to critically reflect on how these questions are relevant for their own academic practices.

**ECTS**

Mandatory and further reading will be listed on the course plan that is made available as from the first session.

There is agreement across academic disciplines today that gender influences and structures the production of knowledge and that scientific disciplines, that provide accessible insights into the intersection between gender studies and the guest lecturer’s research field. Students will thereby be encouraged to learn from concrete examples rather than abstract theory. The goal is for students to understand how to apply concepts and methods of gender studies to particular disciplines. A mid-term discussion session and end-term assignment will provide students the opportunity to critically reflect on how these questions are relevant for their own academic practices.

### Seminars

#### 851-0020-00L Gender and Science

**W 2 credits**

C. L. Blaser, M. Ligtenberg

This lecture series offers an introduction to the relationship between gender and science, with a focus on the specific intersections with the sciences taught at ETH.

**Objective**

This lecture series is designed to acquaint students from all levels and departments with the various ways in which gender perspectives matter for specific scientific disciplines, as well as for science in general. Students will learn to recognize and analyse the specific ways in which scientific theories and methods are gendered, and how this connects to their own scientific disciplines.

**Content**

There is agreement across academic disciplines today that gender influences and structures the production of knowledge and that scientific knowledge production in turn shapes gender notions. Even within "hard" sciences such as mathematics, physics, engineering, etc., gender is a significant factor in determining what counts as "objective" knowledge, who can know it, what kind of knowledge is produced, or how this knowledge is acquired and justified. Feminist research aims to reveal how dominant conceptions of science and knowledge practices disadvantage women, and other subordinate groups, with the goal of reforming these practices. An important part of feminist critique is to show that such efforts substantially improve the overall quality of research.

The semester will start with an introductory lecture acquainting students with research questions in the field of Gender and Science by summarizing its key concepts and methods. It will then continue as a series of weekly guest lectures, given by scholars from different scientific disciplines, that provide accessible insights into the intersection between gender studies and the guest lecturer’s research field.

Students will thereby be encouraged to learn from concrete examples rather than abstract theory. The goal is for students to understand how to apply concepts and methods of gender studies to particular disciplines. A mid-term discussion session and end-term assignment will provide students the opportunity to critically reflect on how these questions are relevant for their own academic practices.

### Seminars

#### 701-0019-00L Readings in Environmental Thinking

**W 3 credits**

J. Ghazoul

This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

**Objective**

The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

**Content**

The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

**Literature**

Leopold (1949) A Sand County Almanach

Carson (1962) Silent Spring

Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

**851-0430-00L Günther Anders: The Antiquity of Man**

**W 3 credits**

M. Hagner

The philosopher Günther Anders characterized his monograph “Die Antiquiertheit des Menschen” as a “philosophical anthropology in the age of technology”. And others had written his book under the impression of the atom bomb, the computer and visual mass media. Today, the book is more relevant than ever: What is the role of human beings in the Anthropocene?

**Objective**

The goal of this seminar is a close reading of Günther Anders’s "Die Antiquiertheit des Menschen", reflect its main topics and hypotheses and discuss their relevance for our time.

**Content**

The basic material for this seminar will be the monograph „Die Antiquiertheit des Menschen" (https://www.chbeek.de/antiquiertheit-menschen-bd-1-uber-seele-zeitalter-zweiten-industriellen-revolution/product/23611879)). Reading this book and other texts will lead to a comparison between the period after WW II (1950s-1970s) and the situation in the early 21st century. What can philosophical anthropology tell us about the role of human beings in the age of anthropocene?
851-0011-00L The Body in Global History

Abstract
While being the universal constant which is common to every human being in history, the body is also culturally and historically specific. In this seminar we will examine how ideas of the body have changed throughout history and how these ideas of the body can be useful to understand political, social, and cultural phenomena in particular historical settings.

Objective
Students learn the history of the body from mid-eighteenth century onwards through examples taken from the multidisciplinary scholarship on the body with a special, albeit not exclusive, focus on colonial and postcolonial contexts. More specifically, students are sensitized to the historical and cultural variabilities of the human body that challenge scientific understandings of it as an unchanging biological entity. Adopting a humanities perspective on topics like anatomy and surgery, the treatment of the insane, sexuality, physical culture, eugenics, and body productivity, the course looks at shifting attitudes to body health and fitness and the ways these have been shaped by considerations of gender, race, and class as well as by socioeconomic circumstances of modernity. It considers how bodies have historically concerned governments who have classified different (sections of) populations as "fit" or "unfit" to be members of a certain community.

The "long durée" approach of the course allows to consider the continuities and changes in terms of scientific epistemologies and practices regarding the body. In doing so, debated contemporary issues such as assisted reproductive technologies and wearable systems of surveillance of the worker fatigue in the workplace are discussed.

The course is structured thematically, adopts a multidisciplinary approach, and uses academic texts as well as concrete examples. It intends to a) enable STEM students to develop new perspectives on their core subjects by bringing them in dialogue with the themes dealt with and by raising ethical questions; b) familiarise students in general with major topics in the field of the recent scholarship on the body and make them mindful of the multiple ways in which understanding the body and its relationship with culture and power can help think critically of the present we live in.

851-0175-00L Images of the Human

Abstract
This seminar will explore the multiple transformations of the conception of the "human" in the face of the current scientific, social and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

Objective
By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.

Content
The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the "human". In this way, computer science and technoscience join other scientific disciplines having experienced the need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre's lecture series of this year will be dedicated to exploring the multiple images of the human at work across human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre's activities, the focus will be on current digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.

851-0422-00L A Modern Utopia: Science and Visions of the Future

Abstract
This course explores how science and technoscience produced utopian or dystopian visions of the future in historical context, assessing how they have developed in the physical, natural, and economic sciences since c.1880 have shaped possible "futures" in Western thought.

Objective
This course equips students with the skills to assess how scientific ideas diffused broader ideas of present and future societies in the West since industrialization. Students will be able to compare and contrast different developments in the relationship between science and society, identify key trends in thinking about the future, and explain how science informed ethical and social questions.

Content
This course offers an overview of the history of science and technoscience since 1880 by exploring the intersection of thinking about science and society in the modern utopian tradition, starting with Darwinian evolution, capitalism, and new transport and communication technologies. Different historical cases across the 20th century where scientific and technological change played a central role in defining visions of the future will be studied in detail. We will explore case studies like the impact of new technologies on visions of future war, the atom bomb, overpopulation and ecological catastrophe, transhumanism, AI, and the significance of new digital technologies for the posthuman future. Course materials will include histories of science and technology in addition to popular science texts and science fiction.

851-0421-00L Sapiens: A Reading Course

Abstract
Yuval Noah Harari's "Sapiens" is the most successful historical book of recent years. The seminar examines the text from a history of scientific perspective: What kind of sources does it rely on? What type of history is being written here? And in what tradition does "Sapiens" represent a popular non-fiction book?

Objective
In the course of the seminar, the students develop the competence to deal with the original text and the research literature on the history of anthropology, science and technology in a critical and historically thoughtful way. In doing so, they practice navigating independently through historical literature by means of smaller research tasks.

Content
The aim of the seminar is to introduce students to the history of science in anthropology, prehistory and popular science literature on the history of mankind by reading "Sapiens". In addition to studying and critically discussing the original text, the students explore significant scientific and historical contexts of the book in small groups and present them in the seminar. In this way, they develop an understanding of the underlying narratives and popular science genres that inform "Sapiens".

851-0527-00L Introduction to the History of Technology: Concepts, and Current Debates

Abstract
Technology and society cannot be separated. No society functions without technology. The seminar offers a problem-oriented introduction to basic questions we want to ask about the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

Objective
This course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

Content
History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses vary from the technological and social change that are a product of contemporary orientation and thinking; current historiographical methods provide the tools for answering these questions.

851-0168-00L Aristotle’s Lecture on Physics

Abstract
Aristotle’s lecture on physics is a theory of movement. But his concept of movement or change (kinesis) is much more general than the modern one, that applies only to changes of place by bodies. This as far reaching consequences. Aristotle’s physics can therefore be interpreted as a general theory of natural processes.

Objective
Students should develop a clear understanding of a complex pre-modern theory of nature.

Content
Aristotle’s lecture on physics is a theory of movement. But his concept of movement or change is much more general than the modern one, that applies only to changes of place by bodies. This as far reaching consequences. Aristotle’s physics can therefore be interpreted as a general theory of natural processes.

851-0162-00L Philosophy of Physics

Abstract
Philosophy of Physics

Objective

Content
Number of participants limited to 50.
Close reading of and reflection about selected texts from physicists (e.g. C.F. Weizsäcker, Wilczek, Susskind) on the philosophical problems and consequences of their work.

Participants should develop a clear view of the epistemological foundations of their work and its consequences for philosophy of science and philosophy of nature.

Newton's opus magnum of 1687 is still called a philosophy of nature: "Philosophiae Naturalis Principia Mathematica". The separation of physics from philosophy is new, and institutionally executed only in the 19th century. Since than the experiment is not a philosophical method and mathematical symbolization not part of the languages of philosophy anymore. But although the subjects were divided methodically they stayed in contact via their content. This can be seen in the reflexions of physicists like C. F. v. Weizsächer, Frank Wilczek or Leonard Susskind, who were all concerned with epistemological questions and topics related to the philosophy of science and philosophy of nature. The seminar is devoted to these reflexions and will ask in what relation the philosophy of physicists stands to the physics of their time. We will discuss problems of the unity of physics, of emerging laws and of the beauty or ugliness of the physical universe resp. the theories about it.

The course follows the concept of an "inverted classroom". A prerequisite is that the relevant texts have been read prior to the lecture. The assistants will give support.

851-0087-00L
Knowledge and Practice in Philosophy of War
Does not take place this semester.

W 3 credits 2S

A. Kilcher

In the seminar we read classical texts from the field of 'philosophy of war'. Due to today's technological advancements and ecological problems, we will also discuss contemporary conceptions of war such as lethal autonomous weapons and climate change. Important questions that arise are: Is the concept of war only applicable to human society? Is there a difference between politics and nature?

Students will learn about the different types of arguments and conceptions in philosophical texts and their historical context. They should learn to understand the descriptive and critical value of texts in regard to the topic of war.

Technology and the Environment – On Course for Collision?

W 3 credits 2S

A. Schubbach. J. Noller

Technology has been both the cause and the solution of many environmental problems. Motor vehicle emissions contribute to climate change. Apps are supposed to help us minimizing our CO2 footprint. This course examines which politics, social relations, economic interests, environmental changes, and forms of engineering have conditioned which types and consequences of technology in modern history.

Students will discuss primary and secondary sources about the relationship between technology and the environment since the nineteenth century. They will learn to analyze argumentative strategies, divergent perspectives, and consequences and to write precisely and trenchantly about technology and the environment in society.

851-0081-00L
Artificial Intelligence. Interdisciplinary Perspectives

W 3 credits 2S

A. Schubbach. J. Noller

In the last 50 years, research on artificial intelligence (AI) has repeatedly boomed but failed to deliver on its great promises. In the last decade, however, especially the deep learning approach has achieved remarkable results. This eLearning-seminar will discuss epistemological, but also ethical and political aspects of these recent developments in interdisciplinary perspective.

Students will learn to reflect on one of the most attention-grabbing technologies of recent years in terms of its epistemological basis and social impact.

In the last 50 years, research on artificial intelligence (AI) has repeatedly boomed but failed to deliver on its great promises. In the last decade, however, especially the deep learning approach has achieved remarkable results and is already applied in many contexts. Since this approach breaks with assumptions of the older symbolic approaches of AI research, a new philosophical discussion is needed.

Therefore, the interdisciplinary seminar will start from the classical philosophical debate, which was shaped by thinkers like Herbert Dreyfus and John Searle and focused on the concept of the rule following, in order to confront it with the newer state of research, its data driven approach and the concept of learning. We will discuss the consequences and challenges of these new approaches in AI for their theoretical and philosophical reflection. In a second step, the seminar will discuss not only epistemological, but also ethical and political aspects of the recent developments in AI in interdisciplinary perspectives.

Max Frisch: Experiments of Storytelling

W 3 credits 2S

A. Kilcher

This seminar provides an insight into the poetic and narrative procedures of Max Frisch's prose writing. Frisch's writing can be essentially understood as experimenting as a new mode of narration which takes on epistemological functions and treats themes of existential philosophy.

1) Overview of the prose writings by Max Frisch; 2) insight into the poetic and narrative procedures of Max Frisch's prose writings; 3) understanding of the novels of Max Frisch as epistemological and philosophical projects.

"Narrative: but how?", asked Max Frisch in his diary. In his prose the answer to this question is definitely troublesome since it transcends the classic form and function of narrative. His novels - from Stiller (1954), Homo faber (1957), Mein Name sei Gantenbein (1964) to his late prose Montauk (1975) and Der Mensch erscheint im Holozän (1979) - but also his journals (including 1950) can be essentially understood as experiments of a new mode of narration, which implies a multiple perspective. Not only is the narrative performed according to a formal technique, but, at the same time, it takes on epistemological and existential philosophical functions. The purpose is epistemological since this type of narrative strives to generate knowledge; it is existential philosophical as soon as characters such as Stiller and Gantenbein prove to be myth-maniac inventors of their self. Out of necessity, or playfully, they perform (other) identities. "Ich probiere Geschichten an wie Kleider", thus Gantenbein and again Montauk. Narrative, play, disguise, and (self)deception become anthropological practices; even as "Gier nach Geschichten" (craving for stories) they become an elementary effort of human life.

The Unconditionality of Knowledge: Faust in European Literature

W 3 credits 2V

A. Kilcher

His unconditional desire for knowledge made "Faust" the symbolic figure of the modern period. Since the Renaissance, a rich Faust-literature, ranging from Marlowe, Goethe, and up to Thomas Mann, has portrayed the highly conflictual emancipation of knowledge from theology as well as the self-assertion of a modern knowledge of nature and the human being.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 921 of 2159
Learning objectives: Faust is one of the most dazzling figures in European literature and cultural history. A pact with the devil, magic, sexual desire, power and knowledge, these are the great taboos of the medieval world, which, in 1500, the graduated theologian set out to dismantle. Through this demonstrative gesture of hubris, he became the much-disputed hero of the modern period. Since the "Historia von Johann Fausten" (1587), the wide range of Faust-literature also depicts the highly conflictual emancipation from theological knowledge in favor of an unconditional knowledge of nature and the human being that hides itself behind disciplines such as medicine, astrology and magic. Faust was thereby not only transformed into the epitome of the fortuneteller, he also became the cipher for the risky undertaking of modern knowledge as such, to which he then spectacularly fell victim in an experiment. Consequently, the course's treatment of this subject matter in the literature since the early modern period will center on the question of knowledge as it is negotiated through the Faust-figure, initially, we shall take a look at examples from the early modern period (apart from the Faust-book from 1587, among others the drama version by Christopher Marlowe, 1589). Then we shall move on to new editions around 1800, which highlight the modernity of this norm-transcending and boundary-breaking knowledge paradigm (among others Goethe's Faust). Finally, we shall discuss Faust-figures of the 20th century, such as Friedrich Murnau's Faust movie (1926), Thomas Mann's novel, "Doktor Faustus", written in exile in 1947, or Klaus Mann's "Mephisto" (1936).

851-0107-00L
Science and the Public: A Problem of Mediation that the Media Have to Solve?

**Objective**
Ignorance and error are usually unwelcome participants in the sciences and scientific practices, but we know that we cannot get rid of this. The seminar explores interrelations between the architecture of the university and forms of knowledge production. The emphasis is on the contexts of digitization, digital infrastructures and overlaps with built space and determine the self-understanding of the sciences. At its core the course asks you to identify how teaching and research methods correlate with the social, material and spatial structures of the university.

**Content**
The feuillettun of the «Frankfurter Allgemeine Zeitung» of 27 June 2000 has gone down in the annals of recent media history. The last sequences of the fully mapped human genetic code were printed on six large-format pages: the letters A, G, C and T in various combinations and sequences - a "readable" but incomprehensible jumble of letters. What at the time was astounding journalistic coup and not meta-theoretical tasks as well as head shaking can also be read as allegory of the tense relationship between science and the public. What can, what should, what do «laymen» want to know and understand from scientific findings? Scientific knowledge is often provisional: it is subject to correction. That is why it cannot always satisfy the need for certainty and clarity that arises in the public as soon as political controversies are linked to questions of (scientific) knowledge. This is shown by the Corona pandemic, but not only by it. How can science journalism, how can scientists deal with this problem? Do the natural sciences, medicine and technology differ from the humanities and social sciences in terms of "public awareness"? These questions will be explored on some excursions into recent and also older media, scientific and cultural history.

851-0537-00L
Architectures of Knowledge: Infrastructures of the University

**Objective**
The seminar explores interrelations between the architecture of the university and forms of knowledge production. The emphasis is on the end of the 20th century, when digital infrastructures increasingly merged with the spatial constellation of the lecture hall, laboratory and library. We will discuss the discursive spaces that condition the reading, thinking and perception of knowledge.

**Content**
The seminar deals with the spatial-technical organization and communication forms of the university. Of particular interest is how, in the context of digitization, digital infrastructures overlap and intertwine with built space and determine the self-understanding of the sciences. At its core the course asks you to identify how teaching and research methods correlate with the social, material and spatial structures of the university.

851-0079-00L
Ignorance and Error in the Sciences Does not take place this semester.

**Objective**
Ignorance and error are usually unwelcome participants in the sciences and scientific practices, but we know that we cannot get rid of this. In this seminar we will analyze and discuss the different roles of ignorance and error in sciences from a philosophical perspective.

- The students approach the topic of ignorance and error in sciences and their own studies.
- The students reflect ignorance and error in their own scientific practice.
- The students discuss controversial positions in an interdisciplinary context.

**Content**
Ignorance and error are usually unwelcome participants in the sciences and scientific practices, but we know that we cannot get rid of them. In this seminar we will analyze and discuss the different roles of ignorance and error in sciences from a philosophical perspective.

862-0110-00L
Dialectics

**Objective**
Introduction to dialectics in European philosophy from the Platonic dialogues, ancient skepticism, to the Kantian antinomies and Hegelian philosophy to Adorno's negative dialectics.

**Content**
The MAGPW students should know to get the functions and forms of dialectics in European philosophy, from the Platonic dialogues, ancient skepticism, the Kantian antinomies and Hegelian philosophy to Adorno's negative dialectics.

851-0125-75L
Critiques of Scientific Objectivity Number of participants limited to 30.

**Objective**
This course will review some critical reflections on scientific epistemology, challenging prevalent notions of scientific objectivity. We will start with German critiques from the first half of the 20th century (Heidegger, Husserl, Frankfurt school), go on to French critiques from the second half (Foucault, Latour), and conclude with recent feminist and post-colonial critiques.

**Content**
The students will be able to formulate and criticize arguments engaging with prevalent notions of contemporary scientific objectivity. They will be able to critically reflect on the authority of the knowledge that they learn and produce.

**Abstract**
A student is only permitted to commence the Master thesis if:

- the Bachelor degree programme has been completed
- any additional requirements for admission to the degree programme have been fulfilled
- all credits have been acquired in the categories basic courses and major courses and at least 6 credits have been acquired in the category research colloquium

**Objective**
The Master's thesis gives a thorough historical, philological or philosophical analysis of a topic related to the experimental or formal sciences or to technology. It incorporates the relevant research literature on this topic as well as first attempts at original research.

Abstract
Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective
- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing content- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content
Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects:
- History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivism)
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

Literature
- Annen, H., Steiger, R. & Zwygart, U.: Gemeinsam zum Ziel, Huber, Frauenfeld 2004 (provided as pdf)
- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

Fostered competencies
Subject-specific Competencies: Concepts and Theories assessed
Method-specific Competencies: Analytical Competencies assessed
Decision-making assessed
Problem-solving assessed
Leadership and Responsibility assessed
Self-presentation and Social Influence assessed
Critical Thinking assessed
Self-awareness and Self-reflection assessed

| 853-0063-02L | Military History I (without Exercises) | Z    | 3    | 2V    | A. Wettstein, T. Cubito, M. Olsansky |

Abstract
The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Objective
- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

Content
The lecture first examines the bases of the science of military history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century.

Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

Abstract
The lecture series treats high-impact strategic theory from antiquity to the present.

Objective
The participants know how the understanding of strategy has evolved over time.
They understand the interplay of strategy's basic components: ends, ways, means.
They know the most important classics of strategy and war theory, especially against their specific historical background.

Based on the analysis of historical and contemporary examples, they are aware of the mismatch between declaration and implementation of any given strategy.
They are capable of analyzing original texts and modern scholarly works in the field of strategic studies.

Content
The two-term lecture series treats classic texts of strategic studies from antiquity to the present. Term 1 covers the theories up until roughly 1900, term 2 treats the theories eversince.

Theories are considered classic if they were prominent in their respective times and if they enjoyed a strong reception thereafter, be it in literature, in academic debates or as guidelines for action (doctrine). Each out of some 50 theories is discussed in three steps: historical context, core elements and reception.

Lecture notes
Prior to the lectures, the respective slides are provided as well as a primary sources and literature, as preparatory readings (via Moodle).
The program is also available online (www.milak.ch).

Literature

Prerequisites / notice
The lecture is held in German.
Passive knowledge of English and French are required.

### 853-0064-00L 

**Military Sociology I**

**Abstract**
Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

**Objective**
Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

**Content**
Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

**Literature**
A reader with a set of texts will be handed out.

---

### 853-0101-02L 

**Defense Economics I**

**Abstract**
In terms of structure and content, the event follows the lecturer's book "Militärökonomie" (Military Economics), which is available in two language versions:
- German language: ISBN 978-3-658-06146-3

**Objective**
- Recognizing parallels and contrasts between business and military thinking;
- Understand the link between institutions, human action and economic results.

**Content**
The semester program of the course is divided into 14 modules of 90 minutes each, which combine lecture (teaching of analytical techniques) and exercise (application by means of concrete case studies).

The contents correspond to sections 1 to 2.2.5 of the above book. The following will be discussed:
1. fundamental military economic problems including historical introduction to the topic
2. the institutional foundations of a military organisation
3. the modern military as a planned economy system
4. actors and stakeholders in the system

**Lecture notes**
Lecture slides are given to the participants before the first lecture. In addition, the above mentioned book will be handed over to the participants. Participants of the lecture who are not professional officer candidates are requested to obtain the book from the library or bookstore.

**Literature**
ISBN 978-3-658-06146-3

ISBN 978-3-658-25287-8

**Prerequisites / notice**
none.
The course starts with a kick-off meeting in the first lessons to provide an overview of the role as student coaches and the following online phase. Students will have the chance to reflect, exchange ideas with peers and plan their own teaching accordingly so that they feel confident in their role.

The online course provides a range of relevant topics for developing teaching competencies of Student Teaching Assistants:

- Overview about how learning works. Based on these fundamentals of learning participants reflect on their role as Student TAs to feel comfortable in their new role as a teacher.
- Plan an own lesson by introducing a class and locate it in the larger topic (methods: portal and informative introduction).
- Develop learning activities in order to activate students (active learning methods).
- Giving and also getting feedback. The participants integrate this topic also in their lesson plan.

While working through the online course, Student TAs have the chance to reflect, exchange ideas with peers and plan their own teaching accordingly so that they feel confident in their role.

REQUIREMENT: teaching duties in the current semester

851-0373-00L Learning to Teach

This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities.

Abstract

This course imparts a variety of teaching skills which will help Doctoral Teaching Assistants with their teaching tasks.

Objective

In this course Doctoral Teaching Assistants will ...

- discuss learning science and teaching techniques with peers.
- design the introduction of their course/lecture/exercise class.
- develop learning activities according to learning objectives.
- practice classroom assessment techniques in order to measure student learning.
- engage in peer feedback in order to improve own teaching.

Content

We will meet for the kick-off meeting online on the 1st of October 2021 from 1-3 pm. You will get detailed information together with the invitation email in the first week of the semester. The self-paced online phase, where you work through 6 modules in the Moodle course page will end by the 17th of November 2021. We will meet on the 23/24 or 26 of November 21 for the Consolidation workshop. You will find more information on the course page in Moodle.

Prerequisites / notice

This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities (exercises, excursions, supervision of practicals, lectures, etc.) or those who will assume teaching tasks in the semester following the programme. No previous teacher training is required.

Specialized Continuing Education

Special internal ETH courses offered by LET and the Teaching Specialists.

The "Nazis" and the "Holocaust" are omnipresent in politics and entertainment industry - often combined with a lack of historical knowledge. 

Background Knowledge Arabic World

Global History of Urban Design I

This lecture series asks whether one single model of modernization prevailed on the "Old Continent" or whether we need to differentiate regionally. A special focus lies on the Swiss experience. 

At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments today. 

The thematic foci include: Industrialization on the British Isles, urban growth in Switzerland, the difficult road to democracy in Germany, and French individualism.

Power Point Slides and references will be made available in digital form during the course of the semester.

Prerequisites / notice

This lecture series does not build upon specific previous knowledge by the students.

851-0105-00L

851-0101-88L

National Socialist Persecution, International Politics on Refugees and Science 1933-1945

Does not take place this semester. Number of participants limited to 45

The course discusses the development of National Socialist persecution policy, the reactions of democratic states to the persecution of the Jews and the role of science in the Nazi regime. 

The students are able to distinguish the phases of persecution and know various models to explain how the Holocaust came about. They can situate Swiss refugee policy in an international context. In their engagement with science under National Socialism, they develop an awareness of the socio-political responsibility of science.

The "Nazis" and the "Holocaust" are omnipresent in politics and entertainment industry - often combined with a lack of historical knowledge.

The students learn about the logic of radicalization from exclusion to extermination. The reaction of selected states to the persecution of Jews will enable them to recognise the challenge the Nazi regime posed to Western democracies and to place Swiss refugee policy in an international context.

The fact that "the Germans," whose achievements in art and science made them one of the world's leading nations, murdered millions of people on an industrial scale, caused widespread horror. This is based on the assumption that education and culture stand in contrast to education and culture.

The course combines lecture and tutorial. Active participation in class through short presentations and working papers is required. This requires 1-2 hours of preparation time per week in addition to class attendance.

The topics that are discussed on the basis of a scientifically critical approach are concepts and understandings of history, the role of literature, sciences and religion, concepts of the West and relationship with the West, the role of education, understanding of culture and cultural refinement, current concepts and discourses relevant at the sociocultural level.

This lecture series does not build upon specific previous knowledge by the students.

This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.

In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01. The History and Theory of the City as Project
02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towsns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
09: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
010: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
011: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.
### Literature
There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

### Prerequisites / notice
A list of further recommended literature will be found within each chapter of the reader (Skript).

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

### 851-0011-00L: The Body in Global History

**Abstract**

While being the universal constant which is common to every human being in history, the body is also culturally and historically specific. In this seminar we will examine how ideas of the body have changed throughout history and how these ideas of the body can be useful to understand political, social, and cultural phenomena in particular historical settings.

**Objective**

Students learn the history of the body from mid-eighteenth century onwards through examples taken from the multidisciplinary scholarship on the body with a special, albeit not exclusive, focus on colonial and postcolonial contexts. More specifically, students are sensitized to the historical and cultural variabilities of the human body that challenge scientific understandings of it as an unchanging biological entity.

Adopting a humanities perspective on topics like anatomy and surgery, the treatment of the insane, sexuality, physical culture, eugemics, and body productivity, the course looks at shifting attitudes to body health and fitness and the ways these have been shaped by considerations of gender, race, and class as well as by socioeconomic circumstances of modernity. It considers how bodies have historically concerned governments who have classified different (sections of) populations as ‘fit’ or ‘unfit’ to be members of a certain community.

The ‘long durée’ approach of the course allows to consider the continuities and changes in terms of scientific epistemologies and practices regarding the body. In doing so, debated contemporary issues such as assisted reproductive technologies and wearable systems of surveillance of the worker fatigue in the workplace are discussed.

The course is structured thematically, adopts a multidisciplinary approach, and uses academic texts as well as concrete examples. It intends to a) enable STEM students to develop new perspectives on their core subjects by bringing them in dialogue with the themes dealt with by social theory and by raising ethical questions; b) familiarise students in general with major discourses in the recent scholarship on the body and make them mindful of the multiple ways in which understanding the body and its relationship with culture and power can help think critically of the present we live in.

### 851-0175-00L: Images of the Human

**Abstract**

This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social, and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

**Objective**

By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.

**Content**

The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the “human”. In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climatic change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre’s lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre’s activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relationship to machines, animals and nature.

### 851-0422-00L: A Modern Utopia: Science and Visions of the Future

**Abstract**

This course explores how science and technoscience produced utopian or dystopian visions of the future in historical context, assessing how new developments in the physical, natural, and economic sciences since c.1880 have shaped possible “futures” in Western thought.

**Objective**

This course equips students with the skills to assess how scientific ideas diffused broader ideas of present and future societies in the West since industrialization. Students will be able to compare and contrast different developments in the relationship between science and society, identify key trends in thinking about the future, and explain how science informed ethical and social questions.

**Content**

This course offers an overview of the history of science and technoscience since 1880 by exploring the intersection of thinking about science and society in the modern utopian tradition, starting with Darwinian evolution, capitalism, and new transport and communication technologies. Different historical cases across the 20th century where scientific and technological change played a central role in defining visions of the future will be studied in detail. We will explore case studies like the impact of new technologies on visions of future war, the atom bomb, overpopulation and ecological catastrophe, transhumanism, AI, and the significance of new digital technologies for the posthuman future. Course materials will include histories of science and technology in addition to popular science texts and science fiction.

### 851-0421-00L: Sapiens: A Reading Course

**Abstract**

Yuval Noah Harari’s “Sapiens” is the most successful historical book of recent years. The seminar examines the text from a history of science perspective: What kind of sources does it rely on? What type of history is being written here? And in what tradition does “Sapiens” represent a popular non-fiction book?

**Objective**

In the course of the seminar, the students develop the competence to deal with the original text and the research literature on the history of anthropology, science and technology in a critical and historically thoughtful way. In doing so, they practise navigating independently through historical literature by means of smaller research tasks.

**Content**

The aim of the seminar is to introduce students to the history of science in anthropology, prehistory and popular science literature on the history of mankind by reading “Sapiens”. In addition to studying and critically discussing the original text, the students explore significant scientific and historical contexts of the book in small groups and present them in the seminar. In this way, they develop an understanding of the underlying narratives and popular science genres that inform “Sapiens”.

### 851-0527-00L: Introduction to the History of Technology: Concepts, and Current Debates

**Abstract**

Technology and society cannot be separated: No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

**Objective**

The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

**Content**

History of technology investigates technological developments that arose in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses derive from the technological and social change that are a product of contemporary orientation and history; current historiographical methods provide the tools for answering these questions.
Is Yemen a failed state? The Yemen Republic is the result of the unification in 1990 of two former states: the Yemen Arab Republic (North Yemen) and the People's Democratic Republic of Yemen (South Yemen). The country's history and its former units have been marred with civil wars, poverty and epidemic corruption.

The lecture is part of the "Science in Perspective" course programme: students will learn about the precursors of today's calls for reform and alternative concepts which propagated the "back-to-nature" lifestyle around the 1900s.

The rapid industrialisation, mechanisation and urbanisation of 19th century Europe gave rise to a whole new set of challenges and problems in cities. From 1880 onwards, the unique sociopolitical conditions in Germany resulted in anti-urban and cultural criticism by parts of the bourgeoisie and academic youth, culminating in the idea that the fanatical belief in progress would end in disaster. Consequently, a wide array of reform movements sprang up, focusing on medical hygiene and sociopolitical, ideological, religious and spiritual concepts, which were intended to heal the mind and body. These movements were a whole German and Swiss phenomenon and summarised under the term "Lebensreform" which also encompassed naturopathy, dress reforms, naturism, health food and vegetarianism, youth and women's movements, sexual liberation and intentional communities, organic farming, land reform, cooperative/free economy/garden city movements, nature conservation and homeland protection, progressive education and country boarding school movement, art education and Dalcroze eurythmics, expressive dance, theatre reforms, regional literature and art, anthroposophy, the emergence of German-German Christian religious communities, religious socialism and the Jewish renaisance.

This movement was clearly politically diverse, and attracted all manner of advocates, for example, those with social anarchist, jingoistic or anti-Semitic beliefs. What made them kindred spirits was their rather negative experience of modernisation: their fantasies about the era merely confirmed that existing interpretations of the human existence (Dasein) were obsolete. Amongst the fantasies was, as described by Gert Mattenklott, the idea of a dramatic shift in current thinking and the creation of a new world, the emergence of a new mankind that embodied the characteristics of youth, and a new community, strong dichotomies like light and darkness, hot and cold, the fears of dehumanisation and a propensity for vegetarianism were also typical of life reforms.

The lecture is part of the "Science in Perspective" course programme: students will learn about the precursors of today's calls for reform and alternative concepts which propagated the "back-to-nature" lifestyle around the 1900s. Some of the key concepts used then are unknown today or have been disavowed due to exploitation by the totalitarian regimes of the 20th century. Nevertheless, some of the original topics and objectives have once again become contemporary topics of discussion due to the debate about the future of society, the unknown today or have been disavowed due to exploitation by the totalitarian regimes of the 20th century. Nevertheless, some of the original topics and objectives have once again become contemporary topics of discussion due to the debate about the future of society, the whole of mankind and the planet. Historization of present-day concepts is the condition on which plans for a possible future can be developed. The methods by which the whole of mankind and the planet. Historization of present-day concepts is the condition on which plans for a possible future can be developed. The methods by which the whole of mankind and the planet. Historization of present-day concepts is the condition on which plans for a possible future can be developed. The methods by which the whole of mankind and the planet. Historization of present-day concepts is the condition on which plans for a possible future can be developed.
Abstract
This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective
The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

851-0107-00L Science and the Public: A Problem of Mediation that the Media Have to Solve?

Abstract
Scientific knowledge is often provisional; it is subject to correction. That is why it cannot always satisfy the need for certainty and clarity that arises in the public as soon as political controversies are linked to questions of (scientific) knowledge. This is shown by the Corona pandemic, but not only by it.

Objective
Gaining insights into the relationship between the sciences, the public and the media, into their historical development and current problems.

Content
The feuilleton of the «Frankfurter Allgemeine Zeitung» of 27 June 2000 has gone down in the annals of recent media history. The last sequences of the fully mapped human genetic code were printed on six large-format pages: the letters A, G, C and T in various combinations and sequences - a «readable» but incomprehensible jumble of letters. What at the time was astounding journalistic coup and met with enthusiasm as well as head shaking can (also) be read as an allegory of the tense relationship between science and the public. What can, what should, what do «laymen» want to know and understand from scientific findings? Scientific knowledge is often provisional; it is subject to correction. That is why it cannot always satisfy the need for certainty and clarity that arises in the public as soon as political controversies are linked to questions of (scientific) knowledge. This is shown by the Corona pandemic, but not only by it. How can science journalism, how can scientists deal with this problem? Do the natural sciences, medicine and technology differ from the humanities and social sciences in terms of «comprehensibility» and public awareness?

These questions will be explored on some excursions into recent and also older media, scientific and cultural history.

851-0537-00L Architectures of Knowledge: Infrastructures of the University

Abstract
The seminar explores interrelations between the architecture of the university and forms of knowledge production. The emphasis is on the end of the 20th century, when digital infrastructures increasingly merged with the spatial constellation of the lecture hall, laboratory and library. We will discuss the discursive spaces that condition the reading, thinking and perception of knowledge.

Objective
Using positions from the history of technology, science and architecture, the seminar will discuss the spatial-technical ensembles of the university and their significance to the production and circulation of knowledge. Case studies provide insights into the overlapping spatial and digital infrastructures that shaped ideas of research and teaching at the end of the 20th century.

Content
The seminar deals with the spatial-technical organization and communication forms of the university. Of particular interest is how, in the context of digitization, digital infrastructures overlap and intertwine with built space and determine the self-understanding of the sciences. At its core the course asks you to identify how teaching and research methods correlate with the social, material and spatial structures of the university.

851-0101-56L From Cotton to Cocaine: Commodities That Made History (c.1700-1950)

Abstract
Each session focuses on a particular commodity and explores how its production, trade and consumption was entangled with important political, social and cultural developments. Taken together, the case studies (ranging from agricultural crops, via chemically produced drugs to mechanical marvels such as the gramophone) provide a picture of major global transformations in the past 300 years.

Objective
On one level, the course aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants’ understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and ‘exotic’ the inter-cultural sensitivity of the students will be enhanced.

On a second level, the analysis and understanding of these complex interconnections, it is hoped, will help students to get a more nuanced understanding of the historical process that is currently referred to as ‘globalization’ and overcome the eurocentric perspective that still structures many scholarly and media writings on this topic.

851-0008-00L Ban on Alcohol and Science: A Global History of Prohibition 1918-1939

Abstract
The seminar deals with an overview on anti-alcohol campaigns since late 19th century. The focus is on prohibition in the interwar period in different regions. The role of scientific experts in the emergence of prohibition will be discussed from a global historical perspective. Formation of international networks and process of knowledge production on the issue of alcohol are subjects of analysis.

Objective
The reconstruction of the development of prohibitionist regimes helps to understand the process of national institution formations, for example health services. Participants analyze interactions between science, international relations and change of social political context in the process of knowledge production and in the definition of daily life norms on drinking habits.

Once upon a time there was natural law, the foundation of sexual relations between two people of different genders, in order to procreate. Today, new rights and new forms of life are profoundly transforming both naturalness and purpose. Everything seems to change suddenly. However, the long-term history shows us a great variety of erotic cultures, from ancient Greece to the Roman world and then to Christian and multicultural Europe. This course presents some crucial moments of this distant past, in which knowledge, practices and representations have shaped disparate experiences of desire, pleasure and the body. Challenges for a fluid present, ideas for the near future.

Max Frisch: Experiments of Storytelling

W 3 credits

Objective

1) Overview of the prose writings by Max Frisch; 2) insight in the poetic and narrative procedures of Max Frisch's prose writing; 3) understanding of the poetical and philosophical projects

Content

"Narrative: but how?", asked Max Frisch in his diary. In his prose the answer to this question is definitely troublesome since it transcends the classic form and function of narrative. His novels - from Stiller (1954), Homo faber (1957), Mein Name sei Gantenbein (1964) to his late prose Montauk (1975) and Der Mensch erscheint im Holozän (1979) - but also his journals (including 1950) can be essentially understood as experiments of a new mode of narration, which implies a multiple perspective. Not only is the narrative performed according to a formal technique, but, at the same time, it takes on epistemological and existential philosophical functions. The purpose is epistemological since this type of narrative strives to generate knowledge; it is existential philosophical as soon as characters such as Stiller and Gantenbein prove to be myth-maniac inventors of their self. Out of necessity, or playfully, they perform (other) identities. "Ich probiere Geschichten an wie Kiedler", thus Gantenbein and again Montauk. Narrative, play, disguise, and (self)deception become anthropological practices; even as "Gier nach Geschichten" (craving for stories) they become an elementary effort of human life.

The Unconditionality of Knowledge: Faust in European Literature

W 3 credits

Objective

Learning objectives: Faust is one of the most dazzling figures in European literature and cultural history. A pact with the devil, magical sexual desire, power and knowledge, these are the great taboos of the medieval world, which, in 1500, the graduated theologian set out to dismantle. Through this demonstrative gesture of hubris, he became the much-disputed hero of the modern period. Since the "Historia von Johann Fausten" (1587), the wide range of Faust-literature also depicts the highly conflictual emancipation from theological knowledge in favor of an unconditional knowledge of nature and the human being that hides itself behind disciplines such as medicine, astrology and magic. Faust was thereby not only transformed into the epitome of the fortuneteller, he also became the cipher for the risky undertaking of modern knowledge as such, to which he then spectacularly fell victim in an experiment. Consequently, the course's treatment of this subject matter in the literature since the early modern period will center on the question of knowledge as it is negotiated through the Faust-figure. Initially, we shall take a look at examples from the early modern period (apart from the Faust-book from 1587, among others the drama version by Christopher Marlowe, 1589). Then we shall move on to new editions around 1800, which highlight the modernity of this norm-transcending and boundary-breaking knowledge paradigm (among others Goethe's Faust). Finally, we shall discuss Faust-figures of the 20th century, such as Friedrich Murnau's Faust movie (1926), Thomas Mann's novel, "Doktor Faustus", written in exile in 1947, or Klaus Mann's "Mephisto" (1936).

851-0082-00L

Literature and the Knowledge of the Social

W 3 credits

Objective

Overview of of social science in its connection to literature from the 1830s to the present day

Content

Reflexion and historicising the question of the epistemic status of literature and the aestheticization of knowledge. Reflecting and historicising the question of the relevance of literature for the humanities and natural sciences

Data: 06.09.2022 12:51
Autumn Semester 2021
Page 934 of 2159
This course explores the two sides of writing technology. On the one hand, it examines today’s most ubiquitous writing technology: the digital writing of modern computers. On the other, it considers a set of literary texts that reflect on such technology in writing. The goal of the course is to habituate ourselves to moving between these two sides.

Objective

After completing this course, students will be able to provide examples of the role literary texts played in the development of communications technology as well as cite instances where literature reflects on the implications of such technology. Drawing on our readings, students will be able to debate the relevance of humanist postulates—such as the difference between rhetoric and grammar, meaning and information, thinking and calculating—to our digital culture.

Content

In this course we will examine the two sides of writing technology. On the one hand, we will direct our attention to that most conspicuous writing technology of our world: the coded symbols of digital computers. On the other hand, we will consider a set of fictional works that explore the forms, uses, and implications of such technology in writing. We will also regularly jump back and forth between the two sides of the issue, literally and figuratively re-coding literary writing in the language of information theory to see what is lost—and what is gained—in translation.

The tutelary spirit of our course is the American mathematician Claude Shannon, the author of The Mathematical Theory of Communication and the founder of information theory. But Shannon’s own muse was Edgar Allen Poe, whose 1843 story, ‘The Gold-Bug,’ inspired Shannon to regard language as a probabilistic system susceptible to mathematical analysis. A passionate reader of Poe, Shannon was also fascinated by the vertiginous vocabulary of James Joyce’s novels, whose exceptional information content he contrasted with C.K. Ogden’s proposal for “Basic English,” a simplified, ‘universal’ language consisting of only 850 English words. We will examine all of these sources as well as others so that we may reconnect the key terms of Shannon’s theory (“information,” “code,” “message,” “translation,” etc.) with the literary traditions that—at least in part—inspired him.

Over the course of the semester, we will turn from specific writing technologies to more capacious logics of control: writing technologies ‘writ large.’ After looking at the machine languages and feedback mechanisms that underwrite the mid-century field of cybernetics, we will read excerpts from Samuel Beckett’s experimental novel, Watt, and examine how it imagines the intersection of human cognition with digital logic. Watt, Beckett’s hapless protagonist, obliges us to reexamine the programs we habitually follow and to ask ourselves, ‘watt’ has digital communications technology done to how we live and how we think?

Lecture notes

Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Literature

A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

Prerequisites / notice

This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.
### Introduction to Environmental Management / Environmental Management Systems, Energy and Material Flows

- **Content**: Introduction to environmental management/environmental management systems, energy and material flows; economical and ecological problems in industry; characterisation of an enterprise (incl. management handbook); structure and contents of an environmental management system; overview on the ISO 14001 ff. series; methods for environmental evaluation and assessment; integrated management systems; planning methodology and life-cycle-design design; planning examples.

- **Lecture Notes**: Information about environmental management and environmental management systems will be provided by a CD or mail.

- **Literature**: A list with literatures and links will be provided.

- **Prerequisites / Notice**: Delivery of a case study, worked out in groups. Language: Teaching in English on request.

---

### Introduction to Health Economics and Policy (363-1027-00L)

- **Abstract**: Health expenditures constitute about 10% of GDP in OECD countries. Extensive government intervention is a typical feature in health markets. Risk factors to health have been changing with growing importance of lifestyle factors such as smoking, obesity and lack of physical activity. This course gives an introduction to the economic concepts and empirical findings in health economics.

- **Objective**: Introduce students without prior economic background to the main concepts of health economics and policy to enhance students understanding of how health care institutions and markets function. Please note that we will apply basic economic concepts to health care markets. Hence, master students with an economic background have to expect that a large share of the concepts will overlap with their previous courses. However, they are, of course, welcome to join the course.

- **Content**: The course gives an introduction to the economic concepts and empirical findings in health economics to enhance students understanding of how health care institutions and markets function. Motivated by the fact that health care markets are designed differently across countries, this course looks at the challenges in regulating health care markets. First, two important decisions of individuals will be analyzed: What types and amount of personal health care services does an individual demand? How much will health insurance coverage be purchased? In the second part, the supply side of health care markets will be discussed. What are the financial incentives of physicians, and how do these influence physicians' treatment choices? What does it mean and imply that a physician is an agent for a patient? The choices made by societies about how health care services are financed and about the types of organizations that supply health care will be addressed in the third part. One important choice is whether a country will rely on public financing of personal health care services or encourage private health insurance markets. How could and should a public health insurance system be designed? The advantages and disadvantages of the alternatives will be discussed to provide a framework for analyzing specific types of health care systems.

- **Prerequisites / Notice**: Although we apply basic economic concepts to health care questions, students should be aware that this course requires some mathematical skills in terms of maximization problems. Please be prepared that this course might (partially) be run via zoom, depending on the situation.

---

### Simulation of Negotiations (363-1050-00L)

- **Abstract**: The Global Studies Institute (University of Geneva) is organizing a simulation seminar on Nagorno-Karabakh in collaboration with MGIMO Moscow (TBC) and the Chair of Negotiation and Conflict Management (ETHZ).

- **Objective**: Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situation. During the course, they should gain insight into the negotiations between Armenia, Azerbaijan, and the international community, as well as negotiation techniques in general.

- **Prerequisites**: Limited number of participants. Students who wish to register for this course have to apply no later than 18 September. Please send your application to Andreas Knobel: aknobel@ethz.ch, additionally register in mystudies (technical note for the registration: All registered students will initially be placed on a waiting list).

- **Literature**: The Global Studies Institute (University of Geneva) is organizing a simulation seminar on Nagorno-Karabakh in collaboration with MGIMO Moscow (TBC) and the Chair of Negotiation and Conflict Management (ETHZ).
## Content

In the lectures, students will be provided with basic information related to Nagorno-Karabakh. The historical, military, economic and political dimensions, including the various treaties and existing agreements and their evolution will be analyzed. Students will as well participate in an introduction on negotiation techniques, particularly on the negotiation engineering approach. On the basis of the comprehensive analysis, negotiation scenarios will be developed and subsequently tested during a two-day simulation exercise. The simulation exercise will be prepared with the help of experienced negotiators and experts.

The simulation exercise is intended for Masters degree and PhD students. The course will be taught in English. The project is headed by Prof. Micheline Calmy-Rey and Prof. Nicolas Levrat, Global Studies Institute, University of Geneva.

Students who wish to register for this course have to apply no later than 18 September 2021. Please send your (brief) application with your background and motivation to Andreas Knobel: aknobel@ethz.ch, additionally register in mystudies (Technical note for the registration: All registered students will initially be placed on a waiting list.)

The homepage for this course with more information is located at: https://necom.ethz.ch/education/simulation-of-negotiations.html.

Students from ETH Zurich and MGIMO will participate in the seminar sessions via video conferencing. They will go to Geneva for the simulation exercise on 2 and 3 December 2021.

There will be two exercise sessions (see separate course 363-1050-01L).

## Prerequisites / notice

### Evaluation

1. Active participation in class (50%)

### Prerequisites / notice

1. Attend all seminar sessions either in person or via video conference and actively participate in discussions.
2. Participate in person in the two-day simulation exercise (19-20 November 2021).

### Texts to be submitted before, during and after the simulation (50%)

1. Before the simulation: Prepare a 4-5 page summary of your group's negotiating mandate, including a description of the positions of all the parties (group evaluation).
2. During the simulation: Draft and present an introductory and final statement (group evaluation).
3. After the simulation: Prepare a report on the negotiation outcomes to the organization, state or region you represent (3-4 pages) and a press release (max. 1 page). The report and press release are individually evaluated.

## 363-0387-00L Corporate Sustainability

| W  | 3 credits | 2G | V. Hoffmann, C. Bening-Bach, N. U. Blum, J. Meuer |

### Abstract

The lecture explores current challenges of corporate sustainability and prepares students to become champions for sustainable business practices. In the beginning, traditional lectures are complemented by e-modules that allow students to train critical thinking skills. In the 2nd half of the semester, students work in teams on sustainability challenges related to water, energy, mobility, and food.

### Objective

- Students assess the limits and the potential of corporate sustainability for sustainable development.
- Develop critical thinking skills (argumentation, communication, evaluative judgment) that are useful in the context of corporate sustainability using an innovative writing and peer review method.
- Recognize and realize opportunities through team work for corporate sustainability in a business environment.
- Present strategic recommendations in teams with different output formats (tv-style debate, consultancy pitch, technology model walkthrough, argumentation).

### Content

In the first part of the semester, Prof. Volker Hofmann and Dr. Johannes Meuer will share their insights on corporate sustainability with you through a series of lectures. They introduce you to a series of critical thinking exercises and build a foundation for your group work. In the second part of the semester, you participate in one of four tracks in which SusTec researchers will coach your groups through a seven-step program. Our ambition is that you improve your analytic and organizational skills and that you can confidently stand up for corporate sustainability in a professional setting. You will share the final product of your work with fellow students in a final puzzle session at the end of the semester.

### Literature

Presentation slides will be made available on moodle prior to lectures.

### Lecture notes

http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

---

## 363-0503-00L Principles of Microeconomics

| W  | 3 credits | 2G | M. Filippini |

### Abstract

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.
The learning objectives of the course are:

(1) Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can also recognize behavioural failures within a market and discuss basic concepts related to behavioural economics. (6) Students can apply simple mathematical concepts on economic problems.

Topics covered by the course are:

- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade
- Public sector, tax system

Lecture notes, exercises and reference material can be downloaded from Moodle.

The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture "Principles of Microeconomics" is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

- Public sector, tax system
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes

Lecture notes, exercises and reference material can be downloaded from Moodle.

The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

Autumn Semester 2021

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.
Fostered competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: not assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

Personal Competencies
- Adaptability and Flexibility: not assessed
- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

363-0561-00L Financial Market Risks

Abstract
I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the many problems met by the theory in practice. I will put this course in the context of the on-going financial crises in the US, Europe, Japan and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.

Objective
- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks
Content

1- The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.

2- Risks in financial markets
- What is risk?
- Measuring risks of financial assets
- Introduction to three different concepts of probability
- History of financial markets, diversification, market risks

3- Introduction to financial risks and its management.
- Relationship between risk and return
- Portfolio theory: the concept of diversification and optimal allocation
- How to price assets: the Capital Asset Pricing Model
- How to price assets: the Arbitrage Pricing Theory, the factor models and beyond

4- Financial markets: role and efficiency
- What is an efficient market?
- Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
- Deviations from efficiency, puzzles and anomalies in the financial markets
- Financial bubbles, crashes, systemic instabilities

5- An introduction to Options and derivatives
- Calls, Puts and Shares and other derivatives
- Financial alchemy with options (options are building blocs of any possible cash flow)
- Determination of option value; concept of risk hedging

6- Valuation and using options
- A first simple option valuation model
- The Binomial method for valuing options
- The Black-scholes model and formula
- Practical examples and implementation
- Realized prices deviate from these theories: volatility smile and real option trading
- How to imperfectly hedge with real markets?

7- Real options
- The value of follow-on investment opportunities
- The timing option
- The abandonment option
- Flexible production
- Conceptual aspects and extensions

8- Government bonds and their valuation
- Relationship between bonds and interest rates
- Real and nominal rates of interest
- Term structure and Yields to maturity
- Explaining the term structure
- Different models of the term structure

9- Managing international risks
- The foreign exchange market
- Relations between exchanges rates and interest rates, inflation, and other economic variables
- Hedging currency risks
- Currency speculation
- Exchange risk and international investment decisions

351-0555-00L Open- and User Innovation

W  3 credits  2G  S. Häfliger, S. Spaeth

Abstract
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

Objective
The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Performance assessment will be: a written group essay based on the open/user innovation case that participants will research and present during the block seminar (including the slides). Each group will have to hand in a 15-20 page essay, details on the required format and the content will be distributed during the course. Active class participation is required.

Content
This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Lecture notes
The slides of the lectures are made available and updated continuously through the SMI website.
After successful completion of the course you will be able to:

This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, how is the market affected by money on the market? Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market? Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

Objective

Beyond acquiring basic knowledge about public policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

Content

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. Invited practitioners will provide us with insight regarding the current developments in forest, water and spatial planning policies. A key aspect is the distinction between politics and political science and specifically environmental policy.

Lecture notes

The reader and additional lecture material and exercises will be posted on Moodle.

Literature

Reader and additional lecture material on moodle.

Prerequisites / notice

The detailed semester program (syllabus) is made available to the students at the beginning of the semester. During the lecture we will work with Moodle and eduApp. We ask that all students register themselves on these platforms before the lecture and to bring a laptop, tablet or smartphone to class, so that you can complete exercises using Moodle and eduApp.

Fostered competencies

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Sensitivity to Diversity
- Critical Thinking
- Self-direction and Self-management

Prerequisites / notice

No script available

Literature

Prerequisites / notice

Sie brauchen keine Vorkenntnisse, um dem Kurs zu folgen.

Fostered competencies

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Problem-solving
- Critical Thinking
- Self-direction and Self-management

Abstract

The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.
Objective
- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)
Knowledge about possibilities for sustainable innovation

Content
- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost-benefit analysis etc.)
- The role of the media
- prospects for future developments

Lecture notes
Copies of slides and selected documents will be distributed

Prerequisites / notice
The lecture is held biweekly (for 2 hours). The dates are 3.9.; 30.9. (instead of 7.10); 21.10.; 4.11.; 18.11.; 2.12.; 16.12.

### 363-1109-00L Introduction to Microeconomics

**GEsS (Science in Perspective):**
This course is only for students enrolled in a Bachelor's degree programme.

Students enrolled in a Master's degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

**Note for D-MAVT students:** If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

**Objective**
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

**Content**
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

**Lecture notes**
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

**Literature**

**Prerequisites / notice**
This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

### 363-1044-00L Applied Negotiation Seminar

**Number of participants limited to 30.**

**Prerequisites:** Successful completion of lectures "363-1039-00L Introduction to Negotiation".

**Abstract**
The block-seminar combines lectures introducing negotiation and negotiation engineering with the respective application through in-class negotiation case studies and games.

**Objective**
In this seminar students can expect to:

- learn more theory of negotiation and apply this learning in simulated negotiations
- have their perceptions of rationality, fairness and trust challenged through little embedded experiments
- learn to recognize and analyze negotiation contexts and interests and generate creative solutions
- learn to negotiate under pressure (with time and mandate restrictions) and experience (and potentially chair) a formal negotiation
- learn to read, analyze and present a scholarly paper
This block seminar is an extension of the course “Introduction to Negotiation” and provides more detailed insight into key aspects of the field of negotiation and negotiation engineering.

In particular,

• a series of brief lectures will outline foundational aspects of negotiation science, such as rationality, fairness, and trust, as well as the possible application of machine learning in negotiation
• three practitioners will describe lessons learnt in their negotiation domains (diplomacy, labor, and business) and allow time for Q&A and discussion
• Professor Ambühl will elucidate further current cases from his professional experience
• students will apply course input in a number of challenging simulations (ranging from simple 30 minute games to full-fledged international ten party negotiations). In each game they will be asked to represent a party and negotiate as skillfully as they possibly can within the constraints of their mandate
• each student will be assigned a scholarly paper (20 to 30 pages) between the two blocks to read. They will give a 20 minute group presentation with one or two of their peers and submit a brief reflection report after the seminar

The course size is deliberately limited (30 maximum) to enable ample opportunity to interact with the lecturers, guests and each other.

Abstract
The Global Studies Institute (University of Geneva) is organizing a simulation seminar on the conflict in Nagorno-Karabakh in collaboration with MGIMO Moscow (TBC) and the Chair of Negotiation and Conflict Management (ETHZ).

Objective
The two main aims of the exercises are: 1) to become familiar with the historical, economic, political dimensions of the conflict in Nagorno-Karabakh (first session); 2) to work on the mandates for the simulation under supervision of the lecturers (second session).

Content
For the first session students will be asked to prepare and deliver a 15 minute talk on some aspect of the conflict.

Dates, Time:
First session: 12 October 2021, 13-17 h
Second session: 9 November 2021, 8-12 h

Prerequisites / notice
In order to participate in this module students also need to apply and register for the lecture 363-1050-00 L Simulation of Negotiations.

Number of participants limited to 40

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will
• Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
• Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;
I. Introduction to Moral Reasoning

1. Ethics - the basics
1.1 What ethics is not... 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity 1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!)
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more...)
3.1 Introduction to Dual use research
3.1.1 Selection of study participants – the concept of vulnerability
3.1.2 The (mis)representation of data
3.1.3 Informed consent
3.1.4 Respect for potential and enrolled participants

Critical Thinking - assessed
Integrity and Work Ethics - assessed
Self-awareness and Self-reflection - assessed

Environmental Ethics
701-0703-00L
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to address environmental challenges.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practicing of newly acquired knowledge in smaller exercises.

