**Abstract**

General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

**Objective**

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**

1. Stoichiometry
   - Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
2. Atoms
4. Basics of chemical thermodynamics
   - System and surroundings. Description of state and change of state of chemical systems.
5. First law of thermodynamics
6. Second law of thermodynamics
   - Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
7. Gibbs energy and chemical potential.
8. Chemical equilibrium
9. Acids and bases
10. Dissolution and precipitation.
    - Heterogeneous equilibrium. Dissolution and solubility product. Carbon dioxide-carbonic acid-carbonate equilibrium.

**Lecture notes**

Online-Skript mit durchgerechneten Beispielen.

**Abstract**

This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.
1. Single-Variable Calculus:
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

2. Linear Algebra and Complex Numbers:
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

3. Ordinary Differential Equations:
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Genetics and Evolution:
   Mendelian genetics, linkage and chromosomes, evolution of genomes, how evolution works, phylegetic reconstructions, microevolution, species and speciation, macroevolution.

5. Diversity of Life:
   introduction to viruses, prokaryotes, origin and evolution of eukaryotes, nonvascular and seedless vascular plants, seed plants, introduction to fungi, overview of animal diversity, introduction to invertebrates, origin and evolution of vertebrates.

6. Environmental Systems:
   the influence of environmental factors (temperature, radiation, water, nutrients etc.) on organisms; adaptation to certain conditions, biodiversity: variation, causes, threats, conservation, ecosystem compartments, energy and material flows, ecological communities: structure, stability, succession, evolution: method and specialization, conservation strategy.

7. Aquatic Ecology:
   impact of environmental factors (temperature, radiation, water, nutrients etc.) on organisms; adaptation to certain conditions, ecosystem concepts, aquatic and terrestrial ecosystems, corresponding methodological approaches will be presented.

8. Terrestrial Ecology:
   the first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

9. Integrative Ecology:
   the first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

   This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

11. Environmental Systems I
   The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.
The lecture discusses the role of the environmental systems based on selected environmental problems, among these the exploration of raw materials and fossil fuels, climate change and its impacts on man and environment, and the spread and control of infectious diseases in the human population and agricultural systems.

Slides are provided by instructors and are accessible via moodle.

### 751-0013-00L World Food System

**Abstract**
Knowledge about the World Food System will be provided, based on case studies along food value chains in countries with various development stages and dependent on multiple boundary conditions. This shall generate profound understanding of the associated global challenges especially food scarcity, suboptimal diet and nutrition, food quality and safety as well as effects on the environment.

**Objective**
Attending this course, the students will recognize the elements of the World Food System (WFS) approach and the problems it is supposed to treat. They will especially comprehend the four pillars of global food security, namely (I) food availability (including sustainable production and processing), (II) access to food (physical and monetary), (III) food use (including quality and safety as well as the impact on human health and well being) and (IV) resilience to the boundary conditions (environmental, economic and political). This insight will make them aware of the global driving forces behind our ETH research on food security and is expected to alleviate motivation and understanding for the association of subsequent specific courses within a general context. The course equivalently implements agricultural and food sciences, thus supporting the interdisciplinary view on the WFS scope.

**Content**
Case studies on certain foods of plant and animal origin serve to demonstrate the entire food value chain from the production of raw material to processed food and its consumer relevant property functions. In doing so, important corresponding aspects for developed, emerging and developing countries are demonstrated, by use of engineering as well as natural and social science approaches.

**Lecture notes**
Handouts and links are provided online.

**Literature**
Information on books and other literature references is communicated during the course.

**Prerequisites / notice**
The course is part of the block exam after the first study year. Paper copies can be used ("Open Book") during the on-line exam, but no other means are not allowed. The course is taught in German.

### 351-1158-00L Principles of Economics

**Abstract**
This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, markets, and behavioral economics before moving on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

**Objective**
After successful completion of the course you will be able to:
- Describe the basic micro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.

**Content**
Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

**Abstract**

**Objective**
Capability of preparing biological specimen, microscopy and documentation. Understanding the correlation between plant structure and function at the level of organs, tissues and cells.

Awareness of the link between plant anatomy, systematics, physiology, ecology, and development.
Content

Anatomical adaptations to different environments.

Prerequisites / notice
Groups of a maximum of 30 students.

529-0030-00L Laboratory Course: Elementary Chemical Techniques O 3 credits 6P A. de Mello, F. Jenny, M. H. Schrotth Abstract
This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e. g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

Objective
This course is intended to provide an overview of experimental chemical methods. The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

Content
The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:
- Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

Lecture notes
The script will be published on the web. Details will be provided on the first day of the semester.

Literature
A thorough study of all script materials is requested before the course starts.

Prerequisites / notice
Safety conceptt: https://chab.ethz.ch/studium/bachelor1.html

252-0839-00L Informatics O 2 credits 2G L. E. Fässler, M. Dahind L Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists and tables and with relational databases, introduction to programming.

Objective
The students learn to
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data.

Content
1. Modeling and simulations
2. Data management with lists and tables
3. Data management with a relational database
4. Introduction to macro programming
5. Introduction to programming with Python

Lecture notes
All materials for the lecture are available at www.evim.ethz.ch

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Basic Courses (Second Year)

Examination Block

Number Title Type ECTS Hours Lecturers
402-0063-00L Physics II O 5 credits 3V+1U A. Vaterlaus

Abstract
Introduction to the concepts and tools in Physics, with the help of demonstration experiments. The Chapters treated are Electromagnetism, Refraction and Diffraction of Waves, Elements of Quantum Mechanics with applications to Spectroscopy, Thermodynamics, Phase Transitions, Transport Phenomena. Whenever possible, examples relevant to the students’ main field of study are given.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve them.

- **Abstract**  
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

- **Objective**  
  Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

- **Abstract**  
  Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

- **Objective**  
  Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

- **Content**  
  Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

- **Abstract**  
  Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft.
Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungs instrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

- Grundlagen und Ziele unternehmerischen Entscheidens
- Kosten und Leistungsrechnung
- Produktionstheorie
- Produktionsprogrammplanung
- Investitionsplanung und Finanzierung
- Entscheidungen unter Unsicherheit und Risikomanagement

Lecture notes
Vorlesungsunterlagen werden im Laufe des Semesters zur Verfügung gestellt

Literature

752-6003-00L Introduction to Nutritional Science O 2 credits 1.5V M. B. Zimmermann, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

Objective
To introduce the students to the both the macro- and the micronutrients.

Content
The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

Lecture notes
There is no script. Powerpoint presentations will be made available.

Abstract
Important concepts from population, quantitative and molecular genetics are introduced and applied to plant and animal populations.

Objective
After the course, the students will be able to
- work with genetic polymorphisms and explain mechanisms underlying allele frequency changes in natural and experimental populations;
- determine factors affecting the selection intensity
- explain the difference between genotypic and phenotypic values
- quantify the expected genetic gain per time unit
- explain important molecular methods to determine genetic polymorphisms;
- map traits in plant and animal populations using molecular marker information;
- integrate different concepts from population, molecular and quantitative genetics and explain their importance for applications in genetics in agricultural sciences.

Content
Molecular genetics (15%)
- DNA sequence variation
- Marker & genotyping technologies (SSRs, AFLPs, SNPs, KASP, GBS, RADseq, AmpSeq, Chip Technologies)

Population genetics (30%)
- Allele- and genotype frequencies in populations
- Hardy-Weinberg equilibrium
- Genetic drift, differentiation of populations
- Fitness, selection
- Inbreeding, relationship, effective population size

Quantitative genetics (40%)
- Recombination, crossing over, linkage analysis, genetic mapping
- QTL mapping
- Forms of selection and selection differential
- Heritability
- Quantification of expected genetic gain
- genotypic value, allele substitution effect, breeding value
- Integrative genetics (15%)
- Genome-wide association mapping
- Estimation of genomic breeding values

Lecture notes
Slides and exercises will be provided in advance of each class via Moodle

Students enrolled in a Master's degree programme may
Der EU Lebensmittelsektor

Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications.

The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed

Domain C - Social Competencies
- Communication: not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: not assessed

Microeconomics of the Agriculture and Food Sector

In dieser Vorlesung sollen Mikroökonomische Zusammenhänge am Fallbeispiel des Agrar- und Ernährungssektors vermittelt werden. Ziel ist das Verständnis theoretischer mikroökonomischer Methoden und deren Anwendbarkeit auf den Ernährungssektor.

- Der EU Lebensmittelsektor
- Preiselastizitäten von Angebot und Nachfrage im Ernährungssektor
- Marktformen
- Gewinnmaximierung
- Wettbewerbsangebot
- Monopol/ Monopolistischer Wettbewerb/ Monopson
- Oligopol (Stackelberg, Cournot, Bertrand)
- Preisbildung/ Preisdiskriminierung
- Kartelle
- Dominante Firma

Optimization of Agricultural Production Systems

Introduction in to optimization of agricultural production systems with linear and non-linear programming models.

Students will learn the underlying principles (Optimization, Duality, Simplex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrange, Kuhn-Tucker) and illustrated with various examples.

The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented.

Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Resource and Environmental Economics

Students acquire a deeper understanding of basic microeconomic models.

Concepts and Theories

- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: not assessed
- Project Management: not assessed

- Analytics and Flexibility: not assessed

- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

Note for D-MAVT students: If you have already successfully completed "Principles of Microeconomics" (LE 363-0503-00L), then you will not be permitted to attend it again.
Abstract
Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

Objective
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regulation functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, private goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of over-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Literature

752-2120-00L Consumer Behaviour I W 2 credits 2V M. Siegrist, A. Beardh, A. Berthold
Abstract
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Content
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, private goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of over-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Literature

751-5005-00L Agroecology and the Transition to Sustainable Food Systems W 2 credits 2G M. Sonneveldt, M. Grant, S. E. Ulbrich, B. Wehrli
Abstract
The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

Objective
Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions. This course enables students and the interested public to engage in a lively and critical debate on important topics and scientific contributions to agroecology. Based on the knowledge gained, students are able to form a personal opinion on the role of agroecology and to reflect on the different facets and real-world applications supporting a transition towards sustainable food systems.

Content
Organization of the lecture:
The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET). Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture: At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):
The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.

While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):
The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/61315399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

On the Moodle-page you can find some pre-readings for the course.

Prerequisites and notice
The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.

Plant Sciences

751-3700-00L Plant Ecophysiology O 2 credits 2V M. Gharun, M. Lehmann, A. Walter
Abstract
The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and C allocation, yield and production, stress physiology. Lab and field measurements are included.

Objective
The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology and will have hands-on experiences with equipment used in plant ecophysiology.

Lecture notes:
Handouts stehen online.

Literature:

Prerequisites / notice:
Dieser Kurs basiert auf Grundlagen der Pflanzenbestimmung und der Pflanzenphysiologie. Er ist Basis für die Veranstaltungen Pflanzenbau, Teil Futterbau und Graslandsysteme.

**Abstract:**
The aim of these lecture is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

**Objective:**
At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

**Content:**
A general introduction explains the appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

**Lecture notes:**
The slides will be distributed online.

**Abstract:**
A motivation letter must be submitted after the first lecture Monday 27.9. (maximum 100 words) until 29.9. to Achim Walter (Achim.Walter@usys.ethz.ch). A confirmation of the definitive participation in the course will be communicated on 1.10. The definitive registration for the course will be undertaken by the study secretariat.

**Objective:**
Agriculture needs to become more sustainable via innovative approaches. This course allows students to explore in group work, how this could be realized. There are short impulse talks on ‘Smart Farming’ given by experts on technology and entrepreneurship. Most importantly, students elaborate the first steps to create a startup company in this field.

**Abstract:**
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective:**
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria triticum blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisin and pisatin dimethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-4801-00L System-Oriented Management of Herbivore Insects W+ 2 credits 2G to be announced

Abstract
Does not take place this semester.

Objective
The focus is on the potential to assess strategies and tactics of pest management, in view of the demands from the economy, environment and society. Significant management measures will be explained using practical examples, such as surveillance and forecasting, resistance management, biological control as well as the use of plant protection products, incl. regulatory aspects and ecotoxicology.

751-5003-00L Sustainable Agroecosystems II W+ 2 credits 2V K. Benabderrazik, M. Hartmann

Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate change, soil degradation, etc.) in both temperate and tropical contexts, from building food system resilience through innovative measures, to addressing soil fertility and GHG emissions. A wide variety of case studies will be presented, covering different scales (e.g. value-chains, farm and soil management). The class is complemented by a role-playing exercise on food system transformation. Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the exercise, students will learn to cooperate through a teamwork exercise and understand what is the role of each stakeholder in the food system in order to support a sustainable transformation.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.
Students will:

The overall goal of this course is to provide general knowledge about the behaviour, housing and welfare of domestic animals. The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetables (6 h) and viticulture (6 h). Under the responsibility of Agroscope representatives, basic knowledge of production systems (yield formation and physiology, cultivation methods, main varieties, quality) of these horticultural crops, which are important in Switzerland, is imparted.

The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives and different facets and real-world applications supporting a transition towards sustainable food systems. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions.

Agroecology and the Transition to Sustainable Food Systems

The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html

The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).

At the end of the lecture series, the course will be evaluated with the students. Public lecture part (virtually via Zoom webinar):

The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.

While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):

The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/61315399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

The lecture notes can be found on the Moodle-page you can find some pre-readings for the course.

Prerequisites

Language and script: German or French, maybe selected parts in English.

The student's lecture (19:15-20:00h CEST/CET) will be set up in two parts consisting of a public and a student lecture:

At the end of the lecture series, the course will be evaluated with the students.

Animal Sciences

751-7506-00L  Animal Housing and Behaviour  O  1 credit  1V  J. Müller, S. Goumon

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part 2, G. Bee, M. A. Boessinger, - Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten).

Agroecology and the Transition to Sustainable Food

The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Performance Assessment: 1 written report (20%) + 1 final examination (80% of grade)

Applied Animal Nutrition

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Performance Assessment: 1 written report (20%) + 1 final examination (80% of grade)

Animal Feed and Feeding of Ruminants

The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Performance Assessment: 1 written report (20%) + 1 final examination (80% of grade)

Regulatory Physiology

Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Hormonstase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerzen) wird diese komplexe Funktion verständlich.