Lecture notes
Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.
### Literature

- John O'Neill et al., Environmental Values, 2008
- Konrad Oll/Jan Diers/Liese Vogt-Kleschin, Handbuch Umweltheik, 2016

### General introductions:
- Marcus Düwel et al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. A. et. al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

### Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term.
We expect participants to engage in and contribute to discussions for keeping the course interesting and lively.

---

### 851-0101-87L World Views in the Digital Age
- **Number of participants limited to 36.**
- **W 3 credits 2S J. Leuthold, C. aus der Au Heymann**

### Abstract
World views guide our thoughts and our actions even though we may not be aware of it. By means of lectures, discussions and contributions of participants, we examine elements of world views regarding the underlying philosophical concepts and their relations to the sciences, philosophy and religion.

### Objective
Students shall obtain a basis for their own exploration of world views, with a focus on new technological developments.
Prior knowledge of philosophical concepts and history is not required but are studied in the course.

### 851-0430-00L Günther Anders: The Antiquity of Man
- **W 3 credits 2S M. Hagner**

### Abstract
The philosopher Günther Anders characterized his monograph "Die Antiquiertheit des Menschen" as a "philosophical anthropology in the age of technocracy". Anders had written his book under the impression of the atom bomb, the computer and visual mass media. Today, the book is more relevant than ever: What is the role of human beings in the Anthropocene?

### Objective
The goal of this seminar is a close reading of Günther Anders's "Die Antiquiertheit des Menschen", reflect its main topics and hypotheses and discuss their relevance for our time.

### Content
The basic material for this seminar will be the monograph „Die Antiquiertheit des Menschen“ (https://www.chbeck.de/antiquiertheit-menschen). Reading this book and other texts will lead to a comparison between the period after WW II (1950s-1970s) and the situation in the early 21st century. What can philosophical anthropology tell us about the role of human beings in the age of anthropocene?

### 851-0162-00L Philosophy of Physics
- **W 3 credits 3S M. Hapke, R. Wallny**

### Abstract
Close reading of and reflection about selected texts from physicists (e.g. C.F: Weizsäcker, Wilczek, Susskind) on the philosophical problems and consequences of their work.

### Objective
Participants should develop a clear view of the epistemological foundations of their work and its consequences for philosophy of science and philosophy of nature.

### Content
Newton's opus magnum of 1687 is still called a philosophy of nature: "Philosophiae Naturalis Principia Mathematica". The separation of physics from philosophy is new, and institutionally executed only in the 19th century. Since than the experiment is not a philosophical method and mathematical symbolization not part of the languages of philosophy anymore. But although the subjects were divided methodically they stayed in contact via their content. This can be seen in the reflections of physicists like C. F. v. Weizsächer, Frank Wilczek or Leonard Susskind, who were all concerned with epistemological questions and topics related to the philosophy of science and philosophy of nature. The seminar is devoted to these reflections and will ask in what relation the philosophy of physicists stands to the physics of their time. We will discuss problems of the unity of physics, of emerging laws and of the beauty or ugliness of the physical universe resp. the theories about it.

### Literature
- see moodle

### 851-0087-00L Knowledge and Practice in Philosophy of War
- **W 3 credits 2S**

### Abstract
In the seminar we read classical texts from the field of ‘philosophy of war’. Due to today’s technological advancements and ecological problems, we will also discuss contemporary conceptions of war such as lethal autonomous weapons and climate change. Important questions that arise are: Is the concept of war only applicable to human society? Is there a difference between politics and nature?

### Objective
Students learn about the different types of arguments and conceptions in philosophical texts and their historical context. They should learn to understand the descriptive and critical value of texts in regard to the topic of war.

### 851-0125-65L A Sampler of Histories and Philosophies of Mathematics
- **W 3 credits 2V R. Wagner**

### Abstract
This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

### Objective
The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices.

### Literature
- to acquire skills in order to read and comment on scientific texts written in the past ages.
- to develop a critical understanding of scientific notions;
- to introduce students to the philosophical dimension of science;
- to develop a critical understanding of scientific notions;
- to acquire skills in order to read and comment on scientific texts written in the past ages.

### 851-0125-76L Critiques of Scientific Objectivity
- **W 3 credits 2S R. Wagner**

### Abstract
This course will review some critical reflections on scientific epistemology, challenging prevalent notions of scientific objectivity. We will start with German critiques from the first half of the 20th century (Heidegger, Husserl, Frankfurt school), go on to French critiques from the second half (Foucault, Latour), and conclude with recent feminist and post-colonial critiques.

### Objective
The students will be able to formulate and criticize arguments engaging with prevalent notions of contemporary scientific objectivity. They will be able to critically reflect on the authority of the knowledge that they learn and produce.

### Literature
- Marcus Düwel et al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. A. et. al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008
- to acquire skills in order to read and comment on scientific texts written in the past ages.

### 851-0197-00L Medieval and Early Modern Science and Philosophy
- **W 3 credits 2V E. Sammarchi**

### Abstract
The course analyses the evolution of the relation between science and philosophy during the Middle Age and the Early Modern Period.

### Objective
The course aims are:
- to introduce students to the philosophical dimension of science;
- to develop a critical understanding of scientific notions;
- to acquire skills in order to read and comment on scientific texts written in the past ages.
The course is focused on the investigation of scientific thought between 1000 and 1700, that is to say the period that saw the flourishing of scientific thought. In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses interweaving in current local situations and tries to think about potentials for spatial policy practice.

In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such interweaving in current local situations and tries to think about potentials for spatial policy practice.

Artificial Intelligence. Interdisciplinary Perspectives

In the last 50 years, research on artificial intelligence (AI) has repeatedly boomed but failed to deliver on its great promises. In the last decade, however, especially the deep learning approach has achieved remarkable results. This eLearning-seminar will discuss epistemological, but also ethical and political aspects of these recent developments in interdisciplinary perspective.

The seminar will be conducted as an eLearning event in cooperation with LMU Munich.

Science in Society

Whose voice should count how much? On the authority of the sciences in democracy.

Not a few members of the elites argue that important issues in democracy like policies against climate change, free trade agreements, urban planning are too complicate for the people. Experts should have a stronger say in politics. Less democracy = more rationality? The course should give an answer to this question.

Pharmacy is one of the most controversial areas of medicine because it is concerned with beliefs, moods, relationships, and behaviors. This course offers an overview of some representative topics in philosophy of psychiatry.

Pharmaceuticals, human values, and the law

The objective of this course is to offer historical context and philosophical reflection on mental disorders and psychiatric practices.

University lecturers

Mind the enrolment deadlines at UZH:

https://www.uzh.ch/cmssss/en/studies/application/deadline.html

As a classical topic in philosophy of religion, the relation of faith and knowledge provokes a host of questions. And what would such accounts entail for the relation of religion and science? The seminar will discuss these and other topics critically, and the interplay between psychiatry and legal responsibility.

Theory and Practice: Heterotopia, Referential Space and Spatial Effects

In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such interweaving in current local situations and tries to think about potentials for spatial policy practice.

The additional personal work (besides the course) is about 20 working hours for the creation of a scientific journal, individual deepening and filming!
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 23LB006

Mind the enrolment deadlines at UZH:

Abstract

The course offers an introduction to analytical, phenomenological and hermeneutic philosophy of religion. Influential positions, vital questions and significant developments will be discussed and critically reflected.

Objective

Special emphasis will be placed on the relationship between religious and scientific discourse in the 20th century. To get a better grasp of the complexity of this relationship, different narratives will be examined as to how the modern ideal of modelling all cognitive values on scientific ones came to exert supreme authority in Western societies. The still prevalent, mainstream view has deep roots in 19th century positivism, which assumed a necessary historical progress from religion to metaphysics to science. In this perspective, scientific knowledge uncovers "objective" reality by displacing superstition and more "primitive", mythical or metaphysical accounts of human and cosmic origins. On the other hand, there is the more recent, "heterodox" view advanced by philosophers and historians of science like S. Gaukroger, that the success of science in the West in the early-modern era might be related to its close association with theology rather than attempts to emancipate itself from it. The question here arises: What traditional ideas of God and religious faith contributed to the modern ideal of knowledge and truth -- an ideal which, in a strange twist of historical irony, finally led to the seeming exclusion of all religious discourse from the properly scientific quest for real knowledge and truth in present-day secular societies?

Abstract

Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content

Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes

Reader with issue-specific articles. E-version is partly available under
https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html
By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations. This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the end of the Second World War. After the transformation of 1989/91; the focus here is on current issues in international security policy. Part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period international Neuordnungen after 1918, 1945 and 1989 and the seitherige Ausgestaltung der Schweizer Aussenpolitik im Zentrum. In this context, we will discuss the determinative factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges. Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it. After a brief introduction to the Swiss foreign policy system, the course will focus on the following themes:

1. The rise of Switzerland as a global power
2. The role of Switzerland in the international system
3. The Swiss approach to international security policy
4. The impact of globalization on Swiss foreign policy
5. The future of Swiss foreign policy

The course will be supported by an e-learning environment.

Lecture notes

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester.

The class will be taught in English.

Prerequisites / notice

Students will be asked to make a contribution in class choosing one out of three options:

(a) presentation in class (15 Minutes) based on a paper to be discussed on a particular day in class
(b) review paper based on a selected publication in the course material
(c) preparation of questions for a selected invited speaker, and subsequent submission of protocol about the content of the talk and the discussion

In addition, they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final discussion, marks will have a weight of 40% and writing marks will have a weight of 60%.

Swiss Foreign Policy

| W | 3 credits | 2V | D. Möckli |

Abstract

This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determinative factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges.

Content

Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it. After a brief introduction to the Swiss foreign policy system, the course will focus on the following themes:

1. The rise of Switzerland as a global power
2. The role of Switzerland in the international system
3. The Swiss approach to international security policy
4. The impact of globalization on Swiss foreign policy
5. The future of Swiss foreign policy

The course will be supported by an e-learning environment.

853-0047-01L

World Politics Since 1945: The History of International Relations (Without Exercises)

| W | 3 credits | 2V | L. Horovitz |

Abstract

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Content

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Prerequisites / notice

The course will be supported on a website on Moodle. If you have any questions, please contact Oliver roos (oliver.roos@siapo.gess.ethz.ch).

853-0015-01L Conflict Research I: Political Violence

Abstract
Introduction to research on political violence in domestic and international politics. This course covers the causes and solutions to different types of political violence including interstate wars, civil wars, terrorism or social protests.

Objective
Knowledge on different types of political violence and their causes.

Content
This course offers an introduction to research on the causes and solutions to political violence in domestic and international politics. First, we discuss the definitions and concepts used in conflict research, the data and methods commonly applied and their historical development. Second, we focus on interstate wars und examine in this context state formation, nationalism and democracy. The third part of the course focuses on different types of political violence, including civil war, terrorism or social protests.

Prerequisites / notice
The course «Conflict Research II» in the following semester further examines civil wars.

853-0302-01L European Integration (Seminar without Tutorial)

Abstract
The lecture course covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Objective
The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.

Content
1. Introduction
2. Theories of European integration
3. Institutional development of European integration
4. Development of political integration
5. Internal market and monetary union
6. Internal and external security policies
7. Constitutionalization
8. Widening and differentiation
9. European integration in crisis
10. Institutions
11. Law-making and law enforcement
12. Statehood and democracy
13. Switzerland, the EEA and Neighbourhood Policies

Lecture notes
The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Literature
Die Literatur wird auf Moodle bereitgestellt.

Prerequisites / notice
The grade is based on a written exam.

860-0023-00L International Environmental Politics

Abstract
This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

Objective
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.
This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

Lecture notes

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

<tr>
<td>853-0061-00L</td>
<td><strong>Introduction to Cybersecurity Politics</strong></td>
</tr>
<tr>
<td></td>
<td>The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different answers to these new challenges (countermeasures).</td>
</tr>
<tr>
<td>Objective</td>
<td>Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.</td>
</tr>
<tr>
<td>Content</td>
<td>We start with an overview of cybersecurity issue from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).</td>
</tr>
<tr>
<td>Literature</td>
<td>A script with background information and comments on the literature will be made available at the beginning of the semester.</td>
</tr>
<tr>
<td>Prerequisites / notice</td>

The lecture is being supported by a website on Moodle. If you have any questions, please contact Oliver Roos, oliver.roos@iipo.gess.ethz.ch.

851-0650-00L

Abstract
The AI4Good course is a hackathon turned into a full course. At the beginning, stakeholders active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members.

Objective
Given a specific problem in global development, students shall learn to self-responsibly design, implement and experimentally evaluate a suitable solution. Students will also learn to critically evaluate their ideas and solutions together with all course members in a broader context that goes beyond mere technical solutions, but touch on ethics, local culture etc., too.

Content
The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Organizers of the course will make sure that only those problems are selected that are suitable for a machine learning approach and where sufficient amounts of data (and labels) are available. Students will organize themselves into small groups of 3-5 students, where each group works on solving a specific problem. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Every two weeks, each group will present ideas and progress during a short presentation followed by a discussion with all course members. At the end of the course, students will present their final results and submit source code. In addition, they will describe the developed method in form of a scientific paper of 8 pages. Grading will depend on the source code, the paper, and active participation in class.

Note: The course AI4Good is not related to Hack4Good, which is a students' initiative organized by the Analytics Club at ETH. For more information about Hack4Good check out the website: https://analytics-club.org/wordpress/hack4good/.

Prerequisites / notice
Students with a strong background in machine learning and excellent programming skills (preferably in Python)

851-0536-00L

Abstract
Technology and the Environment – On Course for Collision?

Technology has been both the cause and the solution of many environmental problems. Motor vehicle emissions contribute to climate change. Apps are supposed to help us minimize our CO2 footprint. This course examines which politics, social relations, economic interests, environmental changes, and forms of engineering have conditioned which types and consequences of technology in modern history.

Objective
Students will discuss primary and secondary sources about the relationship between technology and the environment since the nineteenth century. They will learn to analyze argumentative strategies, divergent perspectives, and consequences and to write precisely and trenchantly about technology and the environment in society.

851-0101-74L

Abstract
Sustainable Development - Bridging Art and Science

In this course students deepen their knowledge about global development and sustainability issues. We will show five movies each of them linked to one of the five P’s (Planet, People, Prosperity, Peace and Partnerships) reflecting the topics of the 2030 Agenda. Afterwards the movie will be critically discussed with researchers and relevant stakeholders from the broader society.

Objective
• Students get a broad understanding of some of the most important issues and discussions related to sustainable development.
• Students get exposed to diverse realities of young people in developing countries.
• Students can critically reflect upon the information that is presented to them in the movies and relate it to the broader discussions around sustainable development.
• Students reflect on issues concerning communicating research and the realities of low-income settings to a wider public.

Content
The aim of the course is to deepen student’s knowledge about global issues and to inspire them to reflect critically upon complex topics, which are related to the broader discourse on sustainable development. In each class, we show a documentary film, which is linked to one of the five critical areas of the 2030 Agenda (Planet, People, Prosperity, Peace and Partnerships), putting specific focus on realities in developing countries. Following the movie screenings, we will discuss the topic of the film in the light of sustainable development with an expert from academia and/or a practitioner from the field of development cooperation. In preparation for each class, the students read an academic paper, which will also be considered in the discussion. The idea of “Bridging Art and Science” is to expose an interdisciplinary group of students to artistic and scientific perspectives alike and to challenge them to deal with bias and polarization, and the role that the media and films play in that regard. The participants of the course will be given the chance to embrace the complexity of sustainable global development.

851-0535-10L

Abstract
Yemen: A Failed State?

Is Yemen a failed state? The Yemeni Republic is the result of the unification in 1990 of two former states: The Yemen Arab Republic (North Yemen) and the People’s Democratic Republic of Yemen (South Yemen). The country’s history and its former units have been marred with civil wars, poverty and epidemic corruption.

Objective
1. Examine the concept of failed state within the international relations literature.
2. Take a closer look at Yemen(s) political history(ies), its/their political, social structures, and power dynamics.
3. Introduce the concept of the ‘cunning state’ and its exploitation of the discourse of failed state

Content
This seminar looks at the concept of failed states and how useful it can be in describing the situation in a country like Yemen. It will also take a closer look at Yemen(s) political history(ies) and its/their political and social structures. Students are expected to write a paper and make a presentation.

851-0594-04L

Abstract
One Study, Two Paths: The Dual-Use Dilemma in the Life Sciences

Particularly suitable for students (from Bachelor 3rd year onwards) of D-BIOL, D-CHAB, D-HEST

Maximum number of participants limited to 20

Research and technologies emerging from the life sciences bring beneficial aspects to our society but also unforeseeable risks regarding biosafety and biosecurity. In this course, students will learn about the advances in science and technology and their implications for society and international treaties (BWC or CWC) and their social, ethical and legal responsibilities as life scientists.

Objective
By the end of this course, students will be able to critically assess their own research regarding the possibility to apply scientific results or methods with benevolent or malevolent intentions (dual-use) and will be able to integrate strategies into their research design to reduce the misuse potential.
Life sciences evolve rapidly supported by developments in related disciplines. However, while those new and emerging technologies greatly benefit society, they additionally bring along predictable as well as unforeseeable risks in the context of biosafety and biosecurity.

The ability of life science professionals to critically assess their own research regarding potential misuse risks and how to reduce these is a crucial aspect to maintain research integrity against the background of novel security concerns arising from the speed and dynamics of advancements in the life- and associated sciences.

During the course, you will discuss about your societal, ethical, and legal responsibilities as life scientists. You will become aware of biosafety and biosafety risks and what scientists can do to minimize misuse potential in highest-risk research (= dual use research of concern). A strong focus of the seminar lies on interactive group work for which you will be able to build on your individual experiences and scientific background. Additionally, a combination of lectures and input from guest speakers will provide you with essential background information and insights into real-world applications. You will understand the dual-use dilemma and learn about biological warfare, biological terrorism, and the international prohibition regimes; the national implementation of the biological and toxins weapons convention and about efforts to build the web of prevention against the misuse of life sciences.

Support and Diagnosis of Knowledge Acquisition Processes (EW3) n
Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3) and for students who intend to enrol in the "Teaching Diploma".

Prerequisites: successful participation in 851-0240-00L "Human Learning (EW1)".

Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
(1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
(2) You have a basic understanding about psychological test theory and can appropriately administer tests.
(3) You know various techniques of formative assessment and can apply these to uncover students’ misconceptions.

Human-Computer Interaction: Cognition and Usability
Number of participants limited to 35.
Particularly suitable for students of D-ARCH, D-INFK, D-ITET

Abstract
This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project.

The Science of Learning From Failure
Number of participants limited to 60.

Abstract
We can learn from failure. But, what does “failure” mean? And, what, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects thinking, knowledge, creativity, problem-solving, and motivation.
### Objective
Students will:
- Critically read and analyze articles on research that addresses failure in learning
- Participate in in-class problem-solving activities around research in failure
- Discuss and reflect upon topics in both online and face-to-face formats
- Engage in activities through the online platform
- Complete a final paper on a subtopic related to failure in learning

By the end of the course, students should be able to:
- Demonstrate a critical understanding of the role that failure plays in learning
- Discuss how and why failure can benefit learning
- Discuss how and why failure does not facilitate learning
- Apply understanding to a related sub-topic

### Content
We learn from our mistakes, or rather, we hope that we do. Another way to say this is that we can learn from failure. But, what does "failure" mean? What, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects development of knowledge, creativity, problem-solving, and general thinking and learning. More specifically, they will have the opportunity to question and evaluate the potential relationships between the facets around failure within individual, interactional, cultural, societal, and global contexts through seminal readings and problem-solving activities. Students from any discipline are welcome to this course to learn more about how failure can be harnessed to improve our knowledge, capabilities, innovations, teamwork, and contribute to the larger global world.

### Prerequisites / notice
This seminar is an interactive course, thus attendance and classroom participation are required. Processing of online tasks is a requirement for obtaining credit points.

### The course is held as 2 separate courses with each a maximum of 30 students: one course in German and one course in English.

<td>Content: This course consists of three main elements: A) Attendance of lectures that provide the theoretical foundations of &quot;Psychological Aspects of Risk Management and Technology&quot; together with reading assignments for each lecture. B) Attendance of guest lectures that provide a rich source of practical insights and enable the transfer of theory into practice by discussing real-life cases with experts from various industries. C) Furthermore, this course enables you to apply what you have learned in the classroom into practice by participating in a group assignment in which you gain insights into various risk industries (e.g., aviation, healthcare, insurance) and topics (e.g., risks in cyber-attacks, mountaineering, autonomous vehicles). These projects help students understand key aspects through in-depth application of the course material on real-life topics. Each group project will be mentored and graded by one of the lecturers (70% of course grade). To round off the course at the end of the year, you will have the opportunity to present your group's findings to the lecturers and to your peers (30% of course grade).</td>

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 953 of 2159
The study of consciousness involves scholars from diverse fields, such as psychology, neuroscience, cognitive science, philosophy, linguistics, computer science, medicine, religious studies, anthropology, as well as literature and art studies. While the study of consciousness is presented mainly from the point of view of psychology in this course, additional interdisciplinary viewpoints are also integrated.

Psychological consciousness studies involve research on levels and states of consciousness. Psychologically researched levels of consciousness are the conscious, preconscious, unconscious/subconscious, and nonconscious levels of mental processing. Psychological research on states of consciousness—which is the main focus of this course—takes waking consciousness as the most common state (ordinary state of consciousness, OSC), using it as a baseline against which altered states of consciousness (ASCs) are compared. Some of the most prominently or promising researched ASCs in psychology will be introduced in this course and include sleepwalking/dreaming, hypnosis, meditation, sensory deprivation (e.g., floating tank), reality-based architecture, and ASCs induced by psychoactive drugs (classic psychedelics, dissociative anesthetics, empathogens). Furthermore, it will also be shown how a growing number of health and clinical studies investigate the therapeutic potential of being temporarily in an ASC. Finally, in this course, two mental phenomena that are also highly relevant for the scientific mind—insight and flow—are also introduced from a consciousness-studies perspective.

**Objective**

After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas.

**Content**

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

**Literature**

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture " (851-0703-03L) or "Introduction to Law" (851-0703-00L), cannot register for this course unit.

**Objective**

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

**Content**

- Basic concepts of law, sources of law.
- Private law: Contract law (particularly contract for work and services), tort law, property law.
- Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU and into criminal law.
Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15142).

Contract Design I
This course is taught by Professor Alexander Stremitzer (laweconbusiness.ethz.ch/group/professor/stremitzer.html). Note that this is NOT a legal drafting class that focuses on contractual language. Instead, in Contract Design I, you will learn what the content of a contract should be so that parties can reach their goals.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2021)” and enroll. The password is “ContractDesign01”.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract
Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.

Objective
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CvIdfG70zq0). However, this course prioritizes applications of contract design. Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Law and Urban Space
Particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherrera@uzh.ch).

Prerequisites / notice
Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherrera@uzh.ch).

Prerequisites / notice
Handouts, prerecorded videos, slides, and other materials

System of Swiss planning law,
Constitutional and statutory provisions,
Space planning and fundamental rights,
Instruments,
Application, legal protection, enforcement,
Practical training.

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999
Hänni, Peter, Planungs-, Bau- und besonderes Umweltschutzrecht, 6.A., Bern 2016

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

Implementing online projects and undertaking information technology activities.

1) Welches Recht gilt im E-Business?
- Internationalität des Internets
- Regulierte Branchen
2) Gestaltung und Vermarktung von E-Business-Angeboten
- Verwendung fremder und Schutz der eigenen Inhalte
- Haftung im E-Business (und wie sie beschränkt werden kann)
- Domain-Namen
3) Beziehung zu E-Business-Kunden
- Verträge im E-Business, Konsumentenschutz
- Elektronische Signaturen
- Datenschutz
- Spam
4) Verträge mit E-Business-Providern

Änderungen, Umstellungen und Kürzungen bleiben vorbehalten. Der aktuelle Termin- und Themenplan ist zu gegebener Zeit über die elektronische Dokumentenablage abrufbar.

Es wird mit Folien gearbeitet, die als PDF über die elektronische Dokumentenablage (ILIAS) auf dem System der ETHZ gängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Der Termin- und Themenplan ist zu gegebener Zeit über die elektronische Dokumentenablage abrufbar.

Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via elektronische Dokumentenablage).

Die Semesterendprüfung war vor Corona in Form eines schriftlichen Kurztests (normalerweise ein MC, im letzten Jahr Coronabedingt aber eine Falllösung) in der letzten Doppelstunde ausgestaltet. Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

Particularly suitable for students of D-ITET, D-MAVT
Abstract

The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

Objective

The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution.
- They shall be familiar with the issues of corporate compliance, i.e., the systems to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes

A comprehensive script will be made available online on the moodle platform.

851-0738-00L

Intellectual Property: Introduction

W 2 credits 2V M. Schweizer

Particularly suitable for students of D-CHAB, D-INFK, D-ITET, D-MAVT

Abstract

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

851-0738-01L

The Role of Intellectual Property in the Engineering and Technical Sector

W 2 credits 2V K. Houshang Pour Islam

Particularly suitable for students of D-BAUG, D-BIOL, D-BSSE, D-CHAB, D-ITET, D-MAVT

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

851-0760-00L

Building a Robot Judge: Data Science for Decision-Making (Course Project)

W 3 credits 2V E. Ash

Particularly suitable for students of D-INFK, D-ITET, D-MTEC

Abstract

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a working robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0761-00L

Building a Robot Judge: Data Science for Decision-Making (Course Project)

W 2 credits 2V E. Ash

This is the optional course project for “Building a Robot Judge: Data Science for the Law.”

Please register only if attending the lecture course or with consent of the instructor.

Some programming experience in Python is required, and some experience with text mining is highly recommended.

Abstract

Students investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models. This is the extra credit for a larger course project for the course.
Objective

In a semester paper, students (individually or in groups) will conceive and implement their own research project applying natural language tools to legal texts. Some programming experience in Python is required, and some experience with NLP is highly recommended.

Content

Students will investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models.

We will use these predictions to better understand the operation of the legal system. In a semester project, student groups will conceive and implement a research design for examining this type of empirical research question.

851-0746-00L Algorithms and Fairness

Any students enrolling in the course must complete a short writing assignment within two weeks of registering. Please contact the instructors via email (aileen.nielsen@gess.ethz.ch) for information about the assignment and for access to the course Slack workspace.

Abstract

From a legal, social science, and applied mathematics perspective, we address the increasingly important question of what AI fairness means and how AI fairness can be addressed by legal, social science, and applied mathematical research to inform policy making.

Objective

Understand the history of fairness as defined in law, social science, and applied mathematics research

Identify logical and mathematical conflicts between different definitions of fairness

Explain why fairness and AI is a highly contested and unresolved problem in law.

Content

This block course will be broken into three components.

Fair outcomes: the equality/equity debate

- The proliferation of fairness definitions

- Impossibility theorems

- AI & fundamental rights

- Fair process

- Appropriate use of AI in administrative or judicial roles

- AI counterparties

- Fair markets

Fair distribution

- Distributing scarce resources

- Data markets and data labor

- The future of work

851-0742-01L Contract Design II

This course is taught by Professor Alexander Stremitzer (https://lawecon.ethz.ch/group/professors/stremitzer.html).

To be considered for Contract Design II, you must have completed Contract Design I in the same semester. Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

Abstract

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a (hypothetical) client organization planning to enter a complex transaction on how to structure the underlying contract.

Objective

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalbertocalderaherrera@uzh.ch).

Prerequisites / notice

To enable you to work under the close supervision of your professor and his team, only a small group of students with backgrounds in law, business, or engineering is admitted to this course. This simulation is time-consuming and challenging. Hence, we can only admit the most successful and motivated students to this class. Further information on the application process will follow.

Sociology

Number Title Type ECTS Hours Lecturers
851-0252-10L Project in Behavioural Finance W 3 credits 2S S. Andraszewicz, C. Hölscher, A. C. Roberts

Abstract

In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

Objective

This course has four main goals:

1) To learn about the most important topics within Behavioural Finance
2) To learn how to conduct behavioural studies, design experiments, plan data collection and experimental tasks
3) To learn about causes of market crashes, factors that influence them, traders’ behaviour before, during and after financial crises
4) To investigate a topic of interest, related to behaviour of traders during market crashes.

Additionally, the course gives to the students the opportunity to practice oral presentations, communication skills, report writing and critical thinking.

Content

The course provides an overview of the most important topics in Behavioural Finance. First part of the course involves reading scientific articles, which will be discussed during the seminar. Therefore, attendance is required to pass the course. Each week, a student volunteer will present a paper and the presentation will be followed by a discussion. After obtaining sufficient knowledge of the field, students will select a topic for a behavioural study of their own. The final assignment consists of preparing and conducting a small behavioural study/experiment, analysing the data and presenting the project in the final meeting of the class. Each student will write a scientific report of their study.

851-0252-13L Network Modeling

W 3 credits 2V C. Stadtfeld, V. Amati

Students are required to have basic knowledge in inferential statistics, such as regression models.
Abstract
Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks. Statistical and numerical methods have been developed to fit these models to empirical data. Emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective
Students will be able to develop hypotheses that relate to the structures and dynamics of (social) networks, and tests those by applying advanced statistical network methods such as exponential random graph models (ERGMs) and stochastic actor-oriented models (SAOMs). Students will be able to explain and compare various network models, and develop an understanding of how those can be fit to empirical data. This will enable students to independently address research questions from various social science fields.

Content
The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  - uniform random graph models
  - small world models
  - preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  - Quadratic assignment procedure regression (QAP regression)
  - Models for testing hypotheses on the network structure:
    - Models for one single observation of a network: exponential random graph models (ERGMs)
    - Models for panel network data: stochastic actor-oriented models (SAOMs)
  - Models for relational event data: dynamic network actor models (DynAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Literature

Prerequisites / notice
Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

851-0252-15L Network Analysis W 3 credits 2V U. Brandes
Particularly suitable for students of D-INFK, D-MATH

Abstract
Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective
Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content
The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion

Lecture notes
Lecture notes are distributed via the associated course moodle.

Literature

851-0585-41L Computational Social Science n W 3 credits 2S D. Helbing, J. Argota Sánchez-Vaqueroz, M. Korecki

Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systemic risks and extreme events. They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

---

**851-0586-03L**

**Applied Network Science: Social Media Networks**

*Number of participant limited to 20*

**Abstract**

We study applications of network science methods, this semester in the domain of social media.

Topics are selected for diversity in research questions and techniques for topics such as privacy and information spread on a variety of platforms. Student teams present results from the recent literature, possibly with replication, in a one-day conference.

**Objective**

Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on social media, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.

---

**851-0745-00L**

**Ethics Workshop: The Impact of Digital Life on Society**

*Number of participants limited to 40.*

**Abstract**

This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

**Objective**

- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.

**Content**

The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, news media, society, social media, digital health and justice will be then considered. These six domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explain-ability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.
Complex Social Systems: Modeling Agents, Learning, and Games

Number of participants limited to 100.

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract
This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

Objective
The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

Content
Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

https://science.sciencemag.org/content/342/6164/1337

Further literature will be recommended in the lectures.

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Fostered competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies
- Negotiation
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Science Research

Number Title Type ECTS Hours Lecturers
851-0020-00L Gender and Science W 2 credits 2V C. L. Blaser, M. Ligtenberg

Abstract
This lecture series offers an introduction to the relationship between gender and science, with a focus on the specific intersections with the sciences taught at ETH.

Objective
This lecture series is designed to acquaint students from all levels and departments with the various ways in which gender perspectives matter for specific scientific disciplines, as well as for science in general. Students will learn to recognize and analyse the specific ways in which scientific theories and methods are gendered, and how this connects to their own scientific disciplines.
Content There is agreement across academic disciplines today that gender influences and structures the production of knowledge and that scientific knowledge production in turn shapes gender notions. Even within “hard” sciences such as mathematics, physics, engineering, etc., gender is a significant factor in determining what counts as “objective” knowledge, who can know it, what kind of knowledge is produced, or how this knowledge is acquired and justified. Feminist research aims to reveal how dominant conceptions of science and knowledge practices disadvantage women, and other subordinate groups, with the goal of reforming these practices. An important part of feminist critique is to show that such efforts substantially improve the overall quality of research.

The semester will start with an introductory lecture acquainting students with research questions in the field of Gender and Science by summarizing its key concepts and methods. It will then continue as a series of weekly guest lectures, given by scholars from different scientific disciplines, that provide accessible insights into the intersection between gender studies and the guest lecturer’s research field. Students will thereby be encouraged to learn from concrete examples rather than abstract theory. The goal is for students to understand how to apply concepts and methods of gender studies to particular disciplines. A mid-term discussion session and end-term assignment will provide students the opportunity to critically reflect on how these questions are relevant for their own academic practices.

851-0157-00L Mind and Brain W 3 credits 2V M. Hagner

Abstract In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature.

Objective By the end of this lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.

Content According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.

Type B: Reflection About Subject-Specific Methods and Contents

Subject-specific courses: Recommended for doctoral, master and bachelor students (after first-year examination only).

Students who already took a course within their main study program are NOT allowed to take the course again.

These course units are also listed under “Type A”, which basically means all students can enroll

D-ARCH

Number Title Type ECTS Hours Lecturers
851-0703-00L Introduction to Law W 2 credits 2V O. Streiff Gnöpff

Abstract Students who have attended or will attend the lecture “Introduction to Law for Civil Engineering and Architecture” (851-0703-03L) or “Introduction to Law” (851-0708-00L), cannot register for this course unit.

Particularly suitable for students of D-ARCH, D-MAVT, D-MATL

Objective Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Content Basic concepts of law, sources of law.

Private law: Contract law (particularly contract for work and services), tort law, property law.

Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU and into criminal law.

Lecture notes Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2017 (Online Resource ETH Library)

Literature Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15142).

851-0742-00L Contract Design I W 3 credits 2V A. Stremitzer

Abstract Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.
### Objective

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CvldtG7Ozq0). However, this course prioritizes applications of contract design. Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Handouts, prerecorded videos, slides, and other materials are available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15143).

---

### Lecture notes

**Prerequisites / notice**

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Streimertz’s Teaching Assistant Diego Caldera (diegoalberto.calderrerrera@uzh.ch).

### 851-0703-04L Law and Urban Space

**Number of participants limited to 45**

- **W 2 credits 1V 0. Streiff Gnopff**

**Abstract**

Legal rules are tied to urban space. Illustrative is the relation between land ownership and urban morphology or between zoning and the functional dimension of urban space. Legal concepts (from property law, fundamental rights and administrative law) with spatial impacts are introduced and related to the theory of urban design. Moreover, it is discussed how these concepts shape specific places.

**Objective**

Students recognize the interplay between legal structures and urban space. They can describe legal concepts with spatial impact. Moreover, they are able to compare legally binding targets with theoretical approaches in urban design. By analysing specific places, students learn to find relevant norms, to analyse and to judge them with regard to urban design theories. Therefore, they are able to distinguish design and policy questions.

**Content**

Using the the term «lawscape» (Philippopoulos-Mihalopoulos), we initially discuss general aspects of the interplay between legal rules and urban space.

The first part of the course is about the morphological dimension of urban space. We compare positions of urban planners like Trancik (Finding Lost Space) or Rowe/Koetter (Collage City) with property law. Freedom of property in turn contrasts to the theoretical approaches of Bernoulli (Die Stadt und ihr Boden) or Rossi (L’architettura della città). Using court decisions concerning nail houses, we study the tensions between urban development and the system of property ownership.

The second part of the course is about the functional dimension of urban space. Key concept is the zone (cf. CIAM 4). This concept is criticized (Wolfrum, Zoning Bien Défini). We compare the concept as well as the critique with the main concerns in spatial planning law. Environmental law and neighbouring rights are also relevant.

In the third part of the course, we work on the social, visual and temporal dimensions of urban space. The positions of Jacobs (The Death and Life of Great American Cities), Cullen (Townscape) or Lynch (The Presence of the Past) are compared with the dichotomy public space/private space, safety regulations, regulations on design reviews or heritage protection laws.

**Lecture notes**

See Literature

**Literature**

Documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15143).

**Number of participants limited to: 45**

### 851-0252-01L Human-Computer-Interaction: Cognition and Usability

- **W 3 credits 2S 0.Zhao, S. Credé, C. Hölscher**

**Abstract**

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

### Objective

Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESE credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

### Abstract

Students implement a range of methods on a sample project. The course is tailored for architecture design students.

### Content

The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the "human". In this way, the concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESE credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

**Abstract**
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will reflect on the question of how democracy could be digitally upgraded to promote innovation, sustainability, and resilience.

**Objective**
To collect credit points, students will have to give a 30-40 minute presentation in the seminar, after which the presentation will be discussed. The presentation will be graded.

**Content**
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.
Further literature will be recommended in the lectures.
There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you.

851-0742-01L Contract Design II

This course is taught by Professor Alexander Stremitzer (https://lawecon.ethz.ch/group/professors/stremitzer.html). To be considered for Contract Design II, you must have completed Contract Design I in the same semester. Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

Abstract

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a (hypothetical) client organization planning to enter a complex transaction on how to structure the underlying contract.

Objective

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegocaldero.calderaherrera@uzh.ch).

Prerequisites / notice

To enable you to work under the close supervision of your professor and his team, only a small group of students with backgrounds in law, business, or engineering is admitted to this course. This simulation is time-consuming and challenging. Hence, we can only admit the most successful and motivated students to this class. Further information on the application process will follow.

052-0517-21L Theory and Practice: Heterotopia, Referential Space and Spatial Effects

Abstract

In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such interweaving in current local situations and tries to think about potentials for spatial policy practice.

Objective

The students gain insight into the spectrum of epistemological and perceptual theories, learn to read them and analyze and critique their respective requirements. From this work an object relationship model is developing in progress, which serves self-examination in the design process as well as the evaluation of architectural situations in general and in particular. The writing of "scientific diaries" in which the contents of the colloquium are combined with the everyday experience of the students in free form, trains the concentrated result-oriented thinking in general, as well as in architectural situations. The special form of the writing of the "scientific diary" leads abstract Theory together with the experience of the students and make the knowledge creatively available in their own way.

Content

In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such interweaving in current local situations and tries to think about potentials for spatial policy practice.

Prerequisites / notice

Cooperation in the form of discussions and scientific diary.

The additional personal work (besides the course) is about 20 working hours for the creation of a scientific journal, individual deepening and filming!

851-0107-00L Science and the Public: A Problem of Mediation that the Media Have to Solve?

Abstract

Scientific knowledge is often provisional; it is subject to correction. That is why it cannot always satisfy the need for certainty and clarity that arises in the public as soon as political controversies are linked to questions of (scientific) knowledge. This is shown by the Corona pandemic, but not only by it. How can science journalism, how can scientists deal with this problem? Do the natural sciences, medicine and technology differ from the humanities and social sciences in terms of comprehensibility and public awareness? These questions will be explored on some excursions into recent and also older media, scientific and cultural history.

Objective

In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such interweaving in current local situations and tries to think about potentials for spatial policy practice.

Content

The feuilleton of the «Frankfurter Allgemeine Zeitung» of 27 June 2000 has gone down in the annals of recent media history. The last not assessed

Science and the Public: A Problem of Mediation that the Media Have to Solve?

Gaining insights into the relationship between the sciences, the public and the media, into their historical development and current problems.

851-0101-80L Basic Problems of Environmental Ethics

Abstract

Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distributions of the burdens in the struggle against the climate change? What is the reasonable understanding of our relation to nature? How should we run our economies?
Objective

Participants should become familiar with basic approaches to central problems in environmental ethics.

The course will try to give an argument-based answer to the question: What are the responsibilities for individuals (e.g. as consumers), and for collectivities (e.g. states and firms).

Another focus will be to clarify the concept of "climate justice".

The course should also enable participants to evaluate different answers to the question how we should organize our economies for securing our ecological niche.

Number Title Type ECTS Hours Lecturers
851-0738-01L The Role of Intellectual Property in the Engineering and Technical Sector W 2 credits 2V K. Houshang Pour Islam

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The lecture addresses students in the fields of engineering, science and other related technical fields.

851-0742-00L Contract Design I W 3 credits 2V A. Stremitzer

Abstract

This course is taught by Professor Alexander Stremitzer (https://laweconbusiness.ethz.ch/group/professor/stremitzer.html). Note that this is NOT a legal drafting class that focuses on contractual language. Instead, in Contact Design I, you will learn what the content of a contract should be so that parties can reach their goals.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2021)" and enroll. The password is "ContractDesign01".

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=Cvld1G70z9Q). However, this course prioritizes applications of contract design. Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Handouts, prerecorded videos, slides, and other materials

Prerequisites / notice
Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Sternitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderrera@uzh.ch).

851-0707-00L Space Planning Law and Environment

W 2 credits 2G O. Bucher

Abstract
System of swiss planning law,
Constitutional and statutory provisions,
Space planning and fundamental rights,
Instruments,
Application, legal protection, enforcement,
Practical training.

Objective
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Content

Lecture notes
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

701-0703-00L Environmental Ethics

W 2 credits 2V A. Deplazes Zemp

Abstract
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to address environmental challenges.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practicing of newly acquired knowledge in smaller exercises.

Lecture notes
Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.

Literature
- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- Konrad Otto/Jan Diers/Kliesch, Handbuch Umweltethik, 2016
- John O'Neill et al., Environmental Values, 2008
- Conradi, O. Edmunds, Environmental Ethics, 2008

Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term.

052-0801-00L Global History of Urban Design I

W 2 credits 2G T. Avermaete

Abstract
This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

Objective
The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01: The History and Theory of the City as Project
02: Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09: Civilization and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: Settlements and their Development: From the Global North to the Global South and Back Again

Prerequisites / notice

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales). A list of further recommended literature will be found within each chapter of the reader (Skript).

Prerequisites / notice

The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members.

Note: The course AI4Good is not related to Hack4Good, which is a students' initiative organized by the Analytics Club at ETH. For more information about Hack4Good check out the website: https://analytics-club.org/wordpress/hack4good/

Prerequisites / notice

Students with a strong background in machine learning and excellent programming skills (preferably in Python) are sought.

Prerequisites / notice

Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying)

Objective

Overview of the legal norms of land registry and surveying law.

Content

Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal problems of surveying, the reform of official surveying, liability of the geo-eter.

Lecture notes

Abgegebene Unterlagen: Skript in digitaler Form

Literature

- Meinrad Huser, Schweizerisches Vermessungsrecht, unter besonderer Berücksichtigung des Geoinformationsrechts und des Grundbuchrechts, Beiträge aus dem Institut für schweizerisches und internationales Baurecht der Universität Freiburg/Schweiz, Zürich 2014

Lecture notes

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

Literature

There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

Prerequisites / notice

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).
Subject-specific Competencies

- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies

- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies not assessed
- Problem-solving assessed
- Project Management not assessed

Social Competencies

- Communication not assessed
- Cooperation and Teamwork assessed
- Customer Orientation assessed
- Leadership and Responsibility not assessed
- Self-presentation and Social Influence not assessed
- Sensitivity to Diversity assessed
- Negotiation assessed

Personal Competencies

- Adaptability and Flexibility not assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection assessed
- Self-direction and Self-management not assessed

**851-0742-01L** Contract Design II

*W* 1 credit 1U  A. Stremitzer

**Abstract**

This course is taught by Professor Alexander Stremitzer ([https://law econ.ethz.ch/group/professors/stremitzer.html](https://lawecon.ethz.ch/group/professors/stremitzer.html)). To be considered for Contract Design II, you must have completed Contract Design I in the same semester. Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

**Objective**

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherra@uzh.ch).

**Prerequisites / notice**

To enable you to work under the close supervision of your professor and his team, only a small group of students with backgrounds in law, business, or engineering is admitted to this course. This simulation is time-consuming and challenging. Hence, we can only admit the most successful and motivated students to this class. Further information on the application process will follow.

**851-0101-80L** Basic Problems of Environmental Ethics

*W* 3 credits 2G  L. Wingert

**Abstract**

Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distribution of the burdens in the struggle against the climate change? What is the reasonable understanding of our relation to nature? How should we run our economies?

**Objective**

Participants should become familiar with basic approaches to central problems in environmental ethics.

The course will try to give an argument-based answer to the question: What are the responsibilities for individuals (e.g. as consumers), and for collectivities (e.g. states and firms).

Another focus will be to clarify the concept of "climate justice".

The course should also enable participants to evaluate different answers to the question how we should organize our economies for securing our ecological niche.

**Literature**

I. Introduction to Moral Reasoning

1. Ethics - the basics
   1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
   2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
   3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities

1. Integrity in research and research misconduct
   1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
   2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
   3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities

1. Research involving human subjects
   1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity
   1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
   2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
   3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice

What are the requirements?

First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):

1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…).

851-0738-01L The Role of Intellectual Property in the Engineering and Technical Sector

Particularly suitable for students of D-BAUG, D-BIOL, D-BSSE, D-CHAB, D-ITET, D-MAVT

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.
Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice

The lecture addresses students in the fields of engineering, science and other related technical fields.

---

Abstract

This course introduces students to legal, economic, and social perspectives on the increasing economic and social importance of technology. We focus particularly on the challenges to current law posed by the increasing rate of tech innovation and adoption generally and also by case-specific features of prominent near-future technologies.

Objective

The course is intended for a wide range of engineering students, from machine learning to bioengineering to human computer interaction, as well as for law students interested in acquiring a better understanding of state-of-the-art technology.

The course will combine both an overview of major areas of law that affect the regulation of technology and also guest lectures on the state-of-the art in a variety of important technologies, ranging from autonomous vehicles to fair artificial intelligence to consumer-facing DNA technologies.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.
The planned course outline is below

1. Overview of science, law, and technology
   a. Studies of law and technology
   b. Should science be regulated, and if so, how?
   c. Technology as a social problem

2. Designing technology for humans
   a. Attention fiduciaries and the digital environment
   b. Does technology weaponize known problems of bounded human rationality?
   c. Should technology be regulated as a psychotropic substance? An addictive substance?
   d. Can technology make life easier?
   e. Psychological effects of surveillance

3. Governing tech
   a. Can small governments regulate big tech?
   b. National and supranational legislation
   c. Enforcing the law with technology
   d. Can enforcement be baked into technology?

4. AI and fairness
   a. Discrimination
   b. Privacy
   c. Opacity
   d. AI and due process

5. Trade secret and technological litigation
   a. Trade secret is a long-standing tool for litigation but does it enjoy too much deference?
   b. Trade secrets and the rights of employees

6. Enforcement against tech
   a. Big tech and antitrust
   b. Consumer protection

7. The Digital Battlefield
   a. Technology for spying
   b. Spying on technology companies
   c. Race to be AI superpower
   d. Immigration policy

8. Contract law
   a. Smart contracts
   b. Modernizing contract law and practice
   c. Regulating cryptocurrencies

9. Tort law
   a. Applying existing tort law to new autonomous technologies
   b. Personhood and personal responsibility
   c. Victim entitlements

10. Self-driving cars and other autonomous robotics
    a. Legal regimes
    b. Diversity in morality judgements related to autonomous vehicles

11. Biometrics
    a. Widespread use of facial recognition
    b. Law enforcement
    c. Connecting biometrics to social data
    d. Solving crimes with biometrics

12. New Biology and Medicine
    a. Unregulated science (biohackers)
    b. Promising technology before it can be delivered
    c. Connecting medicine to social data
    d. Using technology to circumvent medical regulations

---

**Abstract**
This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

**Objective**
By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.

**Content**
The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the “human”. In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre's lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre's activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.

---

**Abstract**
Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distributions of the burdens in the struggle against the climate change? What is the reasonable understanding of our relation to nature? How should we run our economies?
Participants should become familiar with basic approaches to central problems in environmental ethics.

The course will try to give an argument-based answer to the question: What are the responsibilities for individuals (e.g. as consumers), and for collectivities (e.g. states and firms).

Another focus will be to clarify the concept of "climate justice".

The course should also enable participants to evaluate different answers to the question how we should organize our economies for securing our ecological niche.

**Abstract**

Research and technologies emerging from the life sciences bring beneficial aspects to our society but also unforeseeable risks regarding biosafety and biosecurity. In this course, students will learn about the advances in science and technology and their implications for society and international treaties (BWC or CWC) and their social, ethical and legal responsibilities as life scientists.

**Objective**

By the end of this course, students will be able to critically assess their own research regarding the possibility to apply scientific results or methods with benevolent or malevolent intentions (dual-use) and will be able to integrate strategies into their research design to reduce the misuse potential.

**Content**

Life sciences evolve rapidly supported by developments in related disciplines. However, while those new and emerging technologies greatly benefit society, they additionally bring along predictable as well as unforeseeable risks in the context of biosafety and biosecurity.

The ability of life science professionals to critically assess their own research regarding potential misuse risks and how to reduce these is a crucial aspect to maintain research integrity against the background of novel security concerns arising from the speed and dynamics of advancements in the life- and associated sciences.

During the course, you will discuss about your societal, ethical, and legal responsibilities as life scientists. You will become aware of biosafety and biosafety risks and what scientists can do to minimize misuse potential in highest-risk research (="dual use research of concern"). A strong focus of the seminar lies on interactive group work for which you will be able to build on your individual experiences and scientific background. Additionally, a combination of lectures and input from guest speakers will provide you with essential background information and insights into real-world applications. You will understand the dual-use dilemma and learn about biological warfare, biological terrorism, and the international prohibition regimes; the national implementation of the biological and toxins weapons convention and about efforts to build the web of prevention against the misuse of life sciences.

851-0180-00L Research Ethics W 2 credits 2G G. Achermann, P. Emch

Abstract
Number of participants limited to 40
Particularly suitable for students of D-BIOL, D-CHAB, D-HEST
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will
• Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
• Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;
I. Introduction to Moral Reasoning

1. Ethics - the basics
   1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
   2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in "Research Ethics"

3. Decision making: How to solve a moral dilemma
   3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a "right" answer?

II. Research Ethics - Internal responsibilities

1. Integrity in research and research misconduct
   1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
   2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
   3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities

1. Research involving human subjects
   1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity

2. Social responsibility
   2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
   3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!), connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…).

851-0742-00L Contract Design I
This course is taught by Professor Alexander Stremitzer (https://laweconbusiness.ethz.ch/group/professor/stremitzer.html). Note that this is NOT a legal drafting class that focuses on contractual language. Instead, in Contract Design I, you will learn what the content of a contract should be so that parties can reach their goals.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2021)" and enroll. The password is "ContractDesign01".

Number of participants limited to 160. Max 80 ETHZ and 80 UZH Students

Abstract
Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production, and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information. Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

Contract Design II

This course is taught by Professor Alexander Stremitzer. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a startup on how to structure a contract for the sale of its technology. The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice

Students must hand in an extensive group project in addition to the weekly quizzes and short responses. You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn course credit ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Handouts, prerecorded videos, slides, and other materials

851-0738-00L

Intellectual Property: Introduction

 Particularly suitable for students of D-CHAB, D-INFK, D-ITET, D-MAVT, D-MATL, D-MTEC.

Abstract

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn course credit ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

851-0738-01L

The Role of Intellectual Property in the Engineering and Technical Sector

 Particularly suitable for students of D-BAUG, D-BIOL, D-BSEE, D-CHAB, D-ITET, D-MAVT.

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

851-0742-01L

Contract Design II

This course is taught by Professor Alexander Stremitzer (https://lawecn.ethz.ch/group/professors/stremitzer.html). To be considered for Contract Design II, you must have completed Contract Design I in the same semester. Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

Abstract

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a (hypothetical) client organization planning to enter a complex transaction on how to structure the underlying contract.

Objective

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegogaberto.calderaherrera@uzh.ch).

851-0125-65L

A Sampler of Histories and Philosophies of
Participants should become familiar with basic approaches to central problems in environmental ethics.

Objective
The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

851-0101-80L Basic Problems of Environmental Ethics

W 3 credits 2G L. Wingert

Abstract
Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distribution of the burdens in the struggle against the climate change? What is the reasonable understanding of our relation to nature? How should we run our economies?

Objective
The course will try to give an argument-based answer to the question: What are the responsibilities for individuals (e.g. as consumers), and for collectivities (e.g. states and firms).

Another focus will be to clarify the concept of "climate justice".

The course should also enable participants to evaluate different answers to the question how we should organize our economies for securing our ecological niche.

Literature
Preparatory Literature

851-0594-04L One Study, Two Paths: The Dual-Use Dilemma in the Life Sciences

W 3 credits 2S M. Gemünden, O. Thräner

Abstract
Research and technologies emerging from the life sciences bring beneficial aspects to our society but also unforeseeable risks regarding biosafety and biosecurity. In this course, students will learn about the advances in science and technology and their implications for society and international treaties (BWC or CWC) and their social, ethical and legal responsibilities as life scientists.

Objective
By the end of this course, students will be able to critically assess their own research regarding the possibility to apply scientific results or methods with benevolent or malevolent intentions (dual-use) and will be able to integrate strategies into their research design to reduce the misuse potential.

Content
Life sciences evolve rapidly supported by developments in related disciplines. However, while those new and emerging technologies greatly benefit society, they additionally bring along predictable as well as unforeseeable risks in the context of biosafety and biosecurity. The ability of life science professionals to critically assess their own research regarding potential misuse risks and how to reduce these is a crucial aspect to maintain research integrity against the background of novel security concerns arising from the speed and dynamics of advancements in the life- and associated sciences.

During the course, you will discuss about your societal, ethical, and legal responsibilities as life scientists. You will become aware of biosecurity and biosafety risks and what scientists can do to minimize misuse potential in highest-risk research ("dual use research of concern"). A strong focus of the seminar lies on interactive group work for which you will be able to build on your individual experiences and scientific background. Additionally, a combination of lectures and input from guest speakers will provide you with essential background information and insights into real-world applications. You will understand the dual-use dilemma and learn about biological warfare, biological terrorism, and the international prohibition regimes; the national implementation of the biological and toxins weapons convention and about efforts to build the web of prevention against the misuse of life sciences.

701-0703-00L Environmental Ethics W 2 credits 2V A. Deplazes Zemp

Abstract
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to address environmental challenges.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practicing of newly acquired knowledge in smaller exercises.

Lecture notes
Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.

851-0650-00L

The AI4Good course is a hackathon turned into a full course. At the beginning, stakeholders active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members.

Objective

Given a specific problem in global development, students shall learn to self-responsibly design, implement and experimentally evaluate a suitable solution. Students will also learn to critically evaluate their ideas and solutions together with all course members in a broader context that go beyond mere technical solutions, but touch on ethics, local culture etc., too.

Content

The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Organizers of the course will make sure that only those problems are selected that are suitable for a machine learning approach and where sufficient amounts of data (and labels) are available. Students will organize themselves into small groups of 3-5 students, where each group works on solving a specific problem. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Every two weeks, each group will present ideas and progress during a short presentation followed by a discussion with all course members. At the end of the course, students will present their final results and submit source code. In addition, they will describe the developed method in form of a scientific paper of 8 pages. Grading will depend on the source code, the paper, and active participation in class.

Note: The course AI4Good is not related to Hack4Good, which is a students’ initiative organized by the Analytics Club at ETH. For more information about Hack4Good check out the website: https://analytics-club.org/wordpress/hack4good/.

N. Guettler

In the course of the seminar, the students develop the competence to deal with the original text and the research literature on the history of anthropology, science and technology in a critical and historically thoughtful way. In doing so, they practise navigating independently through historical literature by means of smaller research tasks.

Content

The aim of the seminar is to introduce students to the history of science in anthropology, prehistory and popular science literature on the history of mankind by reading “Sapiens”. In addition to studying and critically discussing the original text, the students explore significant scientific and historical contexts of the book in small groups and present them in the seminar. In this way, they develop an understanding of the underlying narratives and popular science genres that inform “Sapiens”.

Prerequisites / notice

Research Ethics

W

2 credits

G. Achermann, P. Emch

Number of participants limited to 40

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract

Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective

Participants of the course Research Ethics will:

- Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
- Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;

Data: 06.09.2022 12:51

Autumn Semester 2021

Page 980 of 2159
I. Introduction to Moral Reasoning

1. Ethics - the basics
1.1 What ethics is not... 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity 1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more...).

363-1027-00L Introduction to Health Economics and Policy W 2 credits 1V C. Walbel

Does not take place this semester.

Abstract
Health expenditures constitute about 10% of GDP in OECD countries. Extensive government intervention is a typical feature in health markets. Risk factors to health have been changing with growing importance of lifestyle factors such as smoking, obesity and lack of physical activity. This course gives an introduction to the economic concepts and empirical findings in health economics.

Objective
Introduce students without prior economic background to the main concepts of health economics and policy to enhance students understanding of how health care institutions and markets function.

Content
The course gives an introduction to the economic concepts and empirical findings in health economics to enhance students understanding of how health care institutions and markets function. Motivated by the fact that health care markets are designed differently across countries, this course looks at the challenges in regulating health care markets. First, two important decisions of individuals will be addressed: What types and amount of personal health care services does an individual demand? How much will health insurance coverage be purchased? In the second part, why is the supply side of health care markets will be discussed. What are the financial incentives of physicians, and how do these influence physicians’ treatment choices? What does it mean and imply that a physician is an agent for a patient? The choices made by societies about how health care services are financed and about the types of organizations that supply health care will be addressed in the third part. One important choice is whether a country will rely on public financing of personal health care services or encourage private health insurance markets. How could and should a public health insurance system be designed? The advantages and disadvantages of the alternatives will be discussed to provide a framework for analyzing specific types of health care systems.