Performance Assessment: 1 written report (20%) + 1 final examination (80% of grade)

In this course, students will learn the principles of linear and non-linear optimization in the context of agricultural production, including the use of the simplex method and the Kuhn-Tucker conditions. Students will also learn how to formulate and solve optimization problems using linear and non-linear programming models. Additionally, students will be introduced to the concept of duality in optimization theory.

### Objective
- An understanding of the economic principles underlying agricultural production systems.
- The ability to formulate and solve optimization problems using linear and non-linear programming models.
- The ability to interpret the results of optimization models and critically discuss their implications.

### Content
Molecular biological laboratory: DNA extraction, DNA quantification, PCR, molecular markers, gel electrophoresis, DNA sequencing, bioinformatics, qPCR.

Angewandtes Methodentraining: Inhalte definiert durch die jeweiligen Arbeitsgruppen.

### Literature

### Taught competencies
- Domain A - Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
- Domain B - Method-specific Competencies
  - Analytical Competencies: assessed

### Practical
- Hands on during lecture

### Examinations
- Written examination

### Prerequisites
- Grundkenntnisse der Ökonomie/Agrarökonomie
- Vorlesung Einführung in die Mikroökonomie

### Electives
The electives listed are recommended. However, electives can be chosen from the complete course offer of the ETH Zurich and University of Zurich.

### Course number and credits
- 751-0903-00L 3 credits
- 751-0401-00L 3 credits
- 363-0537-00L 3 credits
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Literature

### 752-2120-00L Consumer Behaviour I

**Abstract**
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

**Objective**
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

### 751-4108-00L Innovation in Smart Farming

**Abstract**
Agriculture needs to become more sustainable via innovative approaches. This course allows students to explore in group work, how this could be realized. There are short impulse talks on 'Smart Farming' given by experts on technology and entrepreneurship. Most importantly, students elaborate the first steps to create a startup company in this field.

**Objective**
During the course, the students generate their own ideas on 'Smart Farming'. They explore, which technologies provide possibilities for a more sustainable agriculture. They realize trade-offs between economic and technological possibilities.

**Content**

### 751-4504-00L Plant Pathology I

**Abstract**
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective**
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrphs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and psisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

751-4801-00L System-Oriented Management of Herbivore Insects W 2 credits 2G to be announced

Abstract

Does not take place this semester.

The focus is on the potential to assess strategies and tactics of pest management, in view of the demands from the economy, environment and society. Significant management measures will be explained using practical examples, such as surveillance and forecasting, resistance management, biological control as well as the use of plant protection products, incl. regulatory aspects and ecoxotoxicology.

Objective

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will be able to assess options for action in view of requirements from the economy, environment and society. Further, they will learn to elaborate on current issues in pest management, and to critically evaluate case studies.

751-5003-00L Sustainable Agroecosystems II W 2 credits 2V

K. Benabderrazik, M. Hartmann

Abstract

This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective

1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.

2) Learn and experiment on methods for field and laboratory investigations in agroecology.

3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.

4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.

5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content

The course will address a wide range of agricultural and food system challenges (e.g. food security, climate change, soil degradation, etc.) in both temperate and tropical contexts, from building food system resilience through innovative measures, to addressing soil fertility and GHG emissions. A wide variety of case studies will be presented, covering different scales (e.g. value-chains, farm and soil management). The class is completed by a role-playing exercise on food system transformation. Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the exercise, students will learn to cooperate through a teamwork exercise and understand what is the role of each stakeholder in the food system in order to support a sustainable transformation.

Literature

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrärösosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective
The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content
- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxistrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und -bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungplanes auf dem Praxistrieb durch die Gruppe.
- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationengestaltung und Rezeptoptimierung für Mischfutterteilen anhand verschiedener Beispiele; Einsatzgrenzen von Futtermitteln; technologische Futterbearbeitung.

Lecture notes
Handouts in German language will be provided by each lecturer when starting his part of the lecture.

Literature
Die Dozierenden geben in der Lehrveranstaltung die relevante Literatur bekannt.

Prerequisites / notice
Blockkurs in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.

---

Abstract
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Prerequisites / notice
Fach mit benoteter Semesterleistung.

---

Abstract
Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Homöostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerzen) wird diese komplexe Funktion verständlich.

Objective

Content
- Thermoregulation (Fieber)
- Flüssigkeitshomöostase (Durchfall)
- Calciumregulation (Milchfieber)
- Energiehomöostase (Ketose)
- Schmerz (zootechnische Eingriffe)
- Stress (allostatische Last, Epigenetik)

Lecture notes
Unterlagen werden individuell von den Dozierenden abgegeben.

Prerequisites / notice
Spezifische Literatur wird individuell von den Dozierenden angegeben.

---

Abstract
The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: [https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html](https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html).

Objective
Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions. This course enables students and an interested public to engage in a lively and critical debate and to learn about scientific contributions to agroecology. Based on the knowledge gained, students are able to form a personal opinion on the role of agroecology and to reflect on the different facets and real-world applications supporting a transition towards sustainable food systems.
Organization of the lecture:
The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).
Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture:
At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):
The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.
While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):
The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/6131599346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

Lecture notes
On the Moodle-page you can find some pre-readings for the course.

Literature

Prerequisites / notice
The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.

701-0903-00L The Sustainable Development Goals Book Club W+ 2 credits B. B. Pearce, J. Ghazoul

Abstract
The ETH Sustainable Development Goals Book Club is a colloquium for Bachelor students within and outside of Department of Environmental Systems Science centered around the discussion of themes from a single book, with the aim of fostering interdisciplinary, intellectual and critical exploration of the scientific and societal complexities related to the Sustainable Development Goals.

Objective
The aims of this course are to:
- Create an interdisciplinary approach to understanding key concepts of sustainable development and the SDGs
- Create solidarity through a cultural of intellectual exchange at ETH Zurich
- Create a common object of intellectual reference for students with different disciplinary interests to enable diverse ways and modes of thinking

Content
The course is similar to 701-0019-00L Readings in Environmental Thinking with the following differences:
- Targeted at Bachelor’s students (especially first and second year, but open to all) within and outside of the department.
- All participating students will read one book whose themes will be the basis for discussions.
- These discussions, taking place both online and in-person, will be moderated by the main lecturers of the course and discussed by additional professors from within and outside of D-USYS.
- Each discussion will be based on a chapter of a book, always linked to a particular aspect of the SDGs.
- The modes of discussion will vary in length and form, ranging from the traditional, sit-down meeting, to a Twitter book club format (as already pioneered and popularized by author Robert MacFarlane).
- Both students and professors will lead the discussions alternatively.
- Each discussion session will result in a visual output or another shareable output that will be developed by a student or group of students.

Literature
TBD
Could be one of the books already used in 701-0019-00L Readings in Environmental Thinking (Silent Spring, The Sand County Almanac, Collapse..etc.)
Other possibilities:
- Thinking in systems
- Limits to Growth
- Operating Manual for Spaceship Earth
- Small is Beautiful
- For the Common Good
- Factfulness
- The Prize: The Epic Quest for Oil, Money and Power (history of the global petroleum industry from 1850s-1990)

Prerequisites / notice
none

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching. (1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks). (2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

**Gender Issues In Education and STEM**

Number of participants limited to 30.

**Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).**

Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

**Abstract**

In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

**Objective**

- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues.
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher's work.

**Content**

Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice

Prerequisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Abstract**
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

**Objective**
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

**Content**
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
- Disciplinary topics: 32 h
  - Rumen Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
- Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

**Lecture notes**
Documentsations, links and other materials will be provided at the start of the course

**Literature**
Information on books and other references will be communicated during the course

**Prerequisites / notice**
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

<td>to be announced</td>
</tr>
</tbody>
</table>

**Abstract**
The overall goal of the course is to provide the essential scientific knowledge of pig animal health and behaviour and of the implications for husbandry and animal welfare.

**Objective**
Students will
- understand the complex interactions of health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

**Content**
Topics:
- Understanding natural behaviour of pigs to improve their management
- Welfare challenges in pig production
- On-farm and post-mortem health assessment
- Farrowing and lactation
- Pig reproduction and associated problems
- Piglet mortality and morbidity
- Emotions
- Cognition
- Pain

There will be 1 excursion to the pig stable of AgroVet Strickhof.

**Lecture notes**
Handouts/scripts are distributed by the the lecturers.

**Literature**
Specific literature is indicated by the lecturers.

**Prerequisites / notice**
Knowledge in animal health, animal welfare and ethology is recommended but not required.

The lectures will be in English and German (depending on the lecturers)

**Number of participants limited to 20.**
Structure of the contact hour part of the course (16 h):

The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Introduction to both forms of presentation will be offered by the lecturer.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Lecture notes

no scriptum

Prerequisites / notice

Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

Lecture notes
The teaching slides and other materials will be provided during the course.

Literature
Information about books and other references will be communicated during the course.

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

W+ 3 credits 2G R. R. Regös, S. Bonhoeffer

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

>>> Livestock Genetics

Number Title Type ECTS Hours Lecturers
751-6243-00L Breeding and conservation of Animal Genetic Resources W+ 2 credits 2V H. Signer-Hasler, C. Flury, S. Neuenschwander

Abstract
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.

Objective
Learning Objectives: Part 1:
At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:
The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

The students:
- have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
- can name the national and international efforts to conserve agricultural livestock breeds.
- know how to describe genetic diversity.
- can point out what is important in the management of small populations.
- can describe different conservation measures, especially in situ and ex situ conservation.
- can describe current national and international conservation programmes for different livestock breeds.

Prerequisites / notice
Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered.
Examination Part 2: Graded semester performance completed during the block course.
Parts 1 and 2 contribute equally to the final grade.

751-6305-00L Livestock Breeding and Genomics W 3 credits 3G P. von Rohr

Abstract
Swiss routine breeding value estimation/genetic evaluation systems of cattle, pig, sheep and goats are presented with methods and evaluated traits. Examples will be demonstrated using the statistical software R.

Objective
The students know the theoretical and practical application of breeding value estimation in Switzerland for cattle, pig, sheep and goats. The students are able to interpret estimated breeding values.

Content
- basic principles of genetic evaluations
- Applied genetic evaluation in cattle (data, methods, traits, national and international genetic evaluations)
- Applied genetic evaluation in pigs (data, methods, traits)
- Applied genetic evaluation in sheep and goats (data, methods, traits)

Lecture notes
Course notes in the form of a monograph, copies of the slides and solutions to the exercise questions are available on the net.

Literature
To be announced in the lectures.

>>> Methodology Competences

>>> Methods for Scientific Research

Number Title Type ECTS Hours Lecturers

Abstract
Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.
Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

Lecture notes

Handouts will be available (in English)

Literature

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

Taught competencies

| Domain A - Subject-specific Competencies | Concepts and Theories | assessed |
| Domain B - Method-specific Competencies | Analytics Competencies | assessed |
|                                          | Media and Digital Technologies | assessed |
|                                          | Problem-solving | assessed |

751-6127-00L Practical Course in Microscopy of Functional Histology

W+ 3 credits 6P not available

Abstract

Die "Funktionelle Histologie" beschreibt die histologischen und zytologischen Strukturen mit ihren jeweiligen Aufgaben und Wechselwirkungen innerhalb ausgewählter Organ Points. Die endokrinologisch relevanten Organe und deren Präparation werden am Beispiel des Rindes kennengelernt.

Objective

Grundlagen der Histologie; Gewebedünnsschnitte (Gefrier- und Paraffinschnitte) und deren Übersichtsfärbungen und Immunhistochemie; Fortgeschrittene Mikroskopie von Gewebedünnsschnitten; Kritische Bewertung von Physiologie/Pathologie aufgrund morphologisch-histologischer Kriterien

Content

Prerequisites / notice

In Form eines Vortrags werden den anderen TeilnehmerInnen das zugeteilte Organ bzw Gewebe bezüglich der Morphologie, Histologie und funktioneller Gesichtspunkte vorgestellt. In der Nachbereitung zum Praktikum wird ein Bericht angefertigt, in dem die Vorgehensweise (Verfahrensprotokoll), die Befunde (Ergebnisprotokoll) und die kritische Auseinandersetzung mit den Inhalten des Praktikums (kritische Beurteilung) dokumentiert werden.

Prerequisites / notice

For receiving a total of 3 Credit Points for this practical course we kindly ask you to actively take part in the practical performance. In addition, you will have to present an original research publication, address questions from your colleagues and actively participate in the discussion. The last day, you will need to pass a short written examination about the theoretical background of the techniques and results interpretation. Finally, after the course, you will have to write a lab report to be handed in at the beginning of the spring semester.

751-6129-00L Practical Course Epigenetics

W+ 3 credits 6P not available

Abstract

The practical course will comprise of lecture elements introducing the topic of epigenetics and a large amount of practical work where you will be able to perform DNA methylation analyses on your own. In particular, we will focus on DNA extraction and the estimation of global and local DNA methylation.

Objective

The competencies and aims for the course are:

- Get first hands-on experience with the experimental techniques.
- Answer a scientific question by conducting experiments.
- Obtain results of an experiment and get insight into what affects technical variation and thus influences reproducibility.
- Interpret results in an adequate manner to solve a scientific question.
- Combine results to draw an adequate conclusion.
- Present a research paper on epigenetics.

Lecture notes

You will receive in advance a selection of research papers, a document with the theoretical background of the techniques included in the course, the slides of the lessons in pdf and a detailed protocol of the work we will do.

Prerequisites / notice

For receiving a total of 3 Credit Points for this practical course we kindly ask you to actively take part in the practical performance. In addition, you will have to present an original research publication, address questions from your colleagues and actively participate in the discussion. The last day, you will need to pass a short written examination about the theoretical background of the techniques and results interpretation. Finally, after the course, you will have to write a lab report to be handed in at the beginning of the spring semester.

751-6003-00L Training Course in Research Groups (Large)

W+ 6 credits 13P S. M. Bernal Ulloa, S. Neuenschwander, H. Pausch, M. Saenz de Juano Ribes, S. E. Ulbrich
Abstract
The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.

Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends.

The total time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

<td>Forum: Livestock in the World Food System</td>
<td>W+</td>
<td>2 credits</td>
<td>1S</td>
<td>S. Meese</td>
</tr>
</tbody>
</table>

**Abstract**
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum “Livestock in the World Food System”, a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

**Content**
The Forum “Livestock in the World Food System” will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

1. **Element 1. Oral presentation:** The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

2. **Element 2. Scientific writing:**
   - preparation of a short scientific type of paper from a result table offered by the lecturers
   - writing of a critical review of a chosen topic.

**Lecture notes**
There will be a discussion in small groups at several choosable dates.

**Prerequisites / notice**
Introductions to both forms of presentation will be offered by the lecturer.

- The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time. no scriptum
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

The number of participants is limited to 30.

The aim of the course is to gain an understanding of how insects have specialised and adapted to occupy diverse environmental niches and become vital to ecosystem processes. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions and examining insect ecology in an evolutionary context.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO₂, H₂O, N₂O and CH₄. Functional responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets and carbon sequestration. Thus, students will learn about the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Thus, students will learn about the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Students will learn how to evaluate and present scientific Type assessed

The course focuses on the analysis and understanding of the complex and interacting processes of ecology, biogeochemistry and management of terrestrial systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO₂, H₂O, N₂O and CH₄. Functional responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. 751-3405-00L Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

Number of participants limited to 20. Priority will be given to students in Agricultural Sciences

Abstract
The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes
Documents will be distributed during the lecture.

Literature
Documents will be distributed during the lecture.

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH (or bring an equivalent knowledge). This knowledge is indispensable for this 7th semester.

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

Number of participants limited to 20.

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsotopeProject, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally. This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.
Experimental Design and Applied Statistics in Agroecosystem Science

Abstract
Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content
The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:
- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Tropical Cropping Systems, Soils and Livelihoods

This course has been restructured due to Covid-19 restrictions, part I (2 CP) takes place in Autumn 2021, part II (3 CP) in Spring 2022, with an excursion/fieldwork. For more information, please contact the lecturer: kenza.benabderrazik@usys.ethz.ch

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

Objective
Part 1
(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess Food and energy security in tropical agroecosystems

Part 2
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess Food and Energy Security
(6) Collaboration in international students and stakeholders

Content
Part 1 (Fall semester 2021)
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics or agricultural economics. Students will engage in readings, discussions and exchanges on the specificities of tropical agriculture.

Part 2 (Spring 2022)
On the second module, students gain practical knowledge on field - An integral part of the course is the two-week field project in a Tropical region, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to Food and Energy Security.

Prerequisites / notice
Students can only join Part 2 if Part 1 was taken and validated first. A selection of 20 students for the Part 2 will be done on the basis of several elements. We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 28th 2021, justifying your motivation to enroll to this class.

**Abstract**

Students who take this course will increase their knowledge of marketing, its effect on consumer behavior and its role in creating long-term value. The course will introduce important concepts, frameworks and methods for marketing decision-making. A focus will be on managing customer relationships with the help of targeted promotions and data collected through digital technologies.

**Objective**

After taking the class, students will be able to:

1) Define what marketing is and describe its role at different stages of the value chain
2) Apply psychological theories to analyze behavior (e.g., purchase behavior) and identify the needs of (prospective) customers in consumer and business markets
3) Design elements of the marketing mix—e.g., develop new products and set prices—in a way that creates long-term value
4) Create an effective and efficient marketing mix that attracts and engages customers, e.g., by running targeted promotions
5) Use quantitative methods and customer data to manage relationships with customers

**Content**

The class will center on the importance of marketing as an activity that creates long-term value for the benefit of organizations and their customers. It will teach concepts, frameworks and methods for marketing decision making.

The structure of the course will closely follow the different steps of the value chain, i.e., the set of activities necessary for offering valuable products to customers. First, it will introduce students to psychological theories that help explain behavior, e.g., purchase behavior. It will also familiarize students with different methods from marketing research, which can be used to identify the needs of customers. Next, the course will look at the role of the marketing mix in satisfying customer needs. For example, the class will cover new product development and pricing. A focus will be on managing profitable, long-term relationships with customers. To this end, students will gain in-depth knowledge on the use of targeted promotions and marketing data to (1) attract, (2) convert and engage and (3) retain customers.

The course is designed to be “hands-on”, with opportunities to apply skills on business cases involving real-world marketing data. It will feature guest lectures from industry experts.

**Abstract**

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.
The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

701-1651-00L
Environmental Governance

ECTS
6 credits

W+ 2V

3G E. Lieberherr

Abstract
The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes
Lecture slides and additional course material will be provided on Moodle.

Literature
We will mostly work with readings from the following books:

Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester. During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

751-2103-00L
Socioeconomics of Agriculture
W+ 2 credits 2V S. Mann

Abstract
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

Objective
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid. Articles and book abstracts will be uploaded to a course website.

This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective. The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

This course deals with how and why international problem solving efforts (cooperation) in environmental politics emerge, and under what circumstances such efforts are effective. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution, protection of biodiversity, how to deal with plastic waste, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences. After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units
2. Reading assignments, available via Moodle, for a few selected course units
3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

Lecture notes: Assigned reading materials and slides will be available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

851-0626-01L International Aid and Development

Number of participants limited to 60

Prerequisites: Basic knowledge of economics

Abstract

The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Objective

Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

Content

Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid: e.g. Micro-Finance, Budget-Support; Fair-Trade.

Literature

Articles and book abstracts will be uploaded to a course website.

860-0023-00L International Environmental Politics

Particularly suitable for students of D-ITET, D-USYS

Abstract

This course focuses on the conditions under which problem solving efforts in international environmental politics emerge and the conditions under which such efforts and the respective public policies are effective.

Objective

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

Content

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Lecture notes: Assigned reading materials and slides will be available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Methods in Agricultural Economics
The lectures will consist of both theoretical and practical components. In the theoretical part, we will discuss each estimation approach in detail. The lecture will present the assumptions, derivations, as well as the advantages and disadvantages of the estimation approach.

In the empirical part, we will look at simulation results using artificial data. Furthermore, we will investigate a particular estimation approach in practice using STATA.

The course will tentatively cover the following subjects:
- review of ordinary least squares (OLS) estimation
- instrumental variable estimation and two-stage least squares estimation
- seemingly unrelated regression models
- simultaneous equation models
- maximum likelihood estimation
- binary response models
- count data models
- censored and truncated regression models
- sample selection models
- treatment effect models
- static linear panel data models (random effects and fixed effects estimation)

For the theoretical portions of the lectures, we will prepare slides for in-class discussion. Slides will be distributed electronically before each lecture.

For the applied portion of the lectures, we will provide STATA do files, log files, and data sets.

Problem sets will also be made available after every lecture. These problem sets will not be collected or graded, but students can use them in order to prepare for the final exam. Solutions will be made available in the following lecture.

While there is no required textbook for the course, we draw from the following texts, which are also recommend for the preparation of the exam:
- Harmless Econometrics.

Literature

751-0423-00L Risk Analysis and Risk Management in Agriculture W+ 3 credits 2V R. Finger

Abstract
Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on farmers’ decision making under risk and risk management. We present innovative insights, empirical example from European agriculture.

You gain hands-on experience using R.

Objective
- to develop a better understanding of decision making under uncertainty and risk;
- gain hands-on experience in risk analysis and management using R
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against high unemployment and inflation? The lecture provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical economic models, nonlinear dynamics and macroeconomic modeling. The course is structured along three main tasks:

- PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systems oriented management, as an approach to structure problems and to find solutions.

- PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

- PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. Another objective of the self-study tasks is to practice efficient communication of such concepts. These are provided as home work and two of these will be graded (see "Prerequisites").

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Another objective of the self-study tasks is to practice efficient communication of such concepts. These are provided as home work and two of these will be graded (see "Prerequisites").
Content

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society’s resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes

The course webpage (to be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15062) contains announcements, course information and lecture slides.

Literature

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

Taught competencies

| Domain A - Subject-specific Competencies | Concepts and Theories | assessed |
| Domain B - Method-specific Competencies | Techniques and Technologies | not assessed |
| Domain C - Social Competencies | Analytical Competencies | assessed |
| | Decision-making | not assessed |
| | Media and Digital Technologies | not assessed |
| | Problem-solving | assessed |
| | Project Management | not assessed |
| Domain D - Personal Competencies | Communication | not assessed |
| | Cooperation and Teamwork | not assessed |
| | Customer Orientation | not assessed |
| | Leadership and Responsibility | not assessed |
| | Self-presentation and Social Influence | assessed |
| | Sensitivity to Diversity | not assessed |
| | Negotiation | not assessed |
| | Adaptability and Flexibility | not assessed |
| | Critical Thinking | assessed |
| | Integrity and Work Ethics | not assessed |
| | Self-awareness and Self-reflection | not assessed |

Abstract

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

Objective

Part 1

(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess Food and energy security in tropical agroecosystems

Part 2

(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess Food and Energy Security
(6) Collaboration in international students and stakeholders

Content

Part 1 (Fall semester 2021)

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, resilience to soil physics or agricultural economics. Students will engage in readings, discussions and exchanges on the specificities of tropical agriculture.

Part 2 (Spring 2022)

On the second module, students gain practical knowledge on field - An integral part of the course is the two-week field project in a Tropical region, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to Food and Energy Security.

Prerequisites / notice

Students can only join Part 2 if Part 1 was taken and validated first.
A selection of 20 students for the Part 2 will be done on the basis of several elements. We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 28th 2021, justifying your motivation to enroll to this class.

*Only for MSc Agricultural Sciences*

** Abstract **

** Objective **

Im Berufspraktikum führen die Studierenden eine angemessene, anspruchsvolle Aufgabe im beruflichen Umfeld durch. Sie bearbeiten eine definierte Aufgabenstellung oder ein Projekt im Bereich der Agrarwissenschaften. Dabei wenden sie im Studium erworbene fachliche, überfachliche und methodische Kompetenzen im Arbeitsalltag an und erweitern und vertiefen diese. Zudem reflektieren sie die geleistete Praktikumsarbeit.

** Prerequisites / notice **

Der Praktikumsaufenthalt wird in der Regel im dritten Master-Semester, in jedem Fall vor Beginn der Master-Arbeit absolviert. Er kann erst absolviert werden, wenn:
- die Bachelor-Arbeit im Studiensekretariat abgegeben wurde;
- eine Einschreibung ins Master-Studium Agrarwissenschaften erfolgt ist;
- allfällige Zulassungsauflagen erfüllt sind.

** Minors **

</tbody>
</table>

** Abstract **

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.

** Objective **

The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

** Content **

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

** Abstract **

Advanced Management in the Agri-Food Chain:
Framework and models for management of organizations in the Agri-Food Chain in a complex environment.

** Objective **

After the lecture the students ...
... know the characteristics and consequences of complexity in the organizational world.
... know and can apply selected comprehensive models for managing in complex situations.
... know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and ... are able to deepen the relevant topics in an autonomous way.

** Content **

In the lecture the following contents will be treated:
- State, reasons and effects of complexity in the organizational world.
- A basic framework for shaping and governing intelligent organizations.
- Selected contemporary models for managing in the complex organizational world.
- Transfer and adaption of the models to organizations in the Agri-Food Chain.

** Lecture notes **

Reader with selected contents.

- **Abstract**: In this class, students learn the basics of system dynamics and its application to agricultural and regional economic questions. In the second half of the class, students develop their own simulation model, with which they evaluate potential interventions for improving the economic as well as the ecological sustainability of food systems.

- **Objective**:
  - Students learn the basic theory and practice of dynamic simulation
  - Students can develop, analyze and extend a dynamic simulation model and interpret its results.
  - By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

- **Lecture Notes / Literature**
  - Slides (will be provided during the class)
  - Articles and papers (will be provided during the class)

Abstract
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Objective
Students will have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

Content
Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support; Fair-Trade.

Literature
Articles and book abstracts will be uploaded to a course website.

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems, be able to analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices, based on real-life data. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets and carbon sequestration. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

751-3405-00L Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

Number of participants limited to 15.

Priority will be given to students in Agricultural Sciences

Abstract
The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively, and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes
Documents will be distributed during the lecture.

Literature
Documents will be distributed during the lecture.

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH (or bring an equivalent knowledge). This knowledge is indispensable for this 7th semester.

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

Number of participants limited to 20.

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective
Students will become familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Abstract  
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective  
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

701-0263-01L  
**Seminar in Evolutionary Ecology of Infectious Diseases**

Abstract  
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective  
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content  
A core set of 10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes  
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature  
Papers will be assigned and downloaded from a web page announced during the lecture.

751-4506-00L  
**Plant Pathology III**

Abstract  
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective  
The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content  
One exercise will be on an e-learning base (with computers) also to prepare the students for the final e-exam.

Lecture notes  
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise.

Prerequisites / notice  
The course will be in German (spec. nomenclature).

Number of participants limited to 20.

**Objective**

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Objective**

The students will be able to use the software R efficiently for data analysis, graphics and simple programming

**Prerequisites / notice**

252-0840-02L Anwendungsnahe Programmieren mit Python
401-0624-00L Mathematik IV: Statistik
401-6215-00L Using R for Data Analysis and Graphics (Part I)
401-6217-00L Using R for Data Analysis and Graphics (Part II)
701-0105-00L Mathematik VI: Angewandte Statistik für Umweltwissenschaften

**Prerequisites / notice**

**Lecture notes**

The course resources will be provided via the Moodle web learning platform.
As from FS 2019, subscribing via Mystudies should *automatically* make you a student participant of the Moodle course of this lecture, which is at:
https://moodle-app2.let.ethz.ch/course/view.php?id=1518

**Prerequisites / notice**

**Lecture notes**

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

**Prerequisites / notice**

### 751-5510-00L  
**Introduction to Agricultural Robotics**

**W+**  
3 credits  
2G  
S. Mintchev

**Number of participants limited to 20.**

**Abstract**  
In this course, students will learn theoretical and practical aspects of robotics. Lectures will give an introduction to how robots operate in the real world. Students will apply the concepts learned in class on educational robots to simulate a weeding task.

**Objective**  
After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

**Content**  
Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding. The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines. During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in small teams (2 to 3 members) to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

**Lecture notes**  
Copies of the slides and exercises will be provided on the course web page.

**Literature**  

**Prerequisites / notice**  
No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

### 701-0951-00L  
**GIS - Introduction into Geoinformation Science and Technology**

**W+**  
5 credits  
2V+3P  
M. A. M. Niederhuber

**Number of participants limited to 50.**

**Waiting list will be deleted October 8th, 2021.**

**Abstract**  
Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

**Objective**  
Students are able to:
- eludicate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

**Content**  
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;
Analyze publications on long-term field experiments regarding their content on integrated nutrient management; link this information, write it

Introduction to Geographic Information Systems, Tutorial: Introduction to ArcGIS Pro

Prerequisites / notice

Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 25 Studierende betreut werden.

651-4031-00L Geographic Information Systems W+ 3 credits 4G A. Baltsenweiler, M. Hägeli-Golay

Number of participants limited to 60.

Abstract
Introduction to the architecture and data processing capabilities of geographic information systems (GIS). Practical application of spatial data modeling and geoprocessing functions to a selected project from the earth sciences.

Objective
Knowledge of the basic architecture and spatial data handling capabilities of geographic information systems.

Content
Theoretical introduction to the architecture, modules, spatial data types and spatial data handling functions of geographic information systems (GIS). Application of data modeling principles and geoprocessing capabilities using ArcGIS: Data design and modeling, data acquisition, data integration, spatial analysis of vector and raster data, particular functions for digital terrain modeling and hydrology, map generation and 3D-visualization.

Functioning of Soil Systems

Number
751-5101-00L Biogeochemistry and Sustainable Management Does not take place this semester.

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical feedback mechanisms and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will understand and analyse the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems, be able to analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices, based on real-life data. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets and carbon sequestration. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will work with real-life data from the long-term measurement network Swiss FluxNet. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecology, physiology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems Does not take place this semester.

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”.

Objective
Analyze publications on long-term field experiments regarding their content on integrated nutrient management; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

751-3405-00L Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

Number of participants limited to 15.

Abstract
The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.
### 751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

**Number of participants limited to 20.**

<table>
<thead>
<tr>
<th>Credit Hours</th>

<th>Literature</th>
<th>Prerequisites / Notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>W 2 credits</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

**Objective**

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

**Content**

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotopic abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

**Lecture notes**

Handouts will be available on the webpage of the course.

**Literature**

Will be discussed in class.

**Prerequisites / Notice**

This course is based on fundamental knowledge about plant ecophysiology, soil science, and biology in general. Course will be taught in English.

</tr>
</tbody>
</table>

**Abstract**

This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

**Objective**

1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

**Content**

Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

**Abstract**

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/ near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales.

**Objective**

Students are able to
- characterize porous media at different scales
- parameterize structural, flow and transport properties of partially-saturated porous media
- quantify driving forces and resulting fluxes of water, solute, and heat in soils
The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil; to explain and compare the components of soil-water potential and its effect on plant growth. This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

### Content

**Week 1**: Introduction, soil and vadose zone, units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil water content; soil texture; particle size distributions;

**Week 2**: Pore scale consideration, pore sizes, shapes and connectivity, coordination number, continuity and percolation, surface area, soil structure

**Week 3**: Capillarity – capillary rise, surface tension, Young-Laplace equation; Washburn equation; numerical lab

**Week 4**: Soil Water Potential - the energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); units and calculations and measurement of equilibrium soil water potential components

**Week 5**: Soil water characteristics - definitions and measurements; parametric models, fitting and interpretation, hysteresis; demo lab

**Week 6**: Saturated water flow in soils - laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts (Kozeny-Carman)

**Week 7**: Unsatuated water flow in soils - unsaturated hydraulic conductivity models and applications; Richards equation, approximations of Richards equation for steady state; approximate solutions to infiltration (Green-Ampt, Philip); outlook on unstable and preferential flow

**Week 8**: Numerical solution of Richards equation – using Hydrus1D for simulation of unsaturated flow; choosing class project

**Week 9**: Energy balance and land atmosphere interactions - radiation and energy balance; evapotranspiration, definitions and estimation; evaporation stages and characteristic length; soil thermal properties; steady state heat flow; non-steady heat flow

**Week 10**: Root water uptake and transpiration

**Week 11**: Solute and gas transport in soils; transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application; parameter estimation; salt balance.

**Week 12**: Summary of lectures; solution of old exam

**Week 13**: Written semester-end exam

**Week 14**: Short presentations of Hydrus class projects; discussion of written exam

### Literature

**Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

**701-1343-00L**

**Abstract**

Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed.

**Objective**

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying pedoclimatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research.

**Content**

24.09: Introduction.

01.10: Soil water relations; Principles of soil water retention and soil water flow; Soil hydraulic properties.

08.10: Root water uptake; soil hydraulic constraints on transpiration

15.10: Rhizosphere processes and properties; root-soil contact; root hairs; mycorrhiza; rhizodeposition.

22.10: Water flow in roots and xylem; root anatomy, architecture and plasticity; cavitation.

29.10: Transpiration; Vapor Pressure Deficit; Photosynthesis; Stomatal regulation.

05.11: Soil-plant-atmospheric continuum; Below- and above-ground feedbacks; Soil and atmospheric drivers of transpiration losses.

12.11: Modelling Soil-Plant Water Relations (Concept)

19.11: Modelling Soil-Plant Water Relations (Implementation)

26.11: Plant response to drought and consequences for agriculture and forests. Open questions and introduction to seminar topics.

03.12: Group work in the class

10.12: Seminar (presentation of papers)

17.12: Seminar (presentation of papers)

24.12: Seminar (presentation of papers)

**751-5201-10L**

**Abstract**

This course has been restructured due to Covid-19 restrictions, part I (2 CP) takes place in Autumn 2021, part II (3 CP) in Spring 2022, with an excursion/fieldwork. More information, please contact the lecturer: kenza.benabderrazik@usys.ethz.ch

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain theoretical knowledge of field methods, diagnostic tools for tropical soils and agroecosystems. Various experts will present their projects and perspectives on various subjects from Food security, Resilience to Soil physics.

**Objective**

**Part 1**

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa

2. Interdisciplinary analysis of agricultural production systems

3. Knowledge on methods to assess Food and energy security in tropical agroecosystems

**Part 2**

4. Hands-on training on the use of field methods, diagnostic tools and survey methods.

5. Gain practical knowledge on how to assess Food and Energy Security

6. Collaboration in international students and stakeholders

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field. This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

751-5101-00L Biogeochemistry and Sustainable Management

Objective
Will be discussed in class.

At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

751-3405-00L Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

Number of participants limited to 15.

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

Abstract
The course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Objective
At the end of this course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory and communication skills.

Lecture notes
Documents will be distributed during the lecture.

Literature
Documents will be distributed during the lecture.

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students must have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH (or bring an equivalent knowledge). This knowledge is indispensable for this 7th semester.

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

Objective
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture. Copies of the slides and exercises will be provided on the course web page.
#### Taught competencies

**Domain A - Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Domain B - Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

**Domain C - Social Competencies**

- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Negotiation: not assessed

**Domain D - Personal Competencies**

- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

#### Non-Ruminant Science

<td>2V</td>
<td>to be announced</td>
</tr>
</tbody>
</table>

**Abstract**
The overall goal of the course is to provide the essential scientific knowledge of pig animal health and behaviour and of the implications for husbandry and animal welfare.

**Objective**

- understand the complex interactions of health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

**Content**

- Understanding natural behaviour of pigs to improve their management
- Welfare challenges in pig production
- On-farm and post-mortem health assessment
- Farrowing and lactation
- Pig reproduction and associated problems
- Piglet mortality and morbidity
- Emotions
- Cognition
- Pain

There will be 1 excursion to the pig stable of AgroVet Strickhof.

**Lecture notes**
Handouts/scripts are distributed by the lecturers.

**Literature**
Specific literature is indicated by the lecturers.

**Prerequisites / notice**
Knowledge in animal health, animal welfare and ethology is recommended but not required.

The lectures will be in English and German (depending on the lecturers)

---

**751-6243-00L Breeding and conservation of Animal Genetic Resources**

**Abstract**
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.

**Objective**

**Learning Objectives:** Part 1: At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:

- The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

- The students:
  - have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
  - can name the national and international efforts to conserve agricultural livestock breeds.
  - know how to describe genetic diversity.
  - can point out what is important in the management of small populations.
  - can describe different conservation measures, especially in situ and ex situ conservation.
  - can describe current national and international conservation programmes for different livestock breeds.

**Prerequisites / notice**

Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered.
Examination Part 2: Graded semester performance completed during the block course.
Parts 1 and 2 contribute equally to the final grade.

751-6127-00L Practical Course in Microscopy of Functional Histology

W  3 credits  6P  not available

Abstract
The "Funktionelle Histologie" describes the histological and zytological structures with their respective influences on the regulation of the endocrinological processes. The endocrinology and reproduction of ruminants are presented at the example of the oviduct as a leading organ. The methodology includes the preparation of microsections, analysis of the histological structures, and the application of immunohistochemical techniques.

Objective
Grundlagen der Histologie; Gewebedünnschnitte (Gefrier- und Paraffinschnitte) und deren Übersichtsfärbungen und Immunhistochemie; Fortgeschrittene Mikroskopie von Gewebedünnschnitten; Kritische Bewertung von Physiologie/Pathologie aufgrund morphologisch/histologischer Kriterien

Content
Jeder/m Studierenden wird ein Organ zugeteilt, mit welchem sie/er sich intensiv theoretisch und praktisch auseinandersetzt. Anhand dieses Organes als rotem Faden, welches vom Schlachthof bereitgestellt und von den Studierenden selber seziert, eingebettet, geschnitten, gefärbt und mikroskopiert werden, wird die Lernziele erreicht.

Prerequisites / notice
In Form eines Vortrags werden den anderen TeilnehmerInnen das zugeteilte Organ bzw Gewebe bezüglich der Morphologie, Histologie und funktioneller Gesichtspunkte vorgestellt. In der Nachbereitung zum Praktikum wird ein Bericht angefertigt, in dem die Vorgehensweise (Verfahrenskonzept), die Befunde (Ergebnisprotokoll) und die kritische Auseinandersetzung mit den Inhalten des Praktikums (kritische Beurteilung) dokumentiert werden.

Lecture notes
You will receive in advance a selection of research papers, a document with the theoretical background of the techniques included in the course, the slides of the lessons in pdf and a detailed protocol of the work we will do.

751-6129-00L Practical Course Epigenetics

W  3 credits  6P  not available

Abstract
The practical course will comprise of lecture elements introducing the topic of epigenetics and a large amount of practical work where you will be able to perform DNA methylation analyses on your own. In particular, we will focus on DNA extraction and the estimation of global and local DNA methylation.

Objective
Die Theorie wird im Kurs im Detail vertieft und diskutiert.

Content

Prerequisites / notice
In Form eines Vortrags werden den anderen TeilnehmerInnen das zugeteilte Organ bzw Gewebe bezüglich der Morphologie, Histologie und funktioneller Gesichtspunkte vorgestellt.

Lecture notes

751-6305-00L Livestock Breeding and Genomics

W+  3 credits  3G  P. von Rohr

Abstract
Swiss routine breeding value estimation/ genetic evaluation systems of cattle, pig, sheep and goats are presented with methods and evaluated traits. Examples will be demonstrated using the statistical software R.

Objective
The students know the theoretical and practical application of breeding value estimation in Switzerland for cattle, pig, sheep and goats. The students are able to interpret estimated breeding values.

Content
Basic principles of genetic evaluations
Genetic evaluation in cattle (data, methods, traits, national and international genetic evaluations)
Genetic evaluation in pigs (data, methods, traits)
Genetic evaluation in sheep and goats (data, methods, traits)

Literature
To be announced in the lectures.

751-6113-00L Endocrinology and Biology of Reproduction

W+  3 credits  2G  S. E. Ulbrich, S. M. Bernal Ulio

Abstract
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen)
Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Ruminant Science

Number Title Type ECTS Hours Lecturers
751-6501-00L Ruminant Science (HS)
W  4 credits  4G  K. Giller, M. Terranova, U. Witschi

Abstract
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

Objective
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.
Content
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
  - Disciplinary topics: 32 h
    - Ruminal Digestion: 8 h
    - Ruminant Nutrition Physiology: 12 h
    - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

Lecture notes
Documentations, links and other materials will be provided at the start of the course

Literature
Information on books and other references will be communicated during the course

Prerequisites / notice
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

751-7211-00L Ruminal Digestion W 1 credit 1G not available

Abstract
This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

Objective
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Content
Structure of the contact hour part of the course (16 h):

2 h Introduction and blackboard exercise

8 h Basic topics in ruminal digestion, lectures and group exercises:
  - Systematics of the microbes involved in microbial digestion
  - Measurement of microbial digestion
  - Interactions of microbes and epithelium of the digestive tract
  - Differences between ruminal and hindgut microbial digestion
  - Microbial nutrient degradation and its modification
  - Efficiency of microbial protein synthesis
  - Manipulation of the ruminal digestion

4 h exercise at AgroVet-Strickhof:
  - Measurements of microbial digestion
  - Laboratory exercise with a rumen fistulated cow and a Rumen Simulation Technique

2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

Lecture notes
Lecture notes are provided via Moodle.

Literature
Will be communicated at the start of the course.

Prerequisites / notice
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

751-6001-00L Forum: Livestock in the World Food System W 2 credits 1S S. Meese

Abstract
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturer are the audience.

Element 2. Scientific writing:
1. preparation of a short scientific type of paper from a result table offered by the lecturers
2. writing of a critical review of a chosen topic.

There will be a discussion in small groups at several choosable dates.