Abstract

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

Number of participants limited to 35.

Maximum number of participants limited to 20.

Number of participants limited to 160.

Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitiation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CvIdfG7OzdQ). However, this course prioritizes applications of contract design.

Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

851-0738-00L  Intellectual Property: Introduction

<table>
<thead>
<tr>
<th>Objective</th>
<th>The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abstract</td>
<td>The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.</td>
</tr>
<tr>
<td>Content</td>
<td>Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).</td>
</tr>
</tbody>
</table>

851-0252-13L  Network Modeling

<table>
<thead>
<tr>
<th>Objective</th>
<th>Students are required to have basic knowledge in Data Science</th>
</tr>
</thead>
</table>
Network science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks. Statistical and numerical methods have been developed to fit these models to empirical data. Emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Students will be able to develop hypotheses that relate to the structures and dynamics of (social) networks, and tests those by applying advanced statistical network methods such as exponential random graph models (ERGMs) and stochastic actor-oriented models (SAOMs). Students will be able to explain and compare various network models, and develop an understanding of how those can be fit to empirical data. This will enable students to independently address research questions from various social science fields.

The following topics will be covered:

- Introduction to network models and their applications

  - Stylized models:
    - uniform random graph models
    - small world models
    - preferential attachment models

- Models for testing hypotheses while controlling for the network structure:
  - Quadratic assignment procedure regression (QAP regression)

- Models for testing hypotheses on the network structure:
  - Models for one single observation of a network: exponential random graph models (ERGMs)
  - Models for panel network data: stochastic actor-oriented models (SAOMs)
  - Models for relational event data: dynamic network actor models (DYNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes and lecture notes are distributed via the associated course moodle.

**Literature**

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

**Prerequisites / notice**

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

**851-0252-15L Network Analysis**

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

**Objective**

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

**Content**

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion

**Lecture notes**

Lecture notes are distributed via the associated course moodle.

**Abstract**

This course introduces students to legal, economic, and social perspectives on the increasing economic and social importance of technology. We focus particularly on the challenges to current law posed by the increasing rate of tech innovation and adoption generally and also by case-specific features of prominent near-future technologies.

**Objective**

The course is intended for a wide range of engineering students, from machine learning to bioengineering to human computer interaction, as well as for law students interested in acquiring a better understanding of state-of-the-art technology.

The course will combine both an overview of major areas of law that affect the regulation of technology and also guest lectures on the state-of-the art in a variety of important technologies, ranging from autonomous vehicles to fair artificial intelligence to consumer-facing DNA technologies.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.
The planned course outline is below

1. Overview of science, law, and technology
   a. Studies of law and technology
   b. Should science be regulated, and if so, how?
   c. Technology as a social problem

2. Designing technology for humans
   a. Attention fiduciaries and the digital environment
   b. Does technology weaponize known problems of bounded human rationality?
   c. Should technology be regulated as a psychotropic substance? An addictive substance?
   d. Can technology make life easier?
   e. Psychological effects of surveillance

3. Governing tech
   a. Can small governments regulate big tech?
   b. National and supranational legislation
   c. Enforcing the law with technology
   d. Can enforcement be baked into technology?

4. AI and fairness
   a. Discrimination
   b. Privacy
   c. Opacity
   d. AI and due process

5. Trade secret and technological litigation
   a. Trade secret is a long-standing tool for litigation but does it enjoy too much deference?
   b. Trade secrets and the rights of employees

6. Enforcement against tech
   a. Big tech and antitrust
   b. Consumer protection

7. The Digital Battlefield
   a. Technology for spying
   b. Spying on technology companies
   c. Race to be AI superpower
   d. Immigration policy

8. Contract law
   a. Smart contracts
   b. Modernizing contract law and practice
   c. Regulating cryptocurrencies

9. Tort law
   a. Applying existing tort law to new autonomous technologies
   b. Personhood and personal responsibility
   c. Victim entitlements

10. Self-driving cars and other autonomous robotics
    a. Legal regimes
    b. Diversity in morality judgements related to autonomous vehicles

11. Biometrics
    a. Widespread use of facial recognition
    b. Law enforcement
    c. Connecting biometrics to social data
    d. Solving crimes with biometrics

12. New Biology and Medicine
    a. Unregulated science (biohackers)
    b. Promising technology before it can be delivered
    c. Connecting medicine to social data
    d. Using technology to circumvent medical regulations

---

Complex Social Systems: Modeling Agents, Learning, W and Games

Prerequisites: Basic programming skills, elementary probability and statistics.

Objective

The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

Content

Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.
Lecture notes
The lecture slides will be presented on the course web page after each lecture.

851-0760-00L Building a Robot Judge: Data Science for Decision-Making
Particularly suitable for students of D-INFK, D-ITET, D-MTEC

Abstract
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective
This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0761-00L Building a Robot Judge: Data Science for Decision-Making (Course Project)
This is the optional course project for "Building a Robot Judge: Data Science for the Law."

Abstract
Students investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models. This is the extra credit for a larger course project for the course.

Objective
In a semester paper, students (individually or in groups) will conceive and implement their own research project applying natural language tools to legal texts. Some programming experience in Python is required, and some experience with NLP is highly recommended.
Content
Students will investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models. We will use these predictions to better understand the operation of the legal system. In a semester project, student groups will conceive and implement a research design for examining this type of empirical research question.

<tr>
<td>Abstract</td>
<td>This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the “human”. In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre’s lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre’s activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.</td>

A Sampler of Histories and Philosophies of Mathematics

Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

W 3 credits 2V R. Wagner

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

860-0023-00L

International Environmental Politics

Particularly suitable for students D-ITET, D-USYS

W 3 credits 2V T. Bernauer

Abstract

This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

Objective

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

Content

This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:
1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Lecture notes

Assigned reading materials and slides will be available via Moodle.

**Abstract**
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

**Objective**
The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

**Content**

1) Welches Recht gilt im E-Business?
- Internationalität des Internets
- Regulierte Branchen

2) Gestaltung und Vermarktung von E-Business-Angeboten
- Verwendung fremder und Schutz der eigenen Inhalte
- Haftung im E-Business (und wie sie beschränkt werden kann)
- Domain-Namen

3) Beziehung zu E-Business-Kunden
- Verträge im E-Business, Konsumentenschutz
- Elektronische Signaturen
- Datenschutz
- Spam

4) Verträge mit E-Business-Providern

**Lecture notes**

- Es wird mit Folien gearbeitet, die als PDF über die elektronische Dokumentenablage (ILIAS) auf dem System der ETHZ vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar.
- Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich ist.

**Literature**

- Die Semesterendprüfung war vor Corona in Form eines schriftlichen Kurztests (normalerweise ein MC, im letzten Jahr Coronabedingt aber eine Falllösung) in der letzten Doppelstunde ausgestaltet. Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

</tr>
</tbody>
</table>

**Abstract**

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

**Objective**

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

**Abstract**

The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

**Objective**

- The students shall obtain the following competence:
  - They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
  - They shall be acquainted with corporate functions as contracting, information, claims management and dispute resolution
  - They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
  - They shall be able to contribute to the legal management of the company and to discuss legal issues.
  - They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**

A comprehensive script will be made available online on the moodle platform.
The Role of Intellectual Property in the Engineering and Technical Sector

**Abstract**

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

**Prerequisites / notice**

The lecture addresses students in the fields of engineering, science and other related technical fields.

---

**851-0738-00L**

**Intellectual Property: Introduction**

**Abstract**

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

**Objective**

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

**Prerequisites / notice**

The course addresses students in the fields of engineering, science and other related technical fields.

---

**851-0732-06L**

**Law & Tech**

**Abstract**

This course introduces students to legal, economic, and social perspectives on the increasing economic and social importance of technology. We focus particularly on the challenges to current law posed by the increasing rate of tech innovation and adoption generally and also by case-specific features of prominent near-future technologies.

**Objective**

The course is intended for a wide range of engineering students, from machine learning to bioengineering to human computer interaction, as well as for law students interested in acquiring a better understanding of state-of-the-art technology.

The course will combine both an overview of major areas of law that affect the regulation of technology and also guest lectures on the state-of-the-art in a variety of important technologies, ranging from autonomous vehicles to fair artificial intelligence to consumer-facing DNA technologies.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.
The planned course outline is below

1. Overview of science, law, and technology
   a. Studies of law and technology
   b. Should science be regulated, and if so, how?
   c. Technology as a social problem

2. Designing technology for humans
   a. Attention fiduciaries and the digital environment
   b. Does technology weaponize known problems of bounded human rationality?
   c. Should technology be regulated as a psychotropic substance? An addictive substance?
   d. Can technology make life easier?
   e. Psychological effects of surveillance

3. Governing tech
   a. Can small governments regulate big tech?
   b. National and supranational legislation
   c. Enforcing the law with technology
   d. Can enforcement be baked into technology?

4. AI and fairness
   a. Discrimination
   b. Privacy
   c. Opacity
   d. AI and due process

5. Trade secret and technological litigation
   a. Trade secret is a long-standing tool for litigation but does it enjoy too much deference?
   b. Trade secrets and the rights of employees

6. Enforcement against tech
   a. Big tech and antitrust
   b. Consumer protection

7. The Digital Battlefield
   a. Technology for spying
   b. Spying on technology companies
   c. Race to be AI superpower
   d. Immigration policy

8. Contract law
   a. Smart contracts
   b. Modernizing contract law and practice
   c. Regulating cryptocurrencies

9. Tort law
   a. Applying existing tort law to new autonomous technologies
   b. Personhood and personal responsibility
   c. Victim entitlements

10. Self-driving cars and other autonomous robotics
    a. Legal regimes
    b. Diversity in morality judgements related to autonomous vehicles

11. Biometrics
    a. Widespread use of facial recognition
    b. Law enforcement
    c. Connecting biometrics to social data
    d. Solving crimes with biometrics

12. New Biology and Medicine
    a. Unregulated science (biohackers)
    b. Promising technology before it can be delivered
    c. Connecting medicine to social data
    d. Using technology to circumvent medical regulations

Number of participants limited to 100.

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract
This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

Objective
The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

Content
Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.
Lecture notes
The lecture slides will be presented on the course web page after each lecture.

Further literature will be recommended in the lectures.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Fostered competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: assessed

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

851-0760-00L Building a Robot Judge: Data Science for Decision-Making
3 credits 2V E. Ash

Abstract
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective
This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0761-00L Building a Robot Judge: Data Science for Decision-Making (Course Project)
2 credits 2V E. Ash

Abstract
This is the optional course project for "Building a Robot Judge: Data Science for the Law."

Please register only if attending the lecture course or with consent of the instructor.

Some programming experience in Python is required, and some experience with text mining is highly recommended.

Objective
Students investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models. This is the extra credit for a larger course project for the course.

In a semester paper, students (individually or in groups) will conceive and implement their own research project applying natural language tools to legal texts. Some programming experience in Python is required, and some experience with NLP is highly recommended.
Students will investigate and implement the relevant machine learning tools for making legal predictions, including regression, classification, and deep neural networks models. We will use these predictions to better understand the operation of the legal system. In a semester project, student groups will conceive and implement a research design for examining this type of empirical research question.

Further literature will be recommended in the lectures.
The course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Contract Design I

This course aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CVtfG70zq0). However, this course prioritizes applications of contract design. Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Lecture notes

Handouts, prerecorded videos, slides, and other materials

Prerequisites / notice

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Stremitzer's Teaching Assistant Diego Caldera (diegoalberto.calderra@uzh.ch).
Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion

Lecture notes

Lecture notes are distributed via the associated course moodle.

Abstract

Images of the Human

This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social, and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

Objective

By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.

Content

The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the “human”. In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre's lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre's activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.

851-0742-01L

Contract Design II

This course is taught by Professor Alexander Stremitzer (https://laweco.ethz.ch/group/professors/stremitzer.html).

To be considered for Contract Design II, you must have completed Contract Design I in the same semester.

Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

Abstract

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a (hypothetical) client organization planning to enter a complex transaction on how to structure the underlying contract.

Objective

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherrera@uzh.ch).

851-0125-65L

A Sampler of Histories and Philosophies of Mathematics

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

851-0197-00L

Medieval and Early Modern Science and Philosophy

The course focuses on the investigation of scientific thought between 1000 and 1700, that is to say the period that saw the flourishing of natural philosophy and the birth of the modern scientific method. Several case-studies, taken from different scientific fields (especially algebra, astronomy, and physics) are presented in class in order to examine the relation between science and philosophy and the shift from medieval times to the early modern world.

Data: 06.09.2022 12:51
Autumn Semester 2021
Page 999 of 2159
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.

Jaap Hage, Bram Akkersmans (Eds.), Introduction to Law, Cham 2017 (Online Resource ETH Library)
Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15142).

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O’Neill et al., Environmental Values, 2008
- Konrad Ott/Jan Dierks/Lieske Voget-Kleschin, Handbuch Umweltethik, 2016

Generel introductions:

#### Prerequisites / notice
The lecture is being supported by a website on Moodle. If you have any questions, please contact Oliver Roos, oliver.roos@alpgo.ess.ethz.ch.
Content
The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Organizers of the course will make sure that only those problems are selected that are suitable for a machine learning approach and where sufficient amounts of data (and labels) are available. Students will organize themselves into small groups of 3-5 students, where each group works on solving a specific problem. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Every two weeks, each group will present ideas and progress during a short presentation followed by a discussion with all course members. At the end of the course, students will present their final results and submit source code. In addition, they will describe the developed method in form of a scientific paper of 8 pages. Grading will depend on the source code, the paper, and active participation in class.

Note: The course AI4Good is not related to Hack4Good, which is a students' initiative organized by the Analytics Club at ETH. For more information about Hack4Good check out the website: https://analytics-club.org/wordpress/hack4good/.

Prerequisites / notice
Students with a strong background in machine learning and excellent programming skills (preferably in Python)

<table>
<thead>
<tr>
<th>D-MTEC</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number</strong></td>
</tr>
<tr>
<td>851-0252-10L</td>
</tr>
</tbody>
</table>

**Abstract**
Particularly suitable for students of D-MTEC

**Objective**
This course has four main goals:
1) To learn about the most important topics within Behavioural Finance
2) To learn how to conduct behavioural studies, design experiments, plan data collection and experimental tasks
3) To learn about causes of market crashes, factors that influence them, traders' behaviour before, during and after financial crises
4) To investigate a topic of interest, related to behaviour of traders during market crashes.

Additionally, the course gives to the students the opportunity to practice oral presentations, communication skills, report writing and critical thinking.

| 851-0738-00L | Intellectual Property: Introduction | W | 2 credits | 2V | M. Schweizer |

**Abstract**
The course provides an overview of the most important topics in Behavioural Finance. First part of the course involves reading scientific articles, which will be discussed during the seminar. Therefore, attendance is required to pass the course. Each week, a student volunteer will present a paper and the presentation will be followed by a discussion. After obtaining sufficient knowledge of the field, students will select a topic for a behavioural study of their own. The final assignment consists of preparing and conducting a small behavioural study/experiment, analysing the data and presenting the project in the final meeting of the class. Each student will write a scientific report of their study.

| 363-0565-00L | Principles of Macroeconomics | W | 3 credits | 2V | J.-E. Sturm |

**Abstract**
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

**Objective**
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

**Content**
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

**Lecture notes**
The course webpage (to be found at https://moodle-appp2.let.ethz.ch/course/view.php?id=15062) contains announcements, course information and lecture slides.

**Literature**

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

Principles of Microeconomics

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.

**Objective**
The learning objectives of the course are:

1. Students must be able to discuss basic principles, problems and approaches in microeconomics.
2. Students can analyse and explain simple economic principles in a market using supply and demand graphs.
3. Students can contrast different market structures and describe firm and consumer behaviour.
4. Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole.
5. Students can also recognize behavioural failures within a market and discuss basic concepts related to behavioural economics.
6. Students can apply simple mathematical concepts on economic problems.

**Content**

The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture "Principles of Microeconomics" is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

Topics covered by the course are:
- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

**Lecture notes**
Lecture notes, exercises and reference material can be downloaded from Moodle.

**Literature**
The book can also be used for the course 'Principles of Microeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

**Complementary**

**Prerequisites / notice**
GESS (Science in Perspective): This lecture is for MSc students only. BSc students register for 363-1109-00L Einführung in die Mikroökonomie.

### Introduction to Microeconomics

**GESS (Science in Perspective):**

This course is only for students enrolled in a Bachelor’s degree programme.

Students enrolled in a Master's degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

**Note for D-MAVT students:** If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

**Objective**
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

**Content**
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

**Lecture notes**
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

**Literature**

**Prerequisites / notice**
This course “Einführung in die Mikroökonomie” (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 “Principles of Microeconomics” for Master students.

### Applied Negotiation Seminar

**Prerequisites:** Successful completion of lectures "363-1039-00L Introduction to Negotiation".

**Abstract**
The block-seminar combines lectures introducing negotiation and negotiation engineering with the respective application through in-class negotiation case studies and games.
In this seminar students can expect to:

- learn more theory of negotiation and apply this learning in simulated negotiations
- have their perceptions of rationality, fairness and trust challenged through little embedded experiments
- learn to recognize and analyze negotiation contexts and interests and generate creative solutions
- learn to negotiate under pressure (with time and mandate restrictions) and experience (and potentially chair) a formal negotiation
- learn to read, analyze and present a scholarly paper

This block seminar is an extension of the course "Introduction to Negotiation" and provides more detailed insight into key aspects of the field of negotiation and negotiation engineering.

In particular,

- a series of brief lectures will outline foundational aspects of negotiation science, such as rationality, fairness, and trust, as well as the possible application of machine learning in negotiation
- three practitioners will describe lessons learnt in their negotiation domains (diplomacy, labor, and business) and allow time for Q&A and discussion
- Professor Ambühl will elucidate further current cases from his professional experience
- students will apply course input in a number of challenging simulations (ranging from simple 30 minute games to full-fledged international ten party negotiations). In each game they will be asked to represent a party and negotiate as skillfully as they possibly can within the constraints of their mandate
- each student will be assigned a scholarly paper (20 to 30 pages) between the two blocks to read. They will give a 20 minute group presentation with one or two of their peers and submit a brief reflection report after the seminar

The course size is deliberately limited (30 maximum) to enable ample opportunity to interact with the lecturers, guests and each other.

| This course is taught by Professor Alexander Stremitzer ([https://laweconbusiness.ethz.ch/group/professor/stremitzer]
| Note that this is NOT a legal drafting class that focuses on contractual language. Instead, in Contract Design I, you will learn what the content of a contract should be so that parties can reach their goals. |
| You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2021)” and enroll. The password is “ContractDesign01”. |
| Number of participants limited to 160. Max 80 ETHZ and 80 UZH Students |
| Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome. |
| You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses. |
| ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses. |
| LECTURE NOTES | PREREQUISITES / NOTICE | 851-0732-06L | Law & Tech | V | 3 credits | S |
| Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderrherrera@uzh.ch). |
| This course introduces students to legal, economic, and social perspectives on the increasing economic and social importance of technology. We focus particularly on the challenges to current law posed by the increasing rate of tech innovation and adoption generally and also by case-specific features of prominent near-future technologies. |
| The course is intended for a wide range of engineering students, from machine learning to bioengineering to human computer interaction, as well as for law students interested in acquiring a better understanding of state-of-the-art technology. |
| The course will combine both an overview of major areas of law that affect the regulation of technology and also guest lectures on the state-of-the art in a variety of important technologies, ranging from autonomous vehicles to fair artificial intelligence to consumer-facing DNA technologies. |
| The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences. |
The planned course outline is below

1. Overview of science, law, and technology
   a. Studies of law and technology
   b. Should science be regulated, and if so, how?
   c. Technology as a social problem

2. Designing technology for humans
   a. Attention fiduciaries and the digital environment
   b. Does technology weaponize known problems of bounded human rationality?
   c. Should technology be regulated as a psychotropic substance? An addictive substance?
   d. Can technology make life easier?
   e. Psychological effects of surveillance

3. Governing tech
   a. Can small governments regulate big tech?
   b. National and supranational legislation
   c. Enforcing the law with technology
   d. Can enforcement be baked into technology?

4. AI and fairness
   a. Discrimination
   b. Privacy
   c. Opacity
   d. AI and due process

5. Trade secret and technological litigation
   a. Trade secret is a long-standing tool for litigation but does it enjoy too much deference?
   b. Trade secrets and the rights of employees

6. Enforcement against tech
   a. Big tech and antitrust
   b. Consumer protection

7. The Digital Battlefield
   a. Technology for spying
   b. Spying on technology companies
   c. Race to be AI superpower
   d. Immigration policy

8. Contract law
   a. Smart contracts
   b. Modernizing contract law and practice
   c. Regulating cryptocurrencies

9. Tort law
   a. Applying existing tort law to new autonomous technologies
   b. Personhood and personal responsibility
   c. Victim entitlements

10. Self-driving cars and other autonomous robotics
    a. Legal regimes
    b. Diversity in morality judgements related to autonomous vehicles

11. Biometrics
    a. Widespread use of facial recognition
    b. Law enforcement
    c. Connecting biometrics to social data
    d. Solving crimes with biometrics

12. New Biology and Medicine
    a. Unregulated science (biohackers)
    b. Promising technology before it can be delivered
    c. Connecting medicine to social data
    d. Using technology to circumvent medical regulations

Particularly suitable for students of D-INFK, D-ITET, D-MTEC

Abstract

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data science research project.

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and technical inventions and the use of patent information.

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to make their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CvIdfG70zq0). However, this course prioritizes applications of contract design.

The Role of Intellectual Property in the Engineering and Technical Sector

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and how to safeguard their commercialisation.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

The lecture addresses students in the fields of engineering, science and other related technical fields.
The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current case studies.

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

### 851-0735-10L Business Law

**Number of participants limited to 100**

**Business Law**

**W** 2 credits 2V P. Peyrot

**Abstract**

Particularly suitable for students of D-ITET, D-MAVT

The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

**Objective**

- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution
- They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**

A comprehensive script will be made available online on the moodle platform.

### 851-0703-00L Introduction to Law

**Students who have attended or will attend the lecture**

"Introduction to Law for Civil Engineering and Architecture" (851-0703-03L) or "Introduction to Law" (851-0708-00L), cannot register for this course unit.

**Introduction to Law**

**W** 2 credits 2V O. Streiff Gnöpf

**Abstract**

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

**Objective**

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

**Content**

Basic concepts of law, sources of law.

Private law: Contract law (particularly contract for work and services), tort law, property law.

Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU and into criminal law.

**Lecture notes**

Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2017 (Online Resource ETH Library)

**Literature**

Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=15142).

### 853-0047-01L World Politics Since 1945: The History of International Relations (Without Exercises)

**W** 3 credits 2V L. Horovitz

**Abstract**

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

**Objective**

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

**Content**

cf. *Diploma Supplement*

**Prerequisites / notice**

The lecture is being supported by a website on Moodle. If you have any questions, please contact Oliver roos (oliver.roos@sipo.gess.ethz.ch).

**Fostered competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: not assessed
  - Analytical Competencies: assessed
  - Decision-making: not assessed
  - Media and Digital Technologies: not assessed
  - Problem-solving: not assessed
  - Project Management: not assessed

- Social Competencies
  - Communication: not assessed
  - Cooperation and Teamwork: not assessed
  - Customer Orientation: not assessed
  - Leadership and Responsibility: not assessed
  - Self-presentation and Social Influence: not assessed
  - Sensitivity to Diversity: not assessed

- Personal Competencies
  - Adaptability and Flexibility: assessed
  - Creative Thinking: not assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: not assessed
  - Self-awareness and Self-reflection: not assessed
  - Self-direction and Self-management: assessed

### 853-0725-00L History Part One: Europe (The Cradle of Modernity, Britain, 1789-1914)

**W** 3 credits 2V H. Fischer-Tiné

**Abstract**

A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture series asks whether one single model of modernization prevailed on the 'Old Continent' or whether we need to differentiate regionally. A special focus lies on the Swiss experience.
### Course Details

#### 701-0703-00L Environmental Ethics

**Abstract**
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

**Objective**
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

**Content**
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to address environmental challenges.
- Familiarization with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practicing of newly acquired knowledge in smaller exercises.

**Lecture notes**
Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.

**Literature**
- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John ONeill et al., Environmental Values, 2008
- Konrad Ott/Jan Diers/Kliesch, Handbuch Umweltethik, 2016

**Prerequisites / notice**
The procedure for accumulating CP will be explained at the start of term.

#### 701-0985-00L Social Intercourse with Current Environmental Risks

**Abstract**
The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.

**Objective**
- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)

**Content**
- Risks and technical systems (risk categories, risk perception, risk management)
- Illurgy with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- prospects for future developments

**Lecture notes**
Copies of slides and selected documents will be distributed.

**Prerequisites / notice**
The lecture is held biweekly (for 2 hours). The dates are 3.9.; 30.9. (instead of 7.10); 21.10; 4.11.; 18.11.; 2.12.; 16.12.

#### 853-0061-00L Introduction to Cybersecurity Politics

**Abstract**
The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different responses to these new challenges (countermeasures).

**Objective**
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

**Content**
We start with an overview of cybersecurity issue from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

**Lecture notes**
A script with background information and comments on the literature will be made available at the beginning of the semester.

**Literature**
Literature for each session will be available on Moodle.

**Prerequisites / notice**
The lecture is being supported by a website on Moodle.

**Fostered competencies**
- Subject-specific Competencies
  - Concepts and Theories
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving

- Method-specific Competencies
  - Communication
  - Cooperation and Teamwork
  - Sensitivity to Diversity

- Social Competencies
  - Critical Thinking
  - Self-direction and Self-management

- Personal Competencies
  - Creative Thinking
  - Critical Thinking
  - Self-direction and Self-management

**Notice**
Does not take place this semester.
AI4Good: The Role of Technology in National and International Security Policy

**Abstract**

The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

**Objective**

Participants will gain a broad and in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts.

**Content**

The first part discusses the significance of technology in national security and military capabilities, with a focus on case studies from the 20th century. The second part examines the challenges posed by new and emerging technologies, such as artificial intelligence, cyber threats, and space technologies. The third part explores the implications of these technologies for international security relations and the role of international institutions.

**Literature**

Lecture notes

**Prerequisites / notice**

The lecture is being supported by a website on Moodle. If you have any questions, please contact Oliver Roos, oliver.roos@alipio.gess.ethz.ch.

---

AI4Good II: Contract Design II

**Abstract**

This course is taught by Professor Alexander Stremitzer (https://lawecon.ethz.ch/group/professors/stremitzer.html). To be considered for Contract Design II, you must have completed Contract Design I in the same semester.

**Objective**

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a hypothetical client organization planning to enter a complex transaction on how to structure the underlying contract.

**Prerequisites / notice**

To enable you to work under the close supervision of your professor and his team, only a small group of students with backgrounds in law, business, or engineering is admitted to this course. This simulation is time-consuming and challenging. Hence, we can only admit the most successful and motivated students to this class. Further information on the application process will follow.

---

Complex Social Systems: Modeling Agents, Learning, and Games

**Number**

851-0101-86L

**Title**

Complex Social Systems: Modeling Agents, Learning, and Games

**Type**

W

**ECTS**

3 credits

**Hours**

2S

**Lecturers**

N. Antulov-Funtulin, T. Asikis, D. Helbing

**Prerequisites**

Basic programming skills, elementary probability and statistics.

**Abstract**

This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

**Objective**

The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

**Content**

Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

**Lecture notes**

The lecture slides will be presented on the course web page after each lecture.
The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members. Further literature will be recommended in the lectures.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

851-0650-00L  
AI4Good  
W  3 credits  2G  J. D. Wegner  

Abstract  
The AI4Good course is a hackathon turned into a full course. At the beginning, stakeholders active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members. Further literature will be recommended in the lectures.

Objective  
Given a specific problem in global development, students shall learn to self-responsibly design, implement and experimentally evaluate a suitable solution. Students will also learn to critically evaluate their ideas and solutions together with all course members in a broader context that go beyond mere technical solutions, but touch on ethics, local culture etc., too.

Content  
The AI4Good course is a hackathon turned into a full course. At the beginning of the course, stakeholders (e.g., NGOs) active in the development sector will describe several problems that could be solved with a machine learning approach. Organizers of the course will make sure that only those problems are selected that are suitable for a machine learning approach and where sufficient amounts of data (and labels) are available. Students will organize themselves into small groups of 3-5 students, where each group works on solving a specific problem. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Every two weeks, each group will present ideas and progress during a short presentation followed by a discussion with all course members. At the end of the course, students will present their final results and submit source code. In addition, they will describe the developed method in form of a scientific paper of 8 pages. Grading will depend on the source code, the paper, and active participation in class.

Note: The course AI4Good is not related to Hack4Good, which is a students' initiative organized by the Analytics Club at ETH. For more information about Hack4Good check out the website: https://analytics-club.org/wordpress/hack4good/. Students with a strong background in machine learning and excellent programming skills (preferably in Python)

851-0175-00L  
Images of the Human  
W  3 credits  2G  J. L. Gastaldi  

Abstract  
This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

Objective  
By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences. They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current trends in science, technology and society, particularly in the context of new digital practices.

Content  
The remarkable development of AI in the past decade has brought about a renewed urge to rethink our image of the “human”. In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre’s lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and their transformation as a consequence of the current global challenges. In line with the Turing Centre’s activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.
This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematics
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

851-0742-01L Contract Design II

This course is taught by Professor Alexander Stremitzer (https://lawecon.ethz.ch/group/professors/stremitzer.html).

To be considered for Contract Design II, you must have completed Contract Design I in the same semester.

Students can only register for Contract Design II after having obtained approval by Prof. Stremitzer.

Abstract

Contract Design II is a masterclass in the form of an interactive clinic that allows you to deepen your understanding of contracting by applying insights from Contract Design I to a comprehensive case study. Together with your classmates, you are going to advise a (hypothetical) client organization planning to enter a complex transaction on how to structure the underlying contract.

Objective

There is a possibility that representatives from companies that were previously engaged in similar deals will visit us in class and tell you about their experience firsthand. In Contract Design I, you will receive more detailed information on the content and learning objectives of Contract Design II. If you have urgent questions, please do not hesitate to send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherrera@uzh.ch).

Prerequisites / notice

To enable you to work under the close supervision of your professor and his team, only a small group of students with backgrounds in law, business, or engineering is admitted to this course. This simulation is time-consuming and challenging. Hence, we can only admit the most successful and motivated students to this class. Further information on the application process will follow.

851-0742-01L Contract Design II

860-0023-00L International Environmental Politics | W | 3 credits | 2V | T. Bernauer

Abstract

This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

Objective

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

Content

This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Lecture notes

Assigned reading materials and slides will be available via Moodle.

Literature

Assigned reading materials and slides will be available via Moodle.

### 701-0703-00L Environmental Ethics

**W** 2 credits 2V A. Deplazes Zemp

**Abstract**

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

**Objective**

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

**Content**

- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to addressing environmental challenges.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Praciticing of newly acquired knowledge in smaller exercises.

**Lecture notes**

Presentation slides of the individual sessions will be distributed, including the most important theories and keywords; extended reading lists.

**Literature**

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Konrad Ott/Jan Dierks/Lieske Voget-Kleschin, Handbuch Umweltethik, 2016

**Prerequisites / notice**

We expect participants to engage in and contribute to discussions for keeping the course interesting and lively.

---

### 701-0747-00L Environmental Policy of Switzerland

**W** 3 credits 2G E. Lieberherr

**Abstract**

This course presents the basics of public policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors and processes are addressed from a political science perspective both theoretically as well as by means of current Swiss environmental policy examples.

**Objective**

Beyond acquiring basic knowledge about public policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

**Content**

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. Invited practitioners will provide us with insight regarding the current developments in forest, water and spatial planning policies. A key aspect is the distinction between politics and political science and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

**Lecture notes**

The reader and additional lecture material and exercises will be posted on Moodle.

**Literature**

Reader and additional lecture material on Moodle.

**Prerequisites / notice**

The detailed semester program (syllabus) is made available to the students at the beginning of the semester. During the lecture we will work with Moodle and eduApp. We ask that all students register themselves on these platforms before the lecture and to bring a laptop, tablet or smartphone to class, so that you can complete exercises using Moodle and eduApp.
Social Intercourse with Current Environmental Risks

- Risks and technical systems (risk categories, risk perception, risk management)
- Getting acquainted to the extended risk concept

By B. Nowack

The AI4Good course is a hackathon turned into a full course. At the beginning, stakeholders active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members.

Objective
- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)
- Knowledge about possibilities for sustainable innovation

Content
- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost-benefit analysis etc.)
- The role of the media
- Prospects for future developments

Lecture notes
Copies of slides and selected documents will be distributed.

Prerequisites / notice
The course is 1 credit (4 hours) and 1 credit (2 hours) weekly. The course is aimed at students with a background in environmental studies or related fields. The course covers the fundamentals of environmental science and policy, including case studies of current environmental issues and the role of technology in solving these problems.

AF4Good

The AF4Good course is a hackathon turned into a full course. At the beginning, stakeholders active in the development sector will describe several problems that could be solved with a machine learning approach. Students will spend the semester on designing, implementing, and testing suitable solutions using machine learning. Progress will be discussed with all course members.

Objective
- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)
- Knowledge about possibilities for sustainable innovation

Content
- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost-benefit analysis etc.)
- The role of the media
- Prospects for future developments

Lecture notes
Copies of slides and selected documents will be distributed.

Prerequisites / notice
The course is 1 credit (4 hours) and 1 credit (2 hours) weekly. The course is aimed at students with a background in environmental studies or related fields. The course covers the fundamentals of environmental science and policy, including case studies of current environmental issues and the role of technology in solving these problems.

Images of the Human

This seminar will explore the multiple transformations of the conception of the “human” in the face of the current scientific, social and technological challenges, focusing on those related to recent digital technologies and practices. The lectures will be delivered by researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences.

Objective
- By the end of the course, students will be able to describe and compare different conceptions of the human at work in multiple fields of the humanities and the social sciences.
- They will be able to evaluate both the differences and the convergences between those conceptions, and critically assess their relation to current technological and societal changes.

Content
- The remarkable development of AI in the past decade has brought back a renewed urge to rethink our image of the “human.” In this way, computer science and technology join other scientific disciplines having experienced the same need in the face of current challenges, such as climate change or the global pandemic, which question the place of the human in its environment. Such circumstances reveal that a science of the human is today more necessary than ever. For this reason, the Turing Centre’s lecture series of this year will be dedicated to exploring the multiple images of the human at work across the human sciences and other transformation as a consequence of the current global challenges. In line with the Turing Centre’s activities, the focus will be on challenges related to recent digital technologies and practices. Various researchers from ETH and abroad, with different disciplinary backgrounds in the humanities and the social sciences, will present what they consider crucial concepts, methods, challenges, and limits in our investigations about the human and its relation to machines, animals and nature.

Sapiens: A Reading Course

Yuval Noah Haran’s “Sapiens” is the most successful historical book of recent years. The seminar examines the text from a history of science perspective: What kind of sources does it rely on? What type of history is being written here? And in what tradition does “Sapiens” represent a popular non-fiction book?

Objective
- In the course of the seminar, the students develop the competence to deal with the original text and the research literature on the history of anthropology, science and technology in a critical and historically thoughtful way. In doing so, they practice navigating independently through historical literaturatively in the context of new digital practices.

Content
- The aim of the seminar is to introduce students to the history of science in anthropology, prehistory and popular science literature on the history of mankind by reading “Sapiens”. In addition to studying and critically discussing the original text, the students explore significant scientific and historical contexts of the book in small groups and present them in the seminar. In this way, they develop an understanding of the underlying narratives and popular science genres that inform “Sapiens”.

Real Estate Property Law

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Objective
- Overview of the legal norms of land registry and surveying law.

Content
- Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal principles of surveying, the reform of official surveying, liability of the geom-eter.
Lecture notes  
Abgegebene Unterlagen: Skript in digitaler Form

- Self-direction and Self-management: not assessed

851-0101-80L Basic Problems of Environmental Ethics  
W 3 credits  2G  L. Wingert

Abstract
Climate change exerts a pressure on us to significantly change our individual and collective behaviour. Such a pressure raises questions like: Who has to give up what? What is a fair distribution of the burdens in the struggle against the climate change? What is the reasonable understanding of our relation to nature? How should we run our economies?

Objective
Participants should become familiar with basic approaches to central problems in environmental ethics.

The course will try to give an argument-based answer to the question: What are the responsibilities for individuals (e.g. as consumers), and for collectivities (e.g. states and firms).

Another focus will be to clarify the concept of "climate justice".

The course should also enable participants to evaluate different answers to the question how we should organize our economies for securing our ecological niche.

Literature
Preparatory Literature

Language Courses of the UZH and ETH Zurich

A maximum of three credits from language courses may be recognised. In addition, only advanced courses (level B2 upwards) in the European languages English, French, Italian and Spanish are recognised. German language courses are recognised from level C2 upwards.

This course offers participants the opportunity to read short stories in order to raise their awareness of linguistic aspects and cultural issues in the Francophone world, and to improve their oral skills, mainly through oral presentations.

The primary objective of this course is to develop participants' written comprehension and, more specifically, to refine their perception of the implicit meanings and cultural aspects present in the literary texts proposed for reading. The course further aims to raise participants' awareness of contemporary cultural issues in the Francophone world. Another goal is to improve participants' oral skills, specifically so they can deliver structured presentations and express personal, informed, and nuanced opinions.

### Abstract
- **Italian B2-C1: Language Structure**
  - The course gives participants the opportunity to broaden and intensify their knowledge of complex morphosyntactic structures. The objective is to improve their proficiency in expressing complex content.
  - The aim is that at the end of the course, participants understand a wide range of texts and are able to express themselves clearly and effectively in a wide variety of oral and written situations.

- **English Language and Literature (C1-C2)**
  - Bachelor and master students at C1-C2 level. The course enhances students' appreciation and understanding of literature in English.
  - The analysis and interpretation of literary texts, students improve their analytical and English language skills; their grammar skills through writing; and their range of vocabulary through reading, discussions, and writing.

- **Advanced English for Academic Purposes (C1-C2)**
  - This course is designed for Bachelor's and Master's students from all disciplines who wish to improve their English from C1 towards C2 level and train their language skills at mastery level. Selected academic English features are included to add value to the course to meet the standard entrance requirements by leading universities and colleges worldwide.

### Objective

851-0846-03L  Spanish B2: Grammar and Communication  W  2 credits  2G  University lecturers

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kur sgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract  The most important grammar topics of this course are past tense forms, subordinate clauses, linking devices, reported speech, periphrastic verb constructions, and verbs that express change. The course also deals with topics that typically cause problems for higher level learners, including ser/estar, por/para, and indicative and subjunctive forms of verbs.

Objective  In this course, participants improve their comprehension of written and oral texts that deal with current issues, as well as of scientific texts from participants' own fields of study. They are able to analyse various points of view and can create clear and detailed oral and written texts on scientific issues from their field of study, while taking a position and expressing definite views on these issues.

| Abstract | Russian I is the first part of a five-semester Russian course. The course leads to A1.1 level on the Common European Framework of Reference for Languages. The goal of the course is to introduce participants to the Cyrillic alphabet and to Russian phonetics; participants build up a basic vocabulary, learn the basics of Russian grammar, and are introduced to Russian culture. |
Objective
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Reading and writing Russian script; saying hello and goodbye; introducing yourself; asking for someone’s name; addressing someone; apologizing; indicating your country and place of origin and residence; stating your profession; talking about family; talking about your wellbeing; asking about prices; and ordering items in a café.

Abstract
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Talking about food and meals; indicating packaging and quantities; talking about things you need or that you have to buy; talking to people while shopping; naming food establishments, crockery, and cutlery; extending invitations and responding to invitations; asking for explanations of unfamiliar terms; expressing congratulations and wishes; describing daily routines; describing actions in the present, past, and future; and explaining how you get to work.

Objective
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Talking about the weather; naming the seasons and months; understanding activities offered to tourists; expressing agreement, disagreement, and indifference; making appointments; talking about holiday plans and arrangements; expressing prohibitions; making comparisons; talking about learning; indicating date and year; saying what you are interested in and what you are doing; giving biographical details; saying what you would like to do; making and obtaining recommendations; passing on information.

Objective
Participants are able to use the Arabic language adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages. Arabic I is the first part (A1.1 level) of a four-semester Arabic course. The goal of the course is for participants to acquire basic language skills in speaking, listening comprehension, and the reading and writing of Arabic script.

Abstract
Arabic I leads to A1.1 level on the Common European Framework of Reference for Languages. The course is the first part of a five-semester Arabic course. In this course, participants extend their ability to express themselves, in particular regarding daily life (eating, shopping) and work and education (daily routines); it also extends participants’ grammar skills.

Objective
Arabic III leads to A2.1 level on the Common European Framework of Reference for Languages. Arabic III is the third part (A2.1 level) of a four-semester Arabic course. The practice exercises relate to simple discursive situations in daily life. In terms of grammar, special importance is attached to systematically learning the Arabic verbal system.
Objective
Participants are able to use the Arabic language adequately in selected areas and can conduct themselves in a culturally appropriate manner. To this end, the following content is dealt with: Talking about your life; daily routines; expressing wishes, commands, and eventualities; and talking about language and language learning (meta-language skills). Culturally, the focus is on useful phrases and appropriate conduct on important occasions such as holidays, weddings, births, and deaths. In terms of grammar, this course attaches particular importance to the systematization of the Arabic verbal system.

851-0877-00L Chinese I A1.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract
Chinese I leads to A1.1 level on the Common European Framework of Reference for Languages. It is the first part of a four-semester Chinese course. The goal of the course is to introduce participants to standard modern Chinese and to Chinese script, with a focus on speaking skills. The main focus is on communicating in everyday situations, as well as the Hiragana and Katakana syllabaries. Reading and writing training includes use of the computer for Japanese text editing.

Objective
Participants are able to use the Chinese language adequately in selected areas. The focus is on oral language skills at A1.1 level of the Common European Framework of Reference for Languages. Special importance is attached to an academic environment and student life. After one semester, participants have basic knowledge of the Chinese script and of about 200 characters. Content areas that are embedded in various communicative tasks include:

- Greetings and farewells
- Presenting yourself and family members and giving information such as name, age, profession, origin, and telephone number
- Describing objects and institutions
- Language skills
- Shopping

851-0879-00L Chinese III A2.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract
Chinese III leads to A2.1 level on the Common European Framework of Reference for Languages. It provides an extension of participants' skills in standard modern Chinese and in Chinese script. The goal of the course is for participants to communicate in and deal with more complex everyday situations. Special importance is attached to an academic environment and student life.

Objective
Participants are able to use the Chinese language adequately in selected areas and can conduct themselves in a culturally appropriate manner. The focus is on oral language skills at A2.1 level of the Common European Framework of Reference for Languages; reading and writing skills are fostered simultaneously. Special importance is attached to an academic environment and student life. Participants learn about 200 new characters. (After three semesters, participants know about 600 characters). Content areas that are embedded in various communicative tasks include: Directions, your living situation, public transport, visits to doctors and hospitals, hairdresser appointments.

851-0881-00L Japanese I A1.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract
Japanese I leads to A1.1 level on the Common European Framework of Reference for Languages. It is the first part of a five-semester Japanese course. The goal of the course is for participants to learn the basic vocabulary and sentence structures needed to communicate in everyday situations. This includes an introduction to Hiragana and Katakana syllabaries writing and its use in word processing.

Objective
Participants are able to use the Japanese language adequately in selected areas. The focus is equally on fostering speaking, listening, writing, and reading skills at A1.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. Special importance is attached to an academic environment and student life. In addition, the two syllabic writing systems and the use of Japanese computer word processing are learnt. Content areas that are embedded in various communicative tasks include: Greetings, introducing yourself, and talking about yourself (personal and professional identity, studies, interests, daily life); asking for information; and requesting services.

851-0881-02L Japanese 1 [A1.1]
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract
Elementary introduction to the Japanese language. Students acquire a basic vocabulary together with the most frequently used sentence structures, as well as the Hiragana and Katakana syllabaries. Reading and writing training includes use of the computer for Japanese text editing.

Objective
Everyday conversation / Reading simple texts written with Hiragana and Katakana syllabaries / Writing simple texts about everyday topics using the Hiragana and Katakana syllabaries on the computer.

851-0883-00L Japanese III A2.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/angebot.html

Abstract
Japanese III leads to A2.1 level on the Common European Framework of Reference for Languages. It provides an extension of participants' skills in standard modern Japanese and in Chinese script. The goal of the course is for participants to communicate in and deal with more complex everyday situations. This includes an introduction to Hiragana and Katakana syllabaries writing and its use in word processing.

Objective
Participants are able to use the Japanese language adequately in selected areas. The focus is equally on fostering speaking, listening, writing, and reading skills at A2.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. Special importance is attached to an academic environment and student life. After two semesters, participants have basic knowledge of the Japanese script and of about 400 characters. Content areas that are embedded in various communicative tasks include: Directions, your living situation, public transport, visits to doctors and hospitals, hairdresser appointments.

The course gives participants an initial insight into the contemporary reality of the global Spanish-speaking community through journalistic texts. The skills they practice in this approach include reading, writing, and oral interaction, and the course includes reading and writing activities and oral debates.

**Objective**

Participants work on two areas: First, due to the size of the Hispanic world, each week they focus on a nation or a region, thus gaining a deeper insight into that nation. Second, participants can choose to investigate various aspects of the Hispanic world, according to their own interests.

This course gives an overview of the societies that form the Hispanic world in two ways: On the one hand, the course looks at the perspectives of the various nations that comprise this international community, and on the other, it looks at various aspects that define this community, including its politics, news, traditions, and culture.

The course offers participants the opportunity to:

- The main subject matter of this course includes a systematic discussion of the usage of past tenses; subordinate clauses; linking expressions; reported speech; periphrastic verb constructions; and verbs of change. In addition, participants undertake individual reading of various text types, with a particular emphasis on technical subjects and/or subjects related to their fields of study.

In this course, participants acquire oral and written academic communication skills; they acquire knowledge of the grammar areas relevant to B2-C1 level of the Common European Framework Reference for Languages; and they consolidate previously acquired grammar.

### Objective

This course offers participants a choice of films that reflect recent issues in order to raise their awareness of the ongoing concerns of Francophone culture (the media and the press).

The main objective of this course is to give participants an opportunity to practice and improve the four language skills by developing a fictitious but plausible scenario that requires the use of specific rhetorical, lexical, and pragmatic tools. In addition, the course allows participants to develop their knowledge of contemporary French cinema, and also to enable them to improve their speaking skills, mainly through oral presentations.

The primary objective of this course is to develop participants’ listening comprehension skills and more specifically, to improve their understanding of implicit and cultural meanings of the films on the program. It further aims to raise participants’ awareness of the history, aesthetics, and contemporary issues of French cinema. The second objective of the course is to improve participants’ speaking skills, especially by giving them the opportunity to produce structured presentations and to express their personal, informed, and nuanced opinions.

Participants practice a range of oral interactions, such as casual and formal conversation, interviews, debates, negotiations, and presentations. They discuss current issues and their fields of study and/or work.

The course aims to expose participants to a range of conversational situations, providing them with tools that help them to improve their ability to perform various tasks linguistically and socially.

- The course approaches the Italian language through short stories, relevant both for their linguistic structures and content, which is related to historical and sociological realities typical for Italy. Participants deepen their lexical and syntactic competence by means of oral and written presentations, class discussions, reflections on the structures of the stories, and targeted exercises.

- The course offers participants the opportunity to:
  - Better understand complex literary texts
  - Be able to grasp nuances of meaning expressed through certain lexical and syntactical choices more effectively
  - Learn how to express themselves clearly and in a differentiated way
  - Understand through short narrative texts some cultural and social realities typical of Italy

This course offers participants the opportunity to carry out a "case study" based on a topical issue in order to practice and improve the four language skills by developing a fictitious but plausible scenario that requires the use of specific rhetorical, lexical, and pragmatic tools. In addition, the course allows participants to develop their knowledge of Francophone culture (the media and the press).

The main objective of this course is to give participants an opportunity to practice and improve the four language skills (speaking and listening comprehension, writing and reading comprehension) through "case studies." Participants present a complex topic and interact by defending a point of view and/or responding to objections. In addition, the course allows participants to develop their knowledge of Francophone culture (the media and the press).

Abstract
In this course, participants examine and write/prepare various academic text genres, including scientific essays, abstracts, oral presentations, and handouts.

Objective
The course aims to deepen participants’ mastery of academic language. By reading scientific texts and listening to university lectures, participants analyze and study the linguistic structures of these text genres and learn specialist vocabulary from their field of study.

851-0879-01L

Chinese V 2.2+  
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees:

Registration dates:

Abstract
Chinese V requires level A2.2. of the Common European Framework of Reference. The goal of the course is for participants to communicate orally about selected topics from different areas.

Objective
The participants are able to talk about selected topics. The focus is on oral language skills. However, listening, reading and writing skills are also trained. Participants can work with texts or audios/videos using aids such as pop-up dictionaries and writing on the computer. Handwriting is not required. They learn to acquire the key vocabulary and to develop idioms for each topics. The students practice, for example, how to express a fact, their own opinion, criticism, agreement, concerns, etc. and how to respond to them.

Content
The vocabulary of 600 words, which was acquired in the courses I-IV, will be enlarged by another 150. Which means, that of the ten lessons of the book, five will have to be mastered.

The participants will learn 25 grammatical structures and the corresponding syntax. Furthermore they will learn 50 idiomatic phrases, and their respective use in everyday life. They will also acquire the competence to understand new characters from those already known.

We will train the faculty of understanding by listening, in order to enhance the chances to pass the listening test of the HSK 4 (B 2).

Lecture notes
This course will be supported by a module in OLAT. The participants will be asked to do some of their portfolios on OLAT.

Literature
HSK Standard Course 4, Teil 1, HSK标准教程4上 （含1MP3）
ISBN: 9787561939031 und HSK标准教程4上练习册 （含1MP3）

Prerequisites / notice
It is mandatory that the course Chinese IV has been successfully completed. Or else, that a certificate of the HSK 3 examination in the last two years is provided.

</tbody>
</table>
| **Objective** | 1) Students can explain the importance of evolution for the development of humans and diseases.  
2) The students know the cell as the smallest unit of the body. They can explain how the functions of the cell are disturbed in certain diseases and where therapies intervene. They can describe the multiplication of cells in the body and show how errors in this multiplication can lead to diseases.  
3) The students know DNA as the basis of life. They can explain how the DNA information is stored and how this information can be reproduced and protected from damage. They can describe how the information is read and translated into proteins. They can explain which mechanisms at the level of DNA, RNA and proteins can cause diseases.  
4) Students can explain which technologies can be used to diagnose and treat diseases.  
5) Students can explain how people differ genetically and know the molecular basis of these differences. They can explain how these differences can lead to diseases and why some of these differences do not affect diseases.  
6) The students know the molecular causes of the most common hereditary diseases and can determine the probability of occurrence and transmission to offspring.  
7) Students can explain the biochemical and molecular basis of human reproduction and know the basic principles of human embryonic development. The students can explain which mechanisms can be disturbed by a faulty development. | | | | |

| **Objective** | The students learn to  
- understand the role of computer science in science,  
- to control computer and automate processes of problem solving by programming,  
- choose and apply appropriate tools from computer science,  
- process and analyze real-world data from their subject of study,  
- handle the complexity of real-world data. | | | | |
| **Content**   | 1. The role of computer science in science  
2. Introduction to Programming with Python  
3. Modeling and simulations  
4. Data management with lists and tables  
5. Data management with a relational database  
6. Introduction to Matrices | | | | |

Mathematics I

401-0291-00L

Abstract
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

Objective
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences.

Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical

applications manually and using computer algebra systems.

## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsraten
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralrechnung (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen: Beschränkt, Logistisch, Gompertz
- Stationäre Lösungen
- Lineare DGL 1. Ordnung
- Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes

In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:
- Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
- Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
- Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
- Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

Abstract
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, the sensory organs, the neuromuscular system, the cardiovascular system and the respiratory system.

Objective
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Content
- Anatomy and Physiology I (fall term):
  - Basics of cytology, histology, embryology; nervous system, sensory organs, muscles, cardiovascular system, respiratory system

- Anatomy and Physiology II (spring term):
  - digestive tract, endocrine organs, metabolism and thermoregulation, skin, blood and immune system, urinary system, circadian rhythm, reproductive organs, pregnancy and birth.
Prerequisites / notice

Requirements: 1st year, scientific part.
Part of the course is read and checked in English.

401-0923-00L  Mathematics III  O  5 credits  3V+2U  E. W. Farkas

Abstract
Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

Objective
Vertiefung und Ausbau des Stoffes der Vorlesungen Mathematik I/II für die Anwendung in der Systemanalyse.

Content
- Euklidische Vektorräume, Skalarprodukt, Orthogonalität
- Entwicklung einer periodischen Funktion in eine Fourier-Reihe
- Komplexe Darstellung
- Anwendungen zur Lösung gewöhnlicher Differentialgleichungen, Reihenansätze.

Systeme linearer Differentialgleichungen 1. Ordnung
- Definition, allgemeine Lösungsmenge, Fundamentalsystem
- Bestimmung von Lösungen mittels Eigenvektoren, Fundamental- system im diagonalisierbaren Fall
- Exponential einer Matrix
- homogene lineare Differentialgleichungen n-ter Ordnung mit konstanten Koeffizienten.

Mathematische Modelle
- Begriffsbildung: (mathematisches) Modell, einführende Beispiele
- Lineare Kompartment-Modelle (Box-Modelle)

Abstract
This course is an introduction to classical physics, with special focus on applications in medicine.

Objective
Obtain an understanding of basic concepts in classical physics and their application (using mathematical pre-knowledge) to the solution of simple problems, including certain applications in medicine.

Content
Obtain an understanding of relevant quantities and of orders of magnitude.

Exam Block C

The examination block will not be offered until Spring Semester 2022.

Abstract
This practical course is designed to give students hands on experience in CAD, FEM, product optimization, mechanical load testing, software development in Python and hardware utilization in robotics.

Objective
The course aims at teaching and solidifying following topics:
- CAD
- FEM
- Product optimization
- Mechanical testing
- Software development in Python

Content
The course is aimed at improving the students knowledge on certain topics such as programming in python and biomechanics, but also teaches new skills such as using CAD software, FEM and mechanical testing. The course is split into 6 different experiments, which will be completed in groups. The students will be assigned to groups at the beginning of the semester. 4 of the experiments will be geared towards the use case of designing a bone plate to bridge a critical size gap of a femur. The experiments are therefore 1) using CAD to reconstruct the initial condition and the bone plate 2) running a FEM in order to analyze the performance of the bone plate 3) with the knowledge of the FEM, optimizing the bone plate and 4) testing of the designed bone plate, the bone plate will be 3D printed. The remaining 2 experiments will 1) focus on programming a robotic arm used in rehabilitation engineering and 2) on the hardware usage of the robotic arm.

Lecture notes
Each experiment has its own tutorial and will be handed out to the students.

Prerequisites / notice
Only motivation and curiosity is required.

Abstract
This course will provide insight into various aspects of medical device design such as patient needs assessment, product specification, research and technical design, validation, regulatory affairs and clinical evaluation.

Objective
The goal of this lecture series is to enable the students to (i) identify the principal functional requirements for a medical device, (ii) to understand the mechanical properties of natural tissues and synthetic biomaterials, (iii) to apply this information and a basic knowledge of mechanics in the calculation of implant performance, (iv) to develop a plan for the pre-clinical evaluation and regulation of a new device.

Content
1. Introduction to Medical Technology
2. Design Process
3. Mechanics
4. Mechanics of Materials
5. Tissue Mechanics
6. Prostheses: Biomechanics and Design
7. Prostheses: Biomaterials, Surfaces and Wear
8. Allografts: Heart Valves
9. Preclinical Evaluation
10. Regulatory Affairs (MepV, FDA, CE)
11. Intellectual Property
12. Group Work and Presentation

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Objective**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials. The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Content**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Abstract**

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree/courses/special-students/special-students-university-of-zurich.html

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

551-0317-00L | Biocompatible Materials | W | 4 credits | 3V | K. Maniura, M. Rottmar, M. Zenobi-Wong

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Content**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Lecture notes**

Handouts are deposited online (moodle).

**Literature**

(available online via ETH library)

Handouts and references therein.
Introduction and historical background  
- Innate and adaptive immunity, Cells and organs of the immune system  
- B cells and antibodies  
- Generation of diversity  
- Antigen presentation and Major Histocompatibility (MHC) antigens  
- Thymus and T cell selection  
- Autoimmunity  
- Cytotoxic T cells and NK cells  
- Th1 and Th2 cells, regulatory T cells  
- Allergies  
- Hypersensitivities  
- Vaccines, immune-therapeutic interventions  

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"  

Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020  

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.  

Fostered competencies  

Subject-specific Competencies  
- Concepts and Theories  
- Method-specific Competencies  
- Analytical Competencies  
- Decision-making  
- Media and Digital Technologies  
- Problem-solving  
- Project Management  

Social Competencies  
- Communication  
- Cooperation and Teamwork  
- Customer Orientation  
- Leadership and Responsibility  
- Self-presentation and Social Influence  
- Sensitivity to Diversity  

Personal Competencies  
- Adaptability and Flexibility  
- Creative Thinking  
- Critical Thinking  
- Integrity and Work Ethics  
- Self-awareness and Self-reflection  
- Self-direction and Self-management

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.  

UZH Module Code: BIO344  

Mind the enrolment deadlines at UZH:  

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.  

On successful completion of the module the student should be able to  
- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system  
- identify key steps in development underlying neurological syndromes and diseases  

Key skills  
On successful completion of the module the student should be able to  
- interpret and critically evaluate original research reports - apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.  

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.  

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344  

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.  

Auxiliary tools:  
None. Bring something to write and your student ID.
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

Examination Block 2

Fundamentals of Biology II: Cell Biology Only for - Biologie BSc (Programme Regulations 2013), - Pharmaceutical Sciences BSc (Programme Regulations 2013), - Health Sciences and Technology BSc (Programme Regulations 2017)

Abstract
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes
The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the netzh (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Literature

Prerequisites / notice
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

Part of the course is read and checked in English.

**Abstract:**  
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, the sensory organs, the nervous system, the cardiovascular system and the respiratory system.

**Objective:**  
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

**Content:**  
The lecture series provides a short overview of human anatomy and physiology  
Anatomy and Physiology I (fall term):  
Basics of cytology, histology, embryology; nervous system, sensory organs, muscles, cardiovascular system, respiratory system  
Anatomy and Physiology II (spring term):  
digestive tract, endocrine organs, metabolism and thermoregulation, skin, blood and immune system, urinary system, circadian rhythm, reproductive organs, pregnancy and birth.

**Prerequisites:**  
Requirements: 1st year, scientific part.

### Mathematics III

**Title:** Mathematics III  
**ECTS:** 5 credits  
**Hours:** 3V+2U  
**Lecturers:** E. W. Farkas

**Abstract:**  
Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

**Objective:**  
Vertiefung und Ausbau des Stoffes der Vorlesungen Mathematik I/II für die Anwendung in der Systemanalyse.

**Content:**  
- Fourier-Reihen  
- Euklidische Vektorräume, Skalarprodukt, Orthogonalität  
- Entwicklung einer periodischen Funktion in eine Fourier-Reihe  
- Komplexe Darstellung  
- Anwendungen zur Lösung gewöhnlicher Differentialgleichungen, Reihenansätze.  
- Systeme linearer Differentialgleichungen 1. Ordnung  
- Definition, allgemeine Lösungsmenge, Fundamentalsystem  
- Bestimmung von Lösungen mittels Eigenvektoren, Fundamentalsystem im diagonalisierbaren Fall  
- Exponential einer Matrix  
- homogene lineare Differentialgleichungen n-ter Ordnung mit konstanten Koeffizienten.  
- Mathematische Modelle  
- Begriffs- bildung: (mathematisches) Modell, einführende Beispiele  
- Lineare Kompartiment-Modelle (Box-Modelle)  
- Laplace-Transformation  
- - Grundbegriffe: Definition der Laplace-Transformation und Rück- transformation, Konvergenz des Laplace-Integrals  
- Eigenschaften der Laplace-Transformation  
- - Anwendungen der Laplace-Transformation zur Lösung linearer Differentialgleichungen mit konstanten Koeffizienten.  
- Partielle Differentialgleichungen  
- Definition, Randbedingungen, Anfangsbedingungen  
- - Diffusionsgleichung: Herleitung, Lösung an einfachen Beispielen  
- - Techniken: Separationsansätze, Basislösungen, Superpositionsprinzip  
- - Laplace-Gleichung: Lösung einfacher Randwertprobleme, Polarmform, Poisson-Formel, harmonische Funktionen.

**Prerequisites / notice:**  
Vorlesungen Mathematik I/II

### Statistics II

**Title:** Statistics II  
**ECTS:** 3 credits  
**Hours:** 2V+1U  
**Lecturers:** M. Kalisch

**Abstract:**  
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlosungsfähigkeit mit der Statistiksoftware R.

**Objective:**  

---

### Examination Block 3

---

### Neuroanatomy and Neurophysiology

**Title:** Neuroanatomy and Neurophysiology  
**ECTS:** 2 credits  
**Hours:** 2V  
**Lecturers:** N. Wenderoth, D. P. Wolfer

**Abstract:**  
Advanced knowledge in anatomy and physiology of the nervous system.

---

Data: 06.09.2022 12:51  
Autumn Semester 2021  
Page 1035 of 2159
Will be distributed at the start of the semester.

M. Kopf

Wird in der Vorlesung bekannt gegeben.

This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to exercise. Students are able to describe the human body as a mechanical system.

Scripts and additional material will be provided during the semester. Online material is provided during the course.

Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity and exercise performance, exercise for health, exercise in the context of disease.

General introduction; Positron-Emission-Tomography as appetizer, including ionising radiation; kinematics of a point mass; dynamics of a point mass (Newton's axioms and forces); physical work, power and energy; conservation of linear and angular momentum; oscillations and waves; mechanics of a rigid body; fluid mechanics; introduction to electricity.

Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Content

Practical and theoretical exercises in small groups in the laboratory.

376-1714-00L | Biocompatible Materials         | W    | 4    | 3V    | K. Maniura, M. Rottmar, M. Zenobi-Wong |

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.
The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

### Abstract

**Concepts of modern genetics and genomics**, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.
Objective
Students are able to

- name the basic concepts of materials science. (remember, 1)
- describe simple relations between atomic structure and macroscopic properties. (understand, 2)
- calculate basic material-specific quantities. (apply, 3)
- read and interpret phase diagrams, material characteristic (e.g. stress-strain) diagrams and Ashby plots (analyse, 4)

Content

Atomic structure
Crystalline structure and defects
Thermodynamics, phase diagrams and phase transformations
Diffusion
Mechanical and thermal properties of materials

376-0130-00L Laboratory Course in Exercise Physiology

W 3 credits 4P C. Spengler

Number of participants limited to 48.

HST: Possible from the 5th semester on.

Abstract
Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

Objective
Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.

Content

Laboratory course:
Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

Lecture notes
Tutorial on Laboratory Experiments in Exercise Physiology
(Editor: Exercise Physiology Lab)

Literature

Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg

Kenney/Wilmore/Costill: Physiology of Sport and Exercise, Human Kinetics

Prerequisites / notice

Prerequisite:
Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)

Desirable:
Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)

376-1033-00L History of Sports

W 2 credits 2V M. Gisler

Abstract
Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding for the development and adaptation of sports from the ancient world to present times.

Content

Lecture notes
Ein Skript für die aktuelle Veranstaltung wird abgegeben.

Literature

376-1107-00L Sport Pedagogy

W 2 credits 2V C. Herrmann

Abstract
The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

Objective
Development of pedagogical-psychological competences for the optimisation of future teaching activities.

Content
- Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

Lecture notes
Teaching materials for the individual lectures are provided to the students via moodle.

Literature
Primärliteratur:
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Objective
Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content
Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes
Instructional materials for each course will be made available to students. All lecture materials will be available to students on Moodle.

Literature

376-1121-00L Socio-Scientific Health Research: A Thematic Insight W 2 credits 2G O. Hämmig, R. Brauchli, S. T. Güntert

Abstract
Presentation of and work with different topics and particularly relevant focal points of socio-scientific health research as well as communication of contents and becoming more familiar with ways of thinking and working in socio-scientific health research.

Objective
The students get to know important and particularly health relevant socio-scientific topics, phenomena and problems and learn how to handle related issues and questions.

Content
There are many different socio-scientific disciplines or rather subdisciplines which deal with health relevant topics such as social or health psychology, medical or health sociology, gerontology, health economics, social epidemiology etc. They all belong to the health sciences and address societal and individual causes and conditions of health and disease. These causes and conditions include experiences such as social integration or exclusion, poverty, migration, violence, social deprivation and discrimination, lifestyle, socialisation and family, personality, profession, unemployment, but also psychosocial aspects of biological characteristics like sex or age. The course gives an insight and overview of these social and personal determinants of health, which turned out to be highly relevant with regard to health, disease, life quality and mortality or life expectancy.

Prerequisites / notice
Willingness to be regularly present and to play an active part in the course.

376-1127-00L Sociology of Sport W 2 credits 2V R. Bürgi, M. Lamprecht

Abstract
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples to highlight the sociological view of sport.

Content
Sport and social change: developments and trends
The economy and the media: dependencies, consequences, scandals
Social inequalities and distinctions: gender differences and group behavior
Conflicts and politics: sports organizations, doping, violence

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

Fostered competencies
Subject-specific Competencies
- Concepts and Theories
Method-specific Competencies
- Analytical Competencies
Social Competencies
- Sensitivity to Diversity
Personal Competencies
- Critical Thinking

376-1581-00L Cancer: Fundamentals, Origin and Therapy W 2 credits 2G H. Nägeli

Abstract

Objective
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

Content
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting therof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions.

The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. The role of tumor microenvironments and phenomena like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Lecture notes
Handouts with reproductions of all presented transparencies will be distributed.

Literature
- additional information is given during the lecture

Prerequisites / notice
The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.
### Adaptability and Flexibility

This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences. Students will be equipped with the knowledge and skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

<table>
<thead>
<tr>
<th>Objective</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.</td>
<td>Identify ethical issues in life sciences and biotechnology.</td>
</tr>
<tr>
<td>B.</td>
<td>Analyze and critically discuss ethical issues in life sciences and biotechnology.</td>
</tr>
<tr>
<td>C.</td>
<td>Become aware of relevant legal and public policy frameworks.</td>
</tr>
<tr>

<td>Distinguish different ethical approaches and argumentative strategies in applied ethics.</td>
</tr>
<tr>
<td>E.</td>
<td>Recognize how ethical issues relate to different accounts of technology and innovation.</td>
</tr>
<tr>
<td>F.</td>
<td>Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.</td>
</tr>
<tr>
<td>G.</td>
<td>Autonomously anticipate ethical issues.</td>
</tr>
<tr>
<td>H.</td>
<td>Propose and communicate solutions to ethical challenges and dilemmas.</td>
</tr>
</tbody>
</table>

### Content

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester. The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy. All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

### Prerequisites / Notice

- Lecture "Introduction in Exercise Therapy" is prerequisite for this course.
- 90% of the lection students must be present.
Possible from the 5th semester on. Requirement: 376-1715-00L "Introduction to Exercise Therapy" passed.

Abstract
Communication skills and methods of psychoregulation applied to the area of Exercise and Sports Therapy.

Objective
The students are able to plan, lead through and evaluate conversations with patients.
The students are familiar with a specific method of psychoregulation.
The participants know different aspects of relationship formation (therapist/client) in therapeutic work.

Content
Communication and conversation: client-centered forms of conversation in theory and practice
Psychoregulative Methods: Theoretical and practical insight into various psychoregulative methods

Lecture notes
Documents will be distributed two weeks before lecture.

Prerequisites / notice
The courses "Exercise and Sports Therapy 1 and 2" have been completed successfully.
A minimum of 90% of attendance if used as credits towards CAS SVGS.
One seminar day in an institution/company specialized in reintegrating of clients into the workforce.

376-1722-00L Spinal Cord Injury and Exercise
Prequisite: Anatomy and Physiology

Abstract
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports.

Objective
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury

Content

529-0731-00L Nucleic Acids and Carbohydrates

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Data: 06.09.2022 12:51   Autumn Semester 2021   Page 1043 of 2159

Methods and Techniques:
- Recombinant DNA technology
- Next generation sequencing methods, sequencing of genomes
- CRISPR technology

Application to human biology:
- Functional genomics/transcriptomics
- Principles of cancer, genetic diseases
- Therapies: cell-based therapies/gene therapies/DNA and RNA vaccination

II) Proteomics

Methods and Techniques:
- Protein cloning and expression
- The antibody molecule
- Measurement and determination of biomolecular interactions
- Protein characterization and engineering
- Modifications and radioactive labelling

Application to human biology:
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

III) Drug discovery: Protein-based libraries

- Immune repertoire mining
- Display and selection technologies
  1. antibody phage display
  2. other polypeptide display technologies
  3. small-molecules display: DNA-encoded chemical libraries

Lecture notes
The lecture series follows the above-described content, and the students are provided with the lecture slides and additional notes. The additional notes are needed for the in-depth study of the individual topics, and to set the frame and content of the in-class group work of the chosen examples.

551-0319-00L

**Cellular Biochemistry (Part I)**

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and analyze the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

752-2120-00L

**Consumer Behaviour I**

**Abstract**

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

**Objective**

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

752-4005-00L

**Food Microbiology I**

**Abstract**

This is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.
Objective

The lecture offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the two part lecture (Food Micro II is offered in the FS) will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP’s of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1 Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Fungi
   2.5. Viruses and Bacteriophages
   2.6. Parasites
   2.7. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature

Recommendations will be given in the first lecture

752-6001-00L Introduction to Nutritional Science

W  3 credits

2V  2 credits

M. B. Zimmermann, C. Wolfrum

Abstract

This course introduces basic concepts of micro- and macronutrient nutrition. Macronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective

To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

Content

The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture notes

There is no script. Powerpoint presentations will be made available.

Literature

752-6301-00L Nutrition-Related Physiology

W  3 credits

2V  2 credits

F. von Meyenn

Abstract

Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

Objective

Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relationship to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

Lecture notes

Handouts for each lecture will be uploaded to Moodle every week.

752-6403-00L Nutrition and Performance

W  2 credits

2V  2 credits

S. Mettler, M. B. Zimmermann

Abstract

The course introduces basic concepts of the interaction between nutrition and exercise performance.

Objective

To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content

The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes

Lecture slides and required handouts will be available on the ETH website (moodle).

Literature

Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.
Prerequisites / notice

General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

ECTS European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of 3S, S. Maurer.

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Thematic Schwerpunkte:
- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzentwicklung unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Folien werden zur Verfügung gestellt.

Thematische Schwerpunkte:
- Get information about recent literature on learning and instruction
- Understanding of research methods used in the empirical human sciences
- Understanding findings relevant for education
- Promoting a positive learning atmosphere, avoiding disciplinary difficulties and they are aware of possible contacts (e.g. illegal or psychological services).

This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

851-0240-00L Human Learning (EW1)
Type: O
ECTS: 2 credits
Hours: 2V
Lecturers: E. Stern

Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

851-0240-22L Coping with Psychosocial Demands of Teaching (EW4 W D2) 1 credit 3S U. Markwalder, S. Maurer, S. Peteranderl-Rüschoff

Abstract
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

Objective
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

Prerequisites / notice
This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

851-0242-06L Cognitively Activating Instructions in MINT Subjects 2 credits 2S R. Schumacher

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L Human Intelligence 1 credit 1S E. Stern

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L Research Methods in Educational Science 1 credit 2S P. Edelsbrunner, T. Braas, C. M. Thurn
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0242-11L Gender Issues In Education and STEM

Number of participants limited to 30.

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

Abstract

In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

Objective

- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher’s work.

Content

Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice

Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

Enrolment at the earliest possible with the lecture 851-0240-00L "Human Learning" in parallel, or to have successfully completed it.

Abstract

In this course students learn the principles and techniques of teaching singular lessons, based on scientific knowledge about learning. The aim is to plan, realize, evaluate and reflect lessons effectively and efficiently.

Objective

- Students know how to prepare, conduct and reflect a single lesson based on educational requirements.
- Students take the learning goals as a starting point considering previous knowledge as well as the professional environment and the ambitions of the learners.
- Students apply the basic teaching techniques of their subject area in a sensible way and know how to appropriately arrange the phases of learning.
- Students know how to simplify and present complex technical contents of their subject area.

Fostered competencies

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: not assessed
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: not assessed
  - Media and Digital Technologies: assessed
  - Problem-solving: not assessed
  - Project Management: not assessed
- Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: assessed
  - Customer Orientation: not assessed
  - Leadership and Responsibility: assessed
  - Self-presentation and Social Influence: assessed
  - Sensitivity to Diversity: assessed
  - Negotiation: not assessed
- Personal Competencies
  - Adaptability and Flexibility: assessed
  - Creative Thinking: assessed
  - Critical Thinking: not assessed
  - Integrity and Work Ethics: not assessed
  - Self-awareness and Self-reflection: assessed
  - Self-direction and Self-management: assessed

376-8008-00L Teaching Internship Including Examination Lessons

Health Sciences and Technology

Only for Health Sciences and Technology TC students.

The teaching internship can just be visited if all other courses of TC are completed.

Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.
Objective
Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Further Subject Didactics

For students enrolled from HS 2019: The courses offered here are credited under the category «Subject Didactics and Professional Training».

Abstract
The mentored paper is designed to bring together the findings from the FD1 and the FD2. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for given topic.

Objective
1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

<td>Objective</td>
<td>This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course.</td>
<td></td>
<td></td>
<td></td>

### Objective

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

### Content

Practical and theoretical exercises in small groups in the laboratory.

### Lecture notes

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

---

**227-0447-00L**

**Image Analysis and Computer Vision**

W 6 credits 3V+1U L. Van Gool, E. Konukoglu, F. Yu

**Abstract**

**Objective**

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Content**

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

**Lecture notes**

Course material Script, computer demonstrations, exercises and problem solutions

**Prerequisites / notice**

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

The course language is English.

---

**327-2125-00L**

**Microscopy Training SEM I - Introduction to SEM**

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs, and others, a fee will be charged (http://www scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form: (link will follow)

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

**Abstract**

This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeEM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

**Objective**

- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

**Content**

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:

- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:

- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

**Lecture notes**

Lecture notes will be distributed.

**Literature**

**Prerequisites / notice**

No mandatory prerequisites.
The seminar provides state-of-the-art insight into the biomechanical function of bone from molecules, to cells, tissue and up to the organ. The course is organized in a highly interactive fashion, where discussion in class is as important as the input by the lecturer. Understanding

- Know effects of work design on competence, motivation, and well-being
- Strategic choices for work design
- The organization-technology interaction and its impact on work design and organizational change
- Balancing stability and flexibility in organizations as design criterium
- Modes of organizational change and change methods
- Approaches to analyzing and designing work
- Effects of work design on performance and well-being
- Work design: From Adam Smith to job crafting

Specifically, the course will cover the following topics:
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterium
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements (e.g. home office)
- Strategic choices for work design

All through the course, students will be guided to work on their projects also, with about 25% of class time devoted to the projects. In the final session, students will present the main results of their projects and discuss main insights also across projects.

The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

**Multiscale Bone Biomechanics**

The seminar provides state-of-the-art insight into the biomechanical function of bone from molecules, to cells, tissue, and up to the organ. Multiscale imaging and simulation allow linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.
Objective

The learning objectives include 1. advanced knowledge of the state-of-the-art in multiscale bone biomechanics; 2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ; 3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy; 4. practical implementation of state-of-the-art multiscale simulation techniques; 5. improved programing skills through the use of python; 6. hands on experience in designing solutions for clinical and industrial problems; 7. encouragement of critical thinking and creating an environment for independent and self-directed learning.

Content

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis. To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells and proteins working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on Quality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

Lecture notes

Material will be provided on Moodle and eColab.

Prerequisites / notice

Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.

363-0790-00L Technology Entrepreneurship

Objective

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Content

See course website: http://www.entrepreneurship.ethz.ch/education/fall/technology-entrepreneurship.html

Prerequisites / notice

Material will be provided on Moodle and eColab.

376-0130-00L Laboratory Course in Exercise Physiology

Objective

Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

Content

Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynanometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

Prerequisites / notice

Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler).

Desirable:

Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)

376-0203-00L Movement and Sport Biomechanics

Objective

Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

Content

Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

376-0207-00L Exercise Physiology

Objective

The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interactions of the different systems influencing factors, e.g. genetics, gender, age, altitude/depth, heat/cold, with respect to performance and health.

Content

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Lecture notes

Lecture slides and case material

Number of participants limited to 48.

HST: Possible from the 5th semester on.

Literature

Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg

Kenney/Wilmore/Costill: Physiology of Sport and Exercise, Human Kinetics

Prerequisite:

Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)

Desirable:

Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)
Content
History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular nad cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

Lecture notes
Online material is provided during the course.

Literature
Wird in der Vorlesung bekannt gegeben.

Prerequisites / notice
Anatomy and Physiology I + II

Abstract
The skeletal muscle biology field purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

Objective
The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content
The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students- each one will focus on one of the following research topics:

1. Topic 1: Molecular pathways that control muscle stem cell self-renewal and differentiation
2. Topic 2: Genome engineering to correct genetic mutations that cause muscle diseases
3. Topic 3: Muscle force composition, force production, and insulin sensitivity
4. Topic 4: Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group's research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

i. Group 1: tissue culture, isolation of muscle stem cells via FACS, differentiation of muscle stem cell into muscle fibers, small molecules screen, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.
ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crisp-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers, Immunofluorescence and PCR.
iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.
iv. Group 4: tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

Prerequisites
Prerequisites:
376-0008-00L Advanced Physiology and Pathophysiology
376-0006-02L Laboratory Course in Molecular biology

376-1033-00L History of Sports

Abstract
Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding for the development and adaptation of sports from the ancient world to present times.

Content

Lecture notes
Ein Skript für die aktuelle Veranstaltung wird abgegeben.

Literature

376-1107-00L Sport Pedagogy

Abstract
The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

Objective
Development of pedagogical-psychological competences for the optimisation of future teaching activities.

Content
- Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

Lecture notes
Teaching materials for the individual lectures are provided to the students via moodle.

Literature
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples to highlight the sociological view of sport.

Content
Sport and social change: developments and trends
The economy and the media: dependencies, consequences, scandals
Social inequalities and distinctions: gender differences and group behavior
Conflicts and politics: sports organizations, doping, violence

Lecture notes
Selected materials for the lecture are available on the Moodle platform.

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

Fostered competencies
Subject-specific Competencies: Concepts and Theories
Method-specific Competencies: Analytical Competencies
Social Competencies: Sensitivity to Diversity
Personal Competencies: Critical Thinking

376-1117-00L

Sport Psychology
W 2 credits 2V

Objective
Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content
Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes
Instructional materials for each course will be made available to students. All lecture materials will be available to students on Moodle.

Literature

Prerequisites / notice
No compulsory prerequisites, but student should have basic knowledge about genetics and molecular biology.
Applications of Cybernetics in Ergonomics

Cybernetics systems have been studied and applied in various research fields, such as for applications in ergonomics. Topics discussed in this lecture (man-machine-interaction, performance in multi-modal interactions, quantification in gestalt principles for the use in product development, information processing) are deepened with exercises conducted at our labs.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems
- Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Literature

Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Rehabilitation Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
- Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Literature

Introductory Books:

Selected Journal Articles and Web Links:

- VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Prerequisites / notice

376-1353-00L Nanostructured Materials Safety W 2 credits 1V P. Wick
- Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection.
- Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials.
- Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.
- Students of other departments, faculties, courses are also welcome.
- This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1714-00L Biocompatible Materials W 4 credits 3V K. Mana, M. Rottmar, M. Zenobi-Wong
- Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.
- The course covers the following topics:
  1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
  2. The concept of biocompatibility.
  3. Introduction into methodology used in biomaterials research and application.
  4. Introduction to different material classes in use for medical applications.

Target Group:
- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome.

Course "Introduction to Toxicology"
Content
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.
A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Lecture notes
Handouts are deposited online (moodle).

Literature

376-1720-00L Application of MATLAB in the Human Movement Sciences

Abstract
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content
Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parameterisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

Literature
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1722-00L Spinal Cord Injury and Exercise

Prerequisite: Anatomy and Physiology

Abstract
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports.

Objective
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

Content
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury

Big Data Analysis in Biomedical Research

**Objective**
This course aims to provide practical tools to analyze large biomedical datasets, and it is tailored towards experimental researchers in the life sciences with minimal prior programming experience, but with a strong interest in exploring big data to solve own research problems. Through theoretical classes, practical demonstrations, in class exercises and homework, the participants will master computational methods to independently manipulate large datasets, effectively visualize big data, and analyze it with appropriate statistical tools and machine learning approaches. For the final assessment, students will conduct an independent data analysis project based on a biomedical problem of their choosing and using publicly available population-based biomedical datasets.

**Content**
While learning the programming skills needed to manipulate and visualize the data, participants will learn the statistical and modeling approaches for big data analysis. The course will cover:
- Basis of Python programming and UNIX;
- High performance computing;
- Manipulation and cleaning of large datasets with Pandas;
- Visualization tools (Matplotlib, Seaborn);
- Machine learning and numerical libraries (SciPy, NumPy, Statsmodels, Scikit-Learn);
- Statistical analysis and modeling of big data, and applications to biomedical datasets (statistical learning, distributions, linear and logistic regressions, principal component analysis, clustering, classification, time series analysis, tree-based methods, predictive models).

Colloquium in Biomechanics

**Objective**
Getting insight into actual areas and problems of biomechanics.

Trauma Biomechanics

**Objective**
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

Literature
This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries. Based on examples from sports science, practical training and movement therapy, different methods of movement analysis are applied and assessed.

Adaptability and Flexibility

Analytical Competencies

Decision-making

Media and Digital Technologies

Problem-solving

Project Management

Communication

Cooperation and Teamwork

Customer Orientation

Leadership and Responsibility

Self-presentation and Social Influence

Sensitivity to Diversity

Negotiation

Adaptability and Flexibility

Creative Thinking

Critical Thinking

Integrity and Work Ethics

Self-awareness and Self-reflection

Self-direction and Self-management

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

This lecture introduces the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Biomechanics of Sports Injuries and Rehabilitation

Systems Biology of Metabolism

Applied Movement Analysis

Physiology Guided Food Structure and Process Design

Epidemiology and Prevention

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address these. The students will be exposed to this interplay all along the GI tract, including taste, aroma and texture perception, swallowing mechanics and gastro intestinal digestion with an engineering or physical sciences angle.

A "cook-and look" approach to process design is no longer applicable in the current environmental, nutritional and competitive constraints. The modern R&D chemical/food engineer should have a clear focus on the desired structure that needs to be achieved to design a process line or a processing equipment, coupled with in depth knowledge of the processed materials.

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during, and after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition applications. Exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

### Course Objectives

After completing this course, students will be able to understand:

- Concepts and Theories
- Analytical Competencies
- Decision-making
- Problem-solving
- Project Management
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking

### Literature

- Lecture notes: Handouts are provided to students in the classroom.

- Literature: Lecture slides and required handouts will be available on the ETH website (moodle).

- Prerequisites / Notice: General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

#### Major in Human Health, Nutrition and Environment

#### Compulsory Courses

<table>

</thead>
</table>

- Abstract: Writing of a review paper on scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.
- Objective: Acquisition of knowledge in the field of the review paper - Assessment of original literature as well as synthesis and analysis of the findings - Practising of academic writing in English - Giving an oral presentation with discussion on the topic of the review paper
- Content: Topics are offered in the domains of the major 'Human Health, Nutrition and Environment' covering 'Public Health', 'Infectious Diseases', 'Nutrition and Health' and 'Environment and Health'.
- Literature: Guidelines will be handed out in the beginning.

| 376-0300-00L| Translational Science for Health and Medicine                         | O    | 3    | 2G    | J. Goldhahn, C. Wolfrum           |

- Abstract: Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.
- Objective: After completing this course, students will be able to understand: Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will get familiar with:

- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process

Challenges of communication:

- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

- revised Linear Models
- revised or got introduced to Generalised Linear Models
- got introduced to Linear Mixed-Effects Models
- got introduced to Generalised Additive Models
- are able to select among these methods to solve an applied problem in Biostatistics
- can perform the data analysis using the statistical software R.
- can interpret the results of such an analysis and draw valid "biological" conclusions |
| Content      | This course is structured into three parts. The first part focuses on Linear and Generalised Linear Models. The second part introduces more advanced methodologies such as Linear Mixed-Effects Models and Generalised Additive Models. Both, part one and two will include the following topics: exploratory data analysis, model fitting, model "selection", residual diagnostics, model validation and results interpretation. Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts. |
| Prerequisites / notice | The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommend to view the online R course "etutoRF". |

| 752-6105-00L | Epidemiology and Prevention | W    | 3    | 2     | M. Puhan, R. Heusser |
| Abstract     | The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. |
| Objective    | The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. |
| Content      | The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods. |
Assessed

Papers will be assigned and downloaded from a web page announced during the lecture.

Publications and class notes can be downloaded from a web page announced during the lecture.

Lecturers

Obtain a detailed understanding of concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, ecological parasitology, communication, C. Vorburger, S. Bonhoeffer, S. B. Freigang, J. Kisielow, R. Regös, P. S. Leibundgut, A. O. Oxenius, E. Wetter Slack, J. Jokela, R. Heusser

This course provides a detailed understanding of Ecological Parasitology

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Waiting list will be deleted on October 1st, 2021.

At the end of this module students are able:

- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, COVID-19, Obesity, Iodine/PH nutrition).

Handouts are provided to students in the classroom.

Objective

At the end of this module students are able:

- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

Content

Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, COVID-19, Obesity, Iodine/PH nutrition).

Abstract

Objective

Literature

Number of participants limited to 20. A minimum of 6 students is required that the course will take place.

Waiting list will be deleted on October 1st, 2021.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Waiting list will be deleted on October 1st, 2021.
1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

**Content**

Lectures:
1. Diversit and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptions of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Ecology and evolution of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

**Prerequisites / notice**

The three practicals will take place at the 05.10.2021, the 19.10.2021 and the 09.11.2021 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture.

Content
This course will address selected and current topics targeting functional characterization and new applications of microorganisms in food and for promoting human health. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to different topics:

- Probiotics and Prebiotics: human gut microbiota, functional foods and microbial-based products for gastrointestinal health and functionality, diet-microbiota interactions, molecular mechanisms; challenges for the production and addition of probiotics to foods.
- Protective Cultures and Antimicrobial Metabolites for enhancing food quality and safety: antifungal cultures; bacteriocin-producing cultures (bacteriocins); long path from research to industry in the development of new protective cultures.
- Legal and protection issues related to functional foods
- Industrial biotechnology of flavor and taste development
- Safety of food cultures and probiotics

Students will be required to complete a Project on a selected current topic relating to functional culture development, application and claims. Project will involve information research and critical assessment to develop an opinion, developed in an oral presentation.

Lecture notes
Copy of the power point slides from lectures will be provided.

Literature
A list of topics for group projects will be supplied, with key references for each topic.

This lecture requires strong basics in microbiology.

376-0302-01L GCP Basic Course (Modules 1 and 2) O 1 credit 1G G. Senti
Only for Health Sciences and Technology MSc.

Abstract The basic course in "Good Clinical Practice" (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Objective Students will get familiar with:
- Key Ethics documents
- (International) Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

Content Module 1:
Research and Research Ethics, Guidelines, (International) Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)

Module 2:
Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention

Abstract Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice The lecture will be taught in English.

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content - X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes Lecture notes and handouts

Literature Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming
Biomedical Engineering

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Content

Practical and theoretical exercises in small groups in the laboratory.

Lecture notes

Bioelectronics and Biosensors

Abstract
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective
During this course the students will:
- learn the basic concepts of bioelectronics
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content
Lecture 1. Introduction to the field of bioelectronics and its challenges

Sources of bioelectronic signals
L2. Membrane and Transport
L3. Action potential and Hodgkin-Huxley
L4. Action potential and Hodgkin-Huxley 2

Measuring bioelectronic signals
L5. Detection and Noise
L6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
L7. Measuring potentials in solution and core conductance
L8. Measuring electronic signals with wearable electronics, ECG, EEG
L9. Measuring mechanical signals with bioelectronics

In vivo stimulation and recording
L10. Functional electric stimulation
L11. In vivo electrophysiology

Optical recording and control of neurons (optogenetics)
L12. Measuring neurons optically, fundamentals of optical microscopy
L13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy

L14. Measuring chemical signals

Lecture notes
The course has its own script including the exercises.

Prerequisites / notice
The course requires an open attitude to the interdisciplinary approach of bioelectronics.
In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion.

Integrity and Work Ethics not assessed
Self-awareness and Self-reflection not assessed
Self-direction and Self-management not assessed
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Basics of theory of probability

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Theory and corresponding exercises are merged together during the classes.

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

The course language is English.
To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems.

Objective
To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems.

Content
Introduction to Surface Science
Physical Structure of Surfaces
Surface Forces (static and dynamic)
Adsorbates on Surfaces
Surface Thermodynamics and Kinetics
The Solid-Liquid Interface
Electron Spectroscopy
Vibrational Spectroscopy on Surfaces
Scanning Probe Microscopy
Introduction to Tribology
Introduction to Corrosion Science

Lecture notes

Literature
https://moodle-app2.let.ethz.ch/course/view.php?id=14993

Prerequisites / notice
Chemistry:
General undergraduate chemistry
including basic chemical kinetics and thermodynamics

Physics:
General undergraduate physics
including basic theory of diffraction and basic knowledge of crystal structures
Microscopy Training SEM I - Introduction to SEM

Objective
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

Content
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Specimen preparation and handling
- Beam/specimen interaction and image formation
- EDX and other elemental analysis techniques
- Imaging techniques for different materials

Lectures:
- Introduction to SEM
- Electron Optics
- Image Formation
- Sample Preparation
- EDX Analysis
- Imaging Modes

Practicals:
- Specimen preparation and handling
- Beam/specimen interaction and image formation
- EDX and other elemental analysis techniques
- Imaging techniques for different materials

Literature

Prerequisites / notice
No mandatory prerequisites.

Microscopy Training TEM I - Introduction to TEM

Objective
Understanding of
1. the setup and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques
Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Technology Entrepreneurship  
**W** 2 credits  
**2V**  
F. Hacklin

**Abstract**  
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

**Objective**  
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**  
See course website: http://www.entrepreneurship.ethz.ch/education/fall/technology-entrepreneurship.html

**363-1065-00L**  
Design Thinking: Human-Centred Solutions to Real World Challenges  
**W** 5 credits  
**5G**  
S. Brusoni

**Abstract**  
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

**Objective**  
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validate them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

**Content**  
Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Multiscale Bone Biomechanics  
**W** 6 credits  
**4S**  
R. Müller, X.-H. Qin

**Abstract**  
The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

**Objective**  
The learning objectives include 1. advanced knowledge of the state-of-the-are in multiscale bone biomechanics; 2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ; 3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy; 4. practical implementation of state-of-the-art multiscale simulation techniques; 5. improved programing skills through the use of python; 6. hands on experience in designing solutions for clinical and industrial problems; 7. encouragement of critical thinking and creating an environment for independent and self-directed studying.
Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis. To better understand the biomechanical function of bones, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue, and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing of organoid technology will be highlighted towards personalized health. For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study basic biology, engineering, and mathematical concepts in video tutorials online (TORQUEs). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. The first part (TORQUEs: Tiny, Open-with-Restictions courses focused on Quality and Effectiveness), students study the basic concepts in short, interactive video lectures on the only learning environment outside the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced molecular investigation of bone ranged from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students- each one will focus on one of the following research topics:

**Topic 1:** Molecular pathways that control muscle stem cell self-renewal and differentiation

**Topic 2:** Genome engineering to correct genetic mutations that cause muscle diseases

**Topic 3:** Muscle fiber composition, force production and insulin sensitivity

**Topic 4:** Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

i. Group 1: tissue culture, isolation of muscle stem cells via FACSc, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.

ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crisp-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers, Immunofluorescence and PCR.

iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.

iv. Group 4: tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crisp-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers, Immunofluorescence and PCR.

iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.

iv. Group 4: tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

Prerequisites / notice

**Prerequisites:**

- Advanced Physiology and Pathophysiology 376-0006-02L Laboratory Course in Molecular Biology 376-0006-02L

**Content**

**Overview of aging and age-related diseases. Key discoveries in molecular biology of aging. Case studies of biotech companies addressing age-related complications. Brief introduction from bench to bedside with focus on start-up companies.**

**Lecture notes**

Material will be provided on Moodle and eColab.

**Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.**

**376-0208-00L Molecular and Cellular Biology of Exercise and Muscle Regeneration - Practical Aspects**

- **W 3 credits**
- **2G**
- **O. Bar-Nur, K. De Bock**

**Abstract**

The skeletal muscle biology field purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

**Objective**

The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

**Content**

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students- each one will focus on one of the following research topics:

**Topic 1:** Molecular pathways that control muscle stem cell self-renewal and differentiation

**376-1151-00L Translation of Basic Research Findings from Genetics and Molecular Mechanisms of Aging**

- **W 3 credits**
- **2V**
- **to be announced**

**Abstract**

Recently, several start-up companies are aiming to translate basic molecular findings into new drugs/therapeutic interventions to slow aging or post-age-related diseases (e.g., Google founded Calico or Craig Venter's Human Longevity, Inc.). This course will teach students the basic skill sets to formulate their own ideas, design experiments to test them and explains the next steps to translate new discoveries.

**Objective**

The overall goal of this course is to be able to analyse current therapeutic interventions to identify an unmet need in molecular biology of aging and apply scientific thinking to discover new mechanisms that could be used as a novel therapeutic intervention.

Learning objectives include:

1. Evaluate the current problem of our aging population, the impact of age-dependent diseases and current strategies to prevent these age-dependent diseases.

2. Analyse/compare current molecular/genetic strategies that address these aging problems.

3. Analyse case studies about biotech companies in the aging sector. Apply the scientific methods to formulate basic research questions to address these problems.

4. Generate own hypotheses (educated guess/idea), design experiments to test them, and map out the next steps to translate them.

**Content**

Overview of aging and age-related diseases. Key discoveries in molecular biology of aging. Case studies of biotech companies addressing age-related complications. Brief introduction from bench to bedside with focus on start-up companies.
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nanochemistry, nanodevices and other properties within nanoscale and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

Objectives

- Physiological, physical, and cognitive factors in sensation, perception, and action
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance, well-being, and comfort
- Usability engineering in system designs, product development, and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature

- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

Abstract

Cybernetics systems have been studied and applied in various research fields, such as for applications in ergonomics. Topics discussed in this lecture (man-machine-interaction, performance in multi-modal interactions, quantification in gestalt principles for the use in product development, information processing) are deepened with exercises conducted at our labs.

To learn and practice cybernetics principles in interface designs and product development,

- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodationvergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Literature

Abstract

Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetostance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- hobby electronics, making a device for 10$ and controlling it using a smartphone.

The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

### Biomedical Applications

**Abstract**
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

**Objective**
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

### Physical Human Robot Interaction (pHRI)

**Abstract**
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

**Objective**
The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1. identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2. compare and select mechatronic components that optimally fulfill the designed design requirements;
3. derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4. design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5. characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6. investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

**Lecture notes**
Will be distributed on Moodle before the lectures.
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine. M. Rottmar, M. Zenobi-Wong.

The concepts of biocompatibility, biodegradation and the interaction between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are discussed. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are performed. The students are able to analyze the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

The course includes study design, measurement techniques, clinical testing, accessing movement data and analysis as well as modeling applications in tissue engineering, drug delivery and for medical devices. The concept of biocompatibility is discussed and important techniques from biomaterials research and development are discussed. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Handouts are deposited online (moodle).
Biomedical datasets are increasing in size and complexity, and discoveries arising from their analysis have important implications in human health and biotechnological advances. While the potential of biomedical dataset analysis is considerable, preclinical researchers often lack the computational tools to analyze them. This course will provide the basis of data analysis of large biomedical data.

**Objective**

This course aims to provide practical tools to analyze large biomedical datasets, and it is tailored towards experimental researchers in the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

**Content**

While learning the programming skills needed to manipulate and visualize the data, participants will learn the statistical and modeling approaches for big data analysis. The course will cover:

- **Basics of Python programming and UNIX**
- **High performance computing**
- **Manipulation and cleaning of large datasets with Pandas**
- **Visualization tools (Matplotlib, Seaborn)**
- **Machine learning and numerical libraries (SciPy, NumPy, Statsmodels, Scikit-Learn)**
- **Statistical analysis and modeling of big data, and applications to biomedical datasets**

**Prerequisites / notice**

Basic understanding of mathematics and statistics, as taught in basic courses at the Bachelor’s level.

---

**401-0629-00L**

**Applied Biostatistics**

This course covers the main methods used in Biostatistics. It starts by revising Linear Models (Regression, Anova), then moves to Generalised Linear Models (logistic regression and methods for count data) and finally introduces more advanced topics (Linear Mixed-Effects Models and Generalised Additive Models). The course strongly focuses on applied aspects of data analysis.

**Objective**

After this course students:

- revised Linear Models
- got introduced to Generalised Linear Models
- got introduced to Generalised Additive Models

- are able to apply these methods to solve an applied problem in Biostatistics
- can perform the data analysis using the statistical software R
- can interpret the results of such an analysis and draw valid “biological” conclusions
This course is structured into three parts. The first part focuses on Linear and Generalised Linear Models. The second part introduces more advanced methodologies such as Linear Mixed-Effects Models and Generalised Additive Models. Both, part one and two will include the following topics: exploratory data analysis, model fitting, model "selection", residual diagnostics, model validation and results interpretation. Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts.

The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommended to view the online R course "etutoR".

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the changes and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Further references will be provided in the course.

Abstract
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Literature
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

551-0319-00L
Cellular Biochemistry (Part I)
W 3 credits
2V U. Kutay, G. Neurohr, M. Peter, K. Weis, I. Zemp

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.
Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

636-0108-00L
Biological Engineering and Biotechnology
W 4 credits
3V M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content
Abstract
A “cook-and-look” approach to process design is no longer applicable in the current environmental, nutritional and competitive constraints. The modern R&D chemical/food engineer should have a clear focus on the desired structure that needs to be achieved to design a process line or processing equipment, coupled with in depth knowledge of the processed materials.

Objective
The objective of this course is to highlight the intimate links between human physiology and product sensory and nutritional functions. To optimize these functions, an understanding of the physiological functions that interact and encode the actions of those product structures must be well understood.

Therefore the objective of this course is for students to be equipped with a skill set that will encompass basic digestion and sensory physiology knowledge and food structures.

The students will be exposed to this interplay all along the GI tract, including taste, aroma and texture perception, swallowing mechanics and gastro intestinal digestion with an engineering or physical sciences angle.

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

Content
- What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences
Positive and negative examples will be illustrated by distinguished guest speakers.

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.
Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life's mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostats for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Literature

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

327-2125-00L Microscopy Training SEM I - Introduction to SEM

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs and others, a fee will be charged (http://www scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form: (link will follow)

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

Abstract

This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.
Objective
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

Content
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Lecture notes
Lecture notes will be distributed.

Prerequisites / notice
No mandatory prerequisites.

376-0121-00L Multiscale Bone Biomechanics 
W 6 credits 4S  R. Müller, X.-H. Qin

Abstract
The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale biological and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.
Objectives

The learning objectives include: 1. advanced knowledge of the state-of-the-art in multiscale bone biomechanics; 2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ; 3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy; 4. practical implementation of state-of-the-art multiscale simulation techniques; 5. improved programming skills through the use of python; 6. hands on experience in designing solutions for clinical and industrial problems; 7. encouragement of critical thinking and creating an environment for independent and self-directed studying.

Content

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis. To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting, and bio-manufacturing and organoid technology will be highlighted toward personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

Lecture notes

Material will be provided on Moodle and eColab.

Prerequisites / notice

Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.

Abstract

The skeletal muscle biology field purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

Objective

The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students- each one will focus on one of the following research topics:

1. Topic 1: Molecular pathways that control muscle stem cell self-renewal and differentiation
2. Topic 2: Genome engineering to correct genetic mutations that cause muscle diseases
3. Topic 3: Muscle fiber composition, force production and insulin sensitivity
4. Topic 4: Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session. For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

i. Group 1: tissue culture, isolation of muscle stem cells via FACS, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.
ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crispr-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers. Immunofluorescence and PCR.
iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.
iv. Group 4: tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

Abstract

Current topics in translational medicine presented by speakers from academia and industry.

Objective

Getting insight into actual areas and problems of translational medicine.

Content

Timely and concise presentations of postgraduate students, post-docs, senior scientists, professors, as well as external guests from both academics and industry will present topics of their interest related to translational medicine.
Translation of Basic Research Findings from Genetics and Molecular Mechanisms of Aging  

Does not take place this semester.  
Number of participants limited to 30.

Abstract  
Recently, several start-up companies are aiming to translate basic molecular findings into new drugs/therapeutic interventions to slow aging or post-pone age-related diseases (e.g., Google founded Calico or Craig Venter's Human Longevity, Inc.). This course will teach students the basic skill sets to formulate their own ideas, design experiments to test them and explains the next steps to translate these ideas to prototypes.

Objective  
The overall goal of this course is to be able to analyse current therapeutic interventions to identify an unmet need in molecular biology of aging and apply scientific thinking to discover new mechanisms that could be used as a novel therapeutic intervention.  
Learning objectives include:  
1. Evaluate the current problem of our aging population, the impact of age-dependent diseases and current strategies to prevent these age-dependent diseases.  
2. Analyse/compare current molecular/genetic strategies that address these aging problems.  
3. Analyse case studies about biotech companies in the aging sector. Apply the scientific methods to formulate basic research questions to address these problems.  
4. Generate own hypotheses (educated guess/design), experiment to test them, and map out the next steps to translate them.

Content  
Overview of aging and age-related diseases. Key discoveries in molecular biology of aging. Case studies of biotech companies addressing age-related complications. Brief introduction from bench to bedside with focus on start-up companies.

Prerequisites / notice  
No compulsory prerequisites, but student should have basic knowledge about genetics and molecular biology.

Practical Methods in Tissue Engineering  

Number of participants limited to 12.

Abstract  
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.  
Objective  
Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Content

Big Data Analysis in Biomedical Research  

Number of participants limited to 12.

Abstract  
Biomedical datasets are increasing in size and complexity, and discoveries arising from their analysis have important implications in human health and biotechnological advances. While the potential of biomedical dataset analysis is considerable, preclinical researchers often lack the computational tools to analyze them. This course will provide the basis of data analysis of large biomedical data sets.

Objective  
This course aims to provide practical tools to analyze large biomedical datasets, and it is tailored towards experimental researchers in the life sciences with minimal prior programming experience, but with a strong interest in exploring big data to solve own research problems. Through theoretical classes, practical demonstrations, in class exercises and homework, the participants will master computational methods to independently manipulate large datasets, effectively visualize big data, and analyze it with appropriate statistical tools and machine learning approaches. For the final assessment, students will conduct an independent data analysis project based on a biomedical problem of their choosing and using publicly available population-based biomedical datasets.

Content  
While learning the programming skills needed to manipulate and visualize the data, participants will learn the statistical and modeling approaches for big data analysis. The course will cover:  
• Basic of Python programming and UNIX;  
• High performance computing;  
• Manipulation and cleaning of large datasets with Pandas;  
• Visualization tools (Matplotlib, Seaborn);  
• Machine learning and numerical libraries (SciPy, NumPy, Statsmodels, Scikit-Learn);  
• Statistical analysis and modeling of big data, and applications to biomedical datasets (statistical learning, distributions, linear and logistic regressions, principal component analysis, clustering, classification, time series analysis, tree-based methods, predictive models).

Prerequisites / notice  
Basic understanding of mathematics and statistics, as taught in basic courses at the Bachelor`s level.

Immunology III  

Number of participants limited to 12.

Abstract  
This course provides a detailed understanding of  
- development of T and B cells  
- the dynamics of an immune response during acute and chronic infection  
- mechanisms of immunopathology  
- modern vaccination strategies

Objective  
Obtain a detailed understanding of  
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,  
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,  
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.  
- Optimization of B cell responses by intelligent design of new vaccines

Prerequisites / notice  
No compulsory prerequisites, but student should have basic knowledge about genetics and molecular biology.

Nanostructured Materials Safety  

Number of participants limited to 12.

Abstract  
Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection

Objective  
Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials

Lecture notes  
Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

Prerequisites / notice  
No compulsory prerequisites, but student should have basic knowledge about genetics and molecular biology.

Immunology III  

Number of participants limited to 12.

Abstract  
This course provides a detailed understanding of  
- development of T and B cells  
- the dynamics of an immune response during acute and chronic infection  
- mechanisms of immunopathology  
- modern vaccination strategies

Objective  
Obtain a detailed understanding of  
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,  
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,  
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.  
- Optimization of B cell responses by intelligent design of new vaccines

Prerequisites / notice  
No compulsory prerequisites, but student should have basic knowledge about genetics and molecular biology.
Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- CD8 T cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

551-0309-00L  Concepts in Modern Genetics  W  6 credits  4V  Y. Barral, D. Bopp, A. Hajnal, O. Voinnet

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

551-0317-00L  Immunology I  W  3 credits  2V  M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Fostered competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
- Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Customer Orientation
  - Leadership and Responsibility
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
  - Negotiation
- Personal Competencies
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

551-0512-00L  Current Topics in Molecular and Cellular Neurobiology  W  2 credits  1S  U. Suter

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.
By the end of this module, each student should be able to
- relate changes in gene structure or function to evolutionary changes in animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

551-0571-00L From DNA to Diversity (University of Zurich)

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

551-1153-00L Systems Biology of Metabolism

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

551-1171-00L Immunology: From Milestones to Current Topics

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content
Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Lecture notes
Original and review articles will be provided during the course.

551-1303-00L Cellular Biochemistry of Health and Disease

Abstract
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.
Objective
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Content
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

Literature
The literature will be provided during the course

Prerequisites / notice
The course will be taught in English.

636-0017-00L
Computational Biology

W 6 credits
3G+2A
T. Vaughan

Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- * maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- * epidemiology
- * pathogen evolution
- * macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e., we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyloodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- * Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date. For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&ansicht=KATALOGDATEN&lerneinheitId=123546&lang=de, or working through the script provided as part of this R course.

636-0108-00L
Biological Engineering and Biotechnology

W 4 credits
3V
M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Lecture notes
Handout during the course.

636-0507-00L
Synthetic Biology II

Does not take place this semester. Students in the MSc Biotechnology (Programme Regulations 2017) may select Synthetic Biology II instead of the Research Project I.

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external.) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course.

Data: 06.09.2022 12:51
Autumn Semester 2021
Page 1089 of 2159

Prerequisites / notice

The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

701-1703-00L Evolutionary Medicine for Infectious Diseases W 3 credits 2G A. Hall

Number of participants limited to 35.

Abstract

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections in humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (~20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

701-1703-00L Evolutionary Medicine for Infectious Diseases W 3 credits 2G A. Hall

Number of participants limited to 35.

Abstract

752-3105-00L Physiology Guided Food Structure and Process Design W 3 credits 2V E. J. Windhab, M. Devezaux de Lavergne, S. Michig Gonzalez, T. Wooster

Abstract

A “cook-and-look” approach to process design is no longer applicable in the current environmental, nutritional and competitive constraints.

Objective

The objective of this course is to highlight the intimate links between human physiology and product sensory and nutritional functions. To optimize these functions, an understanding of the physiological functions that interact and encode the actions of those product structures must be well understood.

Therefore the objective of this course is for students to be equipped with a skill set that will encompass basic digestion and sensory physiology knowledge and food structures.

The students will be exposed to this interplay all along the GI tract, including taste, aroma and texture perception, swallowing mechanics and gastro intestinal digestion with an engineering or physical sciences angle.

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V M. Loessner, M. Schmelcher, M. Schuppler, E. Wetter Slack

Abstract

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content

Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc.) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature

Recommendations will be given in the first lecture

Prerequisites / notice

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break !

752-6100-00L Dietary Etiologies of Chronic Disease W 3 credits 2V M. B. Zimmermann

Abstract

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes

There is no script. Powerpoint presentations will be made available on-line to students.

Literature

To be provided by the individual lecturers, at their discretion.

Prerequisites / notice

No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

752-6105-00L Epidemiology and Prevention W 3 credits 2V M. Puhan, R. Heusser

Abstract

The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

Objective

The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware of how epidemiological facts are used in prevention, practice and politics.

Content

The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

Abstract
Translational science is a cross-disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

Content
- What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences
- Positive and negative examples will be illustrated by distinguished guest speakers.

Abstract
The basic course in “Good Clinical Practice” (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Objective
Students will get familiar with:
- Key Ethics documents
- (Inter)national Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

Content
Module 1:
- Research and Research Ethics, Guidelines, (inter)national Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator’s Brochure, Patient Information Leaflet, Informed Consent Form)

Module 2:
- Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Mind the enrolment deadlines at UZH:

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.
### Objective
On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development
- apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

### Key skills
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

### Content
The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

### Lecture notes
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz as BIC344

### Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

### Prerequisites / notice
Auxiliary tools:
None. Bring something to write and your student ID

**Data:** 06.09.2022 12:51  **Autumn Semester 2021**  **Page 1092 of 2159**
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments. The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

227-1047-00L

**Consciousness: From Philosophy to Neuroscience**

(University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: I11410

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/opense/eur/studies/application/deadline.html

**Abstract**

This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

**Objective**

The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

**Content**

The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

**Lecture notes**

None

**Literature**

We display articles pertaining to the issues we cover in the class on the course's webpage.

**Prerequisites / notice**

Since we are all experts on consciousness, we expect active participation and discussions!

---

227-2125-00L

**Microscopy Training SEM I - Introduction to SEM**

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list. For PhD students, postdocs and others, a fee will be charged (http://www.scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form: (link will follow)

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

**Abstract**

This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeSEM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

**Objective**

- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

**Content**

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

**Lectures:**
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- electron preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

**Practicals:**
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

**Lecture notes**

Lecture notes will be distributed.
The overall goal of this course is to be able to analyse current therapeutic interventions to identify an unmet need in molecular biology of aging and apply scientific thinking to discover new mechanisms that could be used as a novel therapeutic intervention. Analyse case studies about biotech companies in the aging sector. Apply the scientific methods to formulate basic research questions and generate own hypotheses (educated guess/idea), design experiments to test them, and map out the next steps to translate them.

Literature

Prerequisites / notice

No mandatory prerequisites.

376-1151-00L Translation of Basic Research Findings from Genetics and Molecular Mechanisms of Aging W 3 credits 2V to be announced

Abstract
Recently, several start-up companies are aiming to translate basic molecular findings into new drugs/therapeutic interventions to slow aging or post-pone age-related diseases (e.g., Google founded Calico or Craig Venter’s Human Longevity, Inc.). This course will teach students the basic skill sets to formulate their own ideas, design experiments to test them and explain the next steps to translate the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course.

Objective
Students are required to have successfully completed the course “Neural control of movement and motor learning” and to have basic knowledge of applied statistics.

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0309-00L; 327-0703-00L) as suggested prerequisite.

376-0221-00L Methods and Concepts in Human Systems Neuroscience and Motor Control ■ 4 credits 3P M. Alternatt

Abstract
This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, and write short reports or essays.

Objective
This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course.

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0309-00L; 327-0703-00L) as suggested prerequisite.

327-2126-00L Microscopy Training TEM I - Introduction to TEM W 2 credits 3P P. Zeng

Abstract
The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for beginners who are interested in using TEM for their Master or PhD thesis. TEM sample preparation techniques are also discussed. During hands-on sessions at different TEM instruments, students will have the opportunity to examine their own samples if time allows.

Objective
Understanding of
1. the set-up and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques

Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Content
Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- Demo, practical demonstration of a TEM: instrument components, alignment, etc.
- Hands-on training for students: sample loading, instrument alignment and data acquisition.
- Sample preparation for different types of materials
- Practical work with TEMs
- Demonstration of advanced Transmission Electron Microscopy techniques

Literature

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0309-00L; 327-0703-00L) as suggested prerequisite.
This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual, auditory, and other sensory interactions with robots, students will learn about the principles of human-robot interaction through lectures on the latest scientific results. The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

The objective of this course is to impart knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes
Will be distributed on Moodle before the lectures.
Biomedical datasets are increasing in size and complexity, and discoveries arising from their analysis have important implications in human life sciences with minimal prior programming experience, but with a strong interest in exploring big data to solve own research problems. The students are expected to have basic control knowledge from previous classes.

The lecture will be held in English.

There are 4 credit points for this lecture.

Device and Scenarios, pages 157-162.

data:06.09.2022 12:51
The course introduces basic concepts of the interaction between nutrition and exercise performance.

Student Learning Outcomes:
- To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.
- The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how and after exercise.
- Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition intervention.
- In microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.
- Fostered competencies
  - Subject-specific Competencies
    - Concepts and Theories: assessed
    - Techniques and Technologies: assessed
  - Method-specific Competencies
    - Analytical Competencies: not assessed
    - Decision-making: assessed
    - Media and Digital Technologies: not assessed
    - Problem-solving: assessed
  - Social Competencies
    - Communication: not assessed
    - Cooperation and Teamwork: not assessed
    - Customer Orientation: not assessed
    - Leadership and Responsibility: not assessed
    - Self-presentation and Social Influence: not assessed
    - Sensitivity to Diversity: assessed
    - Negotiation: not assessed
  - Personal Competencies
    - Adaptability and Flexibility: not assessed
    - Critical Thinking: assessed
    - Integrity and Work Ethics: not assessed
    - Self-awareness and Self-reflection: assessed
    - Self-direction and Self-management: assessed

Notes:
- To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020
- M. Loessner, M. B. Zimmermann
- The course introduces basic concepts of the interaction between nutrition and exercise performance.
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

**Practical Training**

Practical Training (former name: Practical Training and Semester project) only for majors mentioned below:
- Human Movement Science and Sport
- Medical Technology
- Molecular Health Sciences
- Neurosciences

Objective Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content

1. Linear Algebra and Complex Numbers:
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Multivariable Differential Calculus:
   functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.