Introductions to both forms of presentation will be offered by the lecturer.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and ECTS

752-2122-00L Food and Consumer Behaviour | W | 2 credits | 2V | M. Siegrist, C. Hartmann |

Abstract
This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products. The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.

Number of participants limited to 20.

This course will increase basic knowledge on biotechnological constructions and application of genetically modified organisms (GMO) which are used worldwide in food production systems. The course discusses health issues, the legislation frame and food safety aspects of GMO applications in agriculture, food production and consumption in Switzerland and EU-countries.

This course will provide knowledge and biological background on genetically modified organisms (GMO) and food produced with the help of GMO, especially on the molecular basis of GMO constructions with emphasis on genetically modified food in Switzerland and the EU. Criteria of rationale food safety and health assessment in agriculture and food consumption will be elaborated.

Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used transgenes in food as well as on GMO used for food production and their detection technologies in food; food safety assessment of GMO food; information on the legislation in Switzerland and EU-countries

Copies of slides from lectures will be provided

Actual publications from literature will be provided

Good knowledge in biology, especially in microbiology and molecular biology are prerequisites.

Some contents will be provided by registered students who will present as a group an actual publication.

This course covers the interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing.

Students should be able to describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food. They will apply these criteria when assessing the effects of selected processing technologies on nutritional quality. They will evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods).

The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g. nutritional profile) will be addressed.

There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course.

The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

The course provides students with the basic knowledge to understand the connection between the structure of nutritive and non-nutritive bioactive food and feed components and their effects on the nutrient supply and health of humans and livestock as well as on the quality of animal-derived foods.

Students should be able to:
- describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food
- apply these criteria when assessing the effects of selected processing technologies on nutritional quality
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods)

The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

The teaching slides and other materials will be provided during the course.

Information about books and other references will be communicated during the course.

The course teaches concepts and methodologies of sustainability assessment. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability. The format of the course is seminar-like, interactive.

At the end of the course, the students are aware of food and feed as sources of different bioactive compounds. By a comprehensive understanding of the connection between bioavailability, molecular mechanisms and biological effects, they are able to apply their knowledge on beneficial and detrimental effects of bioactive food and feed components in the fields of human and animal nutrition.

The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

The teaching slides and other materials will be provided during the course.

Information about books and other references will be communicated during the course.

The course is structured as follows:
- overview of rationale, objectives, concepts and origins of sustainable development (approx. 15%)
- overview of the concept of social justice as guiding principle of the social dimension of sustainability (approx. 20%)
- analysis of a selection of concepts and methodologies to assess sustainable development in a variety of contexts (approx. 65%)

Students of this course may also be interested in the course transdisciplinary case study (tdCS) in the Spring semester (701-1502-00L)

Elective courses can be chosen from the entire course programme of the ETH Zurich as well as from the course programme of the University of Zurich.
Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

The students are able to
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications.

Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding.

The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in small teams (2 to 3 members) to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

Copies of the slides and exercises will be provided on the course web page.

No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Class size limitation to 20 students.

Concepts and Theories
Techniques and Technologies
Analytical Competencies
Decision-making
Media and Digital Technologies

Self-awareness and Self-reflection
Self-direction and Self-management

The aim of this lecture series is to offer students and the interested public a deeper insight into the fundamentals of agroecology and its potential role in transforming food systems. For more information on the public lecture part of this course, please visit: https://worldfoodsystem.ethz.ch/outreach-and-events/past-events/agroecology-lectures-2021.html
Objective

Students know the elements of agroecology and are able to critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches. Students are able to understand and explain how the 10 elements could be implemented as guiding principles for policymakers, practitioners and other stakeholders across the food system in planning, managing and evaluating agroecological transitions.

Content

Organization of the lecture:

The lecture series will take place in the fall semester of ETH Zurich, starting in the week of September 20, 2021 and lasting until December 17, 2021. During this period, the lecture will take place once a week, on Tuesdays from 18:00-20:00 (CEST/CET).

Each lecture will be organized in an online format and will be set up in two parts consisting of a public and a student lecture:

At the end of the lecture series, the course will be evaluated with the students.

Public lecture part (virtually via Zoom webinar):

The public lecture (18:00-19:00 CEST/CET) will take place virtually via this Zoom webinar: https://ethz.zoom.us/j/64352765873.

While most public lectures will take one hour, the last public lecture on “Agroecology, The Way Forward”, on Tuesday, 7th December 2021, will last 90 minutes.

Student’s lecture part (exchange with course instructors online via zoom):

The student’s lecture (19:15-20:00h CEST/CET) will take place online via a normal Zoom call: https://ethz.zoom.us/j/61315399346.

For further details, please refer to the Moodle-page of this course: https://moodle-app2.let.ethz.ch/course/view.php?id=15210

Lecture notes

On the Moodle-page you can find some pre-readings for the course.

Prerequisites / notice

The course is designed as a public lecture on “Agroecology in the transition to sustainable food systems” to allow for different perspectives to be represented, heard and discussed.

The Sustainable Development Goals Book Club

W+ 2 credits  B. B. Pearce, J. Ghazoul

Abstract

The ETH Sustainable Development Goals Book Club is a colloquium for Bachelor students within and outside of Department of Environmental Systems Science centered around the discussion of themes from a single book, with the aim of fostering interdisciplinary, intellectual and critical exploration of the scientific and societal complexities related to the Sustainable Development Goals.

Objective

The aims of this course are to:

- Create an interdisciplinary approach to understanding key concepts of sustainable development and the SDGs
- Create solidarity through a cultural of intellectual exchange at ETH Zurich
- Create a common object of intellectual reference for students with different disciplinary interests to enable diverse ways and modes of thinking

Content

The course is similar to 701-0019-00L Readings in Environmental Thinking with the following differences:

- Targeted at Bachelor’s students (especially first and second year, but open to all) within and outside of the department.
- All participating students will read one book whose themes will be the basis for discussions.
- These discussions, taking place both online and in-person, will be moderated by the main lecturers of the course and discussed by additional professors from within and outside of D-USYS.
- Each discussion will be based on a chapter of a book, always linked to a particular aspect of the SDGs.
- The modes of discussion will vary in length and form, ranging from the traditional, sit-down meeting, to a Twitter book club format (as already pioneered and popularized by author Robert MacFarlane).
- Both students and professors will lead the discussions alternatively.
- Each discussion session will result in a visual output or another shareable output that will be developed by a student or group of students.

Literature

TBD

Could be one of the books already used in 701-0019-00L Readings in Environmental Thinking (Silent Spring, The Sand County Almanac, Collapse, etc.).

Other possibilities:

- Thinking in systems
- Limits to Growth
- Operating Manual for Spaceship Earth
- Small is Beautiful
- For the Common Good
- Factfulness
- The Prize: The Epic Quest for Oil, Money and Power (history of the global petroleum industry from 1850s-1990)

Prerequisites / notice

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written under the guidance of a agricultural science professor.

Objective

The independent writing of a scientific paper/thesis

| 052-0703-00L  | Sociology I         | W    | 2 credits | 2V   | C. Schmid, I. Apostol, N. Bathla, A. Hertzog-Fraser |
| Abstract      | Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and contemporary forms of urbanization, and typical examples of models of urbanization. |
| Objective     | This series of lectures should enable students to comprehend architecture in its social context. |
| Content       | Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part central aspects of social change are examined, in particular the transition from Fordism to Neoliberalism and the interlinked processes of globalization and regionalization. The second part deals with historical and current forms of urbanization. Among other aspects, it focuses on the changed significance of the urban-rural contradiction, the processes of suburbanization, periurbanization, and planetary urbanization; the formation of global cities and metropolitan regions; the development of new urban configurations in centres (gentrification) and in urban peripheries (edge city, exopolis, new urban intensity). In the third part these general processes are illustrated by typical models of urbanization: Manchester, Chicago, Los Angeles, Paris and Zürich. |
| Literature    | A detailed collection of original texts will be distributed. |
| Literature    | A detailed collection of original texts will be distributed. |
| 052-0901-00L  | Building History I  | O    | 2 credits | 2V   | S. Holzer     |
| Abstract      | History of building from classical antiquity to modernity: building types, constructions, forms, with particular reference to functional issues such as flexibility of use, statics, durability. This is not a mere history lecture, but an important part of the basic introduction into construction. |
| Objective     | Participants know the fundamentals of building history, including landmark monuments of each era, key historic constructions and forms. They are able to "read" a historic building and to relate it to building history. They are aware of the variety of historic building constructions. |
| Content       | Building History I covers the period from classical Greek antiquity to Gothic architecture. The principal topics include construction issues such as Greek megalithic building, Roman mortar-and-rubble construction, and Gothic rationalism of vaulted architecture. |
| Literature    | Within the Vitruvian and Albertian triad of firmitas, utilitas and venustas, we focus on the first two topics, whereas the last topic (deciphering the "meaning" of architecture) stands at the heart of the "architectural history" lectures. The present lecture contributes essentially to deepening knowledge about historic constructions, an indispensable precondition for building within existing fabric. |
| Lecture notes | Please keep a tight record of manuscript notes yourself. Lecture notes to some topics will be provided. pdf of lecture slides will be on line before each lecture. |
| Literature    | Will be announced during the lectures. |
The lecture introduces the most common building materials: concrete, steel, masonry, and timber, but also clay, glass, and polymers. It focuses on their ecological aspects, such as availability of raw materials, efforts for production, and the emission of hazardous substances. The lecture also covers the disposal and recycling of materials.

For the course 'History and Theory of Architecture I-II', students will rely on assisted self-study to acquire basic knowledge of the history of architecture in Europe. Printed copies of the course scripts will also be available for purchase.

During the course, students are invited to make use of it for their study, and attendance is compulsory.

In addition to the main lectures, the course 'History and Theory of Architecture I-II' will also include a series of seminars, called 'Small Narratives'. These seminars are meant to widen the scope of the programme by exploring case studies, such as buildings and ruins in Zurich, which relate and contribute to the content of the course. While content of the 'Small Narratives' seminars is not part of the exam, students are invited to make use of it for their study, and attendance is compulsory.

The course 'Fundamentals of the History and Theory of Architecture I-II' aims to explore and develop basic methods and strategies to research the history of art and architecture. It consists of four parts, each developed under one of the four Chairs of the gta, and each dealing with a particular area of study in the field of architecture and art history. The course will consist of four different exercises and tasks, carried out under the supervision of each of the four Chairs throughout the year:

1. Architecture and books (M. Delbeke)
2. Architecture and media (L. Stalder)
3. Architecture and art (P. Ursprung)
4. Urbanism and the Commons (T. Avermaete)

For the course 'History and Theory of Architecture I-II', students will rely on assisted self-study to acquire basic knowledge of the history of architecture in Europe.
Abstract
The means and potentials in the field of urban planning and design are pointed out from different perspectives in order to shape the city in the sense of a future-proof and humane environment. To this end, the basic principles are explained and concrete methods of urban design are presented.

Objective
The goal is to provide students with a broad systemic basic knowledge, that enables them to synthesize and evaluate complex urban design and planning problems.

Content
The lecture series imparts basic knowledge in urban planning and design. Pressing questions and main topics of contemporary urban design practice and theory will be addressed. The focus is on illustrating the richness of relationships as well as the potential of the discipline and its handling in everyday urban planning and design practice.

Lecture notes
There is no script to the lecture series. The lectures are recorded on video and made available online on http://www.video.ethz.ch/lectures.html a few days after each lecture.

Literature
At the end of the year course a reader with secondary literature will be made available for download.

Abstract
This course introduces computational design and teaches how design can be modeled and materialized using digital technology. Participants learn to use the computer strategically, thoughtfully, and sensitively within the design process. With the “digital literacy” acquired in this course, they develop an understanding of the potential of a digital building culture.

Objective
To systematically harvest the potential of the computer in their work processes, architects need an insight into the fundamental principles of information technology. The course, students learn the concepts, methods, and instruments of computational design. By the end of the two semesters, students will have mastered the basics of 3D modeling techniques, parametric design, programming code for Computer-aided-design (CAD), and digital prototyping. The acquired knowledge qualifies students to use the computer as a unique instrument to model their designs. Participants also learn to apply CAD and programming code creatively and productively in planning, design, and construction.

Specifically, the learning goals are:
- Critical understanding of the possibilities of information technology in design
- Acquiring an overview of the mechanisms and types of CAD systems and digital building models
- Gaining knowledge of the basic principles of computational geometry
- Applying visualization techniques and creatively using various digital media
- Learning concepts and application of parametric design.
- Being able to integrate computer-aided analysis and optimization methods in design-process
- Understanding the principles of digital process chains from design to production
- Strategically using visual programming code
- Reading, understanding, and adapting programming code within CAD software.

Content
Architecture is no longer conceivable without information technology. The planning, construction, operation, and ultimately the nature of buildings are increasingly influenced by digital technology. The digital is omnipresent both in the work of architects and in our built environment itself.

The courses Computational Design 1 and 2 offer an introduction to the character, challenges, and possibilities of digital technology in architectural design. The lectures will discuss the topics of digital building models and data, computational geometry, digital fabrication, machine intelligence, and mixed reality.

In this course, students will practice digital modeling processes and related techniques. The spectrum of exercises includes manual modeling, visual programming, and programming code within CAD software. Students learn to read, understand and adapt this code. In addition, the courses will provide insights into the nature and handling of different digital media formats, from real-time rendering to mixed reality.

Topics discussed within the lectures:
- CAD - background, and developments
- On the nature of digital models and data
- Architectural geometry
- Computational geometry
- Parametric and generative creation of models
- Computer-aided analysis and optimization of models
- Artificial intelligence and architectural models
- Materialization of digital models
- Mixed reality

Course Structure
The course consists of theoretical lectures, practical tutorials introducing technical concepts, and exercises supported by tutors. Participants can find updated and detailed information on Moodle, which is the learning platform for the course.