5. Multivariable Integral Calculus:
   multiple integrals, line and surface integrals, work and flow, Green, Gauss and Stokes theorems, applications.

6. Partial Differential Equations:
   separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

Literature

- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).
- Thomas, G. B.: Thomas' Calculus, Parts 2 (Pearson Addison-Wesley).

Prerequisites / notice Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

Assistant: Tuesdays and Wednesdays 17-19h, in Room HG E 41.

376-0203-AAL Movement and Sport Biomechanics
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective “Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.”

Content Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

406-0062-AAL Physics I
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

Objective Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter. The student should acquire an overview over the basic concepts in mechanics.

Chapters:
1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-7), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6), 15 (without 15-3, 15-5)

376-1714-AAL Biocompatible Materials
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.
Objective

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Abstract**

This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity. Topics include:

- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Elementary processes in QED
- Radiative corrections

**Objective**

The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore, it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

**Lecture notes**

Will be provided as the course progresses.

Abstract
Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on flagship experiments which have significantly improved our understanding of particle physics today, concentrating mainly on precision experiments with neutrons, muons and exotic atoms.

Objective
You will be able to present and discuss:
- the principle of the experiments
- the underlying technique and methods
- the context and the impact of these experiments on particle physics

Content
Low energy particle physics provides complementary information to high energy physics with colliders. At the Large Hadron Collider one directly searches for new particles at energies up to the TeV range. In a complementary way, low energy particle physics indirectly probes the existence of such particles and provides constraints for "new physics", making use of high precision and high intensities.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- search for rare decays and charged lepton flavor violation
- electric dipole moments and CP violation
- spectroscopy of exotic atoms and symmetries of the standard model
- what atomic physics can do for particle physics and vice versa
- neutron decay and primordial nucleosynthesis
- atomic clock
- Penning traps
- Ramsey spectroscopy
- Spin manipulation
- neutron-matter interaction
- ultra-cold neutron production
- various techniques: detectors, cryogenics, particle beams, laser cooling....

Rauch & Werner: "Neutron Interferometry"
Carlile & Willis: "Experimental Neutron Scattering"
Byrne: "Neutrons, Nuclei and Matter"
Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"

Prerequisites / notice
Einführung in die Kern- und Teilchenphysik / Introduction to Nuclear- and Particle-Physics

402-0725-00L Experimental Methods and Instruments of Particle Physics
Special Students UZH must book the module PHY461 directly at UZH.

Abstract
Physics and design of particle accelerators.
Basics and concepts of particle detectors.
Track- and vertex-detectors, calorimetry, particle identification.
Special applications like Cherenkov detectors, air showers, direct detection of dark matter.
Simulation methods, readout electronics, trigger and data acquisition.
Examples of key experiments.

Objective
Acquire an in-depth understanding and overview of the essential elements of experimental methods in particle physics, including accelerators and experiments.

Content
1. Examples of modern experiments
2. Basics: Bethe-Bloch, radiation length, nucl. interaction length, fixed-target vs. collider, principles of measurements: energy- and momentum-conservation, etc.
3. Physics and layout of accelerators
4. Charged particle tracking and vertexing
5. Calorimetry
6. Particle identification
7. Analysis methods: invariant and missing mass, jet algorithms, b-tagging
8. Special detectors: extended airshower detectors and cryogenic detectors
9. MC simulations (GEANT), trigger, readout, electronics

402-0713-00L Astro-Particle Physics I

Abstract
This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

Objective
Successful students know:
- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

Content
First semester (Astro-Particle Physics I):
- definition of 'Astro-Particle Physics'
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- 'extended air showers' and 'cosmic muons'
- 'knee' and 'ankle' in the energy spectrum
- the 'anti-matter problem' and the Big Bang
- 'cosmic accelerators'

<tbody>
<tr>
<td>These topics will be discussed both in general terms and with specific phenomenological applications in the context of physics beyond the Standard Model, effective description of the weak interaction, as well as the description of non-perturbative strong interaction at low energies.</td>
<td>This course introduces the core concept of constructing EFTs and applies them to the low-energy description of the weak interaction and the effective description of heavy physics beyond the Standard Model.</td>
<td>The focus of the course is on Effective Field Theories (EFTs) and their interplay with dispersion theory. These topics will be discussed both in general terms and with specific phenomenological applications in the context of physics beyond the Standard Model, effective description of the weak interaction, as well as the description of non-perturbative strong interaction at low energies.</td>
</tr>
</tbody>
</table>

### Prerequisites

- For Introduction to String Theory: Students must be familiar with quantum field theory
- For Scattering Amplitudes in Quantum Field Theories: Students must be familiar with quantum field theory
- For Quantum Chromodynamics: A basic knowledge of Feynman rules in scalar field theories and in Yang-Mills theory is assumed.
- For Effective Field Theories for Particle Physics: A basic knowledge of Feynman rules in scalar field theories and in Yang-Mills theory is assumed.

**Abstract**

Introduction to differential geometry and differential topology. Contents: Curves, (hyper-)surfaces in \( \mathbb{R}^n \), geodesics, curvature, Theorema Egregium, Theorem of Gauss-Bonnet. Hyperbolic space. Differentiable manifolds, immersions and embeddings, Sard's Theorem, mapping degree and intersection number, vector bundles, vector fields and flows, differential forms, Stokes' Theorem.

**Objective**

Provide insightful knowledge about the classical theory of curves and surfaces (which is the precursor of modern differential geometry).

**Lecture notes**

Partial lecture notes are available from Prof. Lang's website https://people.math.ethz.ch/~lang/

**Literature**

- Manfredo P. do Carmo: Differential Geometry of Curves and Surfaces
- John M. Lee: Introduction to Smooth Manifolds
- S. Montiel, A. Ros: Curves and Surfaces
- S. Kobayashi: Differential Geometry of Curves and Surfaces
- Wolfgang Kühnel: Differentialgeometrie, Kurven-Flächen-Mannigfaltigkeiten
- Dennis Barden & Charles Thomas: An Introduction to Differential Manifolds

<td>W. Lustermann</td>
</tr>
</tbody>
</table>

**Abstract**

During the semester break participating students stay for 4 weeks at CERN and perform experimental work relevant to our particle physics projects. Dates to be agreed upon.

**Objective**

Students learn, by doing, the needed skills to perform a small particle physics experiment: setup, problem solving, data taking, analysis, interpretation and presentation in a written report of publication quality.

**Content**

Detailed information in: https://ethteilchenpraktikum.web.cern.ch/
### Experimental Foundations of Particle Physics (402-0740-00L)

**Objective**
This course integrates knowledge of all detector components (tracking, calorimetry, trigger) in discussing the experiments as a whole.

**Content**
- The course will not follow the historical trajectory of experimental particle physics. It will instead try to give a modern view of the results of the experiments and show where they fit in the theoretical construction.
- The students will read the original papers collected in the seminal text by Cahn and Goldhaber. The theory will be distilled to the very basics using the textbook by Bettini.

**Prerequisites & Literature**
- Advanced knowledge of particle physics (402-0741-00L)
- Reading ability in English/German

**Number of Participants**
The number of participants is limited.

**Supervisors**
A. Soter, M. Backhaus, M. Donegà

### Proseminar Theoretical Physics (402-0217-MSL)

**Objective**
The number of participants is limited.

**Abstract**
A guided self-study of original papers and of advanced textbooks in theoretical physics. Within the general topic, determined each semester, participants give a presentation on a particular subject and deliver a written report.

**Supervisors**
M. Donegà

### Semester Project in Theoretical Physics (402-0210-MSL)

**Objective**
Students learn all the different steps it takes to perform a complete particle physics experiment in a small team. They acquire skills to do this themselves in the team, including design, construction, data taking and data analysis.

**Abstract**
The number of participants is limited.

**Supervisors**
M. Backhaus, M. Donegà

Abstract
Literature Review: ETH-Library, Journals in Physics, Google Scholar; Thesis Structure: The IMRAD Model; Document Processing: LaTeX and BibTeX, Mathematical Writing, AVETH Survival Guide; ETH Guidelines for Integrity; Authorship Guidelines; ETH Citation Etiquettes; Declaration of Originality.

Objective
Basic standards for scientific works in physics: How to write a Master Thesis. What to know about research integrity.

462-0900-00L Master's Thesis ■
Further information:
www.phys.ethz.ch/phys/education/master/msc-theses

Abstract
The Master's thesis is normally conducted in the fourth semester and concludes the degree programme. With the Master's thesis students verify their ability to undertake independent and scientifically structured work in the area of high energy physics.

Prerequisitses / notice
The time limit for completing the Master's thesis is six months.

| 377-0107-00L | Nervous System | O    | 5    | 5V    | D. P. Wofler, I. Amrein, J. Bohacek, D. Burdakov, G. Schratt, L. Stomiakova, O. Ulrich, N. Wenderoth, further lecturers |
| Abstract    | Structure and function of the central and peripheral nervous system including its major disorders. |
| Objective   | Upon successful completion of this module, students should be able to: |
|             | 1. distinguish important cell types of the nervous system (neurons, glial cells) on the basis of their structure and function; |
|             | 2. correctly describe the neurophysiological basics of stimulus conduction and processing in the peripheral and central nervous system; |
|             | 3. correctly name the organ structures and circuits involved in the development of the peripheral and central nervous system; |
|             | 4. associate the different brain areas with corresponding functions in homeostasis, sensory, motor and cognitive functions; |
|             | 5. identify clinical pictures associated with the loss of function of certain structures of the central and peripheral nervous system and to understand the mode of action of current therapeutic approaches. |
| Content     | In this module, students get an overview of the structure (anatomy) and function (physiology) of the peripheral and central nervous system as well as selected neurological diseases (pathophysiology). |
|             | The module is subdivided into a total of six subject areas: |
|             | 1. basics of neurophysiology, stimulus conduction and processing using the example of the motor end plate, peripheral nervous system, associated clinical pictures (myasthenia gravis) |
|             | 2. structure, circuits and pathways in the spinal cord, spinal nerves, motor stimulus conduction in the spinal cord, spinal cord lesions and pain |
|             | 3. anatomy and function of the brain stem and cranial nerves and their significance for motor and sensory functions, lesions (brain stem syndromes) |
|             | 4. anatomy and function of basal ganglia, thalamus and hypothalamus, control of the autonomic nervous system (homeostasis, food and water intake), basal ganglia defects using Parkinson's disease as an example |
|             | 5. anatomy and function of the cerebellum and vestibular system, fine control of motor functions, associative learning, cerebellar symptoms (ataxia), organ of equilibrium |
|             | 6. anatomy and function of the cerebrum, sensory and motor processing, cognition, learning and memory, neurodegenerative (Alzheimer) and neuropsychiatric (schizophrenia) disorders |

| 551-0033-00L | Molecular Genetics and Cell Biology         | O    | 5    | 5G    | J. Cor, F. Allain, K. Köhler |
| Abstract    | This course teaches the basic principles of evolution, cell biology, molecular biology, genetics and developmental biology using the example of humans. |
| Objective   | 1) Students can explain the importance of evolution for the development of humans and diseases. |
|             | 2) The students know the cell as the smallest unit of the body. They can explain how the functions of the cell are disturbed in certain diseases and where therapies intervene. They can describe the multiplication of cells in the body and show how errors in this multiplication can lead to diseases. |
|             | 3) The students know DNA as the basis of life. They can explain how the DNA information is stored and how this information can be reproduced and protected from damage. They can describe how the information is read and translated into proteins. They can explain which mechanisms at the level of DNA, RNA and proteins can cause diseases. |
|             | 4) Students can explain which technologies can be used to diagnose and treat diseases. |
|             | 5) Students can explain how people differ genetically and know the molecular basis of these differences. They can explain how these differences can lead to diseases and why some of these differences do not affect diseases. |
|             | 6) The students know the molecular causes of the most common hereditary diseases and can determine the probability of occurrence and transmission to offspring. |
|             | 7) Students can explain the biochemical and molecular basis of human reproduction and know the basic principles of human embryonic development. The students can explain which mechanisms can be disturbed by a faulty development. |

| 529-5000-00L | Chemistry (for Medical Students)           | O    | 4    | 3V+1U | S. Wolfrum |
| Abstract    | The lecture teaches the most important fundamental concepts in chemistry (atomic structure, chemical bonds, thermodynamics and kinetics of chemical reactions, acid-base equilibria, types and reactivity of organic compounds, stereochemistry, biomolecules). Connections of chemical processes with medically important biochemical, physiological, and pharmacological questions are highlighted. |
| Objective   | Understanding of the basic concepts of chemistry. Understanding the importance of chemical processes in human physiology and in the diagnosis and treatment of human diseases. |
| Content     | The lecture elaborates the fundamental concepts of chemistry. The organization of the lecture is guided by the two textbooks "Chemie für Mediziner" by Zeeck et al. and Schmuck et al., respectively, referred to below. Accordingly, the following major subject areas will be covered: Atomic structure, periodic table of the elements, types of chemical bonds, states of matter, heterogeneous equilibria, thermodynamics and kinetics of chemical reactions, salt solutions, acids and bases, oxidation and reduction, metal complexes, fundamentals of organic chemistry, important classes of organic compounds and their reactivities, stereochemistry, amino acids and peptides, carbohydrates, lipids, heterocycles, spectroscopy in chemistry and medicine. |
| Lecture notes | Scripts for individual subject areas will be provided electronically prior to the corresponding lectures. |
| Literature  | There are no English translations of these textbooks. |
Prerequisites / notice
There are no specific requirements.

<td>Based on a complex clinical case, students are familiarized with the course of medical care from initial treatment to rehabilitation. Basic terms, modules and processes are introduced. In addition, the students experience the basics of imaging techniques, especially ultrasound. The students complete the Basic Life Support course. After this training sequence, all participants should be able to initiate resuscitation measures in private and in-hospital settings. The students experience learning, teaching and working in the hospital sector as a social process and teamwork in which all senses and a wide range of skills are needed. In addition, the students experience in three workshops the basic process of a physiotherapeutic intervention with the concepts of clinical reasoning, therapeutic aspects and therapy progression. An intensive course in microscopy/histology enables students to perform microscopy independently and to understand histological sections of a histological sample, but also online.</td>

| 377-0111-00L | Medical Anamnesis Technique <br> Only for Human Medicine BSc. | O    | 2 credits | 2G   | S. Markun, S. Neuner-Jehle, N. Scherz |
|              | Abstract                                      |      |         |        |             |
|              | Interviewing techniques to acquire medically relevant information and building an adequate physician-patient relationship. |
Objective

The students can build a relationship with the patient and, based on this, collect the essential concerns and information from the patient in a structured way.

The students know:
- the theoretical basics of communication;
- the structural components of the anamnesis;
- certain communication techniques.

The students can:
- pre-structure an anamnesis (structural components by heart);
- take a simple (but complete) anamnesis.

Content

Fundamentals of medical conversation in theory and practice

Mixed teaching methods, each with a theoretical part followed by practice in small groups and application to real patients. The most central components of communication and anamnesis techniques are reduced to their smallest components and each student performs each component at least once. At the end of the module, the components are practiced in an integrated manner to form a complete anamnesis.

Abstract

This course will focus on the components and functions of the hematopoietic and the immune systems and on diseases affecting or caused by these systems.

Objective

1. The organization and development of hematopoiesis including hematopoietic stem cell development; the role of hematopoietic growth factors and transcription factors in hematopoiesis; the role of hemoglobin in health and disease; erythrocyte physiology and iron metabolism; the principles of blood groups and blood transfusions; the principles of coagulation and the pharmacology of coagulation; the role of platelets and pharmacological platelet inhibition; to define thrombophilia and to understand thrombotic events; the role of leukocytes in health and disease; the analysis of blood samples; the principles of hematopoietic stem cell transplantation. 2. The development of the immune system; the structure and function of primary and secondary lymphoid organs; the cellular and molecular mechanisms of the innate and adaptive immune systems; the effector mechanisms of immune responses against pathogens; basic concepts of immune-mediated diseases (allergy and autoimmunity), tumor immunology, immunodeficiency, organ transplantation; basic knowledge of therapies.

Content

1. Introduction to hematopoiesis, hematopoietic growth factors, hematopoietic transcription factors, erythrocyte physiology, blood groups, blood transfusion, iron metabolism, platelets, coagulation cascade, fibrinolysis, hemoglobin, hemoglobinopathies, leukocytes (granulocytes, monocytes), clinical presentation of neutropenia, pharmacology of hemostasis, clinical presentation of thrombophilia, basics of hematopoietic stem cell transplantation, some aspects of laboratory medicine in hematology, virtual microscopy of blood and bone marrow smears. 2. Structure and anatomical position of primary and secondary lymphoid organs, cells and molecules of the innate immune system, T and B cell development and receptor diversity, major histocompatibility complex (MHC) and antigen presentation, effector B cells and antibodies, effector T cells, regulatory T cells and cytokines, allergy and hypersensitivities, autoimmunity and anti-inflammatory drugs, transplantation and immunosuppressive drugs, immunodeficiency, immune response in cancer and immunotherapies.

Literature

The course is supported by a Moodle page through which students have access to all necessary documentation.

The essential course material will be available on the course's Moodle Page in the form of lesson handouts.

Suggested reference books include:
- Blood: Hoffbrand's Essential Haematology
- Immune system: Herbert Hof, Rüdiger Dörries; unter Mitarbeit von: Gernot Geginat, Dirk Schlüter and Constanze Wendt Medizinische Mikrobiologie Thieme 2017
- http://www.library.ethz.ch/DADS/default_scope:ebi01_prod010873047
- https://institut.elsevierelibrary.de/product/basic-immunology85281

Prerequisites / notice

The course is supported by a Moodle page through which students have access to all necessary documentation.

The Immune system part of this course builds on the content of the "Infection and Immunology" course.

Abstract

The module imparts basic knowledge about the morphology and function of the digestive system and the importance of nutrition for health. One focus is on the understanding of the relationships among food intake, digestion, nutrient absorption and metabolism including the disturbances of these processes and the related diseases.

Objective

The aim of this module is that the students know and understand the morphology and function of the digestive system including its associated glands as well as the importance of nutrition for health. In particular, the students shall understand the relationships between food intake and digestion as well as absorption and metabolism of particular nutrients. This knowledge shall enable the students to deduce the pathophysiology and pathology of the most important diseases of the digestive system and shall give them an idea of the pertinent diagnostics and therapy.

Prerequisites / notice

The module imparts basic knowledge about the morphology and function of the digestive system and the importance of nutrition for health. One focus is on the understanding of the relationships among food intake, digestion, nutrient absorption and metabolism including the disturbances of these processes and the related diseases.

Abstract

Discussion of normal structure and function of the endocrine systems, their interaction with the autonomic nervous system and their role in metabolism. In addition, pathophysiological and clinical aspects, diagnostics and therapeutic concepts of the most important endocrine diseases and related metabolic disorders as well as respective preventive measures are addressed.
Upon successful completion of this module, students should:

- be able to explain the systematics of the endocrine system;
- know the structure and function of the hypothalamus, pituitary gland, adrenal gland, endocrine pancreas, thyroid gland, ovaries, testes;
- know the principles and regulation of bone, calcium and phosphate metabolism, energy balance, glucose metabolism, lipid metabolism, blood pressure;
- know the hormonally regulated metabolic processes (carbohydrates, protein and fat);
- know the most important endocrine diseases and tumors, their development, clinic, diagnostics and therapy;
- know the most important measures for the prevention of metabolic diseases and the underlying mechanisms.

In this module, students learn about anatomy, physiology, and pathophysiology of the endocrine glands, as well as the clinical, diagnostic, therapeutic, and preventive aspects of the most important endocrine diseases. This includes:

- Systematics of the endocrine system: structure and anatomical location of the various endocrine glands.
- Neuronal innervation and vascular supply area of the endocrine glands.
- Hormone classes: Protein and polypeptide hormones, amino and amino acid derivatives steroid hormones, biosynthesis of protein and polypeptide hormones, biosynthesis of amino and amino acid derivatives, biosynthesis of steroid hormones, storage of hormones, secretion of hormones, transport of hormones, half-lives, degradation and excretion of hormones.
- Transmission of information by hormones: hormone action at receptors, structure and function of membrane-associated hormone receptors, structure and function of nuclear receptors, regulation of hormone secretion.
- Structure and function of the hypothalamus, structure and function of the pituitary gland.
- Structure and function of the thyroid gland, under- and over-functioning of the thyroid gland, principles of diagnostics and therapy of thyroid diseases.
- Symptoms, medical history and clinical examination of thyroid diseases.
- Bones, calcium and phosphate metabolism.
- Regulation of glucose, lipid and protein metabolism, eating disorders, etiology, diagnostics, therapy and prevention of adipositas.
- Structure and function of the adrenal gland, pathogenesis, principles of diagnostics and therapy of diseases with hyper- and hypofunction of the adrenal gland. Symptoms, anamnesis and clinical examination in case of hyper- and hypofunction of the adrenal gland.
- Structure and function of the ovaries and testis, principles of reproductive physiology.

There is no traditional script for this course. Instead the course is supported by a Moodle page through which students can access to all necessary texts, exercises, videos and activities.

The essential course material will be available on the course's Moodle Page in the form of scripts and lesson handouts.

The course does not have an "official" textbook, but students may find a general reference book on the topic interesting. For this purpose the text "Endokrinologie und Stoffwechsel" von Stefan Fischli and Giatgen A. Spinas (Herausgeber), Thieme Verlag, may be helpful.

The course builds on the content of the "Chemie für Mediziner", "Biochemie", "Pathobiologie", "Pharmakologie für Mediziner" and "Molekulare Genetik und Zellbiologie" course and "Nutrition and Digestion".

**Abstract**

This course is an introduction to classical physics, with special focus on applications in medicine.

**Objective**

Obtain an understanding of basic concepts in classical physics and their application (using mathematical pre-knowledge) to the solution of simple problems, including certain applications in medicine.

**Content**

General introduction; Positron-Emission-Tomography as an appetizer, including ionising radiation; kinematics of a point mass; dynamics of a point mass (Newton's axioms and forces); physical work, power and energy; conservation of linear and angular momentum; oscillations and waves; mechanics of a rigid body; fluid mechanics; introduction to electricity.

**Literature**

"Physik für Mediziner, Biologen, Pharmazeuten", von Alfred Trautwein, Uwe Kreibig, Jürgen Hüttermann; De Gruyter Verlag.

**Prerequisites / notice**

Will be distributed at the start of the semester.

**Abstract**

Fundamentals and relevance of the aging process, as well as its biochemical, physiological and evolutionary basis. Insights into its individual as well as economic impact, including interventional and pharmacological treatment options.
Objective
Upon successful completion of the module, students should be able to
1. correctly describe the biological bases of the aging process;
2. derive physical and pharmacological choices to modulate the aging process;
3. understand the social and psychological implication of aging;
4. describe the specificities of geriatric medicine in the stationary setting;
5. identify the age-specific differences in both diagnostics and therapeutics.

Content
Fundamentals and relevance of the aging process, as well as its biochemical, physiological and evolutionary basis. Insights into its individual as well as economic impact, including interventional and pharmacological treatment options.

377-0503-02L Rheumatology

Abstract
Disease patterns from the field of rheumatology. The main focus is on inflammatory diseases, including soft tissue and bone diseases.

Objective
At the end of the module, students should be able to do the following:
• list the typical symptoms and manifestations of the disease patterns;
• list the clinical examinations of the clinical pictures and explain the findings;
• list and justify further classifications (such as laboratory tests, imaging, etc.) of the clinical pictures;
• recognize the respective clinical pictures of this topic block based on the symptoms, clinical examinations, findings and further clarifications;
• list the possible treatment options for the disease patterns and explain the indication, prevention and risk factors;
• Early detection of clinical pictures that require rapid therapy, identification of further steps for clarification and therapy;
• describe the causes and pathophysiological basis of the disease patterns.

Content
Overview Rheumatology, Rheumatoid Arthritis, M. Still, Spondyloarthritides, SAPHO Syndrome, Infectious and Crystal Arthritis, Juvenile Idiopathic Arthritis, CRPS, Soft Tissue Diseases, Myopathies, Bone Diseases, Vasculitis, Collagenosis, Drug Therapy in Rheumatology, Ergonomics, Occupational Reintegration.

377-0503-03L Paediatrics

Abstract
The module Paediatrics describes the peculiarities of the paediatric anamnesis as well as selected topics of the healthy and sick child. The focus is on the newborn, development in the first years of life and adolescence. Infections, congenital heart and the most common respiratory diseases are described throughout the different age stages.

Objective
• Knowledge of the paediatric aspects of the medical history
• Knowledge of the enormous variety of child development (inter- and intra-individual variability)
• Milestone concept: Assessment of the stage of development of a child in the first years of life
• Landmark concept: first knowledge of the demilitation on normality versus disorder
• Getting to know frequent developmental pediatric disorders
• Knowledge of the most common congenital heart defects
• Getting to know and recognize respiratory diseases of the upper and lower respiratory tract

Content
It describes the peculiarities of the pediatric anamnesis as well as selected topics of the healthy and sick child. The focus is on the newborn, development in the first years of life and adolescence. Infections, congenital heart, and the most common respiratory diseases are described throughout the different age stages.

377-0511-00L Emergency Medicine

Abstract
By focusing on the 20 most frequent emergencies, the students will learn how to make quick decisions including diagnostic strategy and therapeutic measures. In practical exercises the students practice interprofessional aspects and discuss legal and ethical questions of emergency medicine.
Objective

Perform a triage based on the assessment of the vital signs.

Collect a targeted anamnesis (max. 5-6 questions) of a patient and/or family member

Determine the status of a patient with the necessary clinical examinations.

Determine a differential diagnosis based on the targeted anamnesis and the status.

Interpret the vital signs of a patient

Interpret the results of the paraclinical examinations and confirm/reject the differential diagnosis.

Based on the differential diagnosis, determine the necessary paraclinical examinations

Determine the next steps (treatment in hospital / by family doctor / immediate measures)

Identify possible therapeutic measures

Content

Mornings – case discussions & lectures entire group:

- Hypo / Hyperglycemia
- Principles of poisoning
- Acute Dyspnoea
- Cough
- Acute Diarrhoea
- Gastrointestinal bleeding
- Acute Kidney injury
- Hypertensive Crisis
- Acute Headache
- Coma
- Chest Pain
- Syncope
- Acute Abdominal pain
- Acute blood loss
- Common Trauma
- Head Trauma
- Fever in child
- Crying child
- Seizures and convulsions
- Dyspnoea in child

Afternoon – 4 smaller groups rotating:

- Emergency room (Hospital Lugano)
- Emergency call-center / Ambulance (Croce Verde - Lugano)
- Simulation center (Lugano)
- Case discussion (Bellinzona)
- BLS Refresh

377-0509-00L Pathology

Only for Human Medicine BSc

O 6 credits 6G V. Kölzer, T. Cerny, J. Loffing, H. Moch, N. Rupp, J. Rüschoff, A. Sobottka-Brillout, further lecturers

Abstract

Pathology is the study of causes and effects of disease. This module pathology describes the pathogenetic processes and pathomorphological changes that occur in healthy and diseased tissues and cells of the human body. The module covers basic anatomical and surgical pathology and will cover the current and future possibilities of diagnostic practice in pathology.

Objective

After successfully completing the «General Pathology» module, students should be able to:

1. to describe the goals and methods of pathoanatomical diagnostics and in reference to clinical practice.
2. to name the general causes and mechanisms of disease development and the associated pathomorphological changes in cells and tissues.
3. to fundamentally link the general causes and mechanisms of disease development with the therapeutic approaches that arise from them.
4. to describe the mechanisms of general inflammation, cell damage and circulatory pathology and relate them to the pathogenesis of specific diseases.
5. to explain the basics of the classification of benign and malignant tumors.
6. to describe the value of pathoanatomical and molecular diagnostics for the predictive and prognostic stratification of patients and to fundamentally relate them to clinical therapy decisions.

After successfully completing the «Surgical Pathology» module, students should be able to:

1. to name the most important organ-specific diseases of the nervous system, the endocrine system, the cardiovascular system, the respiratory system, the digestive system, the urogenital system, the musculoskeletal system and the skin and to describe their characteristic macroscopic and microscopic manifestations.
2. to relate the etiology and pathogenesis of the most important organ-specific diseases to their morphological appearance and clinical presentation.
3. to describe the etiopathogenesis of the most important organ-specific diseases and to understand the relation to the mode of action of common therapeutic approaches.
4. to describe the fundamental importance of pathology and molecular diagnostics for personalized medicine and to describe specific application examples.
In the module "General Pathology" general causes and mechanisms of disease development and the associated pathomorphological changes in cells and tissues are discussed. Basics, current and future possibilities of pathoanatomical diagnostics are presented. The module "General Pathology" provides the basics for understanding the diseases treated in "Special Pathology".

The general pathology part covers the main topics:
1. revision and in-depth histology
2. introduction to pathology, histopathological and macroscopic tissue evaluation, postmortem diagnostics
3. introduction to causes and mechanisms of disease development
4. inflammation theory
5. cell damage and circulation pathology
6. general tumor theory
7. predictive pathology

In the module "Special Pathology" you will learn about the most important organ-specific diseases. Each half-day is built around a complex of topics related to special pathology, and is implemented using various teaching methods. The most important part is the main lecture, in which we systematically discuss the diseases of the organs and organ systems with you. Using macroscopic and microscopic slides, we will show you the relation to pathophysiology, symptomatology and medical diagnostics. We establish clinical references by broadcasting the mortality conference at the USZ. An integrated revision course and exercises based on PathoMaps offer you the opportunity to link the subject matter of the lecture with already known contents, to structure it further and to clarify open points together. A special lecture on molecular pathology, digital pathology and bioinformatics will introduce you to future technologies that are of particular importance for modern medicine.

The special pathology part covers the main topics:
1. upper and lower respiratory tract
2. upper gastrointestinal tract
3. lower gastrointestinal tract
4. liver, gall bladder, pancreas
5. kidney, draining urinary tract
6. male sexual organs, prostate
7. future technologies (molecular pathology, digital pathology, bioinformatics)
8. blood and bone marrow, lymphatic system
9. endocrine organs
10. skin, bones, joints, soft tissue
11. female sexual organs, mamma
12. neuropathology

Prerequisites / notice

Voraussetzungen:

377-0513-00L Ethics and Legal Aspects and Communication

Objective

After passing the modul sucessfully, students should be able to
- Know about ethical and legal basics of diagnostics and therapy and how these principles are put into practice
- Knowledge and use of central communication skills with patients, health care teams and the public
- Understand and describe the connections of ethics, law and communication and reflect on the implementation in clinical practice
- Apply the concept of evidence based decision aids
- Apply specific communication skills in simple clinical cases (informed consent, shared decision making, breaking bad news, communication of medical mistakes, Advance care Planning).
- Understand the concept and needs of vulnerable patients and address the concept ethically, legally and communicate adequately
- Know about the necessity of interprofessional collaboration in the process of dealing with ethically and juridically complex cases and practice first steps.

Content

- Overview of clinical ethical cases
- Basics in medical ethics and professional communication
- Knowledge and application of concepts as informed consent, possible alternative juridical instruments
- Knowledge and application of Shared decision Making
- Knowledge and application of advance care planning, concept of advance directives, treatment of patients incapable of decision making
- Breaking bad news, difficult prognoses
- Concept of vulnerability, special needs
- Differences of research/clinical concept of evidence-based and personized medicine
- Conflicts of interests in therapy and research
- Basics on interprofessional cooperation in ethically and legally challenging situations
- Goal of care approach, delaling with end of life decisions
- Differential diagnosis and misdiagnosis, systems of avoidance of medical mistakes

Prerequisites / notice

Voraussetzungen:
- LE 377-0405-10L Ethik in Medizin und Gesundheitswesen
- Organsysteme der ersten vier Semester (Prüfungen absolviert)

377-0515-00L Patient Journeys

Objective

The students are able to analyze an interprofessional patient-path and modify it according to the personal patient situation.
- Students deal with other health professionals and together plan an appropriate patient-path.
- The students are able to take different perspectives (patient, family etc.) and consider them while planning a patient-path.
- Students actively participate in interprofessional sessions, are open to other viewpoints, and consider these for the care and safety of the patients.
Content

Based on various patient situations, students learn how an interprofessional patient-path looks like. During the self-study time, the students bring “their own patient” from their private environment and accompany her/him during the patient-path. Within this framework, the individual path including all health professionals involved, will be analyzed. In a written assignment, the most important aspects will be documented and reflected.

An exemplary patient case follows each session of the modules, to align the theoretical inputs with the corresponding patient case. In addition, together with pharmacy students, the students get to know the different roles of the pharmacy. In further sessions, the students learn which responsibilities, tasks and competences, various health professionals have, during the care of the patients on their path. In addition, the students have the opportunity to visit a rural hospital in another canton and become acquainted with the importance of the free choice of doctors and treatments in other Cantons.

Abstract

In this module we lay the anatomical and physiological foundations for the subject of "reproduction". The associated clinical challenges are conveyed from different points of view and with different actors. The content is chronologically prepared and goes from the normal cycle of the woman and her disorders to the pregnancy and related issues to the obstetrics.

Objective

- Anatomy
  - Knowledge of the function of the female and male sexual organs
  - Explaining the development of the maternal and fetal parts of the placenta
  - Explaining the anatomy of the pelvis and the pelvic floor
- Gynecology
  - Recognizing gynecological emergencies
  - Listing of the various types of bleeding and abnormalities
  - Overview of the benign tumors of the uterus and ovaries as well as the malignant tumors of the cervix and the endometrium
- Reproductive Endocrinology
  - Outlining of the main regulatory hormones of the female cycle and explaining their effects
  - Listing of the most important fertility factors
  - Discussing the main contraceptive methods with their mechanisms of action and contraceptive safety
- Physiological situations in obstetrics
  - Knowledge of the physiological processes and adaptation processes during pregnancy
  - Determination of birth process
  - Being aware of the meaning of the puerperium

Content

This module gives the anatomical and physiological foundations for the subject of "reproduction". The associated clinical challenges are conveyed from different points of view and with different actors. The content is chronologically prepared and shows the normal female cycle and her disorders as well as the pregnancy and related issues to the obstetrics. Students will have the opportunity to work with prospective midwives to learn basic skills of normal birth through a simulation.

Abstract

Advances in our knowledge of cancer genetic and the cancer immunology are changing the ways by which clinicians treat various types of cancer. This is a unique course designed to help students to learn about cutting-edge principles of cancer genetic, cancer immunology and target therapy and to apply these concepts to the clinical practice guided by leading experts in the field.

Objective

- Students will learn basic concepts of cancer patients' management and will acquired knowledge regarding experimental and clinically approved anti-cancer therapies.
Content

Basic knowledge in oncology
1. The cancer outbreak and its prevention
2. Tumor diagnostic, imaging and screening
3. Basic principle of cancer management and tumor recurrence
4. Clinical application: a clinical case study

Experimental immuno-oncology
1. Hallmarks of Cancer
2. The promise of Immuno-oncology
3. Experimental Immunotherapies: Checkpoint Blockade and CAR T cells
4. From Bedside to Bench to Bedside (Journal Club)

Targeted therapy
1. Cancer Genomics and Epigenomics
2. Basic knowledge of signal transduction and cancer metabolism
3. From Arsenic Trioxide and Glivec to modern targeted therapies
4. Mechanism of resistance to targeted therapies

Oncology practice
1. Basic and clinical application: Chemotherapy
2. Basic and clinical application: Radiotherapy
3. Clinical application: Evidence Based Medicine in oncology
4. Design and analysis of Clinical Trial
5. Clinical application: Immunotherapy
6. Clinical application: Target Therapy
7. From Symptoms to diagnosis
8. Oncology Emergency

Abstract

Zurich Ultrasound-Modell (ETH/SGUM/UZH) for ultrasound profiles (curricular) und SGUM certificate basic course abdomen during medical studies (SGUM-Young Sonographers, facultative) with E-Learning and 8 hours practical teaching with 4 students per machine and instructor (curricular), as well as facultative 8 more hours practice and OSCE in the following semester.

Objective

Ultrasound basics
• Understanding of basic ultrasound physics.
• Basic ultrasound anatomy abdomen.
• To know and to do a typical Abdomen and soft-tissue ultrasound examination.
• Classical ultrasound pathology (Aszites, pleural effusion, gallstones, urinary retention …).
• Know the most important artefacts and relevance for ultrasound imaging.
• SGUM basic abdomen certificate sucessful determination

Content

Modules curricular teaching ETHZ
- 1+2 Anatomy
- 3+4 Liver, biliary tract, pleura, hips, lung
- 5+6 Pancreas, spleen, adrenals, abdominal vessels
- 7+8 kidneys, bladder, neck, lymphnodes, FAST

SGUM – Young Sonographers (facultative in the 6th Semester BSc Human Medicine)
- 9+10
- 10+11
- 11+12
- 13+14

Prerequisites / notice

Courses in Medical Sciences

Core Courses 2nd Year

Number Title Type ECTS Hours Lecturers

401-0683-00L Statistics II O 3 credits 2V+1U D. Stekhoven

Abstract

Extension of statistics for medical students. This lecture is based on the content of Statistics I. The focus will be on the understanding and the concrete application of statistical methods, as they are used in medical research. Exercises will be solved using the statistical programming environment R.

Objective

After this course you will understand the concept of a broad selection of statistical methods (see also Content). Furthermore, you will know when to use which method. Especially, you will be able to read, understand, and scrutinise the results from such methods, whether these results are written or graphical.

Using the statistical programming environment R, you will be able to read in data, analyse them in various ways, visualise and publish the results in reports or presentations. Knowing R will also enable you to reproduce published analyses, to check whether they work or to use them for your own medical research questions.
The course will cover the following topics.
For the part on regression: simple linear regression; multiple regression (including factors and interactions); model selection; logistic regression (including odds ratio and their interpretation); Bayes inference.
For the part on data: categorical data (including univariate tests); power analysis (including a guide on writing an ethics proposal); dealing with missing values.
For the part on further methods: supervised vs unsupervised learning; dimensional reduction (including PCA and tSNE); survival analysis (including Kaplan-Meier curves and logrank test).

There is no script.

An Introduction to Statistical Learning with Applications in R

**Abstract**
This lecture gives an introduction to programming in Python and an overview of basic problem solving strategies and design principles for efficient algorithms and data structures.

**Objective**
To learn basic principles of programming in Python and to apply them for implementing algorithmic approaches for solving simple computational problems.

**Content**
This lecture has two goals. On the one hand, an introduction to programming is given, using Python as a sample language. This introduction includes the basic programming principles such as truth values, variables, data types, conditional statements, loops, and functions.

On the other hand, basic data structures (such as lists, stacks, and queues) and important concepts of algorithm design are presented and implemented in Python to efficiently solve basic algorithmic tasks on these data structures.

The main focus lies on general-purpose design techniques for efficient algorithms, such as the greedy method, dynamic programming, or the divide and conquer strategy. These techniques are demonstrated with many examples from practice.

All learning materials will be provided during the course.

**Abstract**
Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective.

**Objective**
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

**Content**
Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

**Lecture notes**

| 376-1103-00L| Frontiers in Nanotechnology | W | 4 credits | 4V | V. Vogel, further lecturers |

**Abstract**
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a
script will be available.

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nanotechnology, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived. To finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

### 376-1714-00L Biocompatible Materials

| Objective | Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced. |
| Content | Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. |
| Literature | - Biocompatible Materials, Ducheyne P. et al., 1st Edition, 2011 (available online via ETH library) |
| Lecture notes | Handouts are deposited online (moodle). |

### 376-1651-00L Clinical and Movement Biomechanics

| Objective | The course covers the following topics: |
| Content | 1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials. 2. The concept of biocompatibility. 3. Introduction into methodology used in biomaterials research and application. 4. Introduction to different material classes in use for medical applications. |
| Lecture notes | Handouts and references therein. |

### 535-0022-00L Computer-Assisted Drug Design

| Objective | The students will learn how molecules can be represented in computers and how molecular similarity is calculated. They will learn the concepts of ligand-based and structure-based virtual screening to identify potential drug candidates, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects. |
| Content | The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.), and structure-based virtual screening (docking, physics-based models). |

### 535-0250-00L Biotransformation of Drugs and Xenobiotics

| Objective | Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism. |
| Content | Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism. |
| Literature | Biotransformation of drugs and xenobiotics |

**Autumn Semester 2021**
Glycobiology in Drug Development

**Abstract**

Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples of prominent glycoprotein drugs, the course aims at providing insight into glycosylation-activity relationships and into biotechnological production and analytics.

**Objective**

Students gain basic knowledge in “pharmaceutical glycobiology”. This implies knowing and understanding:
- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs.
- the major types of protein-linked glycans and the biosynthetic pathways for their formation
- how glycoprotein drugs are produced (including the most important expression systems used), glycoengineered and analysed (quality control).

Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper).

Students gain the ability to reflect on roles of glycosylation in various biological contexts.

**Content**

lecture plan:
1. Glycans - information carriers in biology and pharmacotherapy
2. Glucocerebrosidase and the biosynthesis of N-glycans
3. Improving the therapeutic profile of monoclonal antibodies by glycoengineering
4. Mucin-type O-glycans and sialylation as gCQA of glycoprotein hormone drugs
5. Production and gCQA analysis of Glucocerebrosidase, monoclonal antibodies, glycoprotein hormone drugs - Glycoanalytics
6. EPO “the same but different”

**Literature**

- Recent publications as cited/proposed on the lecture slides

**Prerequisites / notice**

Requirements: Basic knowledge in immunology, molecular biology, protein and carbohydrate chemistry, analytical techniques. Basic knowledge in pharmacology.

**Fostered competencies**

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Problem-solving: assessed

Social Competencies
- Communication: assessed

Personal Competencies
- Creative Thinking: assessed
- Critical Thinking: assessed

**Drug Delivery and Drug Targeting**

**Abstract**

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

**Objective**

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

**Content**

The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

**Literature**

Further references will be provided in the course.

**Fostered competencies**

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

### Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and evolution of cellular processes

#### Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytic techniques.

#### Lecture notes
Scripts on the individual topics can be found under [http://www.mol.biol.ethz.ch/teaching](http://www.mol.biol.ethz.ch/teaching).

#### Literature
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

### 551-0309-00L Concepts in Modern Genetics

| Objective | Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytic techniques. |
| Lecture notes | Scripts on the individual topics can be found under [http://www.mol.biol.ethz.ch/teaching](http://www.mol.biol.ethz.ch/teaching). |

#### 551-0313-00L Microbiology (Part I)

| Objective | This course will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. |
| Content | The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference. |

#### 551-0319-00L Cellular Biochemistry (Part I)

| Objective | The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into cellular processes such as intracellular transport, cell division & growth, and cell migration. |
| Content | Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression. |

### 701-2413-00L Evolutionary Genetics

| Objective | The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation). |
| Content | Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory. Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossingbreeding, effects on fitness; Fisher's fundamental theorem. Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation. |

### 752-4009-00L Molecular Biology of Foodborne Pathogens

| Objective | The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation). |
| Content | The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics. |

### Literature
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

### Enrolment
Enrolment to this course unit only possible at ETH. No enrolment to module BIC0348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: [https://www.ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html](https://www.ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html)

### Prerequisites
The concepts, methods and explanatory power of evolutionary genetics. The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).
Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophages for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break!

752-5103-00L
Functional Microorganisms in Foods

Abstract
This integration course will discuss new applications of functional microbes in food processing and products and in the human gut. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality and safety, and for health benefits for consumers.

Objective
To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods, and for benefiting human health. This course will integrate basic knowledge in food microbiology, physiology, biochemistry, and technology.

Content
This course will address selected and current topics targeting functional characterization and new applications of microorganisms in food and for promoting human health. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to different topics:

- Probiotics and Prebiotics: human gut microbiota, functional foods and microbial-based products for gastrointestinal health and functionality, diet-microbiota interactions, molecular mechanisms; challenges for the production and addition of probiotics to foods.

- Protective Cultures and Antimicrobial Metabolites for enhancing food quality and safety: antifungal cultures; bacteriocin-producing cultures (bacteriocins); long path from research to industry in the development of new protective cultures.

- Legal and protection issues related to functional foods

- Industrial biotechnology of flavor and taste development

- Safety of food cultures and probiotics

Students will be required to complete a Project on a selected current topic relating to functional culture development, application and claims. Project will involve information research and critical assessment to develop an opinion, developed in an oral presentation.

Lecture notes
Copy of the power point slides from lectures will be provided.

Literature
A list of topics for group projects will be supplied, with key references for each topic.

Prerequisites / notice
This lecture requires strong basics in microbiology.
This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).

Objective
This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization

Abstract

Students learn to select concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists and tables and with relational databases, introduction to programming.

Objective

The students learn to

- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data.

Content

1. Modeling and simulations
2. Data management with lists and tables
3. Data management with a relational database
4. Introduction to macro programming
5. Introduction to programming with Python

Lecture notes

All materials for the lecture are available at www.evim.ethz.ch

Prerequisites / notice

This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Abstract

The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective

Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens “behind the scenes” when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

Content

The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes

English lecture notes will be provided during the semester. The lecture notes and the lecture slides will be made available for download on the course web page. Exercises are solved and submitted online.

Abstract

Introduction: RAM machine, data structures; Algorithms: sorting, median, matrix multiplication, shortest paths, minimal spanning trees;

Paradigms: divide & conquer, dynamic programming, greedy algorithms; Data Structures: search trees, dictionaries, priority queues;

Complexity Theory: P and NP, NP-completeness, Cook's theorem, reductions, cryptography and zero-knowledge proofs.

Objective

After this course students learn some basic algorithms as well as underlying paradigms. They will be familiar with basic notions of complexity theory and can use them to classify problems.

The unit "Computer Science in Secondary School Mathematics" addresses key contributions of computer science to general education, the adaptability and flexibility.

Objective

The students learn to
- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data.

Content

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Data management with lists and tables
5. Data management with a relational database
6. Introduction to Matrices

Lecture notes

All materials for the lecture are available at www.gdi.ethz.ch

Literature

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Prerequisites / notice

This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Method-specific Competencies

- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies

- Communication

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

The course offers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Introduction to fundamental concepts of modern programming and operational skills for developing high-quality programs, including large programs as in industry. The course introduces computer engineering principles with an object-oriented approach based.

The primary goals of this course are (1) to introduce the most important concepts of discrete mathematics, (2) to understand and appreciate the role of abstraction and mathematical proofs, and (3) to discuss a number of applications, e.g. in cryptography, coding theory, and algorithm theory.

See course description.

Algorithms and Data Structures

The course provides the foundation of the design and analysis of algorithms. The material is introduced using classical algorithmic problems including graph problems. The necessary basic introduction to graph theory is provided as part of this course.

An understanding of the design and analysis of fundamental algorithms and data structures. A basic understanding of graph theory and several basic graph algorithms.

This course is an introduction into the design and analysis of algorithms. On the one hand, this includes classical algorithm design patterns including induction, divide-and-conquer and dynamic programming. We study these using classical example such as searching and sorting. On the other hand, the course covers the interaction between algorithms and data structures including linked lists, search trees, heaps, and union-find structures. A particular focus are graph algorithms for shortest path and minimal spanning tree problems. We provide the necessary basic introduction into graph theory as part of this course.

A complete script in German is under development. A complete draft is already available on the course website.

Abgesehen vom Skript und Vorlesungsunterlagen empfehlen wir diefolgenden Bücher als zusätzliches Nachschlagewerk.

Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent number of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CST? e) How to represent infinite objects by finite automata and grammars?

Learning the basic concepts of computer science along their historical development

Data: 06.09.2022 12:51

Autumn Semester 2021

Page 1126 of 2159
This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:
- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

The lecture is covered in detail by the textbook "Theoretical Computer Science".

Basic literature:

Further reading:

More exercises and examples in:
6. A. Asteroth, Ch. Baier: Theoretische Informatik

Prerequisites / notice
During the semester, two non-obligatory test exams will be offered.
The course is based in part on "Computer Systems: A Programmer's Perspective" (3rd Edition) by R. Bryant and D. O'Hallaron, with additional material.

Prerequisites / notice
252-0029-00L Parallel Programming
252-0028-00L Design of Digital Circuits

Abstract
Differential and Integral calculus in many variables, vector analysis.

Literature
Für allgemeine Informationen, sehen Sie bitte die Webseite der Vorlesung

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content
* Computing with Matrices and Vectors
  2.1 Fundamentals
  2.2 Software and Libraries
  2.4 Computational Effort
  2.5 Machine Arithmetic and Consequences

* Direct Methods for (Square) Linear Systems of Equations
  3.1 Introduction: Linear Systems of Equations (LSE)
  3.2 Theory: Linear Systems of Equations (LSE)
  3.5 Survey: Elimination Solvers for Linear Systems of Equations
  3.7 Sparse Linear Systems

* Direct Methods for Linear Least Squares Problems
  4.1 Least Squares Solution Concepts
  4.2 Normal Equation Methods
  4.3 Orthogonal Transformation Methods
    4.3.1 Transformation Idea
    4.3.2 Orthogonal/Unitary Matrices
    4.3.3 QR-Decomposition
    4.3.4 QR-Based Solver for Linear Least Squares Problems
  4.4 Singular Value Decomposition (SVD)
  4.5 SVD-Based Optimization and Approximation

* Filtering Algorithms
  5.1 Filters and Convolutions
  5.2 Discrete Fourier Transform (DFT)
  5.3 Fast Fourier Transform (FFT)

* Machine Learning of One-Dimensional Data (Data Interpolation and Data Fitting in 1D)
  6.1 Abstract Interpolation (AI)
  6.2 Global Polynomial Interpolation
  6.4 Splines
  6.7 Least Squares Data Fitting

* Iterative Methods for Non-Linear Systems of Equations
  9.2 Iterative Methods
  9.4 Finding Zeros of Scalar Functions
  9.5 Newton's Method in R^n
  9.7 Non-linear Least Squares

Lecture notes
Lecture materials (PDF documents and codes) will be made available to the participants through the course web page and online repositories. Access information will be communicated in the beginning of the course.
This course uses compilers as examples to expose students to modern software development techniques. Tentative topics include:

**Title**: Algorithms, Probability, and Computing  
**Type**:  
**ECTS**: 8 credits  
**Hours**: 4V+2U+1A  
**Lecturers**: B. Gärtner, M. Ghaffari, R. Kyng, A. Steger, D. Steurer

Objective  
This course provides an in-depth introduction to the core concepts of computer graphics, image processing, multimedia and computer vision. The course forms a basis for the specialization track Visual Computing of the CS master program at ETH.

Content  
Course topics will include: Graphics pipeline, perception and color models, camera models, transformations and projection, projections, lighting, shading, global illumination, texturing, sampling theorem, Fourier transforms, image representations, convolution, linear filtering, diffusion, nonlinear filtering, edge detection, optical flow, image and video compression.

Lecture notes  
In theoretical and practical homework assignments students will learn to apply and implement the presented concepts and algorithms. A scriptum will be handed out for a part of the course. Copies of the slides will be available for download. We will also provide a detailed list of references and textbooks.

Abstract  
This course uses compilers as examples to expose students to modern software development techniques. Tentative topics include: compiler organization; lexical analysis; top-down and bottom-up parsing; symbol tables; semantic analysis; code generation; local and global optimization; register allocation; automatic memory management.

Objective  
Learn principles of compiler design; gain practical experience designing and implementing a medium-scale software system.

Content  
This course uses compilers as examples to expose modern software development techniques. The course introduces the students to the fundamentals of compiler construction. Students will implement a simple yet complete compiler for an object-oriented programming language for a realistic target machine. Students will learn the use of appropriate tools. Throughout the course, students learn to apply their knowledge of theory (automata, grammars, stack machines, program transformation) and well-known programming techniques (module definitions, design patterns, frameworks, software reuse) in a software project.

---

Data: 06.09.2022 12:51  
Autumn Semester 2021
Objective

The objective of the course is for students to understand the theoretical principles, practical considerations, performance tradeoffs, and engineering techniques on which the software underpinning almost all modern computer systems is based, ranging from single embedded systems-on-chip in mobile phones to large-scale geo-replicated groups of datacenters.

Content

By the end of the course, students should be able to reason about highly complex, real, operational software systems, applying concepts such as hierarchy, modularity, consistency, durability, availability, fault-tolerance, and replication.

This course subsumes the topics of both “operating systems” and “distributed systems” into a single coherent picture (reflecting the reality that these disciplines are highly converged). The focus is system software: the foundations of modern computer systems from mobile phones to the large-scale geo-replicated data centers on which Internet companies like Amazon, Facebook, Google, and Microsoft are based.

We will cover a range of topics, such as: scheduling, network protocol stacks, multiplexing and demultiplexing, operating system structure, inter-process communication, memory management, file systems, naming, dataflow, data storage, persistence, and durability. Computer systems performance, remove procedure call, consensus and agreement, fault tolerance, physical and logical clocks, virtualization, and blockchains.

The format of the course is a set of about 25 topics, each covered in a lecture. A script will be published online ahead of each lecture, and the latter will consist of an interactive elaboration of the material in the script. There is no book for the course, but we will refer to books and research papers throughout to provide additional background and explanation.

Prerequisites / notice

We will assume knowledge of the “Systems Programming” and “Computer Networks” courses (or equivalent), and their prerequisites, and build upon them.

Electives

Students may also choose courses from the Master's program in Computer Science. It is their responsibility to make sure that they meet the requirements and conditions for these courses.

| Abstract | This course gives an overview about wireless standards and summarizes the state of art for Wi-Fi 802.11, Cellular 5G, and Internet-of-Things, including new topics such as contact tracing with Bluetooth, audio communication, cognitive radio, visible light communications.
| Objective | The objective of the course is to learn about the general principles of wireless communications, including physics, frequency spectrum regulation, and standards. Further, the most up-to-date standards and protocols used for wireless LAN IEEE 802.11, Wi-Fi, Internet-of-Things, sensor networks, cellular networks, visible light communication, and cognitive radios, are analyzed and evaluated. Students will be introduced to new principles of mobile computing algorithms to improve the behavior of the systems, using a Java-based event-driven simulator. We will also hand out embedded systems that can be used for experiments for optical communication. |
| Content | New: Starting 2020, we will address contact tracing, radio link budget, location distance measurements, and Bluetooth in more depth. |
| Lecture notes | The course material will be made available by the lecturer. |
| Literature | (1) The course webpage (look for Stefan Mangold's site)
(2) The Java 802 protocol emulator "JEmula802" from https://bitbucket.org/lfield/jemula802
| Prerequisites / notice | Students should have interest in wireless communication, and should be familiar with Java programming. Experience with GNU Octave or Matlab will help too (not required). |

<tr>
<td>Objective</td>
<td>With manufacturing processes reaching its limits in terms of transistor density on today's computing architectures, efficient utilization of computing resources must include parallel execution to maintain scaling. The use of computers in academia, industry and society is a fundamental tool for problem solving today while the &quot;think parallel&quot; mind-set of developers is still lagging behind. The aim of the course is to introduce the student to the fundamentals of parallel programming using shared and distributed memory programming models. The goal is on learning to apply these techniques with the help of examples frequently found in science and engineering and to deploy them on large scale high performance computing (HPC) architectures.</td>

An Introduction to Parallel Programming, P. Pacheco, Morgan Kaufmann

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the understanding of diffusion and advection processes, as well as their underlying partial differential equations.

Prerequisites / notice
Students students should be familiar with a compiled programming language (C, C++ or Fortran). Exercises and exams will be designed using C++.

Content

Embedded Systems

Objective
Understanding specific requirements and problems arising in embedded system applications.

Content
An embedded system is some combination of computer hardware and software, either fixed in capability or programmable, that is designed for a specific function or for specific functions within a larger system. The course covers theoretical and practical aspects of embedded system design and includes a series of lab sessions.

Using the formal models and methods in embedded system design in practical applications using the programming language C, the operating system FreeRTOS, a commercial embedded system platform and the associated design environment.

Specifically the following topics will be covered in the course: Embedded system architectures and components, their hardware-software interfaces, the memory architecture, communication between components, embedded operating systems, real-time scheduling theory, shared resources, low-power and low-energy design as well as hardware architecture synthesis.

The focus of this lecture is on the design of embedded systems using formal models and methods as well as computer-based synthesis methods. Besides, the lecture is complemented by laboratory sessions where students learn to program in C, to base their design on the embedded operating systems FreeRTOS, to use a commercial embedded system platform including sensors, and to edit/debug via an integrated development environment.

More information is available at https://www.tec.ee.ethz.ch/education/lectures/embedded-systems.html.