Autumn Semester 2021 Page 61 of 2152
To introduce students to the history and theory of architecture, the course has three objectives. Students are enabled to integrate essential characteristics of structural systems made out of reinforced concrete or steel into their architectural design. Normally, one would expect this course to teach students how to draw architecture while using computers. This course does not because it is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Attendance in the lecture ‘Thinking and Speaking about Art’. Elaboration of a self-contained artistic work in the framework of the group mentorates. (Emphasis of grading for the final semester grade: 3/5 final presentation, 1/5 written project-conception, 1/5 drawing examination in free and perspective drawing).

Objective
In the HS21, students prove artistic thinking and practise and develop their knowledge in a mentored course with an independent artistic work.

Content
Attendance in the lecture ‘Thinking and Speaking about Art’. Elaboration of a self-contained artistic work in the framework of the group mentorates. (Emphasis of grading for the final semester grade: 3/5 final presentation, 1/5 written project-conception, 1/5 drawing examination in free and perspective drawing).

| 052-0805-00L | History and Theory of Architecture III | O    | 2 credits | 2V    | L. Stalder |
| Abstract     | This two-semester course is an introduction to the history of architecture from the Second Industrial Revolution in the 1850s to the Oil Crisis in the 1970s in Europe. Students will be able to identify the “things”—technical objects and ensembles—that transformed architecture, and to relate them to the technical, scientific, and cultural concerns that introduced them as key features of modernity. |      |      |       |                  |
| Objective    | To introduce students to the history and theory of architecture, the course has three objectives. First, students will be able to identify the “things” that transformed architecture in modernity, and the crucial events, buildings, theories, and actors that characterize their history. |      |      |       |                  |
| Content      | The course proposes a new approach to the study of the history and theory of architecture in Europe during modernity. It focuses less on single architects or their buildings, and more on those “things” that have brought profound transformations in the built environment and daily life over the last 200 years, such as the revolving door, the clock, and the partition. |      |      |       |                  |

| 052-0635-00L | Mathematical Thinking and Programming III | O    | 2 credits | 2V    | L. Hovestadt |
| Abstract     | An introduction to information technology for architects. It is not about the HOW, but rather about the WHAT, not about virtuosity when dealing with digital tools, but rather about understanding coding. Not about pragmatism, but rather about literacy. It forms the basis of digital architectonics, the art of joining, which needs to be cultivated with care, prudence and patience. |      |      |       |                  |
| Objective    | Normally, one would expect this course to teach students how to draw architecture while using computers. This course does not because digital architectural models are not drawn, but encoded. |      |      |       |                  |

In the current discussion about building information models (BIM), we see how blocked the situation can become when one draws architecture digitally. Today, digital models are a tedious ‘minefield’ with hundreds of gigabytes of data of all kinds. A digital model as code, however, is lightweight, compact and fast – a sparkling crystal, like poetry.

Specific reference is made to the history of architecture in conjunction with mathematics and philosophy. The essential tool of the trade is the lambda calculus in the implementation of Mathematica. The information technology interconnection of all digital media will be presented: text, image, graphic, model, animation, film, audio and the corresponding software. Current issues will be discussed: Internet, Internet of things, cryptography, privacy, big data, machine intelligence, building information models, responsive cities, smart homes, robotics, energy and logistics. Current and historical modelling processes will be worked on.

<td>Global History of Urban Design I</td>
<td>O</td>
<td>2 credits</td>
<td>2G</td>
<td>T. Avermaete</td>
</tr>
<tr>
<td>Abstract</td>
<td>This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students’ future design work.</td>

Content

In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01: The History and Theory of the City as Project
02: Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
09: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
10: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
11: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

Lecture notes

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

Literature

There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

Prerequisites / notice

A list of further recommended literature will be found within each chapter of the reader (Skript).

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

Objective

The course target is to let the students gain a overview of a line of formative occurrences, works of art, buildings and theories from the early nineteen-seventies. The students should become sensitive for questions and problems in the field of history and theory and they should increasingly be able to relate their own praxis with historical relations.
Content
The two-semester course offers an introduction to the history of modern and contemporary art and architecture since ca. 1970. Motivated by questions of the current discourse, central topics and exemplary works of art and architecture are discussed. Concepts such as “history”, “memory”, “experience”, “research”, “nature”, “diversity” or “surface” are used to focus on specific historical developments and connections. Art and architecture is considered as a field of cultural change as well as an indicator of social, economic, and political conflicts which in turn helps to understand historical dynamics.

Lecture notes
A video documentation of the lecture class is available.

052-0651-00L Building Process I

Abstract
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time. Topics: Acquisition and building law, building economics and sustainability strategies, participants and their services, construction and planning organization.

Process thinking and a look at neighbouring countries complement the series.

Objective
Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic using case studies that investigate currents in new as well as those relevant in terms of architecture and urban design. Active participation as well as interdisciplinary and process-oriented thinking on the part of students is a prerequisite.

Content
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time. Topics: Acquisition and building law, building economics and sustainability strategies, participants and their services, construction and planning organization.

Process thinking and a look at neighbouring countries complement the series.

At the end of the semester, the Chair will provide literature and texts available for download as pdfs. These allow a more in-depth understanding of the lecture material.

052-0705-00L Energy and Climate Systems I

Abstract
The first semester of the annual course focuses on physical principles, component and systems for the efficient and sustainable heating, cooling and ventilation of buildings on different scales and the interaction of technical systems with architectural and urban design.

Content
1. Introduction and overview
2. Heating and cooling systems in buildings
3. Ventilation

Lecture notes
The slides of the lecture serve as lecture notes and are available as download.

A list of relevant literature is available at the chair.

052-0659-00L Architectural Technology V

Abstract
The lecture series explores the correlation among intentions of design, architectonic expression and construction premises. These critical areas or aspects of study, which are presented with selected projects, their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion.

Objective
The lecture series focuses on the physical principles and technical components of renewable and sustainable energy and energy supply of buildings. A special focus is on the interrelation of supply systems and architectural design and construction. Learning and practicing methods of quantifying demand and supply allows identifying parameters relevant for design.

Content
The different themed parts of structural design, building shell and knowledge of material get connected with architectural design in practice and reflected in the wider context of architectural theory. The intention is to consolidate the understanding of the connection between structure, process and formal appearance and expression in the architecture of the 20th century.

Lecture notes
The brochures published by the chair offer additional help. Knowledge of these brochures and their key subjects is recommended for the exam. The brochures can be ordered at the chair after the last lecture before the examination. However, the subject matters of the brochures and the lectures are not identical, the brochures provide information for a deeper understanding of the lectures. Apart from additional articles written by the chair, the brochures are composed of three modules: Project documentation, crucial texts on the work reception as well as theoretical articles about the particular thematic priorities by various authors. Concerning their content these anthologies allow insights into a wide range of theories, lines of reasoning and fields of research up to diverging points of views of specific problems.

052-0609-00L Architectural Technology V

Abstract
The lecture series explores the correlation among intentions of design, architectonic expression and construction premises. Each lecture is focused on individual themes, as for example, the application of certain materials (glass, or natural stone), of particular construction systems (tectonic, hybrid) or design generators (grids, series) and alternatively the search for a definable, tangible architectural expression (vernacular architecture, ready-mades). These critical areas or aspects of study, which are presented with their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion. The yearlong lecture cycle is comprised of twenty individual lectures, in which the majority of projects being analyzed date from the last few decades.
The time spent in the home office has led, among other things, to the accumulation of trillions of bytes. The question of storage arises, J. De Vylder, HS21

Abstract
- The time spent in the home office has led, among other things, to the accumulation of trillions of bytes. The question of storage arises almost automatically. Starting from historical architectures of storage in Switzerland (HS), we discuss social, political and ecological questions of contemporary globalised flows of goods and data (FS) and try answer through an architectural design.

Objective
- HS21 Ability to systematically analyse buildings from different eras and describe them photographically. The study and understanding of architectural rules, qualities and principles by means of graphic representations such as axonometries, plan representations with shadows and colours, but also photographs and models.

Content
- Ideal Architecture: Storage
  - We understand the issue of storage space as an urgent and constant problematic for all human societies in all historical periods. Form the prehistoric jars to the city of Delphi, where the ancient Greeks stored for the first time in history of Europe written documents and personal belongings. From the primitive caves to the Knossos palazzo, from the roman corn warehouses to the Nevada desert, where the hidden side of our cloud society lies with his enormous amount of space used for data storage.

- The act of storing something has to do with the issue of the ‘standard’ measure. Every epoch and every society culturally defines what their standards are, based on the very necessity of their historical time, and so the architecture of the storage space adapts itself to the ever-changing standards and thus evolves. For many periods the most import-ant conventions about storing were derived from the human body. From the weight a healthy person can lift to the way a hand reaches for an object, the body conditions storage.

- To categorize the things our society stores, is as vast as the society itself. Along most Swiss train tracks, one can observe form de-signed to hold materials in different consistencies. From liquid to aeriform to solids, from bulldozed bulk freight to stacked blocks, the physical forces demonstrate the movement and storing.

- In this semester we will look closely at the architecture of storage in Switzerland. By means of fieldwork, drawing, reading, discussion and designing we will search for the ideal in storage and propose a collection of the most interesting storage buildings. We believe that these buildings, in addition to being a crucial part of any functioning of society, possess an underappreciated beauty, and that through typological mapping have the potential to shed light on the mechanism of the built world.

- SS22 REAL ARCHITECTURE: SPACE OF ACCUMULATION

  Accumulation describes the gradual gathering of elements. It is the law by which many great things operate, such as civilization, history, economy and not least the formation of planets. Architecture is also subject to the law of accumulation, as buildings do not appear in an instant, but are gradually put together on the building site. What are the pyramids if not an accumulation of stones? One possible answer would be to say that they are storage; an architectural response to accumulation as old as time itself. Is the traditional storage still valid today? What can spaces of accumulation mean for architecture?

  With the increased focus on accumulation of capital, goods and data in today’s society, you’d think that spaces of accumulation would be an essential part of our daily lives. Instead it is suspiciously missing from the public imagination, hidden away as something necessary but unsightly. It’s true that the complexity and scale of accumulation can be unnerving and as the saying goes: you don’t want to know how the sausage is made. Nevertheless, could it be necessary to understand the sausage for a sustainable future?

- In our studio, using the knowledge from the previous semester on the ideal storage, we will combine the ideal and the real in order to speculate about how recycling meets tomorrow’s space of accumulation, because we believe that answering the question about the accumulation of the future means implicitly linking architecture to the necessities and urgencies of the world to come.

Architectural Design III: House Behaviorology in Switzerland (Kaijima)

Teaching languages are English and German.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class must not enrol.

Project grading at semester end is based on the list of enrolments on 2.11.21 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
The course focuses on a house and housing design in and around Zurich. Through the analysis of existing houses, including their users and locations, and by designing a housing complex, students learn about basic principles of housing design and the knowledge about issues of private/public, common spatial design for urban ecology.

Objective

Knowledge:
- Design research by actor network drawing (Week 1-4)
- Learning about actor networks
- Learning basic research methods (collection and analysis of data and information)
- Understanding a building design by actor networks
- Visualizing a building by actor network drawing
- Finding design principles by drawing

- Principles of house and housing design (Week 5-9)
- Understanding the form of a house by understanding the behavior of climate, material, users, elements and typology
- Learning about dimensions in a house and housing design
- Learning about the architectural form and the gradient of privacy in houses and housing
- Learning the potential of commonly used spaces
- Learning how to design common spaces
- Learning about how to design housing for everyone (children, elderly and differently abled people).
- Learning about the behavior of architecture in relation to weather and climate
- Learning about the behavior of materials
- Learning about the behavior of structure and gravity
- Learning the basics of detailing and construction

Skills:
- Hand drawing by pencil
- CAD drawing and 3d modeling
- Model building
- Learning the character of different tools, the skills to apply them as design methods and hybridizing them to achieve the desired results.
Architectural behaviorology and actor network theory are our two guiding principles to not only design architecture but also understand our current existing environment. By understanding a building, a house not as an isolated object but as a node in a vast and far reaching network, or several networks, we grow conscious of the impact, which our design has, not only on the specific plot, but on the neighbors, the city, the environment, the society. Vice-versa, analyzing and understanding the networks, which have shaped existing buildings, helps us to better understand how and why the design of those buildings came to be. While identifying the relationship between actors within the network, we simultaneously observe the behavior of each actor as a result of their relationship. The behavior can be static or dynamic, actors can be human, non-human, animate or inanimate. How does a building behave towards its environment? What behavior do inhabitants engage in within and around a building? How do we have to design to take Behaviors of certain materials into account? House and housing is the base of our living environment and a diverse fields in architecture. House behaviorology will set the challenge to find sustainable living condition in the city, by understanding historical examples and their geography, density, economic standing, and time period. At first, to find the character and essence of today’s house and housing design in Zurich, we will start with analyzing existing single-family houses in and around the city. We will research and map how these basic units of housing relate to the users, to each other and to their surroundings. What kind of purposes they fulfilled and what kind of activities and behaviors do these houses enable? Second, we will try to improve on the design by changing the single-family house into housing complexes, responding to the need of greater density, but still retaining the qualities of the original houses. Where do we find synergies, when combining houses? What kind of common spaces arise and how can we make use of them to make better neighborhoods? Simultaneously we will have a close look on designing for inclusivity. How do we design for marginalized groups, such as the elderly, children or differently abled people? How can we live together in the urban ecology?

Grading Criteria
The submissions will be graded before each review. Students are expected to do individual work. Each submission will be graded according to the following points:
• Completeness and punctuality of the submission
• Research method, the ability to find and analyze information
• Understanding of the concept of behaviorology and the ability to implement behaviorology within the design
• Structural design, construction details and choice of material, in connection with concept of behaviorology and the actor network
• Choice of typology and design, in connection with the concept of behaviorology and the actor network
• Visualization, the ability to make easy to understand and compelling drawings
The final grade consists of the following partial grades:
• Mid review 1 submission: 30%
• Mid review 2 submission: 30%
• Final review submission: 40%

Lecture notes
Each student will receive a printed reader, containing the basic information about the course, such as schedule, syllabus and other important information, as well as examples and references for the design task, and readings to support the theoretical framework of the course.

Prerequisites / notice
To attend this course, students have to enroll through the "Enrolment in the Design Studios of D-Arch"-page: (www.einschreibung.arch.ethz.ch/).