Prerequisites / notice
Prerequisites: Basic knowledge in computer architectures and programming.

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocolures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.
Content

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

402-0209-00L Quantum Physics for Non-Physicists

Abstract

This is an introduction to the physics of quantum mechanics, aimed primarily at students with little to no background in physics. We start from the basic postulates and follow an information-theoretical approach to study the behaviour of quantum systems, from a single spin to entangled particles in space and the hydrogen atom.

Objective

This course teaches the basics of quantum physics, and complements courses in quantum computation and information theory. Students are equipped with tools to tackle complex quantum mechanical problems and foundational questions. The course covers approximately the same content as QM1, but from an information-driven perspective.

Content

1. Quantum formalism, from qubits to particles in space
2. Time and dynamics for quantum systems
3. Problems in 1D
4. Uncertainty and open systems
5. Spin
6. Problems in 3D
7. Non-locality and foundational aspects of quantum theory

Lecture notes

Lecture notes will be distributed through the semester.

Literature

Quantum Processes Systems, and Information, by Benjamin Schumacher and Michael Westmoreland, available at
https://www.cambridge.org/core/books/quantum-processes-systems-and-information/4E459E64E1EE7121CA2321435FAECC8A

Prerequisites / notice

This course is aimed at non-physicists, and in particular at students with a background in computer science, mathematics or engineering. Basic linear algebra and calculus knowledge is required (equivalent to first-year courses). Physics knowledge is not required. Physicists and students from a different background than outlined above are welcome at their own risk.

Note that while we follow an information-theoretical approach, this is not a course on quantum information theory or quantum computing. It therefore complements those courses offered at ETH in both semesters.

Abstract

Dependency parsing is a fundamental task in natural language processing. This seminar explores a variety of algorithms for efficient dependency parsing and their derivation in a unified algebraic framework.

Objective

The core ideas behind the mathematics of dependency parsing are explored.

Content

Dependency Structures and Lexicalized Grammars: An Algebraic Approach
### 252-2600-05L Software Engineering Seminar

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2S</th>
<th>Z. Su. M. Vechev</th>
</tr>
</thead>
</table>

The seminar covers core concepts and ideas in the general area of machine learning systems, ranging from distributed and federated learning systems, DevOps systems for ML, life cycle and data management systems for ML, etc.

**Abstract**
The course is an introduction to research in software engineering, based on reading and presenting high quality research papers in the field. The instructor may choose a variety of topics or one topic that is explored through several papers.

**Objective**
The main goals of this seminar are 1) learning how to read and understand a recent research paper in computer science; and 2) learning how to present a technical topic in computer science to an audience of peers.

**Content**
The technical content of this course falls into the general area of software engineering but will vary from semester to semester.

### 252-3400-00L Seminar on Machine Learning Systems

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2S</th>
<th>A. Klimovic, C. Zhang</th>
</tr>

This seminar covers core concepts and ideas in the general area of machine learning systems, ranging from distributed and federated learning systems, DevOps systems for ML, life cycle and data management systems for ML, etc.

**Abstract**
The seminar covers core concepts and ideas in the general area of machine learning systems, ranging from distributed and federated learning systems, DevOps systems for ML, life cycle and data management systems for MLs, etc. The focus will be to cover fundamental ideas on ML systems, with an emphasis on software systems and platforms.

**Objective**
The seminar will cover a number of recent papers which have emerged as important contributions in the machine learning research community. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications.

**Content**
Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.

**Lecture notes**
Methodologies to analyze the cases and create final presentations. Short overview of each case.

**Prerequisites / notice**
Successful completion of Lecture "Case Studies from Practice".

### 252-3811-00L Case Studies from Practice Seminar

<table>
<thead>
<tr>
<th>W</th>
<th>4 credits</th>
<th>2S</th>
<th>M. Brandis</th>
</tr>
</thead>
</table>

Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.

**Abstract**
Participants understand the different viewpoints for IT-decisions in practice, including technical and business aspects, can effectively analyze IT questions from the different viewpoints and facilitate decision making.

**Objective**
Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

**Lecture notes**
Methodologies to analyze the cases and create final presentations. Short overview of each case.

**Prerequisites / notice**
Successful completion of Lecture "Case Studies from Practice".

### 252-4811-00L Machine Learning Seminar

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2S</th>

Seminal and recent papers in machine learning are presented and discussed.

**Abstract**
Seminal and recent papers in machine learning are presented and discussed.

**Objective**
Seminal and recent papers in machine learning are presented and discussed.

**Content**
The seminar familiarizes students with advanced and recent ideas in machine learning. Original articles have to be presented, contextualized, and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper.

**Literature**
The seminar will cover a number of recent papers which have emerged as important contributions in the machine learning research community. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications.

### 252-5707-00L Seminar on Media Innovation

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2S</th>
<th>S. Kalloori Saikishore, S. Klingler</th>
</tr>
</thead>
</table>

This seminar introduces students to research and innovation in the area of media technology.

**Abstract**
This seminar introduces students to research and innovation in the area of media technology.

**Objective**
The objectives of this seminar are twofold: (1) learning about recent developments in the area of media technology at the intersection of computer vision, computer graphics, natural language processing, and machine learning and (2) to improve presentation and critical analysis skills.
Content
The media industry is undergoing a fundamental transformation caused by digitalization. Media consumption is shifting away from traditional media such as TV or newspaper towards mobile and delayed consumption. The boundaries between media producers and consumers are getting blurred, and personalized content is increasingly important. Machine learning and AI are crucial tools to help to create better content, understand the consumers' preferences and surface the essential stories in times of information overload.

This seminar introduces students to the latest research in the field of media technology and innovation. It is an exciting field laying at the intersection of computer vision, computer graphics, natural language processing, and machine learning. The seminar will cover a broad spectrum of topics considering not only the technical innovations but also the possibilities these technologies provide to professionals in the media industry and consumers of media.

### 227-2211-00L Seminar in Computer Architecture

**Number of participants limited to 28.**

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

**Abstract**
In this seminar course, we will cover fundamental and cutting-edge research papers in computer architecture. The course will consist of multiple components that are aimed at improving students’ technical skills in computer architecture, critical thinking and analysis on computer architecture concepts, as well as technical presentation of concepts and papers in both spoken and written forms.

**Objective**
The main objective is to learn how to rigorously analyze and present papers and ideas on computer architecture. We will have rigorous presentation and discussion of selected papers during lectures and a written report delivered by each student at the end of the semester.

**Content**
Topics will center around computer architecture. We will, for example, discuss papers on hardware security; architectural acceleration mechanisms for key applications like machine learning, graph processing and bioinformatics; memory systems; interconnects; processing inside memory; various fundamental and emerging paradigms in computer architecture; hardware/software co-design and cooperation; fault tolerance; energy efficiency; heterogeneous and parallel systems; new execution models, etc.

**Lecture notes**
All the materials will be posted on the course website: https://safari.ethz.ch/architecture_seminar/Links to past course materials, including the synthesis report assignment, can be found in this page: https://safari.ethz.ch/architecture_seminar/doku.php?id=sidebar

**Literature**
Key papers and articles, on both fundamentals and cutting-edge topics in computer architecture will be provided and discussed. These will be posted on the course website.

**Prerequisites / notice**
Design of Digital Circuits. Students should have done very well in Design of Digital Circuits and show a genuine interest in Computer Architecture.

### Minor Courses

</tbody>
</table>

**Abstract**
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

**Objective**
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

**Content**
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

**Lecture notes**
Scripts of all lectures will be available.

|--------------|-----------------------|------|------|------|----------------------------|

**Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering**
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and/or appreciate the challenges that entrepreneurs and managers deal with.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. Each group will also submit a "pitch" with a clear recommendation for one of the selected cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Problem-solving

Method-specific Competencies
- Communication
- Self-presentation and Social Influence

Social Competencies
- Creative Thinking
- Critical Thinking

Personal Competencies

 Required reading:
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students.
- Further textbooks are introduced in the lecture.
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

Complementary exercises for the module Discovering Management (Exercises) 351-0778-01L are offered complementary to the course Discovering Management (351-0778-00L). The course offers an additional exercise.

The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise. Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

Students who are enrolled for "Discovering Management Exercises" are asked to write an essay about a particular management issue of choice, using your insights from Discovering Management.

Students have the option to either write this alone or in a group of two students.

Literature

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, "Discovering Management".

- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students.
- Further textbooks are introduced in the lecture.
- Brouchures, checklists, key articles etc. are uploaded in ILIAS
**5. Semester**

<table>

</thead>
</table>

**Objective**

This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

**Abstract**

When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

---

**3G**

Physics I

Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility

This course gives a first introduction to Physics with an emphasis on classical mechanics.

Lecturers: S. Omlin, M. Werder

- Course Code: 401-7855-00L
- Type: W
- Credits: 6
- Hours: 2V+1U
- Lecturers: L. M. Mayer

---

**Galactic Dynamics (Binney & Tremaine, Princeton University Press), L. M. Mayer**

This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and...
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Part 2 - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

Part 3 - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, course material.

Literature
Links to relevant literature will be provided during classes.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

102-0227-00L Systems Analysis and Mathematical Modeling in Urban Water Management
- Introduction to process control (PID controller, fuzzy control)
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation.
- Dynamic behavior of reactor systems

Objective
The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

Lecture notes
Copies of overheads will be made available.

Literature
There will be a required textbook that students need to purchase:

Prerequisites / notice
Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel with the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

151-0573-00L System Modeling
- Introduction to system modeling for control. Generic modeling approaches based on first principles, Lagrangian formalism, energy approaches and experimental data. Model parametrization and parameter estimation. Basic analysis of linear and nonlinear systems.
- Learn how to mathematically describe a physical system or a process in the form of a model usable for analysis and control purposes.

Objective
This class introduces generic system-modeling approaches for control-oriented models based on first principles and experimental data. The class will span numerous examples related to mechatronic, thermodynamic, chemistry, fluid dynamic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Parameter estimation with least-squares methods. Various case studies: loud-speaker, turbines, water-propelled rocket, geostationary satellites, etc. The exercises address practical examples.

Content
The handouts in English will be available in digital form.

Literature
A list of references is included in the handouts.
Discrete-time signals and systems. Fourier- and z-Transforms. Frequency domain characterization of signals and systems.

### 151-0575-01L Signals and Systems

**Abstract**
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

**Objective**
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercises.

**Content**

**Lecture notes**
Lecture notes available on course website.

**Prerequisites / notice**
Control Systems I is helpful but not required.

### 151-0591-00L Control Systems I

**Abstract**
Analysis and controller synthesis for linear time invariant systems with one input and one output signal (SISO); transition matrix; stability; controllability; observability; Laplace transform; transfer functions; transient and steady state responses. PID control; dynamic compensators; Nyquist theorem.

**Objective**
Identify the role and importance of control systems in everyday life. Obtain models of single-input single-output (SISO) linear time invariant (LTI) dynamical systems. Linearization of nonlinear models. Interpret stability, observability and controllability of linear systems. Describe and associate building blocks of linear systems in time and frequency domain with equations and graphical representations (Bode plot, Nyquist plot, root locus). Design feedback controllers to meet stability and performance requirements for SISO LTI systems. Explain differences between expected and actual control results. Notions of robustness and other nuisances such as discrete time implementation.

**Content**

**Lecture notes**

In addition, the slides of the lecture will be put online.

**Literature**

**Prerequisites / notice**
Basic knowledge of (complex) analysis and linear algebra.

### 151-0601-00L Theory of Robotics and Mechatronics

**Abstract**
We further explore how we can discover basic system properties by exciting a system with various types of signals.

**Objective**
Identify the role and importance of control systems in everyday life. Obtain models of single-input single-output (SISO) linear time invariant (LTI) dynamical systems. Linearization of nonlinear models. Interpret stability, observability and controllability of linear systems. Describe and associate building blocks of linear systems in time and frequency domain with equations and graphical representations (Bode plot, Nyquist plot, root locus). **Autumn Semester 2021**  
**Page 1138 of 2159**
Abstract
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Objective
Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Content
An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

151-0709-00L Stochastic Methods for Engineers and Natural Scientists

Abstract
The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.

Objective
By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.

Content
- Probability theory, single and multiple random variables, mappings of random variables
- Estimation of statistical moments and probability densities based on data
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Monte Carlo integration with importance and stratified sampling
- Markov-chain Monte Carlo sampling
- Control-variate and multi-level Monte Carlo estimation

All topics are illustrated with engineering applications.

Lecture notes
Detailed lecture notes will be provided.

227-0076-00L Electrical Engineering II

Abstract
Sinusoidal signals and systems in the time and frequency domain, principle of operation and design of basic analog and digital circuits as well as analog-digital conversion. Basic power electronic circuits, design of magnetic components, electromagnetic energy conversion, principle of operation and characteristics of transformers and selected rotating electrical machines.

Objective

Content

227-0116-00L VLSI 1: HDL based design for FPGAs

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:
- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.
Prerequisites / notice

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

227-0731-00L Power Market I - Portfolio and Risk Management W 6 credits 4G D. Reichelt, G. A. Koeppel

Abstract
Portfolio and risk management in the electrical power business. Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.

Objective

Content
1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   3.7. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture

227-0945-00L Cell and Molecular Biology for Engineers I W 3 credits 2G C. Frei

Abstract
This course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

Content
In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

Lecture notes
Scripts of all lectures will be available.

Literature
**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

**Content**

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. Each group will also submit a "pitch" with a clear recommendation for one of the selected cases. The theory sessions will be assessed via a multiple choice exam.

**Fostered competencies**

- **Social Competencies**
  - Communication
  - Cooperation and Teamwork
  - Customer Orientation
  - Leadership and Responsibility
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
  - Negotiation

- **Personal Competencies**
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

---

**Discovering Management**

- **Abstract**
  - Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

- **Objective**
  - In particular, the aims of the course are to:
    1. (broaden) understanding of management principles and frameworks
    2. advance insights into the sources of corporate and entrepreneurial success
    3. develop skills to apply this knowledge to real-life managerial problems

  - The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and/or appreciate the challenges that entrepreneurs and managers deal with.

- **Content**
  - The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management.   - Through small group work, you will develop analyses of each of the cases. Each group will also submit a "pitch" with a clear recommendation for one of the selected cases. The theory sessions will be assessed via a multiple choice exam.

  - These course materials will form the point of departure for the lectures, class discussions and team work.

**227-2037-00L**

**Physical Modelling and Simulation**

- **Abstract**
  - This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics, and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

- **Objective**
  - Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

- **Content**
  - The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

**351-0778-00L**

**Discovering Management**

- **Abstract**
  - Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. Autumn Semester 2021
Page 1141 of 2159
The general objective of Discovering Management (Exercises) is to complement the course “Discovering Management” with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competencies to apply management theory to a real-life exercise from practice.

Students who are enrolled for “Discovering Management Exercises” are asked to write an essay about a particular management issue of choice, using your insights from Discovering Management.

Students have the option to either write this alone or in a group of two students.

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle.

Students following this course should also be enrolled for course 351-0778-00L, “Discovering Management”.

Systems Dynamics and Complexity

W 3 credits 3G F. Schweitzer

Abstract
Finding solutions: what is complexity, problem solving cycle.

Objective
Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Content
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. Another objective of the self-study tasks is to practice efficient communication of such concepts. These are provided as home work and two of these will be graded (see "Prerequisites").

Lecture notes
The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

363-1082-00L

Enabling Entrepreneurship: From Science to Startup

Students should provide a brief overview (unto 1 page) of their business ideas that they would like to commercialise through the course. If they do not have an idea, they are required to provide a motivation letter stating why they would like to do this elective. If you are unsure about the readiness of your idea or technology to be converted into a startup, please drop me a line to schedule a call or meeting to discuss.

The total number of students will be limited to 40. It is preferable that the students already form teams of at least two persons, where both the team-members would like to do the course. The names of the team-members should be provided together with the business idea or the motivation letter submitted by the students.

The students should submit the necessary information

Students following this course should also be enrolled for course 351-0778-00L, “Discovering Management”.

F. Schweitzer

3 credits

F. Schweitzer
until September 13 and apply to anilsethi@ethz.ch

Abstract
This elective is relevant for students who have developed a technology and are keen to evaluate the steps in starting a startup. This is also relevant for students who would like to start a startup but do not have a technology, but are clear on a specific market and the impact they would like to create.

Objective
Students have technology competence or an idea that they would like to convert into a startup. They are now in the process of evaluating the steps necessary to do so. In summary:

1. Students want to become entrepreneurs
2. The students can be from business or science & technology
3. The course will enable the students to identify the relevance of their technology or idea from the market relevance perspective and thereby create a business case to take it to market.
4. The students will have exposure to investors and entrepreneurs (with a focus on ETH spin-offs) through the course, to gain insight to commercialise their idea

Content
The students would cover the following topics, as the build their idea into a business case:

1. Technology excellence: this assumes that the student has achieved a certain degree of competence in the area of technology that he or she expects to bring to the market
2. Market need and market relevance: The student would then be expected to identify the possible markets that may find the technology of relevance. Market relevance implies the process of identification of how relevant the market perceives the technology, and whether this can sustain over a longer period of time
3. IP and IP strategy: Intellectual property, whether in the form of a patent or a trade secret, implies the secret ingredient that enables the student to achieve certain results that competitors are unable to copy. This enables the student (and subsequently the startup) to hold on to the market that they create with customers
4. Team including future capabilities required: a startup requires multiple people with complementary capabilities. They also need to be motivated while at the same time protecting the interests of the startup
5. Financials: There is a need of funding to achieve milestones. This includes funding for salaries and running of the company
6. Investors and funding options: There are multiple funding options for a startup. They all come with different advantages and limitations.
7. Legal overview, company forms and shareholders’ agreements (including pitfalls)
8. Preparation of business case: The students will finally prepare the business case that can help them to articulate the link of the technology with the market need and its willingness to pay

The seminar includes talks from invited investors, entrepreneurs and legal experts regarding the importance of the various elements being covered in content, workshops and teamwork. There is a particular emphasis on market validation on each step of the journey, to ensure relevance.

Lecture notes
Since the course will revolve around the ideas of the students, the notes will be for the sole purpose of providing guidance to the students to help convert their technologies or ideas into business cases for the purpose of forming startups. Theoretical subject matter will be kept to a minimum and is not the focus of the course.

Literature
Book
Sethi, A. “From Science to Startup”
ISBN 978-3-319-30422-9

Prerequisites / notice
This course is relevant for those students who aspire to become entrepreneurs.

Students applying for this course are requested to submit a 1 page business idea or, in case they don't have a business idea, a brief motivation letter stating why they would like to do this course.

If you are unsure about the readiness of your idea or technology to be converted into a startup, please drop me a line to schedule a call or meeting to discuss.

363-1109-00L
Introduction to Microeconomics

GESS (Science in Perspective):
This course is only for students enrolled in a Bachelor's degree programme.

Students enrolled in a Master's degree programme may attend "Principles of Microeconomics" (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed "Principles of Microeconomics" (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Content
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature
This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: not assessed
- Project Management: not assessed

### Social Competencies
- Communication: not assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

### Personal Competencies
- Adaptability and Flexibility: not assessed
- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

### Content
- Strategies of human-system-interaction, individual needs, physical & mental abilities, and system properties are key factors affecting the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people’s health, well-being, and satisfaction as well as the overall system performance.

### Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

### Literature
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brochures, checklists, key articles etc. are uploaded in ILIAS

---

### Analysis 3

**Abstract**
In this lecture we treat problems in applied analysis. The focus lies on the solution of quasilinear first order PDEs with the method of characteristics, and on the study of three fundamental types of partial differential equations of second order: the Laplace equation, the heat equation, and the wave equation.

**Objective**
The aim of this class is to provide students with a general overview of first and second order PDEs, and teach them how to solve some of these equations using characteristics and/or separation of variables.

**Content**
1.) General introduction to PDEs and their classification (linear, quasilinear, semilinear, nonlinear / elliptic, parabolic, hyperbolic)
2.) Quasilinear first order PDEs
   - Solution with the method of characteristics
   - Conservation laws
3.) Hyperbolic PDEs
   - wave equation
   - d'Alembert formula in (1+1)-dimensions
   - method of separation of variables
4.) Parabolic PDEs
   - heat equation
   - maximum principle
   - method of separation of variables
5.) Elliptic PDEs
   - Laplace equation
   - maximum principle
   - method of separation of variables
   - variational method

**Literature**
- Prerequisites: Analysis I and II, Fourier series (Complex Analysis)

---

### Applied Analysis of Variance and Experimental Design

**Abstract**
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two- and three-factorial and fractional designs, power.

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.
### 401-4623-00L Time Series Analysis

**Objective**
The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARIMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

**Content**
The goal of the course is to have a a good overview of the different types of time series and the approaches used in their statistical analysis.

The key topics which will be covered as:
- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARMA, ARIMA, Introduction into GARCH models

**Literature**
The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

**Prerequisites / notice**
Basic knowledge in probability and statistics

### 401-7855-00L Computational Astrophysics (University of Zurich)

**Objective**
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes.

**Content**
- Large-N gravity calculation, collisionless N-body systems and their simulation
- Fast Fourier Transform and spectral methods in general
- Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
- Lagrangian Hydrodynamics: The SPH method
- Resolution and instabilities in Hydrodynamics
- Initial Conditions: Cosmological Simulations and Astrophysical Disks
- Physical Approximations and Methods for Radiative Transfer in Astrophysics
- Galactic Dynamics (Binney & Tremaine, Princeton University Press), Computer Simulation using Particles (Hockney & Eastwood CRC press), Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

**Literature**
- Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

### 402-0809-00L Introduction to Computational Physics

**Objective**
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

**Content**
- Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

**Literature**
- Lecture notes and slides are available online and will be distributed if desired.
- Literature recommendations and references are included in the lecture notes.

### 402-1701-00L Physics I

**Objective**
This course gives a first introduction to Physics with an emphasis on classical mechanics. Acquire knowledge of the basic principles regarding the physics of classical mechanics. Skills in solving physics problems.

### 636-0007-00L Computational Systems Biology

**Objective**
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Mathematics III: Systems Analysis

W 4 credits 2V+1U L. Brunner, R. Knutti, S. Schemm, H. Wernli, P. Zschenderlein

Abstract

The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective

Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Lecture notes

Overhead slides will be made available through the course website.

Literature

The course "Didactic Basics for Student Teaching Assistants" enhances Student Teaching Assistants (Student TAs) to develop knowledge, 1 credit 3S.

In this course, Student Teaching Assistants will...

- Analytical skills: The ETH Week participants are able to structure complex problems systematically using selected methods. They are able to acquire further knowledge and to critically analyse the knowledge in interdisciplinary groups and with experts and the help of team tutors.
- Design skills: The students are able to use their knowledge and skills to develop concrete approaches for problem solving and decision making to a selected problem statement, critically reflect these approaches, assess their feasibility, and present their work in a creative way (role-plays, videos, exhibitions, etc.).
- Self-competence: The students are able to plan their work effectively, efficiently and autonomously. By considering approaches from different disciplines, they are able to make a judgment and form a personal opinion. In exchange with non-academic partners from business, politics, administration, nongovernmental organisations and media, they are able to communicate appropriately, present their results professionally and creatively and convince a critical audience.
- Social competence: The students are able to work in multidisciplinary teams, i.e., they can reflect critically on their own discipline, debate with students from other disciplines and experts in a critical-constructive and respectful way and can relate their own positions to different intellectual approaches. They can assess how far they are able to actively make a contribution to society by using their personal and professional talents and skills and as "Change Agents".
- Remote collaboration competence: The students work in a hybrid setting blending physical and virtual communication and collaboration methods and tools. They experience the potential and limitations of remote collaboration.

Content

The week is mainly about problem solving and design thinking applied to the complex world of health and well-being. During ETH Week, students will have the opportunity to work in small interdisciplinary groups, allowing them to critically analyse both their own approaches and those of other disciplines, and to integrate these into their work.

While deepening their knowledge about health and well-being, students will be introduced to various methods and tools for generating creative ideas and understand how different people are affected by each part of the system. In addition to lectures and literature, students will acquire knowledge via excursions into the real world, empirical observations, and conversations with researchers and experts.

A key attribute of the ETH Week is that students are expected to find their own problem, rather than just solve the problem that has been handed to them.

Therefore, the first three days of the week will concentrate on identifying a problem the individual teams will work on, while the last two days are focused on generating solutions and communicating the team's ideas.

Prerequisites / notice

No prerequisites. Programme is open to Bachelor and Masters from all ETH Departments. All students must apply through a competitive application process at www.ethz.ch/ethweek. Participation is subject to successful selection through this competitive process.

Fostered competencies

Method-specific Competencies
- Analytical Competencies assessed
- Media and Digital Technologies assessed
- Problem-solving assessed

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Sensitivity to Diversity assessed
- Negotiation assessed

Personal Competencies
- Adaptability and Flexibility assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Self-direction and Self-management assessed

851-0370-00L Didactic Basics for Student Teaching Assistants W 1 credit 1S S. Pedrocchi, B. Voik

Abstract

The course "Didactic Basics for Student Teaching Assistants" enhances Student Teaching Assistants (Student TAs) to develop knowledge, capability and confidence to effectively plan and teach courses and exercises. Participants get trained to think critically about students' learning and create learning situations in which students are actively engaged.

Objective

In this course, Student Teaching Assistants will...

- reflect on their approach to teaching as well as their attitude towards teaching.
- understand the basics of teaching and learning in the context of their subject.
- consciously design the introduction of their course as well as the introduction of single teaching units.
- apply classroom assessment techniques as formative assessments to measure the current status of their students.
- develop a didactic concept according to the learning objectives.
- conduct interactive sequences as learning activities.
- give and get feedback from peers and self-reflect on their teaching practice.
- feel confident to use methods for active learning scenarios in their classes.

Content

The online course provides a range of relevant topics for developing teaching competences of Student Teaching Assistants:

- Overview about how learning works. Based on these fundamentals of learning participants reflect on their role as Student TAs to feel comfortable in their new role as a teacher.
- Plan an own lesson by introducing a class and locate it in the larger topic (methods: portal and informative introduction).
- Develop learning activities in order to activate students (active learning methods).
- Giving and also getting feedback. The participants integrate this topic also in their lesson plan.

While working through the online course, Student TAs have the chance to reflect, exchange ideas with peers and plan their own teaching accordingly so that they feel confident in their role.

Prerequisites / notice

Self-paced online course: https://moodle-app2.let.ethz.ch/course/view.php?id=15127

Consolidation Workshops in November (dates will be announced in the online course at the beginning of the semester)

**Abstract**
The Bachelor thesis is the final requirement of the BSc program and is supervised by one of the D-INFK professors. The thesis encourages students to show and produce a scientifically structured work.

**Objective**
In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work.

**Prerequisites / notice**
The supervisor of the thesis defines the task, start and end date. A written report will be prepared on the scientific studies carried out, followed by a final presentation. The thesis must be handed in within 6 months.

| 851-0240-22L | **Coping with Psychosocial Demands of Teaching (EW4 W DZ)** | 2 credits | 3S | U. Markwalder, S. Maurer, S. Peteranderl-Rüschoff |
| Number of participants limited to 20. | | | | |
| | The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite. | | | |
| Abstract | In this class, students will learn concepts and skills for coping with psychosocial demands of teaching | | | |
| Objective | Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching | | | |
| (1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks). | | | |
| (2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services). | | | |

| 851-0242-06L | **Cognitively Activating Instructions in MINT Subjects** | 2 credits | 2S | R. Schumacher |
| Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport). | | | | |
| This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW1)!". | | | | |
| Abstract | This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance. | | | |
| Objective | - Get to know cognitively activating instructions in MINT subjects | | | |
| - Get information about recent literature on learning and instruction | | | |
| Prerequisites / notice | Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht. | | | |

| 851-0242-07L | **Human Intelligence** | 1 credit | 1S | E. Stern |
| Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport). Number of participants limited to 30. | | | | |
| This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW1)!". | | | | |
| Abstract | The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed. | | | |
| Objective | - Understanding of research methods used in the empirical human sciences | | | |
| - Getting to know intelligence tests | | | |
| - Understanding findings relevant for education | | | |

| 851-0242-08L | **Research Methods in Educational Science** | 1 credit | 2S | P. Edelsbrunner, T. Braas, C. M. Thurn |
| Number of participants limited to 30. | | | | |

Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM); Common perspectives, controversies and empirical evidence will be discussed.

- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher's work.

Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the computer science course.

verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable teaching materials.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

271-0102-00L Teaching Internship Including Examination Lessons in Computer Science

Teaching Internship Computer Science for TC.

**Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

Anlässlich der Hospitalitationen erläutert die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant hat und tauscht sich mit dem/der Studierenden aus. Die von dem/der Studierenden gehaltenen Lektionen werden vor- und nachbesprochen.

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäß Anleitung und reichen sie bis am Vormittag 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

**Lecture notes**

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

272-0103-00L Mentored Work Subject Didactics Computer Science

Mentored Work Subject Didactics in Computer Science for TC and Teaching Diploma.

**Abstract**

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the

| 252-0237-00L | Concepts of Object-Oriented Programming | W   | 8 credits | 3V+2U+2A | P. Müller |
| Abstract     | Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection |
| Objective    | After this course, students will: |
|              | - Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features. |
|              | - Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs. |
|              | - Be able to learn new languages more rapidly. |
|              | - Be aware of many subtle problems of object-oriented programming and know how to avoid them. |
| Content      | The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages. |
| Literature   | Will be announced in the lecture. |
| Prerequisites / notice | Prerequisites: Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience. |

| 252-0417-00L | Randomized Algorithms and Probabilistic Methods | W   | 10 credits | 3V+2U+4A | A. Steger |
| Abstract     | Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains; convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks |
| Objective    | After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas. |
| Content      | Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas. |
| Literature   | Will be announced. |

| 252-0535-00L | Advanced Machine Learning | W   | 10 credits | 3V+2U+4A | J. M. Buhmann, C. Cotrini Jimenez |
| Abstract     | Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects. |
Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning: reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in probability and statistics. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-1407-00L Algorithmic Game Theory

Abstract
Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Objective
Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

Content
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a mathematical model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes
Lecture notes will be usually posted on the website shortly after each lecture.

"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice
Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

263-2800-00L Design of Parallel and High-Performance Computing

Abstract
Advanced topics in parallel and high-performance computing.

Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.
Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

ECTS
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying common perspectives, controversies and empirical evidence will be discussed.

In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

"Human Learning (EW1)".

Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2. You have a basic understanding about psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

Subject Didactics in Computer Science
Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Simultaneous enrolment in Introductory Practical in Computer Science - course 272-0201-00L - is compulsory.

Abstract
The unit “Subject Didactics of Computer Science I” addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

Objective
The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

Content
The course “Subject Didactics of Computer Science I” addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit “Subject Didactics of Computer Science I” are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Lecture notes
Unterlagen und Folien werden zur Verfügung gestellt.

Literature

Prerequisites / notice
Lehrdiplom-Studierende müssen diese Lerneinheit zusammen mit dem Einführungspraktikum Informatik - 272-0201-00L - belegen.
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and
decide themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of
the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a
social angle too.

- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready
for use.

Adaptability and Flexibility
Creative Thinking
Critical Thinking
Integrity and Work Ethics
Self-awareness and Self-reflection
Self-direction and Self-management
Objective
Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content

Literature
Wird von der Praktikumslehrperson bestimmt.

272-0202-00L Professional Exercises ★ Objective
In the course Professional Exercises the students achieve additional school-relevant experiences. The students carry out individually specified, practice related projects, in which they support, document or reflect on learning processes.

Content
Achievement of additional school-relevant experiences. The students carry out individually specified, practice related projects, in which they support, document or reflect on learning processes.

272-0203-00L Teaching Internship in Computer Science ★ Objective
The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Abstract
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils. 
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Literature
Wird von der Praktikumslehrperson bestimmt.

272-0204-00L Teaching Internship for students upgrading TC to Teaching Diploma ★ Objective
This is a supplement to the Teaching Internship required to obtain a Teaching Diploma in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently.

Abstract
These are the students who are planning to upgrade their Teaching Certificate to a Teaching Diploma. The course is intended to widen the students' experience in teaching.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Literature
Wird von der Praktikumslehrperson bestimmt.

272-0205-00L Examination Lesson I in Computer Science ★ Objective
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Abstract
This is the first examination lesson in the course. The students are expected to design and teach a lesson on a topic of their choice. The lesson should be based on an analysis of the students' knowledge and skills and should be supported by relevant teaching materials.

Objective
- They learn to assess pupils’ work.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Literature
Wird von der Praktikumslehrperson bestimmt.
Objective
On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content
Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie der Prüfungstermin besuchen.
Sie erstellen eine Vorbereitung gemäß Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein.
Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflektion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecture notes
Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Prerequisites / notice
Nach Abschluss der übrigen Ausbildung.

Abstract
- To try out different options for specialist further training in their profession.
- To try out different options for specialist further training in their profession.

Objective
Be able to learn new languages more rapidly.
Be able to understand and evaluate language designs.

Content
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
The key problems of single and multiple inheritance and how different languages address them
Generic type systems, in particular, Java generics, C# generics, and C++ templates
The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
How to maintain the consistency of data structures
### Literature
Will be announced in the lecture.

### Prerequisites / notice
Prerequisites:
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

### 252-0417-00L Randomized Algorithms and Probabilistic Methods
- **W 10 credits 3V+2U+4A**
- **A. Steger**

#### Abstract
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

#### Objective
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

#### Content
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

#### Lecture notes
Yes.

#### Literature

### 252-0535-00L Advanced Machine Learning
- **W 10 credits 3V+2U+4A**
- **J. M. Buhmann, C. Cotrini Jimenez**

#### Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

#### Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

#### Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

#### Lecture notes
No lecture notes, but slides will be made available on the course webpage.

#### Literature

#### Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

### 252-1407-00L Algorithmic Game Theory
- **W 7 credits 3V+2U+1A**
- **P. Penna**

#### Abstract
Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

#### Objective
Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a mathematical model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes will be usually posted on the website shortly after each lecture.

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

263-2800-00L Design of Parallel and High-Performance Computing Number of participants limited to 125.
W 9 credits 3V+2U+3A T. Hoefler, M. Püschel

Abstract
Advanced topics in parallel and high-performance computing.

Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

| **Abstract** | The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations. This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm". Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small. 

The field of databases evolves at a fast pace. In order to be prepared to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters, starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

**Literature**

Large scale analytics and machine learning are outside of the scope of this course.

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

This course, in the autumn semester, is only intended for:

- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:

- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2021

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

Prerequisites / notice
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

Fostered competencies
Subject-specific Competencies
Concepts and Theories  assessed

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning

- Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods

- Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation

- Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Abstract
The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSD audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.
This course does not assume prior knowledge of formal methods, and will start with a quick review of topics such as static vs. dynamic verification seL4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution. PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

Reliable and Trustworthy Artificial Intelligence

This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

The course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research papers.

Topics covered:
- Graph sparsifications while preserving cuts or distances
- Various techniques as well as quantitative approaches
- Statistical models and algorithms for the assessment and functional analysis of individual genomic variations
- The identification of variants, prediction of functional effects, imputation and integration problems as well as the association with clinical phenotypes
- Models for organization and representation of large scale biomedical data. This includes ontology concepts, biomedical databases, sequence annotation and data compression.

Objectives
- The course critically reviews central problems in Biomedicine and discusses the technical foundations and solutions for these problems.
- The course will consist of three topic clusters that will cover different aspects of data science problems in Biomedicine:
  1) String algorithms for the efficient representation, search, comparison, composition and compression of large sets of strings, mostly originating from DNA or RNA Sequencing. This includes genome assembly, efficient index data structures for strings and graphs, alignment techniques as well as quantitative approaches.
  2) Statistical models and algorithms for the assessment and functional analysis of individual genomic variations. This includes the identification of variants, prediction of functional effects, imputation and integration problems as well as the association with clinical phenotypes.
  3) Models for organization and representation of large scale biomedical data. This includes ontology concepts, biomedical databases, sequence annotation and data compression.
- The main objective of this course is to expose students to the latest and most exciting research in the area of explainable and interpretable artificial intelligence, a topic of fundamental and increasing importance. Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of problems.
- This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: https://www.swi.inf.ethz.ch/teaching/reliableai21):
  - Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
  - Defenses against attacks
  - Combining gradient-based optimization with logic for encoding background knowledge
  - Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers).
  - Probabilistic certification of deep neural networks
  - Training deep neural networks to be provably robust via automated reasoning
  - Fairness (different notions of fairness, certifiably fair representation learning)
  - Federated Learning (introduction, security considerations)
- While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

For solving assignments, some programming experience in Python is expected.

Prerequisites / notice
- Solid basic knowledge in statistics, algorithms and programming.
- The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.

Prerequisites / notice
This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is highly recommended, though not required formally. If you are not sure whether you’re ready for this class or not, please consult the instructor.

263-5005-00L Artificial Intelligence in Education W 5 credits 2V+1U+1A M. Sachan, T. Sinha

Abstract
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

Objective
The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class discussion, b) work on problem-sets exemplifying the use of educational data mining techniques, and c) undertake a final course project with feedback from instructors.

Content
The course will start with a general introduction to AI, where we will cover supervised and unsupervised learning techniques (e.g., classification and regression models, feature selection and preprocessing of data, clustering, dimensionality reduction and text mining techniques) with a focus on application of these techniques in educational data mining. After the introduction of the basic methodologies, we will continue with the most relevant applications of AI in educational technologies (e.g., intelligent tutoring and student personalization, scaffolding open-ended discovery learning, socially-aware AI and learning at scale with AI systems). In the final part of the course, we will cover challenges associated with using AI in student facing settings.

Lecture notes
Lecture slides will be made available at the course Web site.

Literature
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

Prerequisites / notice
There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

263-5255-00L Foundations of Reinforcement Learning W 5 credits 2V+2A N. He

Abstract
Reinforcement learning (RL) has been in the limelight of many recent breakthroughs in artificial intelligence. This course focuses on theoretical and algorithmic foundations of reinforcement learning, through the lens of optimization, modern approximation, and learning theory. The course targets M.S. students with strong research interests in reinforcement learning, optimization, and control.

Objective
This course aims to provide students with an advanced introduction of RL theory and algorithms as well as bring them near the frontier of this active research field.

By the end of the course, students will be able to
- Identify the strengths and limitations of various reinforcement learning algorithms;
- Formulate and solve sequential decision-making problems by applying relevant reinforcement learning tools;
- Generalize or discover “new” applications, algorithms, or theories of reinforcement learning towards conducting independent research on the topic.

Content
Basic topics include fundamentals of Markov decision processes, approximate dynamic programming, linear programming and primal-dual perspectives of RL, model-based and model-free RL, policy gradient and actor-critic algorithms, Markov games and multi-agent RL. If time allows, we will also discuss advanced topics such as batch RL, inverse RL, causal RL, etc. The course keeps strong emphasis on in-depth understanding of the mathematical modeling and theoretical properties of RL algorithms.

Lecture notes
Lecture notes will be posted on Moodle.

Literature
Dynamic Programming and Optimal Control, Vol I & II, Dimitris Bertsekas

Algorithms for Reinforcement Learning, Csaba Csizmadia.

Prerequisites / notice
Students are expected to have strong mathematical background in linear algebra, probability theory, optimization, and machine learning.

263-5902-00L Computer Vision W 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

Abstract
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision,
2. To introduce the main concepts and techniques used to solve these,
3. To enable students to implement solutions for reasonably complex problems.
4. To enable students to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

<td>8</td>
<td>3+2U+2A</td>
<td>P. Müller</td>
</tr>
</tbody>
</table>

Abstract
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

Objective
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

Data: 06.09.2022 12:51   Autumn Semester 2021   Page 1167 of 2159
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

Prerequisites:
- Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

Security Engineering

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

System Security

The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

### Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

### Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

### Prerequisites / notice
This course is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

### Elective Courses

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1170 of 2159
We will start by presenting the notion of Public-Key Encryption with its various security guarantees and some constructions. Then we will make slides, relevant literature and manuals available during the course.

Reliable and Trustworthy Artificial Intelligence

2V+2U+4A

Type

The course notes will be written in English.

Public-Key Encryption has had a significant impact by enabling remote parties to communicate securely via an insecure channel. Latest encryption schemes go further by providing a fine-grained access to the encrypted data. To satisfy deeper understanding, an important part of the course will be a group hands-on programming project where students will build a system based on the learned material.

Content

This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: https://www.sri.inf.ethz.ch/teaching/reliabai21):

- Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
- Defenses against attacks
- Combining gradient-based optimization with logic for encoding background knowledge
- Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers).
- Probabilistic certification of deep neural networks
- Training deep neural networks to be provably robust via automated reasoning
- Fairness (different notions of fairness, certifiably fair representation learning)
- Federated Learning (introduction, security considerations)

Prerequisites / notice

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

For solving assignments, some programming experience in Python is expected.

263-4657-00L Advanced Encryption Schemes

W 5 credits 2V+1U+1A R. Gay

Abstract

Public-Key Encryption has had a significant impact by enabling remote parties to communicate securely via an insecure channel. Latest encryption schemes go further by providing a fine-grained access to the encrypted data. This course provides hands-on experience with a variety of encryption schemes and protocols.

Objective

The student will be able to:

- understand the security guarantees of encryption schemes and protocols;
- implement and use various encryption schemes and protocols;
- evaluate the security of encryption schemes and protocols.

Content

We will start by presenting the notion of Public-Key Encryption with its various security guarantees and some constructions. Then we will look into encryption schemes with fine-grained access control to the encrypted data, such as identity-based encryption or attribute-based encryption.

Literature

Links to relevant research papers will be given in the course materials.

263-4665-00L Zero-Knowledge Proofs

W 5 credits 2V+1U+1A J. Bootle

Abstract

This course is a detailed introduction to zero-knowledge proof protocols. The objective is to understand various methods of constructing zero-knowledge proof protocols, and be able to analyse their security properties.

Objective

To understand various methods of constructing zero-knowledge proof protocols, and be able to analyse their security properties.

Content

The course will discuss interactive zero-knowledge proofs based on various commitment schemes, and explore connections to other areas like secure multi-party computation. The course may also describe some more advanced constructions of non-interactive proofs.

Prerequisites / notice

Students should have taken a first course in Cryptography (as taught in the Information Security course at Bachelor’s level). Confidence with algebra and probability is desirable.

227-0579-00L Hardware Security

W 7 credits 2V+2U+2A K. Razavi

Abstract

This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures, reviewing and discussing papers, and executing some of these advanced attacks.

Objective

By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.
- writing critical reviews and constructive discussions with peers on this topic.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Literature

Slides, relevant literature and manuals will be made available during the course.

Knowledge of systems programming and computer architecture is a plus.

3V+2U+4A A. Steger

Objective

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

252-0417-00L Randomized Algorithms and Probabilistic Methods

W 10 credits 3V+2U+4A A. Steger

Abstract

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

Objective

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

4V+2U+4A A. Steger

Objective

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.
Content
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Lecture notes
Yes.

Literature

252-0535-00L
Advanced Machine Learning
W 10 credits 3V+2U+4A
J. M. Buhmann, C. Cotrini Jimenez

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
- Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-1425-00L
Geometry: Combinatorics and Algorithms
W 8 credits 3V+2U+2A
J. M. Buhmann, M. Hoffmann, M. Wettstein

Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
Yes.

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH. Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

263-4500-00L
Advanced Algorithms
W 9 credits 3V+2U+3A
M. Ghaftari, G. Zuzic

Abstract
This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

Objective
This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the basic concept of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

The course provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course covers algorithmic aspects of game theory.

Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

The course website can be found at https://people.inf.ethz.ch/gmohsen/AA21/
The course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

The programming assignments will be in C++. This will not be taught in the class.

Prerequisites:
- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++
- Visual Computing course recommended.

Literature:
- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Multiple view geometry in computer vision
- Physically Based Rendering: From Theory to Implementation

Prerequisites / notice
- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++
- Visual Computing course recommended.

Lecturers:
- S. Tang

The course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

**Objective**

- Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.
- Participants understand the different viewpoints for IT-decisions in practice, including technical and business aspects, can effectively analyze IT questions from the different viewpoints and facilitate decision making.
- Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

**Content**

- The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

</tbody>
</table>

**Objective**

- The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

The publications to be presented will be announced on the seminar home page at least one week before the first session. The papers will be presented in the first session of the seminar.

This seminar is an opportunity to become familiar with current research in software engineering and more generally with the methods and tools of software development. Each student will be asked to study some papers from the recent software engineering literature and review them. This is an exercise in critical review and analysis. Active participation is required (a presentation of a paper as well as participation in discussions). Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning. The seminar “Advanced Topics in Machine Learning” familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

The reading list will be published on the course web site.

The papers will be presented in the first session of the seminar.

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The publications to be announced will be published on the seminar home page at least one week before the first session. The seminar will meet only when there is a scheduled presentation. Please consult the seminar’s home page for more information.

The aim of this seminar is to introduce students to recent research results in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages.

To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Number of participants limited to 40.

The reading list will be published on the course web site.

The deadline for deregistering expires at the end of the fourth week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
This seminar covers advanced topics in computer graphics, such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective
The goal is to get an in-depth understanding of actual problems and research topics in the field of computer graphics as well as improve presentations and critical analysis skills.

Content
This seminar covers advanced topics in computer graphics, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics.

All students read the papers and participate in the discussion.

The papers will be presented in the first session of the seminar.

This seminar covers topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The publications to be announced will be published on the seminar home page at least one week before the first session. The seminar will meet only when there is a scheduled presentation. Please consult the seminar’s home page for more information.

Number of participants limited to 24.

Abstract
Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

Research Topics in Software Engineering

The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages.

Prerequisites / notice
Organizational note: the seminar will meet only when there is a scheduled presentation. Please consult the seminar's home page for information.

Hardware Acceleration for Data Processing

The publications to be announced will be published on the seminar home page at least one week before the first session. The seminar will meet only when there is a scheduled presentation. Please consult the seminar’s home page for more information.

Number of participants limited to 24.

Abstract

Beyond iid Learning: Causality, Dynamics, and Interactions

The summer course in machine learning covers topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular. The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers. Students taking this seminar should have the necessary background in systems and low level programming.

Objective
The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

Content
The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

Presenter: Give a presentation about the paper that you read in depth.

Reviewer: Perform a critical review of the paper.

Prerequisites / notice
All other students: read the paper and submit questions they have about the paper before the presentation.

Fostered competencies
Method-specific Competencies
Analytical Competencies
Social Competencies
Communication
Personal Competencies
Critical Thinking

Seminar on Advanced Graph Algorithms and Optimization

Number of participants limited to 6!

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Objective
This seminar aims to familiarize students with current research topics in fast graph algorithms and optimization.

Content
We will study recent papers that made significant contributions in the areas in fast graph algorithms and optimization.

Prerequisites / notice
As prerequisite we require that you passed the course "Advanced Graph Algorithms and Optimization". In exceptional cases, students who passed one of the courses "Randomized Algorithms and Probabilistic Methods", "Optimization for Data Science", or "Advanced Algorithms" may also participate, at the discretion of the lecturer.

Seminar on Advanced Topics in Human-Centric Computer Vision

Numbers of participants limited to 20.

The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modelling of detailed human activities.

Objective
The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

Content

Applied Security Laboratory

Hands-on course on applied aspects of information security. Applied information security, operating system security, OS hardening, computer forensics, web application security, project work, design, implementation, and configuration of security mechanisms, risk analysis, system review.

Objective
The Applied Security Laboratory addresses four major topics: operating system security (hardening, vulnerability scanning, access control, logging), application security with an emphasis on web applications (web server setup, common web exploits, authentication, session handling, code security), computer forensics, and risk analysis and risk management.

Prerequisites / notice
BSc in computer science or related field (engineering, physics, mathematics). Passed at least one learning course, such as "Introduction to Machine Learning" or "Probabilistic Artificial Intelligence".

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
Many machine learning problems go beyond supervised learning on independent data points and require an understanding of the underlying causal mechanisms, the interactions between the learning algorithms and their environment, and adaptation to temporal changes. The course highlights some of these challenges and relates them to state-of-the-art research.

Objective
The goal of this seminar is to gain experience with machine learning research and foster interdisciplinary thinking.

Content
The seminar will be divided into two parts. The first part summarizes the basics of statistical learning theory, game theory, causal inference, and dynamical systems in four lectures. This sets the stage for the second part, where distinguished speakers will present selected aspects in greater detail and link them to their current research.

Keywords: Causal inference, adaptive decision-making, reinforcement learning, game theory, meta learning, interactions with humans.

Lecture notes
Further information will be published on the course website: https://beyond-iid-learning.xyz/
Content
This course emphasizes applied aspects of Information Security. The students will study a number of topics in a hands-on fashion and carry out experiments in order to better understand the need for secure implementation and configuration of IT systems and to assess the effectiveness and impact of security measures. This part is based on a book and virtual machines that include example applications, questions, and answers.

The students will also complete an independent project: based on a set of functional requirements, they will design and implement a prototypical IT system. In addition, they will conduct a thorough security analysis and devise appropriate security measures for their systems. Finally, they will carry out a technical and conceptual review of another system. All project work will be performed in teams and must be properly documented.

Lecture notes

Literature
Recommended reading includes:

* Various: OWASP Guide to Building Secure Web Applications, available online
* Frisch: Essential System Administration, O’Reilly & Associates.
* NIST: Risk Management Guide for Information Technology Systems, available online as PDF
* BSI: IT-Gütespezifikation, available online

Prerequisites / notice
* The lab allows flexible working since there are only few mandatory meetings during the semester.
* The lab covers a variety of different techniques. Thus, participating students should have a solid foundation in the following areas:
  - information security, operating system administration (especially Unix/Linux), and networking. Students are also expected to have a basic understanding of HTML, PHP, JavaScript, and MySQL because several examples are implemented in these languages.
* Students must be prepared to spend more than three hours per week to complete the lab assignments and the project. This applies particularly to students who do not meet the recommended requirements given above. Successful participants of the course receive 8 credits as compensation for their effort.
* All participants must sign the lab’s charter and usage policy during the introduction lecture.

Abstract

Does not take place this semester.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students’ curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content
This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

Lecture notes
no
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer graphics and vision, human machine interaction, as well as gaming technology. The objectives of this course are:

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: 3D Computer Graphics, 3D Computer Vision, and Human-Machine Interaction. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
- Advanced Machine Learning
  https://ml2.inf.ethz.ch/courses/aml/
- Computational Intelligence Lab

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data. Topics covered in the lecture include:

Fundamentals:
- What is data?
- Bayesian Learning
- Computational learning theory

Supervised learning:
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

Unsupervised learning:
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation

Learning Dynamical Systems

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
- The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.
- Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Design of Parallel and High-Performance Computing

<table>

</tbody>
</table>

Abstract
Advanced topics in parallel and high-performance computing. Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

Big Data

Objective
This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRl, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Literature
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice
This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departements interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2021

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations. In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed.

Data Management Systems

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

Prerequisites / notice

The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

Prerequisites / notice

The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

263-3845-00L Data Management Systems W 8 credits 3V+1U+3A G. Alonso

Abstract

263-3850-00L Informal Methods W 5 credits 2G+2A D. Cock

Abstract

Formal methods are increasingly a key part of the methodological toolkit of systems programmers - those writing operating systems, databases, and distributed systems. This course is about how to apply concepts, techniques, and principles from formal methods to such software systems, and how to get into the habit of thinking formally about systems design even when writing low-level C code.

Objective

This course is about equipping students whose focus is systems with the insights and conceptual tools provided by formal methods, and thereby enabling them to become better systems programmers. By the end of the course, students should be able to seamlessly integrate basic concepts from formal methods into how they conceive, design, implement, reason about, and debug computer systems.

Content

This course does not assume prior knowledge of formal methods, and will start with a quick review of topics such static vs. dynamic reasoning, variants and invariants, program algebra and refinement, etc. However, it is strongly recommended that students have already taken one of the introductory formal methods course at ETH (or equivalents elsewhere) before taking this course - the emphasis is on reinforcing these concepts by applying them, not to teach them from scratch.

Instead, the majority of the course will be about how to apply these techniques to actual, practical code in real systems. We will work from real systems code written both by students taking the course, and practical systems developed using formal techniques, in particular the verified seL4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).

Minor in Information Security

252-0463-00L Security Engineering W 7 credits 2V+2U+2A S. Krsic

Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.
Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

References:
- Further relevant books and journal/conference articles will be announced in the lecture.

252-1411-00L Security of Wireless Networks

Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.
Advanced Encryption Schemes

After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.

252-1414-00L

System Security

W 7 credits

A. Perrig, S. Capkun, A. Perrig

Abstract

The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

Objective

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content

The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

263-4640-00L

Network Security

W 8 credits

A. Perrig, S. Frei, M. Legner, K. Paterson

Abstract

Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

Objective

- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

Content

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

Prerequisites / notice

This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L.

Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

263-4657-00L

Advanced Encryption Schemes

W 5 credits

R. Gay

Abstract

Public-Key Encryption has had a significant impact by enabling remote parties to communicate securely via an insecure channel. Latest schemes go further by providing a fine-grained access to the encrypted data.

Objective

The student is comfortable with formal security definitions and proof techniques used to analyze the security of the latest encryption schemes with advanced features. This prepares the student to start reading research papers on the field.

Content

We will start by presenting the notion of Public-Key Encryption with its various security guarantees and some constructions. Then we will look into encryption schemes with fine-grained access control to the encrypted data, such as identity-based encryption or attribute-based encryption and present different methodology to prove their security.

Literature

Links to relevant research papers will be given in the course materials.

Prerequisites / notice

It is recommended for students to have prior exposure to cryptography, e.g. the D-INFK course "Digital Signatures" or "Applied Cryptography".
The course will discuss interactive zero-knowledge proofs based on various commitment schemes, and explore connections to other areas like secure multi-party computation. The course may also describe some more advanced constructions of non-interactive proofs.

Lecture notes
The course notes will be written in English.

Prerequisites / notice
Students should have taken a first course in Cryptography (as taught in the Information Security course at Bachelor’s level). Confidence with algebra and probability is desirable.

-------------------------------------

### Hardware Security (227-0579-00L)

**Number**: W 7 credits 2V+2U+2A  K. Razavi

**Abstract**
This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is to familiarize the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures, reviewing and discussing papers, and executing some of these advanced attacks.

**Objective**
By the end of the course, the students will be familiar with the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.
- writing critical reviews and constructive discussions with peers on this topic.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

**Literature**
Slides, relevant literature and manuals will be made available during the course.

**Prerequisites / notice**
Knowledge of systems programming and computer architecture is a plus.

#### Advanced Machine Learning
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

**Content**
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

**263-2400-00L** **Reliable and Trustworthy Artificial Intelligence**  
**W** 6 credits  
2V+2U+1A  
M. Vechev

**Abstract**  
Creating reliable and explainable probabilistic models is a fundamental challenge to solving the artificial intelligence problem. This course covers some of the latest and most exciting advances that bring us closer to constructing such models.

**Objective**  
To facilitate deeper understanding, an important part of the course will be a group hands-on programming project where students will build a system based on the learned material.

**Content**  
This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: [https://www.sri.inf.ethz.ch/teaching/reliableai21](https://www.sri.inf.ethz.ch/teaching/reliableai21)).

- Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
- Defenses against attacks
- Combining gradient-based optimization with logic for encoding background knowledge
- Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers).
- Probabilistic certification of deep neural networks
- Training deep neural networks to be provably robust via automated reasoning
- Fairness (different notions of fairness, certifiably fair representation learning)
- Federated Learning (introduction, security considerations)

**Prerequisites / notice**  
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

For solving assignments, some programming experience in Python is expected.

**263-3210-00L** **Deep Learning**  
**W** 8 credits  
3V+2U+2A  
F. Perez Cruz, A. Lucchi

**Number of participants limited to 320.**

**Abstract**  
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

**Objective**  
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

**Prerequisites / notice**  
The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
- Advanced Machine Learning  
[https://ml2.inf.ethz.ch/courses/aml/](https://ml2.inf.ethz.ch/courses/aml/)
- Computational Intelligence Lab  
- Introduction to Machine Learning  
[https://las.inf.ethz.ch/teaching/introml-S19](https://las.inf.ethz.ch/teaching/introml-S19)
- Statistical Learning Theory  
[http://ml2.inf.ethz.ch/courses/slt/](http://ml2.inf.ethz.ch/courses/slt/)
- Computational Statistics  
- Probabilistic Artificial Intelligence  
[https://las.inf.ethz.ch/teaching/pai-f18](https://las.inf.ethz.ch/teaching/pai-f18)

**263-5005-00L** **Artificial Intelligence in Education**  
**W** 5 credits  
2V+1U+1A  
M. Sachan, T. Sinha

**Number of participants limited to 75.**

**Abstract**  
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

**Objective**  
The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class discussion, b) work on problem-sets exemplifying the use of educational data mining techniques, and c) undertake a final course project with feedback from instructors.

**Content**  
The course will start with a general introduction to AI, where we will cover supervised and unsupervised learning techniques (e.g., classification and regression models, feature selection and preprocessing of data, clustering, dimensionality reduction and text mining techniques) with a focus on application of these techniques in educational data mining. After the introduction of the basic methodologies, we will continue with the most relevant applications of AI in educational technologies (e.g., intelligent tutoring and student personalization, scaffolding open-ended discovery learning, socially-aware AI and learning at scale with AI systems). In the final part of the course, we will cover challenges associated with using AI in student facing settings.

**Lecture notes**  
Lecture slides will be made available at the course Web site.

**Literature**  
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.
Prerequisites / notice
There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

| Abstract                        |      |      |       |                 |
| Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them. |
| Objective                       |      |      |       |                 |
| - Students are familiar with fundamental network-security concepts. |
| - Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures. |
| - Students can identify and assess vulnerabilities in software systems and network protocols. |
| - Students have an in-depth understanding of a range of important state-of-the-art security technologies. |
| - Students can implement network-security protocols based on cryptographic libraries. |
| Content                         |      |      |       |                 |
| The course will cover topics spanning four broad themes with a focus on the first two themes: (1) network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems; (2) network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks; (3) analysis and inference topics such as traffic monitoring and network forensics; and (4) new technologies related to next-generation networks. In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics. |
This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall semester, with rotating topics. Repetition for credit is possible with consent of the instructor. In the Fall 2021, the course will cover advanced topics in Internet routing and forwarding.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

**Prerequisites / notice**

Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

<td></td>
</tr>
</tbody>
</table>

**Abstract**

This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall semester, with rotating topics. Repetition for credit is possible with consent of the instructor. In the Fall 2021, the course will cover advanced topics in Internet routing and forwarding.

**Objective**

The goals of this course is to provide students with a deeper understanding of the existing and upcoming Internet routing and forwarding technologies used in large-scale computer networks such as Internet Service Providers (e.g., Swisscom or Deutsche Telekom), Content Delivery Networks (e.g., Netflix) and Data Centers (e.g., Google). Besides covering the fundamentals, the course will be "hands-on" and will enable students to play with the technologies in realistic network environments, and even implement some of them on their own during labs and a final group project.

**Content**

The course will cover advanced topics in Internet routing and forwarding such as:

- Tunneling
- Hierarchical routing
- Traffic Engineering and Load Balancing
- Virtual Private Networks
- Quality of Service/Queuing/Scheduling
- Fast Convergence
- Network virtualization
- Network programmability (OpenFlow, P4)
- Network measurements

The course will be divided in two main blocks. The first block (~8 weeks) will interleave classical lectures with practical exercises and labs. The second block (~6 weeks) will consist of a practical project which will be performed in small groups (~3 students). During the second block, lecture slots will be replaced by feedback sessions where students will be able to ask questions and get feedback about their project.

The last week of the semester will be dedicated to student presentations and demonstrations.

**Lecture notes**

Lecture notes and material will be made available before each course on the course website.

**Literature**

Relevant references will be made available through the course website.

**Prerequisites / notice**

Prerequisites: Communication Networks (227-0120-00L) or equivalents / good programming skills (in any language) are expected as both the exercises and the final project will involve coding.

**Abstract**

Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection.

**Objective**

After this course, students will:

- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1189 of 2159
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:

- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

Prerequisites: Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming), profiling experience

263-2400-00L
Reliable and Trustworthy Artificial Intelligence
W 6 credits 2V+2U+1A M. Vechev
Abstract
Creating reliable and explainable probabilistic models is a fundamental challenge to solving the artificial intelligence problem. This course covers some of the latest and most exciting advances that bring us closer to constructing such models.
Objective
The main objective of this course is to expose students to the latest and most exciting research in the area of explainable and interpretable artificial intelligence, a topic of fundamental and increasing importance. Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of problems.

To facilitate deeper understanding, an important part of the course will be a group hands-on programming project where students will build a system based on the learned material.

Content
This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: https://www.sri.inf.ethz.ch/teaching/reliableai21):

- Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
- * Defenses against attacks
- * Combining gradient-based optimization with logic for encoding background knowledge
- * Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers).
- * Probabilistic certification of deep neural networks
- * Training deep neural networks to be provably robust via automated reasoning
- * Fairness (different notions of fairness, certifiably fair representation learning)
- * Federated Learning (introduction, security considerations)

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH). For solving assignments, some programming experience in Python is expected.

263-2800-00L
Design of Parallel and High-Performance Computing
W 9 credits 3V+2U+3A T. Hoefl, M. Püschel
Number of participants limited to 125.
Abstract
Advanced topics in parallel and high-performance computing.
Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

Minor in Systems Software
Number Title Type ECTS Hours Lecturers
252-1414-00L
System Security
W 7 credits 2V+2U+2A S. Capkun, A. Perrig
Abstract
The first part of the lecture covers individual system aspects starting with tamper-proof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.
Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
Content
The first part of the lecture covers individual system's aspects starting with tamper-proof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dracce, ...), cryptogaphic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

263-2800-00L
Design of Parallel and High-Performance Computing
Number of participants limited to 125.
Abstract
Advanced topics in parallel and high-performance computing.

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1190 of 2159
Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

<td>263-3850-00L</td>
<td>Informal Methods</td>
<td>W</td>
<td>5</td>
<td>2G+2A</td>
<td>D. Cock</td>
</tr>
<tr>
<td></td>
<td>Abstract</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Formal methods are increasingly a key part of the methodological toolkit of systems programmers - those writing operating systems, databases, and distributed systems. This course is about how to apply concepts, techniques, and principles from formal methods to such software systems, and how to get into the habit of thinking formally about systems design even when writing low-level C code.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>This course is about equipping students whose focus is systems with the insights and conceptual tools provided by formal methods, and thereby enabling them to become better systems programmers. By the end of the course, students should be able to seamlessly integrate basic concepts form formal methods into how they conceive, design, implement, reason about, and debug computer systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The goal is not to provide a comprehensive introduction to formal methods - this is well covered by other courses in the department. Instead, it is intended to provide students in computer systems (who may or may not have existing background knowledge of formal methods) with a basis for applying formal methods in their work.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Literature</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The course does not assume prior knowledge of formal methods, and will start with a quick review of topics such static vs. dynamic reasoning, variants and invariants, program algebra and refinement, etc. However, it is strongly recommended that students have already taken one of the introductory formal methods course at ETH (or equivalents elsewhere) before taking this course - the emphasis is on reinforcing these concepts by applying them, not to teach them from scratch.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Prerequisites / notice</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Instead, the majority of the course will be about how to apply these techniques to actual, practical code in real systems. We will work from real systems code written both by students taking the course, and practical systems developed using formal techniques, in particular the verified sel4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).</td>

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a mathematical model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
Prerequisites / notice

This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is highly recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.

Algebraic Methods in Combinatorics

Abstract

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Objective

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Content

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application. The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757
- Applications such as: Solution of Kakeya problem in finite fields, explicit constructions of Ramsey graphs and many others.
- The course will be on the blackboard only, but there will be a set of typset lecture notes which follow the class closely.

Lit. 401-3901-00L

Linear & Combinatorial Optimization

Abstract

The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

Objective

Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Content

Literature

- Former course title: Mathematical Optimization.
Elective Courses (only for Programme Regulations 2020)

Students can individually choose from the entire Master course offerings in the area of Computer Science (or a closely related field), from ETH Zurich, EPF Lausanne, the University of Zurich and - but only with the consent of the Director of Studies - from all other Swiss universities.

</table>
We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in securing them. The first part of the lecture covers individual system’s aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

The first part of the lecture covers individual system’s aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understating these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SOL.

Along the lectures, model cases will be elaborated and evaluated in the exercises.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can learn about various topics such as static vs. dynamic reasoning, variants and invariants, program algebra and refinement, etc. However, it is strongly recommended that students have already taken one of the introductory formal methods course at ETH (or equivalents elsewhere) before taking this course. The emphasis is on reinforcing these concepts by applying them, to not teach them from scratch.

Instead, the majority of the course will be about how to apply these techniques to actual, practical code in real systems. We will work from real systems code written both by students taking the course, and practical systems developed using formal techniques, in particular the verified seL4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations, camera models and calibration, invariant features, multiple-view geometry, model fitting, stereo matching, segmentation, 2D shape matching, shape from silhouettes, optical flow, structure from motion, tracking, object recognition, object category recognition. Creating reliable and explainable probabilistic models is a fundamental challenge to solving the artificial intelligence problem. This course covers some of the latest and most exciting advances that bring us closer to constructing such models.

**Literature**

**Prerequisites / notice**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution. PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

### Focus Elective Courses Visual Computing

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
---|---|---|---|---|---

**Abstract**

This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

**Objective**

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**

Camera models and calibration, invariant features, multiple-view geometry, model fitting, stereo matching, segmentation, 2D shape matching, shape from silhouettes, optical flow, structure from motion, tracking, object recognition, object category recognition.

**Lecture notes**

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

252-0546-00L | Physically-Based Simulation in Computer Graphics | W | 5 credits | 2V+1U+1A | V. da Costa de Azevedo, B. Solenthaler, B. Thomaszewski

**Abstract**

This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

**Objective**

This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

**Content**

The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

**Prerequisites / notice**

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended. The programming assignments will be in C++. This will not be taught in the class.

263-2400-00L | Reliable and Trustworthy Artificial Intelligence | W | 6 credits | 2V+2U+1A | M. Vechev

**Abstract**

Creating reliable and explainable probabilistic models is a fundamental challenge to solving the artificial intelligence problem. This course covers some of the latest and most exciting advances that bring us closer to constructing such models.

**Objective**

The main objective of this course is to expose students to the latest and most exciting research in the area of explainable and interpretable artificial intelligence, a topic of fundamental and increasing importance. Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of problems.

To facilitate deeper understanding, an important part of the course will be a group hands-on programming project where students will build a system based on the learned material.
This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: https://www.sri.inf.ethz.ch/teaching/reliableai21):

- Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
- Defenses against attacks
- Combining gradient-based optimization with logic for encoding background knowledge
- Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers)
- Probabilistic certification of deep neural networks
- Training deep neural networks to be provably robust via automated reasoning
- Fairness (different notions of fairness, certifiably fair representation learning)
- Federated Learning (introduction, security considerations)

The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and communication. How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study how to approach these questions, and how to apply them to create intelligent systems that can be used in real-world applications. The course is designed for graduate students.

This seminar is a prerequisite for the advanced seminar "Advanced Topics in Machine Learning" (263-5051-00L) and familiarity with the material covered in "Introduction to Machine Learning" at ETH is assumed.

Prerequisites / notice

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). Students must be able to follow the content of the course and critically analyze the presented material. Registration is subject to the availability of topics and the seminar leaders. Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

For solving assignments, some programming experience in Python is expected.

Seminar in Visual Computing

#### Course Description

**Abstract**

- In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modelling of detailed human activities.

**Objective**

- The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

**Content**

- The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

- Presenter: Give a presentation about the paper that you read in depth.
- Reviewer: Perform a critical review of the paper.

All other students: read the paper and submit questions they have about the paper before the presentation.

Prerequisites / notice

Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1198 of 2159
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

### Core Focus Courses General Studies

#### 252-0237-00L

**Title:** Concepts of Object-Oriented Programming

- **Type:** W
- **ECTS:** 8 credits
- **Hours:** 3V+2U+2A
- **Lecturers:** P. Müller

**Abstract:**
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

**Objective:**
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

**Content:**
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them.
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them.
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing.
- How to maintain the consistency of data structures

**Literature:**
Will be announced in the lecture.

**Prerequisites / notice:**
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

#### 252-0417-00L

**Title:** Randomized Algorithms and Probabilistic Methods

- **Type:** W
- **ECTS:** 10 credits
- **Hours:** 3V+2U+4A
- **Lecturers:** A. Steger

**Abstract:**
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

**Objective:**
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

**Content:**
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

**Lecture notes:**
Yes.

**Literature:**

#### 252-0463-00L

**Title:** Security Engineering

- **Type:** W
- **ECTS:** 7 credits
- **Hours:** 2V+2U+2A
- **Lecturers:** S. Krstic

**Abstract:**
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements&risk analysis, system modeling&model-based development methods, implementation-level security, and evaluation criteria for secure systems

**Literature:**
The papers will be presented in the first session of the seminar.

---

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1199 of 2159
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems.
Content

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature

- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice

Prerequisite: Class on Information Security

252-0535-00L Advanced Machine Learning W 10 credits 3V+2U+4A J. M. Buhmann, C. Cotrini Jimenez

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.
**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

**Prerequisites / notice**

The course is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters; starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2021

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

<table>

**Abstract**
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

**Objective**
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

**Content**
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understating these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

**Literature**
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

**Prerequisites / notice**
The course requires that the student have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

**Fostered competencies**
Subject-specific Competencies: assessed
- Concepts and Theories
- Techniques and Technologies

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1203 of 2159
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

- Students are familiar with fundamental network-security concepts.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0211-00L or 263-4660-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose network programming language such as C/C++, Go, Python, or Rust.

The goals of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition before taking this course.

This course provides an in-depth study of network attack techniques and methods to defend against them.

- Students are familiar with fundamental network-security concepts.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0211-00L or 263-4660-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose network programming language such as C/C++, Go, Python, or Rust.

The goals of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition before taking this course.

### Computer Architecture

Gain hands-on-experience with real products and the latest technology in distributed systems.

**Course Information**
- Credits: 6
- Lecturer: C. Zhang
- Prerequisites: Bachelor Studies at ETH
- Literature:
  - T. Roscoe, R. Wattenhofer, C. Zhang
- Prerequisites / notice: Knowledge of game theory is required.

**Abstract**
This course involves the participation in a substantial development and/or evaluation project involving distributed systems technology. There are projects available in a wide range of areas: from web services to ubiquitous computing including wireless networks, ad-hoc networks, RFID, and distributed applications on smartphones.

**Objective**
- Gain hands-on-experience with real products and the latest technology in distributed systems.

**Content**
This course involves the participation in a substantial development and/or evaluation project involving distributed systems technology. There are projects available in a wide range of areas: from web services to ubiquitous computing including as well wireless networks, ad-hoc networks, and distributed application on smartphones. The goal of the project is for the students to gain hands-on-experience with real products and the latest technology in distributed systems. There is no lecture associated to the course.

---

### Algorithmic Game Theory

**Course Information**
- Credits: 7
- Lecturer: P. Penna
- Prerequisites: No prerequisites.
- Literature:
  - "Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004
  - "Game Theory, Economics, and Computability", edited by O. Mutlu

**Abstract**
Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Objective**
- Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

**Content**
- The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a mathematical model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

**Outline:**
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy');
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

**Lecture notes**
Lecture notes will be usually posted on the website shortly after each lecture.

**Prerequisites / notice**
Several copies of both books are available in the Computer Science library.

---

### Security of Wireless Networks

**Course Information**
- Credits: 6
- Lecturer: S. Capkun, K. Kostiainen
- Prerequisites: Security of Wireless Networks
- Literature:
  - "Game Theory, Economics, and Computability", edited by O. Mutlu
  - "Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

**Abstract**
Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

**Objective**
After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.

**Content**

---

### Geometry: Combinatorics and Algorithms

**Course Information**
- Credits: 8
- Lecturer: M. Hoffmann, M. Wettstein
- Prerequisites: No prerequisites.
- Literature:

**Abstract**
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

**Objective**
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

**Content**
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

---

### Computer Architecture

**Course Information**
- Credits: 8
- Lecturer: O. Mutlu
- Prerequisites: No prerequisites.
- Literature:
  - Computer architecture is the science & art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

**Abstract**

This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

**Objective**
- Gain hands-on-experience with real products and the latest technology in distributed systems.

**Content**
- There are projects available in a wide range of areas: from web services to ubiquitous computing including wireless networks, ad-hoc networks, and distributed application on smartphones. The goal of the project is for the students to gain hands-on-experience with real products and the latest technology in distributed systems. There is no lecture associated to the course.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1206 of 2159
Objective
We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, processing-in-memory, interconnection networks, specialized systems for major data-intensive workloads (e.g., graph analytics, bioinformatics, machine learning), etc.

Content
The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

Lecture notes
All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

The video recordings of the lectures are expected to be made available after lectures.

Literature
We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

Prerequisites / notice

263-2400-00L Reliable and Trustworthy Artificial Intelligence W 6 credits 2V+2U+1A M. Vechev

Abstract
Creating reliable and explainable probabilistic models is a fundamental challenge to solving the artificial intelligence problem. This course covers some of the latest and most exciting advances that bring us closer to constructing such models.

Objective
The main objective of this course is to expose students to the latest and most exciting research in the area of explainable and interpretable artificial intelligence, a topic of fundamental and increasing importance. Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of problems.

To facilitate deeper understanding, an important part of the course will be a group hands-on programming project where students will build a system based on the learned material.

Content
This comprehensive course covers some of the latest and most important research advances (over the last 3 years) underlying the creation of safe, trustworthy, and reliable AI (more information here: https://www.sri.inf.ethz.ch/teaching/reliableai21):

- Adversarial Attacks on Deep Learning (noise-based, geometry attacks, sound attacks, physical attacks, autonomous driving, out-of-distribution)
- Defenses against attacks
- Combining gradient-based optimization with logic for encoding background knowledge
- Complete Certification of deep neural networks via automated reasoning (e.g., via numerical relaxations, mixed-integer solvers).
- Probabilistic certification of deep neural networks
- Training deep neural networks to be provably robust via automated reasoning
- fairness (different notions of fairness, certifiably fair representation learning)
- Federated Learning (introduction, security considerations)

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

For solving assignments, some programming experience in Python is expected.

252-3005-00L Natural Language Processing W 5 credits 2V+2U+1A R. Cotterell

Number of participants limited to 400.

Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-3210-00L Deep Learning W 8 credits 3V+2U+2A F. Perez Cruz, A. Lucchi

Number of participants limited to 320.

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
### Prerequisites / notice

This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
- Advanced Machine Learning
  https://ml2.inf.ethz.ch/courses/aml/
- Computational Intelligence Lab
  http://da.inf.ethz.ch/teaching/2019/CIL/
- Introduction to Machine Learning
  https://ias.inf.ethz.ch/teaching/introml-S19
- Statistical Learning Theory
  http://m2.inf.ethz.ch/courses/slt/
- Computational Statistics
  https://stat.ethz.ch/lectures/sis19/comp-stats.php
- Probabilistic Artificial Intelligence
  https://fas.inf.ethz.ch/teaching/pai-f18

<tr>
<td>Abstract</td>
<td>Formal methods are increasingly a key part of the methodological toolkit of systems programmers - those writing operating systems, databases, and distributed systems. This course is about how to apply concepts, techniques, and principles from formal methods to such software systems, and how to get into the habit of thinking formally about systems design even when writing low-level C code.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This course is about equipping students whose focus is systems with the insights and conceptual tools provided by formal methods, and thereby enabling them to become better systems programmers. By the end of the course, students should be able to seamlessly integrate basic concepts form formal methods into how they conceive, design, implement, reason about, and debug computer systems.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The goal is not to provide a comprehensive introduction to formal methods - this is well covered by other courses in the department. Instead, it is intended to provide students in computer systems (who may or may not have existing background knowledge of formal methods) with a basis for applying formal methods in their work.</td>

This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall semester, with rotating topics. Repetition for credit is possible with consent of the instructor. In the Fall 2021, the course will cover advanced topics in Internet routing and forwarding.

Content
The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

261-5100-00L
Computational Biomedicine
Number of participants limited to 120.

Objective
Over the past years, rapid technological advancements have transformed classical disciplines such as biology and medicine into fields of applied data science. While the sheer amount of the collected data often makes computational approaches inevitable for analysis, it is the domain specific structure and close relation to research and clinic, that call for accurate, robust and efficient algorithms. In this course we will critically review central problems in Biomedicine and will discuss the technical foundations and solutions for these problems.

Content
The course will consist of three topic clusters that will cover different aspects of data science problems in Biomedicine:
1) String algorithms for the efficient representation, search, comparison, composition and compression of large sets of strings, mostly originating from DNA or RNA Sequencing. This includes genome assembly, efficient index data structures for strings and graphs, alignment techniques as well as qualitative approaches.
2) Statistical models and algorithms for the assessment and functional analysis of individual genomic variations. this includes the identification of variants, prediction of functional effects, imputation and integration problems as well as the association with clinical phenotypes.
3) Models for organization and representation of large scale biomedical data. This includes ontology concepts, biomedical databases, sequence annotation and data compression.

Prerequisites / notice

227-0575-00L
Advanced Topics in Communication Networks

Objective
This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall semester, with rotating topics. Repetition for credit is possible with consent of the instructor. In the Fall 2021, the course will cover advanced topics in Internet routing and forwarding.

Content
The course will be divided in two main blocks. The first block (~8 weeks) will interleave classical lectures with practical exercises and labs. The second block (~6 weeks) will consist of a practical project which will be performed in small groups (~3 students). During the second block, lecture slots will be replaced by feedback sessions where students will be able to ask questions and get feedback about their project. The last week of the semester will be dedicated to student presentations and demonstrations.

- Tunneling
- Hierarchical routing
- Traffic Engineering and Load Balancing
- Virtual Private Networks
- Quality of Service/Queueing/Scheduling
- Fast Convergence
- Network virtualization
- Network programmability (OpenFlow, P4)
- Network measurements

Lecture notes
Lecture notes and material will be made available before each course on the course website.

Literature
Relevant references will be made available through the course website.

Prerequisites / notice
Prerequisites: Communication Networks (227-0120-00L) or equivalents / good programming skills (in any language) are expected as both the exercises and the final project will involve coding.

Fostered competencies

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Problem-solving: assessed
  - Project Management: assessed

- Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: assessed

- Personal Competencies
  - Adaptability and Flexibility: assessed
  - Creative Thinking: assessed
  - Critical Thinking: assessed

401-3901-00L
Linear & Combinatorial Optimization

Objective
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- *Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.*
- *Yang, Z. 2006. Computational Molecular Evolution.*
- *Yang, Z. 2006. Computational Molecular Evolution.*

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- maximum likelihood and Bayesian statistics
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- epidemiology
- pathogen evolution
- macroevolution of species

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- maximum likelihood and Bayesian statistics
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- pathogen evolution
- macroevolution of species

### Content

Key topics include:

- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

### Literature

Solid background in linear algebra.

### Prerequisites / notice

Former course title: Mathematical Optimization.

### Fostered competencies

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

**Social Competencies**

- Communication: assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

**Personal Competencies**

- Adaptability and Flexibility: not assessed
- Creative Thinking: assessed
- Critical Thinking: not assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

### 636-0017-00L Computational Biology

**Abstract**

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms for extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

**Objective**

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- maximum likelihood and Bayesian statistics
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- maximum likelihood and Bayesian statistics
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- pathogen evolution
- macroevolution of species

**Content**

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**

Lecture slides will be available on moodle.

**Literature**

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

### Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course “Introduction to Programming”, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date.

http://www.cbb.ethz.ch/news-events.html

For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&ansicht=KATALOGDATEN&lerneinheitId=123546&lang=d e, or working through the script provided as part of this R course.

### Seminar in General Studies

</tr>
</tbody>
</table>
The seminar covers various topics in information security: security protocols, trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Audio: 06.09.2022 12:51 Autumn Semester 2021 Page 1211 of 2159
The course will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

Abstract
This course gives an overview about wireless standards and summarizes the state of art for Wi-Fi 802.11, Cellular 5G, and Internet-of-Things, including new topics such as contact tracing with Bluetooth, audio communication, cognitive radio, visible light communications. The course combines lectures with a set of assignments in which students are asked to work with a JAVA simulation tool.

Objective
The objective of the course is to learn about the general principles of wireless communications, including physics, frequency spectrum regulation, and standards. Further, the most up-to-date standards and protocols used for wireless LAN IEEE 802.11, Wi-Fi, Internet-of-Things, sensor networks, cellular networks, visible light communication, and cognitive radios, are analyzed and evaluated. Students develop their own add-on mobile computing algorithms to improve the behavior of the systems, using a Java-based event-driven simulator. We also hand out embedded systems that can be used for experiments for optical communication.

Content
New: Starting 2020, we will address contact tracing, radio link budget, location distance measurements, and Bluetooth in more depth.

Prerequisites / notice
All other students: read the paper and submit questions they have about the paper before the presentation.

Prerequisites
Only students who fulfill one of the following requirements are allowed to begin a research project:

a) Students should have interest in wireless communication, and should be familiar with Java programming. Experience with GNU Octave or Matlab will help too (not required).

b) For Computer Science MSc.

ECTS: 4P+3A

Professors

Hours

2nd semester students join a research group of D-INFK in order to acquire a broader view of the different research groups and areas. The research plan aims at planning and structuring a student's research work and thesis. It further contributes to the student's ability to write research proposals. To register the internship, please submit a document to the Student Administration Office containing the following information at the latest two weeks after beginning the internship:

- a detailed task description: task, technologies, milestones etc.
- start and end date of the internship
- supervisor: name and academic degree

Internships

Internship

Type

ECTS

Hours

Lecturers

W

0 credits

external organisers

Internship

Only for Computer Science MSc.

Abstract

An internship provides opportunities to gain experience in an industrial environment and creates a network of contacts.

Objective

The main objective of the internship is to expose students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Content

Internship in a computer science company, which is admitted by the CS Department at ETH. Minimum 10 weeks fulltime employment.

Prerequisites / notice

This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

Election Courses (only for Programme Regulations 2009)

Students can individually chose from the entire Master course offerings from ETH Zurich, EPF Lausanne, the University of Zurich and - but only with the consent of the Director of Studies - from all other Swiss universities.

For further details, refer to Art. 31 of the Regulations 2009 for the Master Program in Computer Science.

Interfocus Courses

Algorithms Lab

Only for master students!

Abstract

Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

Objective

The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them (using C/C++, STL, CGAL, and BGL).

Literature

Information Security Lab

Only for master students!

Number of participants limited to 250.

Abstract

The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Objective

After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

Content

1. Universal approximation with single- and multi-layer networks

2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory

3. Fundamental limits of deep neural network learning

4. Geometry of decision surfaces

5. Separating capacity of nonlinear decision surfaces

6. Vapnik-Chervonenkis (VC) dimension

7. VC dimension of neural networks

8. Generalization error in neural network learning

Lecture notes

Detailed lecture notes are available on the course web page https://www.mins.ee.ethz.ch/teaching/int/
**Abstract**
This InterFocus Course will provide a broad, hands-on introduction to Information Security, introducing adversarial thinking and security by design as key approaches to building secure systems.

**Objective**
This course will introduce key concepts from Information Security, both from attack and defence perspectives. Students will gain an appreciation of the complexity and challenge of building secure systems.

**Content**
The course is organised in two-week segments. In each segment, a new concept from Information Security will be introduced. The overall scope will be broad, including cryptography, protocol design, network security, system security.

**Lecture notes**
Will be made available during the semester.

**Literature**
Paul C. van Oorschot, Computer Security and the Internet: Tools and Jewels.
Dan Boneh and Victor Shoup, A Graduate Course in Applied Cryptography.

**Prerequisites / notice**
Ideally, students will have taken the D-INFK Bachelors course "Information Security" or an equivalent course at Bachelors level.

---

**GESS Science in Perspective**

Note that no more than six credits can be accredited in this category.

see GESS Science in Perspective: Language Courses
ETH/UZH

see GESS Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended GESS Science in Perspective (Type B) for D-INFK.

---

- Only students who fulfill the following criteria are allowed to begin with their master thesis:
  - a. successful completion of the bachelor programme;
  - b. fulfilling any additional requirements necessary to gain admission to the master programme;
  - c. "Inter focus courses" (12 credits) completed;
  - d. "Focus courses" (26 credits) completed.

**Abstract**
The Master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

**Objective**
To work independently and to produce a scientifically structured work under the supervision of a Computer Science Professor.

**Content**
Independent project work supervised by a Computer Science professor. Duration 6 months.

**Prerequisites / notice**
Supervisor must be a professor at D-INFK or affiliated, see https://inf.ethz.ch/people/faculty.html

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Thermodynamics is key to understanding and use of energy conversion processes in Nature and technology. The main objective of this course is to give a compact introduction into basics of Thermodynamics: Thermodynamic states and thermodynamic processes; Work and Heat; First and Second Laws of Thermodynamics. Students shall learn how to use energy balance equation in the analysis of power cycles and shall be able to evaluate efficiency of internal combustion engines, gas turbines and steam power plants. The course shall extensively use thermodynamic charts to build up students' intuition about opportunities and restrictions to increase useful work output of energy conversion. Thermodynamic functions such as entropy, enthalpy and free enthalpy shall be used to understand chemical and phase equilibrium. The course also gives introduction to refrigeration cycles, combustion and refrigeration. The course compactly covers the standard course of thermodynamics for engineers, with additional topics of a general physics interest (nonideal gas equation of state and Joule-Thomson effect) also included.

This course provides the students with an introduction to thermodynamics and energy conversion. Students shall gain basic understanding of energy and energy interactions as well as their link to energy conversion technologies.

Objective

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties’ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients’ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

Content

“Design and Building Process MIBS” is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the establish building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering and construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the provided services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

Objective

Building materials with a special focus on regenerative materials: earth, bio-based and reuse. Sourcing, properties and performance, building envelope integration and detailing, sustainable building construction

Abstract

Special focus on regenerative materials: earth, bio-based and reuse

Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, wood and bamboo, earth
- Insulating materials (bio-based vs conventional)
- Air barrier, vapour barrier and sealants
- Interior finishing

Assessment of materials and components behaviour and performance

Solutions for energy retrofitting of (historical) buildings

Aspects of sustainability and durability
This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Objective
- Students must be able to discuss basic principles, problems and approaches in microeconomics. Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can also recognize behavioural failures within a market and discuss basic concepts related to behavioural economics. (6) Students can apply simple mathematical concepts on economic problems.

Content
- The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programmes. Thus, the goal of the lecture “Principles of Microeconomics” is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

Topics covered by the course are:
- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes
Lecture notes, exercises and reference material can be downloaded from Moodle.
Literature
N. Gregory Mankiw and Mark P. Taylor (2020), "Economics", 5th edition, South-Western Cengage Learning. The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

GESS (Science in Perspective): This lecture is for MSc students only. BSc students register for 363-1109-00L Einführung in die Mikroökonomie.

066-0423-00L Application of CFD in Buildings

Limited number of participants. Enrolment is only possible in agreement with the chair.

W 3 credits 3V D. Lakehal

Abstract
Fundamentals, Applications and Project works in the area of CFD in buildings.

Objective
I- Understanding:
- Basic principles of fluid flow & heat transfer
- Basic concepts of CFD
- Validation and verification, practical guidelines

II- Application and project works of CFD in buildings. Use of the CFD software www.transat-cfd.com only, which is installed in the computer room of the Archi. Department.

Students will have two projects:

1- Group projects: Beginning of Nov. Projects will be assigned by the tutors to the students organized in groups of 2. Projects will include canonical problems in two dimensions essentially. A report is to be handed out end of Nov.

2- Individual Projects: 2nd week of Nov. to Christmas. These are individual projects, chosen by students from the list of items below.

NOTE:
Students enrolled in the "Integrated Design Project" course can use their Individual Project (this class) for their IDP project, provided (1) they attend this course (CFD in Buildings) and use the CFD code TransAT to benefit the support of the tutors.

Content
I. Fundamentals
- Basic principles of fluid flow & heat transfer
- Laminar versus turbulent flow
- Forced vs. natural convection
- Basic concepts of CFD (Discretization, schemes, solvers, etc.)
- Turbulence modelling
- Near-wall treatment
- Validation and verification, practical guidelines

II. Application of CFD for real problems including (Projects):

1. Wind – Urban Scale: students would use the building shape to determine locations for wind inlets and outlets based on façade pressures
2. Wind – Cross-ventilation: using the interior shape of a building with inlets and outlets to determine flow rates
3. Stack effect: on a windless day with people in the building, how much airflow would be anticipated airflow rate given inlets and outlets
4. Wind & heat removal: Given inlets and outlets with people in the building, how much heat is removed from the building
5. Solar chimney: given a building with a chimney, how much extra airflow is created if the chimney is solar (absorbs radiation) vs. typical (not designed to absorb radiation)
6. Plant/vegetation effects: Given a building with a courtyard, how much is cross-ventilation affected by including plants vs. not having plants or how will the plants affect stack venting.
7. Air pollution and contaminant dispersion

Lecture notes
Material (pdf files) will be sent to the students before the start of the course.
We will update the material in due time.

151-8007-00L Urban Physics

Abstract
Urban physics: wind, wind comfort, pollutant dispersion, natural ventilation, driving rain, heat islands, climate change and weather conditions, urban acoustics and energy use in the urban context.

Objective
- Basic knowledge of the global climate and the local microclimate around buildings
- Impact of urban environment on wind, ventilation, rain, pollutants, acoustics and energy, and their relation to comfort, durability, air quality and energy demand
- Application of urban physics concepts in urban design

Content
- Climate Change. The Global Picture: global energy balance, global climate models, the IPCC process. Towards regional climate scenarios: role of spatial resolution, overview of approaches, hydrostatic RCMs, cloud-resolving RCMs
- Urban micro climate and comfort: urban heat island effect, wind flow and radiation in the built environment, convective heat transport modelling, heat balance and ventilation of urban spaces - impact of morphology, outdoor wind comfort, outdoor thermal comfort,
- Urban energy and urban design. Energy performance of building quarters and cities, decentralized urban energy production and storage technologies, district heating networks, optimization of energy consumption at district level, effect of the micro climate, urban heat islands, and climate change on the energy performance of buildings and building blocks.
- Wind driving rain (WDR): WDR phenomena, WDR experimental and modeling, wind blocking effect, applications and moisture durability
- Pollutant dispersion. pollutant cycle : emission, transport and deposition, air quality
- Urban acoustics. noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation

Lecture notes
The course lectures and material are provided online via Moodle.

Prerequisites / notice
For MiBS Master students 151-8011-ool Building Physics Theory & Application is a pre-requisite for this course or instructor permission. For others no prior knowledge is required.

066-0421-00L Building Systems I

Abstract
Building Systems I gives an overview of fundamentals and concepts relevant for the design of building systems.

Objective
The course has the following learning objectives:
- Knowledge of the fundamentals, principles and technologies for building heating, cooling, ventilation and electricity supply.
- Knowledge of the integration and interdependencies of building systems and building structure, construction and aesthetics
- Ability to estimate relevant quantities and qualities for heating/cooling/ventilation/electricity of buildings and the related supply systems
- Ability to evaluate and choose an approach for sustainable heating/cooling/ventilation/electricity, the system and its components
- Synthesis in own integrated design projects

Content
1. Comfort & Environment
2. Heating / cooling concepts and demand
3. Natural / mechanical ventilation concepts and demand
4. Solar generation / electricity storage and demand
5. Information & Communication Technologies

101-0524-00L Lean, Integrated and Digital Project Delivery

Abstract
This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.
By the end of the course, students will be able to plan and manage the lean, integrated, and digital project delivery of a construction project.

Students will know they are able to achieve this overall course goal when they can:

1. Apply the fundamental theories of lean production to the context of construction management. This includes the ability to describe the three views of production: transformation, flow and value generation; evaluate the benefits of a pull production system compared to push production systems; evaluate how production variability and uncertainty contributes to work-in-process and 'waste'; and apply the concepts of lean production to several construction management tools including the Last Planner System, Pull Planning, Target Value Design, and Takt Planning.

2. Understand the fundamentals of Virtual Design and Construction and Building Information Modeling. This includes the ability to prepare a model breakdown structure capable of integrating project information for all stakeholders; describe the upcoming transition to a common data environment for BIM that will use platforms such as Autodesk Forge; and describe the barriers to successful implementation of BIM within construction and design firms.

3. Plan and schedule an integrated '5D' scope schedule cost model using the Tri-Constraint Method. This includes the ability to understand the TCM algorithm, apply parametric logic to the creation of a virtual model for construction production; and evaluate the limitations of the critical path method when compared to resource- and space-constrained scheduling.

4. Evaluate benefits of integrated project governance compared to the organization of traditional construction project delivery systems. This includes the ability to evaluate the risks, benefits and considerations for integrated teams using multi-party relational contracts that cross disciplinary and firm boundaries; and explain to others the 'elements' of integrated projects (e.g. colocation, early involvement of key stakeholders, shared risk/reward, collaborative decision making).

The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the four criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g. colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects.

For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, takt time planning, production tracking, and target value design.

For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and ‘5D and 6D’ models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

Lecture Presentation slides will be available for viewing and download the day before each lecture.

The class will be presented in a ‘flipped classroom’ environment where students will be required to do readings or watch video before class. In-class activities will act to reinforce and expand upon these primary concepts.

If possible due to COVID restrictions, students will be expected to attend a half-day workshop on the Last Planner System. The date of this workshop will be provided at a later point in time.

A full list of required readings will be made available to the students via Moodle.

Project Management for Construction Projects (101-0007-00L) is a recommended but not required prerequisite for this course.

101-0608-00L Design-Integrated Life Cycle Assessment W 3 credits 2G G. Habert

Abstract

Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

Objective

The course will follow two main objectives and a third optional objective, depending on the design projects the students’ choose. At the end of the course, the students will:

1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation
Content

The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand

The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:

1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Part II: Project-based learning

In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:

1) Introduction to Rhinoceros 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis

Lecture notes

As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice

- Prerequisite: Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.
- The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.

151-0209-00L

Abstract

Renewable energy technologies: solar PV, solar thermal, biomass, wind, geothermal, hydro, waste-to-energy. Focus is on the engineering aspects.

Objective

Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.

Lecture notes

Lecture Notes containing copies of the presented slides.

Prerequisites / notice

- Prerequisite: strong background on the fundamentals of engineering thermodynamics, equivalent to the material taught in the courses Thermodynamics I, II, and III of D-MAVT.

101-0123-00L

Abstract

The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form of a structure and the forces within it by promoting the development of designed projects.

Objective

After successfully completing this course the students will able to:

1. Critically question structural design concepts of historical and contemporary references
2. Use graphic statics and strut-and-tie models based on the Theory of Plasticity to describe the load bearing behavior of structures
3. Understand different construction technologies and have an awareness of their potential for structural design
4. Use contemporary digital tools for the design of structures in equilibrium
5. Design an appropriate structural system for a given design task taking into account architectural considerations

Content

The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester; a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

Theory:

Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project:

Specific structural design approaches and design references based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students’ ability to integrate architectural considerations into their structural design.

529-0010-00L

Abstract

This is a general chemistry course aimed at first year undergraduate students in the Department of Mechanical and Process Engineering (D-MAVT) and graduate students in the Department of Architecture (D-ARCH).
The course is based on "Chemistry The Central Science" by Brown, LeMay, Bursten, Murphy, Woodward, and Stoltzfus. Pearson, 14th Edition in SI units (global edition).

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Lectures are available prior to every lecture and can be downloaded from Moodle.

The aims of the course are as follows:
1) To provide a thorough understanding of the basic principles of chemistry and its application.
2) To develop an understanding of the atomic and molecular nature of matter and of the chemical reactions that describe its transformations.
3) To emphasize areas considered most relevant in an engineering context.

Electronic structure of atoms, chemical bonding, molecular geometry and bonding theories, intermolecular forces, gases, thermodynamics, chemical thermodynamics, chemical kinetics, equilibria, liquids and solutions, acids and bases, redox- and electrochemistry.

Abstract
Lecture notes containing copies of the presented slides.

Introduction to Mathematical Optimization

Adaptability and Flexibility

Electronic structure of atoms, chemical bonding, molecular geometry and bonding theories, intermolecular forces, gases, thermodynamics, chemical thermodynamics, chemical kinetics, equilibria, liquids and solutions, acids and bases, redox- and electrochemistry.

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

An Introduction to Sustainable Development in the Built Environment

**Abstract**

In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict. What does it mean for the built environment?

This course provides an introduction to the notion of sustainable development when applied to our built environment.

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, economical, ecological, institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

**Literature**

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided. A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

**Prerequisites / notice**

This course is meant for students who did not already attend the course “Mathematical Optimization”, which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

**Corporation Sustainability**

3 credits

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

**Lecture notes**

Moodle platform (enrollment needed)

**Literature**

**Course Code: 402-0809-01L**

**Introduction to Computational Physics (for Civil Engineers)**

4 credits

This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

**Prerequisites / notice**

Successful completion of IM1: 101-0579-00 Evaluation tools is a prerequisite for this course.

**Lecture notes**

http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Presentation slides will be made available on moodle prior to lectures.

**Literature**

Lecture recommendations will be distributed during the lecture

**TEACHING FORMAT/ ATTENDANCE:** Please note that we aim to offer you the course in-class and online, but at this point we cannot guarantee that a purely online participation is possible. Irrespective of the format (in-class or online), the course includes several mandatory sessions that participants must attend to successfully earn credit points.
Objective

Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

Content

Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations. Using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

Lecture notes

Lecture notes and slides are available online and will be distributed if desired.

Structural Reliability and Risk Analysis

W 3 credits 2G S. Marelli

Abstract

Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective

The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content

Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIa or Euro- codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post- and pre-post risk assessment methods are presented.

Lecture notes

Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

Carbon Mitigation

W 3 credits 2G N. Gruber

Priority is given to the target groups: Bachelor and Master Environmental Sciences and PhD Environmental Sciences until September 21st 2021.

Waiting list will be deleted October 1st, 2021.

Abstract

Future climate change can only be kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations by guest speakers from industry and the public sector, and final presentations by the students.

Objective

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content

From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes

None

Literature

None

Prerequisites / notice

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

This book also can be used for the course '363-0503-00L Principles of Microeconomics' (Filippini). Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

The course itself will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Finally, the course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

The course itself will help you answer.
Three buildings case study will be presented.

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), Label SNBS, MINERGIE-ECCO and 2000-Watt-Site (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

This alternance of working session on one specific criteria for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus point (operation energy, mobility, daylight, indoor air quality).

All documents for certification labels as well as detail plans of the buildings will be available for the students.

### Content

**The Digital in Architecture II (Exercise)**

- **Prerequisite:** Successful completion of the course “Structural Design VI” (063-0696-00L), “Design III” (052-0541.143/45) or “Das Digitale in der Architektur” (063-0610-00L).
- **This core course (ending with =00L=) can only be passed once! Please check before signing up.**

#### ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.

#### ZoomLink: https://ethz.zoom.us/j/66588100789

**Informatics**

- **Prerequisite:** Successful completion of the courses “Structural Design VI” (063-0696-00L), “Design III” (052-0541.143/45) or “Das Digitale in der Architektur” (063-0610-00L).

#### ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.

### Objective

- **Students learn to**
  - choose and apply appropriate tools from computer science,
  - process and analyze real-world data from their subject of study,
  - handle the complexity of real-world data.
- **Content**
  1. Modeling and simulations
  2. Data management with lists and tables
  3. Data management with a relational database
  4. Introduction to macro programming
  5. Introduction to programming with Python
- **Prerequisites / notice**
  - All materials for the lecture are available at www.evim.ethz.ch
  - This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

### Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.

### Notice

- Relevant readings will be recommended throughout the course (and made available to the students via Moodle).
- The students will be randomly assigned to teams. Students will be graded as a team based on the final Project report and the in-class oral presentation of the Project Proposal as well as a final exam (50% exam and 50% project report and presentation). Homework will not be graded but your final report and presentation will consist mostly of your homework assignments consolidated and put in a report and presentation format.

### Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1227 of 2159
Objective
- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Literature
Aerni, P., 2016a. Coping with Migration-Induced Urban Growth: Addressing the Blind Spot of UN Habitat. Sustainability 8(800), doi:10.3390/su8080800

Prerequisites / notice
The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html

Abstract
ETH Week is an innovative one-week course designed to foster critical thinking and creative learning. Students from all departments as well as professors and external experts will work together in interdisciplinary teams. They will develop interventions that could play a role in solving some of our most pressing global challenges. In 2021, ETH Week will focus on the topic of health and well-being.
Objective - Domain specific knowledge: Students have immersed knowledge about a certain complex, societal topic which will be selected every year. They understand the complex system context of the current topic, by comprehending its scientific, technical, political, social, ecological and economic perspectives.

- Analytical skills: The ETH Week participants are able to structure complex problems systematically using selected methods. They are able to acquire further knowledge and to critically analyse the knowledge in interdisciplinary groups and with experts and the help of team tutors.

- Design skills: The students are able to use their knowledge and skills to develop concrete approaches for problem solving and decision making to a selected problem statement, critically reflect these approaches, assess their feasibility, to transfer them into a concrete form (physical model, prototypes, strategy paper, etc.) and to present this work in a creative way (role-plays, videos, exhibitions, etc.).

- Self-competence: The students are able to plan their work effectively, efficiently and autonomously. By considering approaches from different disciplines they are able to make a judgment and form a personal opinion. In exchange with non-academic partners from business, politics, administration, nongovernmental organisations and media they are able to communicate appropriately, present their results professionally and creatively and convince a critical audience.

- Social competence: The students are able to work in multidisciplinary teams, i.e. they can reflect critically their own discipline, debate with students from other disciplines and experts in a critical-constructive and respectful way and can relate their own positions to different intellectual approaches. They can assess how far they are able to actively make a contribution to society by using their personal and professional talents and skills and as “Change Agents”.

- Remote collaboration competence: The students work in a hybrid setting blending physical and virtual communication and collaboration methods and tools. They experience the potential and limitations of remote collaboration.

Content The week is mainly about problem solving and design thinking applied to the complex world of health and well-being. During ETH Week students will have the opportunity to work in small interdisciplinary groups, allowing them to critically analyse both their own approaches and those of other disciplines, and to integrate these into their work.

While deepening their knowledge about health and well-being, students will be introduced to various methods and tools for generating creative ideas and understand how different people are affected by each part of the system. In addition to lectures and literature, students will acquire knowledge via excursions into the real world, empirical observations, and conversations with researchers and experts.

A key attribute of the ETH Week is that students are expected to find their own problem, rather than just solve the problem that has been handed to them.

Therefore, the first three days of the week will concentrate on identifying a problem the individual teams will work on, while the last two days are focused on generating solutions and communicating the team’s ideas.

Prerequisites / notice No prerequisites. Programme is open to Bachelor and Masters from all ETH Departments. All students must apply through a competitive application process at www.ethz.ch/ethweek. Participation is subject to successful selection through this competitive process.

376-1177-00L Human Factors I

W 3 credits 2V M. Menozzi Jäckli, R. Huang, M. Siegrist

Abstract Strategies of human-system-interaction, individual needs, physical & mental abilities, and system properties are key factors affecting the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people’s health, well-being, and satisfaction as well as the overall system performance.

Objective The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content - Physiological, physical, and cognitive factors in sensation, perception, and action
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance, well-being, and comfort
- Usability engineering in system designs, product development, and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature - Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

363-1065-00L Design Thinking: Human-Centred Solutions to Real World Challenges

Does not take place this semester.

W 5 credits 5G S. Brusoni

Abstract The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Information and application: http://sparkslabs.ch/

Objective During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders (empathy).
- Engage in collaborative ideation with a multidisciplinary team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through meanings beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

For more information and the application visit: http://sparklabs.ch/

Please note that the class is designed for full-time MSc students. Interested MAS students need to send an email to Linda Armbruster to learn about the requirements of the class.

History and Theory in Architecture IX (Avermaete)

This core course (ends with «01L») can only be passed once! Please check this before signing up.

Abstract

This survey course offers an introduction to urban theory for students of architecture and urban design, by exploring the past and current discourses on cities and urban development.

Objective

It is often said that we live in an ‘urban age’: cities are the most common habitat for the inhabitants of the world, today. Moreover, while more than half of the global population lives in cities according to the reports of the UN, it is expected that within the next few decades this amount will increase to two-thirds. This ‘urban’ condition, however, cannot be generalized. Within the term ‘city’ a broad range of different urban conditions are taken together: from metropolises to suburban neighborhoods, and from shrinking (old industrial) cities to the new cities that prosper under the conditions of globalization. Nevertheless, because of the increase of the urbanized environments, the development of cities forms the topic of discussion among a wide range of people. Urban developments do concern politicians, economists, anthropologists, philosophers, citizens and activists, developers and designers. In turn, the urban realm has provoked theorists, citizens, politicians, artists and designers to think and write about its form and functioning, appearance and structure. The discourse regarding the current growth of cities has a long pedigree in history, going back to the establishment of Greek and Roman city-states. In turn, urban planners have made valuable contributions to these discussions, in writings and in actual urban design projects and proposals.

This survey course aims to offer an introduction to urban theory for students of architecture and urban design, by exploring the past and current discourses on cities and urban development. By investigating a range of topics, from politics to poverty, and from modernization to commodification, it aims to show how urban and architectural design are related to theory. The aim of the course is to challenge the question how architects and urban designers can have an influence on urban development. With this question, also students are urged to reflect upon their own position regarding architectural interventions in the urban fabric.

This course aims to offer a survey of the history and current state of urban theory for students of urban design and architecture. Weekly, one-hour lectures address one particular topic at a time (e.g. politics, public space, capital). In each lecture, this theme is investigated through three case-studies (either of particular cities or seminal contributions by theorists or designers) that highlight crucial moments in the history and developments of cities. At the same time, the case studies will be structured so as to bridge between urban theories and concrete urban situations, design reflections and political ambitions. This will help convey to students the historical pedigree of current discourses on cities, whether simultaneously gain insight the role of designers in respect to the chosen topic. Students will prepare the meetings by reading fragments from core texts on the forefront.

Content

European Aspects of Spatial Development

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective

Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:

- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

Prequisites / notice

Open mind, ability to manage uncertainty and to work with students from various background. Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session.

Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Please note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Evidence-Based Design: Methods and Tools For Evaluating Architectural Design

Number of participants limited to 40

Particularly suitable for students of D-ARCH

Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Prerequisites / notice

Only for master students, otherwise a special permission by the lecturer is required.

### Lecture notes

The documents for the lecture will be provided at the moodle.

### Literature

Obligatory literature:

Recommended literature:

**Governance models:**

**Planning models:**

**EU as a political context:**

**Territorial cooperation in Europe:**

**Planning families and cultures:**

**Planning systems in Europe:**

**Content**

- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the basis of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1231 of 2159
Objective

The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Information Systems for Engineers

| 252-0834-00L | Information Systems for Engineers | W 4 credits | 2V+1U | G. Fourny |

Abstract

This course provides the basics of relational databases from the perspective of the user.

Objective

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality.
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

- Lecture material (slides).

Prerequisites / notice

- For non-CS/DS students only, BSc and MSc students (analytics).
- Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

Urban Design III

| 052-0707-00L | Urban Design III | W 2 credits | 2V | H. Klumpner, M. Fessel |
Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

Objective
How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how we look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.

Content
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasons, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

Abstract
The seminar week is obligatory for students of all semesters. There are many and varied study contents.

Objective
The students will be enabled to discuss narrowly formulated factual questions in small groups and in direct contact with the professors.

Lecture notes
The learning material, available via https://moodle-app2.let.ethz.ch/ is comprised of:
- ToolBox 'Reader' with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings

Literature
- Reading material will be provided throughout the semester.

| 051-0911-21L | Seminar Week Autumn Semester 2021 | W 2 credits 3A Lecturers |
| 063-0607-00L | Energy- and Climate Systems III | W 2 credits 2V |

063-0607-00L Energy- and Climate Systems III
This core course (ending with «00L») can only be passed once! Please check before signing up.

Abstract
The course 'Energy- and Climate Systems III' introduces computational design and analysis methods and tools for climate responsive architectural design. Exercises throughout the semester will allow applying new concepts learnt in exemplary architectural design tasks.

Objective
By the end of this course, students will be able to:
- compare and assess passive and active design strategies for bioclimatic buildings
- analyze environmental site characteristics for its climate and (solar) energy potentials
- apply computational simulation tools to support performance-driven designs
- translate design ideas into parametric models and into optimization problems
- synthesize learnt content of the course in exemplary architectural design tasks, serving as a basis for the students' future design studios and projects

Data: 06.09.2022 12:51   Autumn Semester 2021   Page 1233 of 2159
**Climate Responsive Architecture with Hive**

All students need to be capable of working with ‘Rhino / Grasshopper’ modeling software on ‘Windows’ or willing to acquire the necessary skills before or during the course and are recommended to have completed the online blended learning course ‘Climate responsive architecture with Hive’.

**151-3209-00L Engineering Design Optimization**

- **W 4 credits 4G K. Shea, T. Stankovic**
- **Number of participants limited to 60.**
- **Abstract**
  The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.
- **Objective**
  The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course students will be able to express engineering design problems as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization model. They will understand the links between optimization and engineering design in order to design more efficient and performance optimized technical products. The exercises are MATLAB based.
- **Content**
  1. Optimization modeling and theory
  3. Constrained optimization methods
- **Lecture notes**
  available on Moodle
- **Suggested Reading:**
  O. Martin: Bayesian analysis with python. Packt Publishing Ltd, 2016
- **Prerequisites / notice**
  Familiarity with MATLAB and / or Python is advised.

**101-0139-00L Scientific Machine and Deep Learning for Design and Construction in Civil Engineering**

- **W 3 credits 4G M. A. Kraus, D. Griego**
- **Abstract**
  This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.
- **Objective**
  This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.
- **Content**
  The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.
- **Lecture notes**
  The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.
- **Suggested Reading:**
  O. Martin: Bayesian analysis with python. Packt Publishing Ltd, 2016
- **Prerequisites / notice**
  Familiarity with MATLAB and / or Python is advised.

**052-0639-00L Climate Responsive Architecture with Hive**

- **W 1 credit 2G A. Schlütter**
- **Abstract**
  This Online course provides an introduction to climate-responsive design using the Hive tool and how to apply it in early building design stages. Hive allows architecture and building science students to understand the relation between architectural design, climate, comfort and energy. Hive is a plugin for the 3D modeling environment Rhino and its visual programming interface Grasshopper.
- **Objective**
  - Recall general principles of climate responsive design and examples of it.
  - Utilize 3D building geometries to conduct simplified energy demand and supply simulations.
  - Observe relevant physical principles and interactions between climate, energy and geometry.
  - Implement passive and active concepts for Climate Responsive Design.
  - Apply Hive for building design analysis and integrate it into own designs or in design courses.
  - Identify and harness synergies and trade-offs between climate, energy and architectural design aspects.
- **Content**
  The course can be frequented individually, or as a prerequisite for other courses such as the master course Climate and Energy Systems 3 or architectural design studios.
- **Prerequisites / notice**
  A working Rhino 6 or 7 license is necessary.

**851-0096-00L Science in Society**

- **W 3 credits 2G L. Wingert**
- **Abstract**
  Whose voice should count how much? On the authority of the sciences in democracy.
- **Objective**
  Not a few members of the elites argue that important issues in democracy like policies against climate change, free trade agreements, urban planning are too complicate for the people. Experts should have a stronger say in politics. Less democracy = more rationality? The course should give an answer to this question.
Implementation of Environmental and Other Sustainability Goals
Master students in Environmental Engineering choosing module Ecological Systems Design are not allowed to enrol 102-0327-01 Advanced Environmental Assessments (2KP) as already included in 102-0307-01 Advanced Environmental, Social and Economic Assessments (5KP).

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications, regarding products & services as well as organisations.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including 'organisational LCA' (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- demonstrate life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management

Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multisource processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of 'Continuous Improvement'
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small exercises related to course issues.

Lecture notes
Part I: Slides and background reading material will be available on lecture homepage
Part II: Documents will be available on Ilias

Literature
Will be made available.

Prerequisites / notice
This course should only be elected by students of environmental engineering with a module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. (2016). Environmental Life Cycle Assessment, CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5.2)).

Real Estate Property Law
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Objective
Overview of the legal norms of land registry and surveying law.

Content
Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal problems of surveying, the reform of official surveying, liability of the geom-eter.

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1235 of 2159
The semester project is designed to train students in solving specific research questions in the field of integrated building systems. The project courses focus on fostering various competencies, including analytical, method-specific, social, and personal competencies. The semester project itself enables students to identify site-specific energy demand and potentials, develop integrated energy and climate systems on both the urban and building scale and evaluate their interactions and impact on building design and operation.

**Abstract**
During the integrated design studio students work on a selected integrated architectural / urban design project, considering both energy-and climate systems (HVAC) as well architectural and urban design in a specific site context. The objective is to follow an integrated design process to achieve synergistic solutions.

**Objective**
The integrated design studio enables students to identify site-specific energy demand and potentials, develop integrated energy and climate systems on both the urban and building scale and evaluate their interactions and impact on building design and operation. Retrieving relevant concepts and technologies of energy and HVAC systems, students are able to develop and compare integrated concepts using appropriate methods and digital toolsets and present them to a mixed audience using drawings, renderings and reports.

**Content**
During the studio students will work in groups on a contemporary integrated design project (urban and/or building scale) executing an integrated design process from the analysis of site potentials, the identification of demands, the development of an urban scale energy concept and a matching building energy- and HVAC-systems concept. Input lectures from academics and professionals will highlight specific topics relevant to the task. The projects will be presented by the student groups and discussed with internal and external reviewers at midterm and at the final presentations.

**Abstract**
The semester project can commence only after the first year of coursework is completed.

**Objective**
The semester project focuses in solving specific research questions in the field of integrated building systems.

**Content**
The semester project is designed to train students in solving specific research questions in the field of integrated building systems. The goal is to apply acquired knowledge which is gained throughout the first year of the master's program. The semester project is advised by a professor who is affiliated with one of the partner departments of the Master program "Integrated building systems".