The design studio is structured as a year-long course. The submissions during the autumn semester will be individual work. Schedule Autumn Semester 2021:
• Introduction 21.09.21
• Mid Review 1: 12. & 13.10.21
• Mid Review 2: 16. & 17.11.21
• Final Review: 21. & 22.12.21
Individual work only.
Costs: ca. 100 CHF (besides the seminar week)

Assistants
Teaching: Sandrine Badox, Tanguy Caversaccio, Christoph Danuser, Kelly Man
Research: Tazuru Harada

Collaboration: GTA, Chair for the Theory of Architecture
ITA, Chair of Structural Design

052-0545-21L Architectural Design III: A Forest Bath (A.Spiro)
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

W 14 credits 2V+14U A. Spiro, J. De Vylder, D. Mettler, D. Studer

Over the course of the design studio, you are going to acquire specific knowledge about different concepts of construction and apply them to your own projects. Central topic during the semester is the development of a design based on a central structural idea.

You will be working on
- a precise relation between spatial and supporting structure
- a materialisation based on the principles of the structural concept
- a concept for openings and lighting based on the principles of the structural concept

You will learn to develop your project based on
- your structural concept
- specific aspects of building in the forest
- your in-depth analysis of the immediate surroundings of the chosen site

Most of the spaces we design will not be insulated. This allows for a simple and direct way of construction. Based on this, you will work out a part of your project in detail, relating to measurements of the human body.

Concerning the representation of your project, you will
- learn a solid way of drawing in CAD in a 1:200 scale
- use combinations of CAD and analog drawing to convey the intended atmosphere
- use and enhance your hand drawing for 3D illustrations

By building physical models, you can
- learn about the adequate detailing in a respective scale
- simulate actual joinings and find out about their impact on the architectural expression
- develop further abilities to represent materials and surfaces in an appropriate way

The acquired knowledge in relation to structure, material, lighting, drawing and model building will be the base for the 4th semester where we are going to elaborate on these topics in a more complex way, designing urban residential buildings.

In this regard, our design task will be a forest bath in the Käferberg area close to the campus. Bathing in the forest allows a new experience of the local recreation area and adds a new level of use. The bath is explicitly not expected to feature a single large pool. Hence the actual way of bathing in the forest needs to be developed specifically in every project based on the structural idea and specific aspects of the chosen site. The bath is supposed to be open all year round. Therefore it offers both open and enclosed spaces, a rest area and the usual auxiliary spaces of a public bath. Special attention will be given to the transition of indoor and outdoor spaces which offers vast opportunities for specific designs between covered and uncovered, bright and dark, open and closed, and intelligent concepts for heated and uninsulated spaces.

During the definition of our approach to the design task, we will have several opportunities to spend time in the forest and get to know the controlled natural environment of the “urban forest”. In several exercises at the beginning of the semester, we are developing collections of objects, drawings, and impressions. This pool of ideas will be present in the studio as a base to define your own field of interest, which will later condense in your projects.

The forest will be present in the studio in the form of a large model which we are going to build during the first weeks as a base for your daily work on your projects and the critiques. During the course of the semester, you can choose from a range of sites that differ in respect to the density of the forest, topography and access.

Throughout the 3rd semester, we are focusing on structure as a catalyst for our designs. You will learn about different structural concepts and apply their basic principles in your projects. Further key aspects are the use of materials and their inherent properties, a conscious way of designing with daylight, and the development of coherent roof structures.

Outlook 4th Semester

Next semester, the core subject of our studio will be programme instead of structure. We are going to design residential buildings in Zurich. Starting from a selection of inspirational houses and apartments which we are analysing and measuring during extensive visits at the beginning of the semester to get an understanding for their architectural elements and spatial, you are going to develop your own specific form of living. From a selection of different sites in the city center, you determine the best suited for your project and develop dwellings right down to the materialisation in detail. In doing so, we will pick up and elaborate the topics we are touching in the first semester on a more complex level.

The 3rd semester has been newly developed based on core topics of the chair. It replaces the respective fall semester courses which used to focus on working in the built fabric. Further information about the housing semester are available on our Website in the form of semester documentation brochures (see Small Pleasures of Life I-III, https://spiro.arch.ethz.ch/lehre/zweiter-jahreskurs).

For the 4th semester, we are going to elaborate on these topics in a more complex way, designing urban residential buildings.

Students who do not wish to change the design class don't have to participate in the internal enrolment.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is also the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

We are going to design a bath in the nearby forest. You are going to acquire profound knowledge about structural concepts and work with contradictions and corresponding aspects between spatial structure and support structure. Further key aspects are materials and their inherent properties, light and the roof structure as such. The specific context of the forest strongly informs the design process.

Objective

Over the course of the design studio, you are going to acquire specific knowledge about different concepts of construction and apply them to your own projects. Central topic during the semester is the development of a design based on a central structural idea.

You will be working on
- a precise relation between spatial and supporting structure

Autumn Semester 2021
Abstract
In semester HS / III, a simple exercise will explore the development of the same program in the two different contexts of NEW-USE and RE-USE. On a given free plot versus a given build plot, the same project will be designed. In the FS / IV semester, the same simple exercise will test the results of the previous semester on a subsequent change.

Objective
It is clear. As good as the whole realm is on track on Re-Word today, a critical moment must be ambitioned. But not just to be critical. But to give the idea of Re-Prefix a chance to go beyond the tendency and give a chance for a truly different Future of Attitude. Not just a Pragmatic Future, but a Future to Dream about. d-RE-AM. About.

Content
The 333% studio is a studio on the scale of the BA SEM III & IV expectations. At the same time, the 333% studio is part of a broader ambition shaped by the title 3.33% 33.3% 333%. In fact, these 3 sets of 3 numbers are 3 different studios but sharing the same interest 3 times. The interest of RE-USE. In the 33.3% and 3.33% studio - MA SEM I, II and III - the idea of economy, ecology and ergonomics is explored with a gesture of 3.33% or 33.3% of the normal 100% investment. A true belief in the under-explored capacity to really do less. Or said: needing less.

The 333% studio takes the perspective across two semesters - HS / III and FS / IV. In semester HS / III, a simple exercise will explore the development of the same program in the two different contexts of NEW-USE and RE-USE. On a given free plot versus a given build plot, the same project will be designed. In the FS / IV semester, the same simple exercise will test the results of the previous semester on a subsequent change. Both projects from the previous semester will be challenged with a new program, twice each time. One can say: it is a matter of RE-USE - semester FS / IV - of the RE-USE and the NEW-USE - semester HS / III -.

We introduce the word (P)RE-USE here since the NEW USE - semester HS / III - will still be tested in its first concept for its ability to be prepared for the next RE-USE. Likewise, the RE-USE project will be evaluated for its ability to change once more.

We will talk about many more RE-PREFIX words. The RE-WORD - once started with the word RE-USE - is everywhere and always today. The RE-word is omnipresent and in many ways. Many RE-words have now been found and defined. And many more must and will be added. Never is it a play on words. Always it is another angle. Or to explore the idea more and more. And to discover yet another entrance.

At all. We will find out together that in the end, taking into account all these RE-WORDS, it is and will be more a matter of RE-ATTITUDE. USE words in account. Attitudes must be changed. At all.

RE-THINKING-RE is the alter ego of the 3.33% 33.3% 333% studios. If we are not critical, RE-ERA may only be a trend, but in fact it is and will always be an eternal URGE. The urge of u-R-g-E.

It is clear. As good as the whole realm is on track on RE-WORD today, a CRITICAL moment must be ambitioned. But not just to be CRITICAL. But to give the idea of RE-PREFIX a chance to go beyond the tendency and give a chance for a truly different FUTURE of ATTITUDE. And not just a PRAGMATIC FUTURE, but a FUTURE to DREAM about. d-RE-AM. About.

Architectural Design V-IX: Falera Village - Attempts after the Community of Fate (A. Caminada)

Abstract
In HS21 in Falera, we will investigate the question of whether, in our time of individual action and unrestricted access to materials, places can emerge that are able to inspire us.

Objective
In teaching, we remain true to our goals and do not want to teach students a certain type of architecture - be it in terms of methods, images or styles. Rather, what needs to be developed is an idea that supports the location. The idea must be a spatial equivalent of the design. In the course of the semester, the focus is on the material and construction used, and also on the spatial atmosphere that can support a certain event. In the end, the idea, shape, construction, material and atmosphere should be in a coherent relationship.

Content
There are places that touch us. The conditions that led to it were very different. In the mountain regions, for example, foreign capital worked on important trade routes or at the base of pass crossings, in other places the power of faith and religion. In remote regions, living conditions were very modest. Due to the limited availability of materials, people had to be inventive. The possibilities for action were not limitless. It was necessary to observe the regularities written in the materials. The power of a place and its architecture emerged from the repetition of the almost identical.

Many mountain villages were in a similar situation. There were major changes towards the end of the last century. Above all, tourism and the hotel industry, followed a little later by the construction of second homes, led to modest prosperity. The new opportunities resulted in a radical decline in agricultural livelihoods. The social structure of the village and the influence of the church have fallen. Liberation from these mighty bonds has been a relief for many. Effects were not lacking. Individual forms of life and the disappearance of local knowledge led to a leveling of phenomena in the entire Alpine region. The power of a specific place has largely been dissolved.

The freedom gained also has a downside. The canon of values that characterized the culture of space has disappeared. Orientation guidelines are always in question.

The big change also took place in the Graubünden village of Falera. The small farming village became a tourist place. Falera still likes to see itself as a farming village. Agriculture is still present. With the change, the farmers have moved to the edge of the village. The stables in the village center are empty or have been converted. Holiday homes were built in the style of farmhouses. The stable entity, which used to see itself as a farming village. Agriculture is still present. With the change, the farmers have moved to the edge of the village. The stables in the village center are empty or have been converted. Holiday homes were built in the style of farmhouses. The stable entity, which used to...
Managing with environmental conditions of a site (orientation, visual, circulation, resources, pre-existences, etc.).
- Having the ability to rethink the pre-established and the interest to discover unknown approaches.
- Incorporating an emotional approach to architecture – designing from experience.
- Controlling and articulating the various qualities of space (dimensional, material, environmental, etc.).
- Integrating the behaviour of the building as a fundamental part of the project.
- Designing with natural systems and thermodynamics to create spaces with “real” comfort.
- Re-learning how to live and build in future climate paradigms.
- Knowing how to find expression and character of spaces through the use of matter.
- Understanding the potential offered by construction systems and technology.
- Combining technical decisions with formal ones in a significant way.
- Detecting opportunities to give innovative answers to the relationship between buildings and nature.
- Incorporating interdependence as a determining factor in the design of buildings.
- Organizing the work in a way, which is appropriate to the available time and the requested objectives.

Abstract

Amplitude. Dynamic landscape structures for the Zealand.

The search for future-oriented strategies in dealing with these extremes requires a paradigm shift - from fighting against to working with natural processes. It is necessary to lay new landscape structures that can deal with the fluctuations of the amplitudes.

Objective

Basic knowledge in landscape architecture, development of an attitude, formulation of a hypothesis, choice of appropriate design elements, design and representation of complex / dynamic systems and landscapes, alternation between different scales.
Heat, drought, heavy rain events - in the course of climate change, the extremes are getting stronger and the frequencies in which they occur faster and faster. Natural and cultural landscapes that were in equilibrium until a few years ago need to be adapted. These changes will not only affect the life of flora, fauna and people, but also the character and ultimately the identity of our Swiss landscape.

The search for future-oriented strategies in dealing with these extremes requires a paradigm shift - from fighting against to working with natural processes. It is necessary to lay new landscape structures that can deal with the fluctuations of the amplitudes.

But how can the forces of extremes be used and turned into positive things? And how should the new landscape deal with the dynamics - direct, balance, absorb?

As the most important production area in Switzerland, the Three Lakes Region is exposed to these extremes, as witnessed by the debris flow in Cressier and the floods in July as well as the dry periods of recent years. Therefore, the third Jura water correction is currently being considered, which, in addition to the previous tasks of large-scale drainage and bed load management, also includes irrigation.

The territory between Lake Neuchâtel and Lake Biel is characterized by the most varied levels of culture, infrastructure, settlement and industrial landscapes. The spatial planning consideration reveals extremes: small-grained, historical settlement cores collide with sprawling industrial areas such as the last refinery in Switzerland.

In search of new scenic identities for this valley, we will deal intensively with systems, processes and strategies without losing sight of spatial qualities, atmospheres and poetry.

The introduction of a new water system serves as a design engine. Due to the complexity of the territory and the task, an iterative design method is pursued that oscillates between design and analysis and between large and small scales. The development of an attitude, the crystallization of the specific topics and the selection of the appropriate design means are just as much a part of the work process as the design of the transformation processes.

### Abstract

This studio works on the idea that a substantial understanding of today's technology (internet of things, big data, machine intelligence ...) changes the perspective to architectural theory and will result in different architectural designs and building constructions.

### Objective

1) Identification and understanding of the challenges of today's technologies;
2) techniques of working within the plenty of the internet;
3) a methodology to design digital architectures;
4) understanding of the shift from hard building construction to soft building applications, and
5) an understanding of the importance of becoming a literate digital persona in order to be an architect today.

### Content

**METEORA #05 ENGENDERINGS**

**FASHION, JOURNALISM, FEMINISM**

*‘IF NATURE IS UNJUST, CHANGE NATURE.’*

**About freedom, nature, technology, gender, intellect.**

**What it is, a HUMAN?**

**Gendered by nature or engendered by ratio?**

**An architectonic stageplay:**

Coco Chanel (1918) moves into the Villa Lemoine of Rem Koolhaas (1998) to discuss the XENOFEMINIST MANIFESTO (2018)

**METEORA #05 will use artificial intelligence**

*to write a text to explicate a precise position in today’s world,*

*to create a spectrum of images to reflect this world* and

*design an architectural artefact which brings things into adequate proportions*
Visibility and its Hidden Dimensions:

If something catches the eye, what is next to it will be mechanically less looked at. For a light to appear, it has to emerge from the surrounding darkness. And what attracts the light often leaves its surroundings in shadow. Hence an implacable theorem: the visible is always born from the invisible.