**Abstract**
This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

**Objective**
The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

- The History and Theory of the City as Project
- Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
- The Idea of the Polis: Rome, Greece and Beyond
- The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
- Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
- Of Absolutism and Enlightenment: Baroque, Defense and Colonization
- The City of Labor: Company Towns as Cross-Cultural Phenomen
- Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
- The History and Theory of the City as Project
- The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
- Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
- Of Absolutism and Enlightenment: Baroque, Defense and Colonization
- The City of Labor: Company Towns as Cross-Cultural Phenomen
- Garden Cities of Tomorrow: From the Global North to the Global South and Back Again

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

851-0609-06L Governing the Energy Transition

<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary. This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.</td>

A list of further recommended literature will be found within each chapter of the reader (Skript).
Content

This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

851-0101-74L Sustainable Development - Bridging Art and Science W 3 credits 2G L. Hensgen, S. Patel

In this course students deepen their knowledge about global development and sustainability issues. We will show five movies each of them linked to one of the five P’s (Planet, People, Prosperity, Peace and Partnerships) reflecting the topics of the 2030 Agenda. Afterwards the movie will be critically discussed with researchers and relevant stakeholders from the broader society.

Objective

- Students get a broad understanding of some of the most important issues and discussions related to sustainable development.
- Students get exposed to diverse realities of young people in developing countries
- Students can critically reflect upon the information that is presented to them in the movies and relate it to the broader discussions around sustainable development.
- Students reflect on issues concerning communicating research and the realities of low-income settings to a wider public.

Content

The aim of the course is to deepen student’s knowledge about global issues and to inspire them to reflect critically upon complex topics, which are related to the broader discourse on sustainable development. In each class, we show a documentary film, which is linked to one of the five critical areas of the 2030 Agenda (Planet, People, Prosperity, Peace and Partnerships), putting specific focus on realities in developing countries. Following the movie screenings, we will discuss the topic of the film in the light of sustainable development with an expert from academia and/or a practitioner from the field of development cooperation. In preparation for each class, the students read an academic paper, which will also be considered in the discussion. The idea of "Bridging Art and Science" is to expose an interdisciplinary group of students to artistic and scientific perspectives alike and to challenge them to deal with bias and polarization, and the role that the media and films play in that regard. The participants of the course will be given the chance to embrace the complexity of sustainable global development.

851-0252-01L Human-Computer Interaction: Cognition and Usability W 3 credits 2S H. Zhao, S. Credé, C. Hölscher

Number of participants limited to 35.

Abstract

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

363-0311-00L Psychological Aspects of Risk Management and Technology W 3 credits 2V G. Grote, N. Bienefeld-Seall, J. Schmutz, R. Schneider, M. Zumbühl

Number of participants limited to 65.

Abstract

Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1238 of 2159
Objective
- You know how risk and risk management is defined and applied in different industries
- You know the challenges of decision making under risk and uncertainty and its effects on organisations
- Know about and (partially) apply some risk management tools
- Gain some more in-depth knowledge in a selected field within risk management through the semester project (e.g. transport systems, IT, insurance)

This course consists of three main elements:

A) Attendance of lectures that provide the theoretical foundations of “Psychological Aspects of Risk Management and Technology” together with reading assignments for each lecture.

B) Attendance of guest lectures that provide a rich source of practical insights and enable the transfer of theory into practice by discussing real-life cases with experts from various industries.

C) Furthermore, this course enables you to apply what you have learned in the classroom into practice by participating in a group assignment in which you gain insights into various risk industries (e.g., aviation, healthcare, insurance) and topics (e.g., risks in cyber-attacks, mountaineering, autonomous vehicles). These projects help students understand and apply key aspects through in-depth application of the course material on real-life topics. Each group project will be mentored and graded by one of the lecturers (70% of course grade). To round off the course at the end of the year, you will have the opportunity to present your group’s findings to the lecturers and to your peers (30% of course grade).

Content
The course is organized into fourteen sessions. Sessions comprise a mixture of (guest) lectures, case discussions, and presentations. Through class discussion we will further deepen understanding of the topics and themes of the class. For each session you are required to prepare by reading the assigned literature or case material provided on the Moodle e-learning platform. Topics covered include:

- Elements of risk management:
  - Risk identification and evaluation
  - Risk mitigation
  - Risk communication

- Psychological and organizational concepts relevant in risk management
  - Decision-making under uncertainty
  - Risk perception
  - Resilient organizational processes for managing uncertainty

- Case studies on different elements of risk management (e.g., rule-making, training, managing project risks, automation)

- Group projects related to company case studies

- Case studies on different real-world contracts (e.g., rule-making, training, managing project risks, automation)

Lecture notes
There is no script, but slides will be made available before the lectures.

Literature
There are texts for each of the course topics made available before the lectures.

Prerequisites / notice
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (SWICA, SWISS, University Hospital Zurich).

851-0742-00L Contract Design I

This course is taught by Professor Alexander Stremitzer (https://laweconbusiness.ethz.ch/group/professor/stremitzer.html). Note that this is NOT a legal drafting class that focuses on contractual language. Instead, in Contract Design I, you will learn what the content of a contract should be so that parties can reach their goals.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2021)” and enroll. The password is “ContractDesign01”.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract
Contract Design I aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place, and then engineer contracts that achieve the desired outcome.

Objective
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights, for which more than half a dozen Nobel Prizes were awarded in the past two decades, and transfer them to the art of writing real-world contracts. In other words, Contract Design I will provide you with analytical tools related to contracting that are invaluable to successful lawyers, business leaders, and startup founders.

In Contract Design I, you will be asked to watch a series of videos (10-15 minutes each) that we produced for this course. These video episodes introduce you to key concepts of economic, behavioral, and experimental contract theory. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting. You can find the welcome video at this link (https://www.youtube.com/watch?v=CvIdfG70zq0). However, this course prioritizes applications of contract design. Therefore, we will use class time to discuss a selection of exciting real-world case studies, ranging from purchases & sales of assets, oil & gas exploration, movie production & distribution, construction & development, M&A deals, to executive compensation and many other types of transactions.

ETH students: Your final grade will consist of two components: 1) You are required to take weekly computer-based quizzes during class time. Thus, it is imperative that you attend the lectures to be able to finish the quizzes and pass this course. Moreover, we regularly post questions regarding the case studies that we examine in class. 2) You have to compose short responses to these questions and upload them. Note that UZH students enrolling in this course earn more ECTS on completing this course than ETH students. This is because UZH students must hand in an extensive group project in addition to the weekly quizzes and short responses.

Lecture notes
Handouts, prerecorded videos, slides, and other materials

Prerequisites / notice
Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INF, and D-MAVT. If you have any questions on Contract Design I, please send an e-mail to Professor Stremitzer’s Teaching Assistant Diego Caldera (diegoalberto.calderaherrera@uzh.ch).

851-0252-15L Network Analysis

Particularly suitable for students of D-INF, D-MATH

W 3 credits 2V U. Brandes
Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion

Lecture notes

Lecture notes are distributed via the associated course moodle.

Literature

851-0101-86L Complex Social Systems: Modeling Agents, Learning, W and Games 3 credits 2S N. Antulov-Fantulin, T. Asikis, D. Helbing

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract

This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

Objective

The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

Content

Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.

Lecture notes

The lecture slides will be presented on the course web page after each lecture.

Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.
### Subject-specific Competencies

**851-0467-00L**  
**From Traffic Modeling to Smart Cities and Digital Democracies**  
**W** 3 credits  
**2S**

**D. Helbing, S. Mahajan**

*Number of participants limited to 50.*

**Abstract**  
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will reflect on the question of how democracy could be digitally upgraded to promote innovation, sustainability, and resilience.

**Objective**  
To collect credit points, students will have to give a 30-40 minute presentation in the seminar, after which the presentation will be discussed. The presentation will be graded.

**Content**  
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination, and cooperation.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Master thesis are supervised and reviewed by one or several professors and possibly by other persons at the same time. At least one professor has to be a member of a department involved in the study programme (article 2). This regulation is also valid for master thesis taking place outside ETH Zurich.

Abstract

A 6-months Master thesis completes the Master’s program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking.

Objective

A 6-months Master thesis completes the Master's program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking.

Content

A 6-months Master thesis completes the Master's program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking. The thesis can be performed either at ETH Zurich, an industrial enterprise, or in a research institution, but has to be advised by one or more professors affiliated with the Master program "Integrated building systems".

The responsible supervisor defines the topic in consultation with the student, together with the scope of work, criteria of assessment, and dates of beginning and delivery of the work.

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

</tbody>
</table>

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The lecture course discusses the basic concepts, approaches and methods of transport planning in both their theoretical and practical contexts.

Objective

The course introduces the basic theories and methods of transport planning.

Content

Basic theoretical links between transport, space and economic development; basic terminology; measurement and observation of travel behaviour; methods of the four stage approach; cost-benefit analysis.

Objective

Die Studierenden sind nach der Vorlesung in der Lage,
- für die Chemie wichtigen physikalischen Grössen und deren Einheiten zu rechnen,
- einige Eigenschaften chemisch relevanter Teilchen zu benennen und experimentelle Methoden zur Bestimmung dieser Eigenschaften vorzuschlagen,
- Anwendungen und Gefahren der Radioaktivität zu benennen,
- radioaktive Zerfallsprozesse zu kategorisieren und den zeitlichen Verlauf von einfachen Zerfallsreaktionen mathematisch wiedergeben sowie qualitativ vorhersagen und darzustellen,
- Wellen- und Teilchengenschaften von elektromagnetischer Strahlung und Materie zu beschreiben und experimentelle Methoden zu deren Nachweis vorzuschlagen.
- die Grundlagen der Quantenmechanik (Bedeutung der Wellenfunktion, Heisenbergsche Unschärferelation, Operatoren, Kommutatoren) zu erklären und einfache Rechnungen damit auszuführen,
- Absorptions- und Emissionspektren von Einfachtonenatom zu analysieren und zu berechnen,
- die Schrödinger-Gleichung für ein atomares Molekelensystem aufzustellen,
- die Schrödinger-Gleichung für die Modellsysteme Teilchen im Kasten und harmonischer Oszillator in eine Dimension selbstständig zu lösen und auf höherdimensionale nicht-wechselwirkende Probleme zu verallgemeinern,
- Molekülschwingungen von zweiatomigen Molekülen mit dem Modell des harmonischen und des anharmonischen Oszillators zu modellieren,
- das Konzept eines Orbitsals zu erklären und die qualitative Form der Orbitale des Wasserstoffatoms mathematisch und bildlich wiedergeben,
- den Aufbau des Periodensystems der Elemente mit Hilfe des Orbitalkonzepts zu erklären,
- Ähnlichkeiten in der elektronischen Struktur von Atomen zu erkennen und zu benutzen, um chemisch relevante Eigenschaften vorhersagen zu und
- Term- und Symbole für atomare Grundzustände aufzustellen.

Content

Atomic structure and structure of matter: atomic theory, elementary particles, atomic nuclei, radioactivity, nuclear reactions. Atomic orbitals and energy levels: ionisation energies, atomic spectroscopy, term values and symbols. Quantum mechanical atom model: wave-particle duality, the uncertainty principle, Schrödinger’s equation, the hydrogen atom, construction of the periodic table of the elements. Chemical bonding: ionic bonding, covalent bonding, molecular orbitals.

Information about the practical course will be given on the first day.

Abstract

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration).

Analysis of measured data, vapour pressure, conductivity, calorimetry, solubility.

Objective

Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pKₐ-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity), oxidation state and redox behaviour (syntheses), redox-titrations, galvanic elements, metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration).

Analysis of measured values (measuring error, average value, error analysis), states of aggregation (vapour pressure, characteristics of electrolytes (conductivity measurements), thermodynamics (calorimetry, solubility).

Content

The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

The Bachelor's programme in Interdisciplinary Sciences allows students to choose from any subject taught at a Bachelor level at ETH Zurich.

In consultation with the Director of Studies of Interdisciplinary Sciences, every student must establish his/her own individual study programme at the beginning of the 2nd year. See the Programme Regulations 2018 for further details.

<td></td>
<td>The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens &quot;behind the scenes&quot; when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.</td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.</td>
</tr>
<tr>

1. Introduction and overview

Analytical Competencies

Assessed

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:

- The script will be available on moodle.

Astrophysics I

In addition to the lecture notes, the following supplementary books can be recommended:

- Semiconductor Nanostructures
- Introduction to Solid State Physics.

The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of:

i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

Prerequisites / notice

The course is taught in English.

Voraussetzungen: Physik I, II, III wünschenswert

Objective

The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, magnetism, superconductivity.

Content

The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, thermal properties of insulators, metals (classical and quantum mechanical description of electronic states, thermal and transport properties of metals); semiconductors (bandstructure and n/p-type doping); magnetism, superconductivity.

Lecture notes

The script will be available on moodle.

Literature

- Itach & Lüth, Festkörperphysik
- C. Kittel, Festkörperphysik
- Ashcroft & Mermin, Festkörperphysik
- W. Känzig, Kondensierte Materie

Prerequisites / notice

Voraussetzungen: Physik I, II, III wünschenswert

Astrophysics I

This introductory course will develop basic concepts in astrophysics as applied to the understanding of the physics of planets, stars, galaxies, and the Universe.

Objective

The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of:

1. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots
5. The integer quantum Hall effect
6. Surface and metal-semiconductor contacts, fabrication of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport and scattering mechanisms
9. Single- and bilayer graphene
10. Electron transport in quantum point contacts; Landauer-Büttiker description, ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

Lecture notes

In addition to the lecture notes, the following supplementary books can be recommended:

Prerequisites / notice

The course is suitable for all physics students beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitious students in the third year may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.
This course consists of the following parts, which introduce the students to the chemistry of transition metals as well as lanthanides and actinides:

Prerequisites / notice

Excercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Fostered competencies

- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, Analytical Competencies, Media and Digital Technologies, Problem-solving
- Method-specific Competencies: Communication, Self-presentation and Social Influence, Sensitivity to Diversity
- Social Competencies: Creative Thinking, Critical Thinking, Integrity and Work Ethics
- Personal Competencies: Self-direction and Self-management

402-2203-01L Classical Mechanics W 7 credits 4V+2U R. Renner

Abstract
A conceptual introduction to theoretical physics: Newtonian mechanics, central force problem, oscillations, Lagrangian mechanics, symmetries and conservation laws, spinning top, relativistic space-time structure, particles in an electromagnetic field, Hamiltonian mechanics, canonical transformations, integrable systems, Hamilton-Jacobi equation.

Objective
Fundamental understanding of the description of Mechanics in the Lagrangian and Hamiltonian formulation. Detailed understanding of important applications, in particular, the Kepler problem, the physics of rigid bodies (spinning top) and of oscillatory systems.

529-0051-00L Analytical Chemistry I W 3 credits 3G D. Günther, M.-O. Ebert, G. Schwarz, R. Zenobi

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).
- Raman spectroscopy.
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/Vis spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

Lecture notes
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice

Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

529-0121-00L Inorganic Chemistry I W 3 credits 2V+1U H. Grützmacher, P. Steinegger

Abstract
Discussion of syntheses, structures, and general reactivity of coordination compounds of the transition metals as well as the lanthanides and actinides. Introduction of methods of characterization, physical-chemical properties of coordination compounds as well as principles of radiocactivity.

Objective
The students will learn and understand the methodological basics of binding theory in complexes of transition metals. They will be able to explain the structure, chemical bonding, spectroscopic properties as well as general strategies for the synthesis of complexes of transition metals. The students will acquire knowledge on the fundamentals of radioactive decay and radiochemistry. Furthermore, they will be familiar with the basics of inorganic chemistry of lanthanides and actinides.

Content
This course consists of the following parts, which introduce the students to the chemistry of transition metals as well as lanthanides and actinides: 1) General definitions and terms in coordination chemistry; 2) Coordination numbers and structures; 3) Ligand types; 4) The chemical bond in coordination compounds part A: Crystal field theory and ligand field theory; 5) The chemical bond in coordination compounds part B: Qualitative MO theory; 6) Reactivity and reaction mechanisms of coordination compounds; 7) Group theory and character tables; 8) Properties and characterization of coordination compounds; 9) Introduction to radiochemistry; 10) Principles of the chemistry of the lanthanides and actinides.

Lecture notes
Eine kommentierte Foliensammlung ist im HCI-Shop erhältlich.

Literature

529-0221-00L Organic Chemistry I
W 3 credits 2V+1U H. Wennemers
Abstract
Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals,
imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as
nucleophiles) and of carboxylic acid derivatives. Aldol reactions.
Objective
Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic
acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms
and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by
solving the problems handed out each time and discussed one week later in the exercise class.
Content
Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals,
imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as
nucleophiles) and of carboxylic acid derivatives. Aldol reactions.
Lecture notes
A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.
Literature
No set textbooks. Optional literature will be proposed at the beginning of the class and in the lecture notes.

701-0023-00L Numerical Methods in Environmental Sciences
W 3 credits 2G C. Schär, C. Zeman
Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.
Objective
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.
Content
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative
numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of
Environmental Science.

701-0461-00L Weather Systems
W 3 credits 2G M. A. Sprenger, F. Scholder-Aemisegger
Abstract
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-
alantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms,
oroergic wind); planetary boundary layer
Objective
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1251 of 2159
701-0475-00L  Atmospheric Physics  W  3 credits  2G  U. Lohmann

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation especially prediction of thunderstorm development, aerosol physics as well as artificial weather modification.

Webpage for course: https://iac.ethz.ch/edu/courses/bachelor/vertiefung/atmospheric-physics.html

Objective
Students are able to explain the mechanisms of thunderstorm formation using knowledge of thermodynamics and cloud microphysics.

- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

Content
The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to classify radiosondes with the help of the thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in them. Atmospheric mixing processes are introduced for fog formation. The concept of the air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation formation (convective vs. stratiform) is discussed as well as the formation and different stages of severe convective storms.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=15387

Literature

Prerequisites / notice
50% of the time we use the concept of "flipped classroom" (en.wikipedia.org/wiki/Flipped_classroom), which we introduce at the beginning.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

Fostered competencies
Subject-specific Competencies  Concepts and Theories  assessed
Method-specific Competencies  Analytical Competencies  assessed
Social Competencies  Communication  assessed
Personal Competencies  Critical Thinking  assessed
Self-direction and Self-management  assessed

701-0501-00L  Pedosphere  W  3 credits  2V  R. Kretzschmar

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

Lecture notes
Polybook

Prerequisites / notice
Prerequisites: Basic knowledge in chemistry, biology and geology.

752-4001-00L  Microbiology  W  2 credits  2V  M. Ackermann, M. Schuppler,

Abstract
Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Content

Lecture notes
Wird von den jeweiligen Dozenten ausgegeben.

Literature
Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms

Laboratory Courses, Semester Papers, Proseminars, Field Trips

Further laboratory courses must be applied for at the respective Director of Studies.

Number  Title  Type  ECTS  Hours  Lecturers
529-0011-04L  Practical Course General Chemistry  O  8 credits  12P  H. V. Schönberg, E. C. Meister

Information about the practical course will be given on the first day.

Abstract
Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redoxreactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration), Analysis of measured data, vapour pressure, conductivity, calorimetry, solubility.
5. Semester (Physical-Chemical Direction)

Laboratory Courses, Semester Papers, Proseminars, Field Trips

Further laboratory courses must be applied for at the respective Director of Studies.

Abstract
Introduction to the chemistry of ionic equilibria: Acids and bases, redox reactions, formation of coordination complexes and precipitation reactions.

Objective
Understanding and describing ionic equilibria from both a qualitative and a quantitative perspective.

Content
Chemical equilibrium and equilibrium constants, mono- and polyprotic acids and bases in aqueous solution, calculation of equilibrium concentrations, acidity functions, Lewis acids, acids in non-aqueous solvents, redox reactions and equilibria, Galvanic cells, electrode potentials, Nernst equation, coordination chemistry, stepwise formation of metal complexes, solubility and resonance theory in organic chemistry, description of linear and cyclic conjugated molecules, aromaticity, Huckel rules, organic isomerism, Fischer projections, CIP rules, point groups, molecular symmetry and chirality, topicity, chemical bonding: Lewis bonding model and thermochemistry, learning of organic chemistry reactions, intermolecular interactions.

Literature
G. B. Thomas, M. D. Weir, J. Hass: Analysis 1, Lehr- und Übungsbuch, Pearson-Verlag

Abstract
Die Vorlesung vermittelt eine Einführung in einige physikalischen Grundlagen der Chemie, insbesondere in die Radioaktivität, die Quantenmechanik, den Aufbau der Materie und eines Atoms, des Periodensystems der Elemente und die chemische Bindung.

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1255 of 2159
Die Studierenden sind nach der Vorlesung in der Lage,
- mit für die Chemie wichtigen physikalischen Grössen und deren Einheiten zu rechnen,
- einige Eigenschaften chemisch relevanter Teilchen zu benennen und experimentelle Methoden zur Bestimmung dieser Eigenschaften vorzuschlagen,
- Anwendungen und Gefahren der Radioaktivität zu benennen,
- radioaktive Zerfallsprozesse und den zeitlichen Verlauf von einfachen Zerfallsreaktionen mathematisch wiedergeben sowie qualitativ vorherzusagen und darzustellen,
- Wellen- und Teilchengenschaften von elektromagnetischer Strahlung und Materie zu beschreiben und experimentelle Methoden zu deren Nachweis vorzuschlagen,
- die Grundlagen der Quantenmechanik (Bedeutung der Wellenfunktion, Heisenberg'sche Unschärferelation, Operatoren, Kommutatoren) zu erklären und einfache Rechnungen damit auszuführen,
- Absorptions- und Emissionspektren von Einklektronenatomen zu analysieren und zu berechnen,
- die Schrödingergleichung für ein molekulares Molekülsystem aufzustellen,
- den Aufbau des Periodensystems der Elemente mit Hilfe des Orbitalkonzepts zu erklären,
- Ähnlichkeiten in der elektronischen Struktur von Atomen zu erkennen und zu benutzen, um chemisch relevante Eigenschaften vorherzusagen, und
- Termsymbole für atomare Grundzustände aufzustellen.

### Content

Atomic structure and structure of matter: atomic theory, elementary particles, atomic nuclei, radioactivity, nuclear reactions. Atomic models and energy levels: ionisation energies, atomic spectroscopy, term values and symbols. Quantum mechanical atom model: wavefunction, probability, uncertainty principle, Schrödinger's equation, the hydrogen atom, construction of the periodic table of the elements. Chemical bonding: ionic bonding, covalent bonding, molecular orbitals.

</tbody>
</table>

*Information about the practical course will be given on the first day.*

### Objective

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration).

Analysis of measured data, vapour pressure, conductivity, calorimetry, solubility.

### Content

The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

<td>401-0373-00L</td>
<td>Mathematics III: Partial Differential Equations</td>
<td>O</td>
<td>4</td>
<td>2V+1U</td>
<td>A. Carlotto</td>
</tr>
</tbody>
</table>

Classical tools to solve the most common linear partial differential equations.
Content
1) Examples of partial differential equations
   - Classification of PDEs
   - Superposition principle

2) One-dimensional wave equation
   - D’Alembert’s formula
   - Duhamel’s principle

3) Fourier series
   - Representation of piecewise continuous functions via Fourier series
   - Examples and applications

4) Separation of variables
   - Solution of wave and heat equation
   - Homogeneous and inhomogeneous boundary conditions
   - Dirichlet and Neumann boundary conditions

5) Laplace equation
   - Solution of Laplace’s equation on the rectangle, disk and annulus
   - Poisson formula
   - Mean value theorem and maximum principle

6) Fourier transform
   - Derivation and definition
   - Inverse Fourier transformation and inversion formula
   - Interpretation and properties of the Fourier transform
   - Solution of the heat equation

7) Laplace transform (if time allows)
   - Definition, motivation and properties
   - Inverse Laplace transform of rational functions
   - Application to ordinary differential equations

Lecture notes
See the course web site (linked under Lernmaterialien)

Literature

Additional books:

4) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (chapters 1,2,11,12,6)

For additional sources, see the course web site (linked under Lernmaterialien)

Prerequisites / notice
Required background:
1) Multivariate functions: partial derivatives, differentiability, Jacobian matrix, Jacobian determinant

2) Multiple integrals: Riemann integrals in two or three variables, change of variables

3) Basic knowledge of ordinary differential equations

529-0001-00L Introduction to Computer Science

Abstract
Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.

Objective
Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content
Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation; Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.

Lecture notes
Script booklet (copies of powerpoint slides, in English), distributed at first or second lecture.

Literature
See: www.csms.ethz.ch/education/lnfo

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam (compulsory performance component, 12% of the exam mark; in case of repetition of the exam, the exercise marks from a previous semester can be kept).

For more information about the lecture: www.csms.ethz.ch/education/lnfo

252-0027-00L Introduction to Programming

Abstract
Introduction to fundamental concepts of modern programming and operational skills for developing high-quality programs, including large programs as in industry. The course introduces software engineering principles with an object-oriented approach based.
Many people can write programs. The "Introduction to Programming" course goes beyond that basic goal: it teaches the fundamental concepts and skills necessary to perform programming at a professional level. As a result of successfully completing the course, students master the fundamental control structures, data structures, reasoning patterns and programming language mechanisms characterizing modern programming, as well as the fundamental rules of producing high-quality software. They have the necessary programming background for later courses introducing programming skills in specialized application areas.

Lecturers

A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.

ECTS  European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The Master's programme in Interdisciplinary Sciences allows students to choose from any subject taught at the Master's level at ETH Zurich.

In consultation with the Director of Studies of Interdisciplinary Sciences, every student must establish his/her own individual study programme at the beginning of the Master's programme. See the Programme Regulations 2007/2020 for further details.

**Majors**

The following list provides various Majors that can be chosen from: https://ethz.ch/content/dam/ethz/special-interest/chab/chab-dept/studies/documents/IN/WL_IN_SR19192101_EN.pdf

In addition it is possible to create an individual Major in accordance with the Programme Regulations (Art. 19 paragraph 3).

**General Courses**

Selection of courses from entire course catalogue of ETH, according to individual study plan

**Proseminars, Laboratory Courses, Research Projects and Sem. Papers**

Abstract

In a research project students extend their knowledge in a particular field, get acquainted with the scientific way of working, and learn to work on an actual research topic. Research projects are carried out in a core or optional subject area as chosen by the student.

Objective

Students are accustomed to scientific work and they get to know one specific research field.

Selection of courses from entire course catalogue of ETH, according to individual study plan

**GESS Science in Perspective**

see GESS Science in Perspective: Language Courses

see GESS Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended GESS Science in Perspective (Type B) for D-CHAB.

**Master's Thesis**

Only students who fulfill the following criteria are allowed to begin with their Master's thesis:

1. successful completion of the Bachelor's programme;
2. fulfilling of any additional requirements necessary to gain admission to the Master's programme.

Duration of the Master's Thesis: 4 months.

In the Master's thesis students prove their ability to independent, structured and scientific working. The Master's thesis is usually carried out in a core or optional subject area as chosen by the student.

### Compulsory Basic Courses

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

#### Abstract
Lectures, exercises and excursions serve as an introduction to atmospheric sciences, hydrology and soil science. Students gain a broad vision of the cutting edge topics that are being researched and studied at the Department of Environmental Systems Science at ETH, Eawag, WSL a.o. This will be the base for a future dialog between the field of landscape architecture and the field of sciences.

#### Objective
Students acquire basic knowledge in atmospheric sciences, hydrology and soil science:
- Understanding basic chemical and physical processes in the atmosphere that influence weather and climate
- Knowledge of water balance, principles of integral water management and climatic factors in the field of hydrology
- Fundamentals about the classification of soils, soil-forming processes, physical and chemical soil properties, soil biology and ecology, soil degradation and protection

Students develop an understanding of the relevance of these topics in the field of landscape architecture. Temporal and physical scale, research methods, units of measurement, lexicon, modes of representation and critical literature form the framework for the joint discourse.

#### Content
The course unit consists of the three courses "Climate", "Water" and "Soil", which are organized in modules.

**Module 1: Climate**, 20.–24.09.2021
- Atmospheric dynamics: weather conditions, precipitation formation, weather forecast
- Climate physics: past and future changes in global climate and scenarios for Switzerland
- Land-climate dynamics: interaction between the land surface and the climate system
- Hydrology and water cycle: extreme precipitation, influence of climate change on the cryosphere
- Atmospheric chemistry: aerosols, greenhouse gases, air pollution

**Module 2: Water**, 27.09.–1.10.2021
Basics:
- Water supply: water balance, groundwater, water quality (water protection)
- Hydrological hazards: floods and drought
- Water use: drinking water, hydropower, ecology
- External influencing factors: human influence in the historical dimension, global change

Hydrological profile of the northern side of the Alps:
- Alpine region (Grisel area): dominate role of snow and ice, dangerous processes, liquefaction of the water balance in the wake of climate change, uses (hydropower) and conflicts of use, new images of the Alpine region
- From the Alps to the Mittelland (locations along the Aare): Lake Thun (role of lakes in the water cycle, river and lake shore planning), Untigen (conflicts of use between groundwater use, flood protection, revitalization and modes of transport) & Seeland (Jura water correction, conflicts of use in the Seeland)
- Jura (Reigoldswil region): Jurassic landforms, water in the karst, water supply in the karst

**Module 3: Soil**, 4.10.–8.10.21
- Introduction to soils: definition, function, formation, classification and mapping
- Soil physics: soil texture, soil structure, soil water potentials, hydraulic conductivity
- Soil chemistry and fertility: clay minerals and oxides, cation exchange capacity, soil pH, essential plant nutrients
- Soil biology and ecology: soil fauna and microflora, fungi, bacteria, food web, organic matter
- Soil degradation and threats to soil resources: erosion, compactation, sealing, contamination, salinization
- Practical aspects of soil protection

**Lecture notes**
The course material will be provided.

**Prerequisites / notice**
The course material includes a reading list.

**The courses "Climate", "Water" and "Soil" are organized with the Fundamental Studio I as joint one-week modules. The weekly schedules will be provided with the course materials.**

**Module 1: Climate**, 20.–24.09.2021
Module 2: Water*, 27.09.–1.10.2021
Module 3: Soil*, 4.10.–8.10.21

- The courses are held in English or German.
- The written session examination covers all three courses "Climate", "Water" and "Soil".
- During the excursions there will be at least one external overnight stay.

**Fostered competencies**

### Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

### Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies

### Social Competencies
- Communication

### Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Data: 06.09.2022 12:51
Autumn Semester 2021
Page 1262 of 2159
This course introduces ecology and plant sciences. Through lectures, exercises and excursions, students will gain a broad vision of the cutting edge topics that are being researched and studied at the Department of Environmental Systems Science at ETH. This will be the base for a future dialog between the field of landscape architecture and the field of sciences.

Objective

Students acquire basic knowledge in ecology and plant sciences focusing in its application in the field of landscape architecture. Temporal and physical scale, research methods, units of measurement, lexicon, modes of representation and critical literature form the framework for the joint discourse.

Content

The fundamental course “Ecology and Plant Sciences” is an introduction to the field of living systems, starting with the history of ecology, followed by an introduction to plant systematics, taxonomy and physiology. The course will also introduce students to the specifics of grassland systems and forests. Lastly, the course will focus on the specifics of tree structure and function.

Lecture notes

Course material will be provided.

Literature

The course material includes a reading list.

Prerequisites / notice

The fundamental course is organized with the Fundamental Studio I as a joint two-week module. The weekly schedule is provided with the course documents.

Module 4 "Ecology and Plant Sciences", 10.10.–21.10.2022

061-0105-00L Designing with Plants I MSc.

Abstract

This fundamental course provides an introduction to the basics of botany and forms a solid foundation of knowledge for the following semesters. The course covers the following areas: Species knowledge of native shrubs and trees in autumn and winter conditions and their habitat requirements, introduction to the identification of plants and consolidation of botanical terms.

Objective

Students will be introduced to botany and after the course they will be able to identify about sixty native trees and shrubs in order to use them appropriately their designs. They will be familiar with botanical terms, which will enable them to have a high level of understanding of botanical literature.

Content

This course focuses on excursions with a botanical expert. In addition, the students are supported by theoretical and conceptual lectures. This gives the students a good basis of botanical knowledge, which can be professionally integrated into their designs. This module is organized together with the Foundation Studio I, so that the knowledge imparted can directly influence the designs. In the morning they are taught in botany and in the afternoon they work on their designs.

The module is divided into different subject areas:

1) Consolidation of botanical terms. These form the basis for the identification and recognition of plants. The most important technical terms are explained and illustrated with suitable plant material.

2) Species knowledge is taught on regular field excursions and supplemented with theoretical input. The species can also be studied in the classroom using fresh material. In addition to site characteristics and seasonal changes, growth forms are also taught.

3) Through the introduction to identification, the students will understand how a simple identification key is constructed and how it is used, so that unknown species can be identified independently.

The fundamental course Designing with Plants I (1st – 12th November 2021) and the foundation studio I are interrelated modules. Taking part of the seminar week in Basel taking place just before this module is highly recommended ( Günther Vogt 061-0151-20L). The weekly schedule is published on the course website (and is included in the reader).

Lecture notes

The notes or reader will be distributed during the course.

Literature

The relevant literature and content for the examination will be indicated during the course.

Prerequisites / notice

The course is aimed exclusively at the students of the master's programme in landscape architecture.

The detailed course schedule is published on the course website (and is included in the reader).

The lectures might take place outside. It is necessary to foresee clothes adapted to the weather.
Fostered competencies

- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

---

061-0107-00L  **Materials and Construction I**  O  2 credits  2G  R. Voss, G. Vogt

*Only for Landscape Architecture MSc.*

**Abstract**
The fundamental course discusses current constructive problems in landscape architecture as part of the complex and multi-faceted urban space that is cultivated and animated by humans. The two parts of the lecture (Materials and Construction I and II) are designed as complementary modules.

**Objective**
The students learn comprehensive skills in dealing with constructive questions (regarding the topics of soil, water and topography). The goal is to promote a value-based critical and research-based thinking that is the prerequisite for discovering new questions and developing independent solutions.

**Content**
The course Materials and Construction I deals with constructive questions around the topic of soil, water and topography. The introductory lecture introduces the two parts of the lecture (Materials and Construction I and II) as a whole and illustrates with concrete examples how thinking about constructive possibilities co-determine and penetrate the design process.

Subsequently, in addition to principles in dealing with soil (floor structures, surface treatment) and water (physical state, element dynamics), a wide range of topics are discussed. These deal with current questions of today's urban landscapes in dealing with contaminated soil, flood protection, drinking water management, etc. The topic of topography represents the continuous and connecting moment.

The fundamental course Materials and Construction I (15th November – 26th November 2021) is closely linked to the foundation studio I. The weekly schedule is published on the course website (and is included in the reader).

**Lecture notes**
The reader will be distributed on Friday, 12th November 2021.

**Literature**
The reader contains all relevant literature (also relevant for the exam).

**Prerequisites / notice**
The course is aimed exclusively at the students of the master's programme in landscape architecture.

---

061-0109-00L  **History and Theory of Landscape Architecture I**  O  2 credits  2V  A. Bucher

*Only for Landscape Architecture MSc.*

**Abstract**
The course deals with phenomena, terms and social contexts of designing nature since the 19th century, in order to derive a basis for ways of thinking and action for the present.

**Objective**
Students acquire an overview of the history of landscape architecture as well as an insight into the changing concepts and ways of thinking about designing nature. They become familiar with historical developments and their actuality and learn "from history". Students also analyse examples and design contexts and develop a basis for ways of thinking and action for current landscape architectural proposals.
Content

Designing nature accompanies the history of mankind. Since industrialisation and with the establishment of landscape architecture as a profession, the understanding of nature and design concepts have changed from the green lung of cities to the current saving of the planet in the Anthropocene. The course deals with the relevant phenomena of designing nature (park, garden city, garden reform, new gardens, modern gardens, natural gardens, postmodern parks and landscapes, ecosystem repair, urban agriculture, slum upgrading, nature-cultures, etc.), terms (nature, landscape, garden, ecology, agriculture, etc.) and their wider contexts. Based on the history and theory of the profession, students develop a strong fundament for designing in the present.

Lecture notes

Course material will be provided.

Literature

The course material includes a reading list.

Prerequisites / notice

The course takes place as a block course alternating with "Ethics in Landscape Architecture".

061-0111-00L Ethics in Landscape Architecture

Announced

061-0113-00L Digital Design Methods I

Only for Landscape Architecture MSc.

Abstract

This course covers basic positions of philosophical ethics with a strong emphasis on central debates in landscape architecture.

Objective

The course aims to provide basic knowledge of concepts and terms within moral philosophy; engage with current debates in landscape architecture through lectures, text analysis, discussions and presentations; develop an understanding of the relation between science/society/design as well as practice and theory; help establish one's own design attitude; provide tools for argumentation; put to practice scientific working methods.

Content

Between the poles of theory and practice and through the development of a foundation in ethics, the students' sensitivity for ecological, political and social issues will be awakened and strengthened. In response to current issues touched upon in the disciplinary media or journalism, we will reflect upon the role of landscape architects in today's society as well as one's own individual attitude within the profession. The overall goal is for students to gain a critical understanding of a range of design approaches as well as an awareness of the specific role of design and design quality in the context of ethical debates.

Lecture notes

Detailed information regarding the course will be communicated at the beginning of the semester.

Literature

The course material includes a reading list.

Prerequisites / notice

The course takes place as a block course alternating with "History and Theory of Landscape Architecture I".

061-0113-00L Digital Design Methods I

Only for Landscape Architecture MSc.

Abstract

This course introduces digital design methods in landscape architecture from data acquisition and modelling, to simulation and visualization.

Objective

Students know the most relevant survey methods, landscape modelling tools as well as simulation and visualization techniques. They are able to use those methods independently in the following semesters and in practice.

Content

Based on a case study, the students work on the entire workflow of a landscape architectural project:

- From data collection in the field to 2D and 3D modelling in the Landscape Visualization and Modelling Lab (LVML), analysis and simulation with various software solutions to visualizations and physical prototypes, this course covers the most important digital methods in landscape architecture.
- The course is divided into three parts:
  1. Survey
  2. Modelling
  3. Analysis, Simulation, Visualization

Lecture notes

Digital and physical learning material is provided throughout the course.

Data: 06.09.2022 12:51  Autumn Semester 2021  Page 1265 of 2159
Core Courses

The core courses build on the basic courses and convey basic, broad knowledge in the core areas of landscape architecture in relation to design lessons. Some of the core courses are compulsory and some are freely selectable. Further details, in particular about taking these subjects, for performance assessments and for compensating for failed subjects, are regulated in Art. 27 and Art. 31 Paragraph 4.

Compulsory Core Courses

Courses are offered in Spring Semester.

Elective Core Courses

</tr>
</tbody>
</table>

Abstract
Specialists give lectures on current architecture-specific topics.

Objective
Obtaining knowledge from architectural practice after 2020.

Content
Specialists give lectures on current architecture-specific topics.

Prerequisites / notice
The lecture series take place on Tuesdays from 6-8 pm in HIL E4 (s. room reservations):

Speakers:
28.09.21: Prof. Patrick Heiz
05.10.21: PD Dr. Erik Wegerhoff - Note: This lectures takes place in the HIL underground carpark (follow the signs!)
12.10.21: Prof. Mike Guyer
02.11.21: Prof. Freek Persyn (ONA E7 Focushalle, Oerlikon)
16.11.21: GD Roger Boltshauser
30.11.21: GD Angela Deuber
07.12.21: Prof. Alexandre Theriot

Compensatory Course for Core Courses

In the first semester of the curriculum no compensation courses for compulsory courses offered.

Advanced Courses

In the first semester of the curriculum there are no main courses offered.

Design Studios

The design studios deal with problem and practice-related tasks on a local, regional, supra-regional, national and international level. Teaching of digital analysis, design and planning methods.

Foundation Studio I and II
- Fundamental Studio I: basic knowledge;
- Fundamental Studio II: Design tasks in the context of the contemporary landscape;

</table>

Abstract
The course introduces to the subject and complexity of the urbanized landscape and teaches the critical engagement with the challenges and potentials of current tendencies in Landscape Architecture. On the basis of theoretical inputs and short design exercises the students will develop analytical, methodical and design skills.

Objective
Students acquire basic analytical, design and methodological skills in the field of Landscape Architecture.

Content
The Foundation Studio I will be dealing with the urban territory of Basel in autumn semester 2021. The complexity of the region with its rich variety of geology and vegetation, the political boarders and an urge for urban renewal will be the background for the development of the design projects. The semester is composed of six modules, which are linked to the respective fundamental course, and a synthesis module:

Module 1 “Climate”, 20.–24.09.2020
Module 2 “Water”, 27.09.–1.10.2021
Module 3 “Soil”, 4.10.–8.10.21
Module 4 “Ecology and Plant Sciences”, 11.10.–22.10.21
Module 5 “Designing with Plants I”, 1.11.–12.11.21
Module 6 “Materials and Construction I”, 15.11.–26.11.21
Module “Synthesis”, 29.11.–22.12.21

In addition to the design professors, external experts of diverse fields will advise and support the students during the development of their design. The organization of the course intends to have lectures and other theoretical inputs in the morning (fundamental courses) and to deal with the same topics in more discursive way in the design studio in the afternoon.
The workbook will be handed in during the first semester week.

- The weekly schedule is published on the course website (and is included in the reader).
- Classes (and critiques) are held in English and German.

Fostered competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: assessed

**Social Competencies**
- Communication: assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed
- Negotiation: assessed

**Personal Competencies**
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Problem-solving: assessed
- Project Management: assessed

**Advanced Studio**

Complex design tasks involving social, topographical, hydrological and ecological issues.

The advanced studio will be offered as of Spring Semester 2022.

**Seminar Week and Internship Report**

In MScLA at least one week of seminar must be completed. Furthermore, part of the course is a six-month internship in the field of landscape architecture, the achievements (work phases, learning success) must be documented in an internship report.

<td>2</td>
<td>3S</td>
<td>S. Hassold, G. Vogt</td>
</tr>
</tbody>
</table>

**Abstract**

Along five walks we explore the city vegetation of Basel and built connections to the conditions of the surrounding landscape. Obtaining a panoptical view of the “nature of the city” is the goal of intensive study of the territory.

**Objective**

In addition to a comprehensive insight into the vegetation of the city of Basel, the students receive an introduction to the method of walking as a way of exploring the urban landscape from a pedestrian perspective.

**Content**

Five walks lead us through the territory of the city of Basel. The tri-national area (Germany, Switzerland, France) with its exceptional geological, topographical, hydrological and climatic situation has a specific and diverse vegetation. We discover this diversity on the walks in the Petite Camargue, on the Tüllinger Hügel, during the crossing of the Jura and in the parks within the city.

The walks are led by proven experts. In conversations, Sonja Hassold (biologist), Günther Vogt (landscape architect) and Markus Ritter (ecologist) explain the relationships between the vegetation found and the conditions of the landscape. In doing so, references are made to the political, social and economic influencing factors that regulate the development of the landscape and significantly influence its shape.

The program is contextualized by dealing with the topic of walking science. Markus Ritter introduces the theory and method of promenadology in evening lectures, seminars and reading sessions, focusing on the person of Lucius Burckhardt (sociologist, 1925 - 2003).

**Lecture notes**

The reader will be given at the introductory course.

**Literature**

All relevant literature is included in the reader.

**Prerequisites / notice**

The weekly schedule is included in the reader.

The costs for the seminar trip (24.10.-30.10.) range between 251.- and 500.- (cost framework B). Included are: All overnight stays (including breakfast), a dinner together, transfers from the hotel to the excursions, reader and all costs for admission to museums.

The course is aimed exclusively at students of the master's program in landscape architecture.

It is highly recommended to participate this Seminar Week in preparation for the Module 5 (061-0105-00L Designing with Plants I) and the lecture Designing with Plants II (061-0106-00L)
### Fostered competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

#### Social Competencies
- Communication: assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: assessed
- Negotiation: assessed

#### Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: not assessed

### Internship Report

**061-0153-00L Internship Report**

**Type:** O 2 credits 4P  T. Galí-Izard, G. Vogt

**Abstract**
Part of the course is a six-month internship in the field of landscape architecture. The internship should include as many work phases as possible in the work of a landscape architect. The students prepare an internship report in which they describe the various internship activities in detail and reflect on the learning success.

**Objective**
The internship report should cover as many work phases as possible in the work of a landscape architect.

**Content**
Part of the course is a six-month internship in the field of landscape architecture. The internship should include as many work phases as possible in the work of a landscape architect. The students prepare an internship report in which they describe the various internship activities in detail and reflect on the learning success.

**Prerequisites / notice**
Internship report (of 6 months, within the field of landscape architecture). The report can be written in German or English language.

#### Science in Perspective

Courses of the "Science in Perspective" programme have to be completed (details see study guidelines Art. 27).

- see GESS Science in Perspective: Language Courses
- see GESS Science in Perspective: Type A: Enhancement of Reflection Capability
- Recommended GESS Science in Perspective (Type B) for D-ARCH.

#### Master's Thesis

The master's thesis is the successful completion of the course. It confirms the ability to work independently in the field of landscape architecture and is tutored by D-ARCH professors (for details see Art. 30 of the study regulations).

**Abstract**
Is offered as of HS22 only.

**Objective**
The master's thesis concludes the course. It shows the ability of the students to do independent design work and is proof of the successful completion of their studies. It is under the direction of professors from D-ARCH.

The processing time for the master's thesis is fourteen weeks.

</tbody>
</table>
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).
(2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

851-0242-11L Gender Issues In Education and STEM ■
Number of participants limited to 30.

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

Abstract
In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

Objective
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives
- To integrate this knowledge with teacher's work.

Content
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice
Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

Subject Didactics and Professional Training

Important: You can only enrol in the courses of this category if you have no more than 12 CP left for possible additional requirements.

Number Title Type ECTS Hours Lecturers
752-9020-00L Teaching Internship Including Examination Lessons Food Science ■ W 6 credits 13P G. Kaufmann

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
Anlässlich der Hospitationen erläutert die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant hat und tauscht sich mit dem/der Studierenden aus. Die von dem/der Studierenden gehaltenen Lektionen werden vor- und nachbesprochen.

Lecture notes
Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Literature
Wird von der Praktikumslehrperson bestimmt.

Further Subject Didactics

For students enrolled from HS 2019: The courses offered here are credited under the category «Subject Didactics and Professional Training».

Number Title Type ECTS Hours Lecturers
752-9005-00L Mentored Work Specialised Courses in the Respective O 2 credits 4A G. Kaufmann, K. Koch, U. Lerch

Subject with an Educational Focus Food Sc. ■

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

<td>3 credits</td>
<td>2V</td>
<td>P. A. Fischer, R. Mezzenga</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>In Physics of Food Colloids the principles of colloid science will applied to the aggregation of food materials based on proteins, polysaccharides, and emulsifiers. Mixtures of such raw material determine the appearance and performance of our daily food. In a number of examples, colloidal laws are linked to food science and the manufacturing and processing of food.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The aggregation of food material determines the appearance and performance of complex food system as well as nutritional aspects. The underlying colloidal laws reflect the structure of the individual raw material (length scale, time scale, and interacting forces). Once these concepts are appreciated the aggregation of most food systems falls into recognizable patterns that can be used to modify and structure exiting food or to design new products. The application and use of these concepts are discussed in light of common food production.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>Lectures include interfacial tension (4h), protein aggregation in bulk and interfaces (4h). Pickering emulsions (2h), gels (2h), aggregation of complex mixtures (4h), and the use of light scattering in investigation complex food structures (8h). Most chapters include some hand-ons examples of the gain knowledge to common food products.</td>
<td></td>
<td></td>
<td></td>
<td></td>

<tr>
<td><strong>Objective</strong></td>
<td>Quantitative process analysis and derivation of process-structure functions for complex liquid or semi-liquid food systems with non-Newtonian flow properties. Handling of optimisation and up-/down-scaling procedures.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>S-PRO2 scheme, reverse engineering approach, dimension analysis, Metzner-Otto and Rieger Novack design schemes of stirred reactors for non-Newtonian fluid processing, mixing/mixing statistics, mixing characteristics, power charac-teristics, dispersing characteristics, dispersing processes in rotor/ stator and membrane devices, spray processing, extrusion processing, diverse case studies for design and scaling of processes for food structure processing.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by understanding the interplay of in-line measurements of complex food properties in processes, process data handling and data analysis as well as building blocks for process control.

### Lecture notes

**Lecture notes**

**752-3023-00L**

**Process Measurements and Automation**

- **Abstract**: Overview on Process Automation, Information Management in processes, process data handling and analysis, In-line measurements of complex food systems, Process control schemes, Overview of sensors and sensor principles, integrated process control case studies
- **Objective**: Understanding the interplay of in-line measurements of complex food properties in processes, process data handling and data analysis as well as building blocks for process control.
- **Content**: Overview Process Automation, Process Control and process data management, Industrial design of automated/controlled processes, overview on sensors/sensor principles, case studies of in-line measurements and control in/of food production processes
- **Lecture notes**: Printed script (120 pages, 80 figures), diverse publications

**752-3201-00L**

**Emerging Thermal and Non Thermal Food Processing**

- **Abstract**: This course is built on the holistic approach in sustainable food processing via the consideration of the total value chain. Selected mechanical, biotechnological, thermal and non-thermal techniques for best biomass and energy use efficiency will be investigated. Focused technologies are new renewable processes, high pressure techniques, electroporation and different radiation based sources.
- **Objective**: Understanding of selected emerging food processing concepts with focus on lower process intensity for healthy and high quality food production, waste reduction as well as biomass and energy use efficiency. Updates from academia and industry around new trends in food process development.
- **Content**: Emerging combined processes based on mechanical, thermal and non-thermal techniques, Multi hurdle technology concept for preservation, Extreme high temperature-short time processes, high pressure techniques, electroporation, radiation, Biorefineries based on emerging process elements, Ongoing industry initiatives
- **Lecture notes**: Script will be distributed before the course via Moodle.

**Literature**

**List of publications and books given in course**

E. J. Windhab, M. Devezeaux de Lavergne, S. Michlig Gonzalez, T. Wooster

A “cook-and-look” approach to process design is no longer applicable in the current environmental, nutritional and competitive constraints. The modern R&D chemical/food engineer should have a clear focus on the desired structure that needs to be achieved to design a process line or a processing equipment, coupled with in depth knowledge of the processed materials.

The objective of this course is to highlight the intimate links between human physiology and product sensory and nutritional functions. To optimize these functions, an understanding of the physiological functions that interact and encode the actions of those product structures must be well understood.

Therefore the objective of this course is for students to be equipped with a skill set that will encompass basic digestion and sensory physiology knowledge and food structures.

The students will be exposed to this interplay all along the GI tract, including taste, aroma and texture perception, swallowing mechanics and gastro intestinal digestion with an engineering or physical sciences angle.

Data: 06.09.2022 12:51 Autumn Semester 2021 Page 1275 of 2159
### Content
Enzymes in foods: the use of added enzymes in food processing, control and/or utilization of endogenous enzymes, production of enzyme preparations for food use, and chemical analysis of food components by enzymatic methods.

### Lecture notes
Course contains lectures and a practical group work.

### Prerequisites / notice
The lectures are supplemented with handouts.

Course prerequisites: Food Chemistry III and Food Analysis III (or equivalent)

### 752-4009-00L
**Molecular Biology of Foodborne Pathogens**

<table>
<thead>
<tr>
<th>W+</th>
<th>3 credits</th>
<th>2V</th>
<th>M. Loesnser, M. Schmelcher, M. Schuppler, E. Wetter Slack</th>
</tr>
</thead>
</table>

### Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

### Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

### Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

### Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Recommendations will be given in the first lecture

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break !

### 752-5103-00L
**Functional Microorganisms in Foods**

<table>
<thead>
<tr>
<th>W+</th>
<th>3 credits</th>
<th>2G</th>
<th>C. Lacroix, A. Geirnaert, A. Greppi</th>
</tr>
</thead>
</table>

### Abstract
This integration course will discuss new applications of functional microbes in food processing and products and in the human gut. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality and safety, and for health benefits for consumers.

### Objective
To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods, and for benefiting human health. This course will integrate basic knowledge in food microbiology, physiology, biochemistry, and technology.

### Content
This course will address selected and current topics targeting functional characterization and new applications of microorganisms in food and for promoting human health. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to different topics:

- Probiotics and Prebiotics: human gut microbiota, functional foods and microbial-based products for gastrointestinal health and functionality, diet-microbiota interactions, molecular mechanisms; challenges for the production and addition of probiotics to foods.
- Protective Cultures and Antimicrobial Metabolites for enhancing food quality and safety: antifungal cultures; bacteriocin-producing cultures (bacteriocins); long path from research to industry in the development of new protective cultures.
- Legal and protection issues related to functional foods
- Industrial biotechnology of flavor and taste development
- Safety of food cultures and probiotics

Students will be required to complete a Project on a selected current topic relating to functional culture development, application and claims. Project work will involve information research and critical assessment to develop an opinion, developed in an oral presentation.

### Lecture notes
Copy of the power point slides from lectures will be provided.

A list of topics for group projects will be supplied, with key references for each topic.

### Literature
This lecture requires strong basics in microbiology.

### 752-1301-00L
**Special Topics in Toxicology**

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2G</th>
<th>K. Hecht, S. Huber</th>
</tr>
</thead>
</table>

### Abstract
Journal-club style course involving student presentations and active discussion and critique of recent publications and modern experimental strategies. The focus is on chemical, biochemical, and nutritional aspects of selected topics in Toxicology, with a new group of topics addressed each semester

### Objective
- to stimulate student interest and provide advanced knowledge of current research in Toxicology and its related sciences
- to develop skills in critical evaluation of scientific literature, oral presentation and questioning
- to understand modern experimental techniques and research approaches relevant in toxicology

### Content
The journal-club style course involves student presentations and active discussion of recent publications. The primary focus is on chemical, biochemical, and nutritional aspects of selected current topics in Toxicology. Participants are masters or PhD students in Food Sciences and related disciplines (i.e. Chemistry, Biochemistry, Pharmaceutical Sciences, etc.).

### Literature
A selection of approximately 20 papers from recent primary scientific literature.

### Prerequisites / notice
The course is open to Masters or PhD level students.

For Masters level participants, a strict prerequisite is (a) previously taken and passed "Introduction to Toxicology" (752-1300) and/or (b) previous courses supporting equivalent knowledge plus permission from the instructor. Please contact the instructor before the start of the class, explaining the basis of your previous knowledge other than the Introduction course, to request special permission.

If you would like to take "Special Topics in Toxicology", do not register at the same time for "Advanced Topics in Toxicology". It is only possible to take one, and it is only possible to take the advanced level after completing this course.

401-0649-00L Applied Statistical Regression

752-5500-00L Applied Bioinformatics: Microbiomes W+ 4 credits 2G N. Bokulich

Abstract
Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.

Objective
Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content
1. Introduction to microbiomes and microbial bioinformatics toolkit. UNIX/bash, Python, Pandas, Jupyter, git/GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology, diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice
No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (UNIX/bash and/or Python), bioinformatics, and statistics.

Students will bring and work on their own laptop computers (students without a laptop should consult with their department’s ISG group).

All software used in the course is free and open-source. Installation instructions will be provided to students prior to the start of the course.

Optional Subjects
Advanced Topics in Toxicology

G. Broggini, P. Wick

Actual publications from literature will be provided. Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website. The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g. nutritional profile) will be addressed.

Gene Technology in Foods

F. Constancias, G. Broggini, A. Greppi, F. Orelli

This course will increase basic knowledge on biotechnological constructions and application of genetically modified organisms (GMO) which are used worldwide in food production systems. The course discusses health issues, the legislation frame and food safety aspects of GMO applications in agriculture, food production and consumption in Switzerland and EU-countries.

Nanostructured Materials Safety

P. Wick

Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection. The goals are to stimulate student interest and provide advanced knowledge of current research in the interdisciplinary area of Food and Nutrition Toxicology and its related sciences. The student should develop skills in the critical evaluation of scientific literature, oral presentation and questioning, and understanding modern experimental techniques in Molecular Toxicology.

Dietary Etiologies of Chronic Disease

M. B. Zimmermann

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Epidemiology and Prevention

M. Puhar, R. Heusser

The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real-world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (UNIX/bash and/or Python), bioinformatics, and statistics.

All software used in the course is free and open-source. Installation instructions will be provided to students prior to the start of the course.

Analytical Competencies

This course will provide knowledge and biological background on genetically modified organisms (GMO) and food produced with the help of GMO, especially on the molecular basis of GMO constructions with emphasis on genetically modified food in Switzerland and the EU. Criteria of rational food safety and health assessment in agriculture and food consumption will be elaborated.

Objectives

- Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used transgenes in food as well as on GMO used for food production and their detection technologies in food; food safety assessment of GMO food; information on the legislation in Switzerland and EU-countries

Lecture notes

Copies of slides from lectures will be provided

Literature

Actual publications from literature will be provided

Prerequisites / note

Good knowledge in biology, especially in microbiology and molecular biology are prerequisites.

Some contents will be provided by registered students who will present as a group an actual publication.