Visibility and movement:

There are also territories where one does not stop, places devoted to transit and exchange (business and industrial zones, areas near railway stations or airports, etc.). From these places, we can only have a partial vision, but also a vision in movement, a dynamic vision. From then on, they call for an architecture that adapts itself to this new speed of vision, and which opens onto another imaginary world. The history of art is full of these regenerations: the impressionists who revealed a new Paris by painting the "hidden banks" of the capital on the outsides of the stations; street-art which gives back a cyma value to the gable walls, elements a priori the least worthy of attention in architecture.

Visibility and intimacy:

There is a "hidden dimension" (to use the title of Edward T. Hall's famous essay) that concerns our bubbles of intimacy, which vary according to times and cultures. These spheres remain the founding gauge of the human relationship with architecture. At what distance is a vis-à-vis acceptable? At what point does one start to see too much? Where is the boundary between proximity and voyeurism? Here we think a balance, both intimate and social, between the visible and the invisible. What's more, we are living at a time when the apprehension of these "bubbles" is being altered by the health crisis.

Visibility and illusion:

The gaze is, in any case, fallible and to take note of it is also to explore new areas of the visible. The art of trompe l'oeil works on certain productive ironies between painting and architecture (the frescoes in the Hall of Giants in the Té Palace in Mantua, a simulacrum of a building collapse, or closer to us, the "masking" of the Louvre Pyramid by J.R.). This art of camouflage does not always have artistic aims. Just think of the tarpaulins that hide the scaffolding on monuments that are being renovated, and on which the façade of the monument in question is drawn or photographed. Proof of the need to keep the facade of an emblematic building in the field of visibility (and even in the simulacrum mode)!

Visibility and new tools:

The change in the way we look at things is also accompanied by an addiction to new tools. The advent of the digital image has had an unexpected consequence: in the cinema, in photography, on television, the nights are "dimmed the light" of the day, not that day and night are two opposing reigns. And what attracts the light often leaves its surroundings in shadow. Hence an implacable theorem: the visible is endowed with an enveloping dimension, with the impression that one can get lost in it. A digital night simply makes you believe that you have "dimmed the light" of the day, not that day and night are two opposing reigns.

Objectives:
- Critical thinking, personal attitude:
  - Demonstrate, through design work, a critical understanding of climate change and the ethical responsibilities of the architect
  - Reflect on pieces of work in progress or already completed both individually and in conversation with peers and faculty
  - Demonstrate, through design work, a growing knowledge of contemporary and historical architectural discourse
  - Critically interpret requirements and working priorities in light of constraints to work practice arising from Covid, home working and personal circumstance. Communicate with teaching team if difficulties arise.

Working methodology:
- Conduct qualitative site/building analysis through photography and observational drawing
- Perform basic topographic surveying
- Use archives to conduct systematic analysis into social history, uses, materials, etc.
- Interpret and synthesize information into a concise and ongoing knowledge base for the design of a project
- Develop an understanding of the geology, climate, ecology, etc. of a place
- Assimilate small, fragmentary observations into broad understanding of place

Acquisition of subject-specific knowledge:
- Consider and understand the relationship and impact of a design on a wider landscape
- Understand the impacts of construction on ecology
- Demonstrate an understanding of the impacts of time on the repair and maintenance of a project
- Demonstrate an understanding of contemporary and historical construction techniques
- Demonstrate a critical understanding of the use of materials in relation to non-renewable resources, embodied energy, recyclability

Conversion of a conceptual intention into an architectural project:
- Develop an integrated and relevant structural, constructional and environmental concept for the project
- Formulate a spatial concept for a project, demonstrating an understanding of conceptual, spatial and programmatic decisions
- Design with reference to historical, political, cultural and other creative and technical fields
- Demonstrate an ability to assimilate a broad range of working practices, identifying and engaging especially with those which help to demonstrate and further ideas

Capability to design:
- Demonstrate an ability to design interior and exterior spaces, as well as the thresholds and the surrounding spaces
- Demonstrate awareness of a design project’s environmental performance in construction and in use
- Demonstrate a good understanding of professional regulation and ethical responsibilities of the architect
- Design buildings, spaces and landscapes which are fully accessible

Representation and presentation in different media:
- Develop a critical eye in photography of place, space and design work with reference to broad photographic traditions
- Develop model making skills of small conceptual models, as well as working models made of everyday household materials, with precise conceptual purpose
- Demonstrate high technical and critical proficiency in 2D and 3D CAD drafting and modelling
- Develop an understanding of the status and purpose of different kinds of representation, and deploy them effectively
- Use detailed drawings and models to illustrate the conceptual construction of a project
- Demonstrate high technical and critical proficiency in image making and collage
- Clearly and concisely describe a concept, working practice, and outcome through written and oral material in English or German.
- Explore use of film and short film clips to present three-dimensional work. Note, advanced editing skills is not required.

Engagement in the studio:
- Actively participate in group projects such as the garden
- Actively listen to others
- Be able to learn alone, as part of a group and as a whole studio
- Demonstrate an ability to work comfortably with ambiguity as circumstances change
- At all times demonstrate honesty, integrity and respect for fellow students, teachers and staff.

Content:

- The architecture of the city lies between the buildings. Too complex in nature, form and design to be understood as a single space, ground has become the network of mobility that defines the contemporary city. This semester, earth works will be the primer for a new experimental garden prepared with the Crowther Lab which, in turn, lead to actions across Zurich’s greatest continuous interior.

- At all times demonstrate honesty, integrity and respect for fellow students, teachers and staff.

Prerequisites / notice:

- Individual work and group work, whereof at least 5 weeks of group work.

Critiques: Dates to follow.

No extra costs.
We are continuing to explore the theme of cohabitation: the interplay of human and nonhuman systems in our built environment. We are focusing on a given ecosystem, as the context for our architectural proposals. Further, we are expanding our toolbox: storytelling and film continue to play an overarching role, but we are opening up the studio to other media and forms of architectural exploration.
The design studio is aimed at the students acquiring the following skills:

**Objective**

- Prefigurative Architecting
- The ability to think in different scales and systems, in order to determine issues and themes by observing the changing conditions of our environment. The aim is to develop an architectural position in relation to these observations and to translate it into a viable and sustainable proposal for the future of our coexistence.
- Storytelling and Narrative-Design
- The ability to translate factual knowledge about architecture and architectural systems into a story. These narratives function in parallel and offer other ways and speeds of communicating the design arguments besides the factual approach. In addition to time-based media such as film and episodic video formats which we call television, we will be developing additional formats with the students from this semester on.

Both learning objectives will be introduced in topic-specific lectures at the beginning of the course.

**Content**

This semester we are continuing to explore the theme of cohabitation: the interplay of human and nonhuman systems in our built environment. But this time, we are focusing on a given ecosystem, as the context for our architectural proposals. Further, we are expanding our toolbox: storytelling and film continue to play an overarching role, but we are opening up the studio to other media and forms of architectural exploration. (see learning objectives)

“Europe's sea of plastic”, Almería in the south of Spain, is our point of departure. It is one of the many places where our globalized and accelerated ways of life become visible and take on built form. Together, we want to explore and understand the different types of architecture that can be found on site. Dating from different times, created for different needs. A deeper understanding of the systemic relations of these local structures is essential in order to become active and to produce architectural models for the future — for Almería and beyond.

**Global (Eco)Systems**

The ongoing industrialization and urbanization of our environment is the main driver of depletion on our planet. These changes are human-made, which is why we speak today of the Anthropocene: an unofficial unit of geologic time, used to describe the most recent period in Earth’s history when human activity started to have a significant impact on the planet’s climate and ecosystems.[1]

It is indispensable taking a look at the motives and conditions of our global actions, which laid ground for the occurrences and changes we are experiencing today and which led to the concept of the Anthropocene. Exponential growth has long been the western societal leitmotif, which places economic interests over ecological ones. But as economist Kenneth Boulding puts it: Anyone who thinks that you can have infinite growth in a finite environment is either a madman or an economist.

And although Western societies have access to data and knowledge about the consequences of their actions, and the limits and finiteness of the Earth’s ecosystem, we still seem unable or unwilling to act differently. The concept of the Anthropocene sees humanity equally responsible for this change. But it was mainly Western societies that emitted and benefited from the massive industrialization and are triggering the ongoing urbanization of our environment. From a relative point of view, it was the capital that drove Western societies. This is why other scholars such as environmental historian and political economist Jason W. Moore have been prompted to recast the notion of the Anthropocene, with the more nuanced and connective concept of the Capitalocene.

Capital-driven thinking is also evident in architecture, both in the built and unbuilt environment. Every crisis, including the most recent one, has caused economic eruptions that led to increasing investments in land and real estate and thus, resulted in profit-oriented-architectures. These take shape in different places, forms and typologies. Exploring them is of great importance, in order to understand the local and global role architecture plays in different systems. By doing so, we reflect on how urbanization — as the most prevalent socio-material form of environment-making under capitalism — has re-ordered human and non-human relations in profound ways.[2] This knowledge enables us to design an architecture that questions the status quo and, beyond that, creates new spaces for our coexistence.

- Individual work and group work, whereof at least 3-4 weeks group work.
- Critiques: 19.-20.10. and 23.-24.11.
- Costs: CHF 100.-- (besides seminar week).
- Prerequisites / notice
  - Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
  - Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.
- **Objective**
  - Understanding and exploring your body and the senses to design and facilitate dialogues.
  - Developing your ability to improvise and adjust to a dynamic environment.
  - Collaborating with a multitude of actors from different (professional) backgrounds.
  - Identifying physical and intangible borders and boundaries that define space.
  - Communicating complex ideas through a performative approach to architecture.
  - Being a host and creating a welcoming environment for a wide variety of people.
  - Documenting a non-linear creative process through a mix of media.
  - Getting immersed in the world around you.

- **Grading criteria:**
  - Clarity and Independence of Position
  - Relevance regarding the case
  - Depth of engagement
  - Representation
  - Design in Dialogue
  - Mutual Collaboration
  - Personal Development
Content

After a long period of forced social distancing and self-isolation, we will be seeing each other soon for the start of the semester. Finally freed from endless Zoom sessions, we can reconnect to the people and places around us. Our HS2021 design studio centres around this reconnection and rediscovery of the physical world and the power of proximity and embodied knowledge. Starting from ONA, the building where we are developing the Design in Dialogue Lab, we will use our brains, bodies and all of our senses and creativity to explore the building’s potential as a safe and social space where we can be and work together.

Like many other buildings in cities across the world, ONA was not built to foster human life and interaction. As a welding factory, it was meant for machines. Situated on the border between Oerlikon and Seebach, it was part of an industrial zone where a.o. weapons were produced. In recent decades the area was transformed into a primarily residential neighbourhood, and the ONA building was converted into a mixed-use office building with ETH being one of the main tenants.

While approaching or entering the ONA building, you are confronted with a series of both physical and intangible obstacles and borders. Despite efforts to make it more accessible, the building’s introverted nature continues to echo in its appearance. The grey concrete walls communicate the story of a space constructed to keep noise inside and people outside. Surrounded by railway tracks and other infrastructure, the main entrance is hidden behind a busy loading bay where trucks pull up during the day to load or unload goods. Once inside, the vast open ground floor is subdivided by walls in an attempt to create a sense of intimacy.

By joining Studio Seebach - Sensing Space, you will become part of a collective effort to identify, reimagine, and potentially remove or redesign some of these barriers. As users and hosts of the space, we will revisit ONA and explore it as - what we like to call - an 'Open Public Structure' that is welcoming to a wide variety of users, from students to local residents. Simultaneously we will also question whether ONA should become a seamless environment or keep certain ‘meaningful thresholds’ that help preserve existing values.

Instead of taking an intellectual approach based on a rational analysis of the spatial conditions, we instead will introduce a more intuitive approach that makes use of our senses and explores our body’s ability to experience the (open) borders and (closed) boundaries that define ONA. We will be joined by practitioners from such diverse disciplines as dance, performing arts, anthropology, philosophy and club culture who will help us to Swarm, Sense and Settle.

French philosopher Maurice Merleau-Ponty once wrote that: “Rather than a mind and a body, a (wo)man is (...) a being who can only get to the truth of things because its body is, as it were, embedded in those things,” According to him, we are all “caught in the fabric of the world”. His words resonate with the assignment formulated by the late American composer and philosopher Pauline Oliveros (“listen to everything until it all belongs together and you are part of it”). The studio takes inspiration from these and other thinkers and practitioners and turns their ideas into actions that allow you to test and train your senses and get immersed in the world around you.

Individual work and group work, whereof at least 3-4 weeks of group work.

Critiques: 19./20.10., 23./24.11.

No extra costs.

052-1123-21L Architectural Design V-IIX: Circular. From Material to W 14 credits 16U R. Boltshauser

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

We as a society, but also specifically we as architects, must use land, resources and energy as sparingly as possible in the future. Therefore, the focus of the design is a holistic consideration of climate-conscious building: we are developing hybrid systems made of earth in combination with re-use building components.

Objective

- Dealing with dense, sustainable, simple building
- Development of a broad theoretical and historical knowledge of a topic in order to transfer the resulting findings to the current context
- Understanding of sustainable building techniques and building materials, rammed earth
- Holistic design of spatial atmospheres in the interplay of context, construction, climate, sustainability, and materiality
- Recognizing the potential of building materials with different technical properties in order to develop own ideas for new building systems and translate them into a design
- Practical work on the model and in the visualization program as part of the design process

Content

The Binz - an urban fragment, which with its contrasts and heterogeneous development forms an ideal area of investigation, is to be analyzed in the coming semester. The possibilities of a spatial redensification of the entire area will be examined and a vision for the future in the form of a master plan will be developed. In addition to the large-scale studies, the focus will be placed on the material clay, as a low Co2 building material, right at the beginning of the semester. Inspired by the history of the Binz region as a clay mining area, clay samples taken on site will provide information on the composition and processing potential of the material. Not only the local availability of clay, but also the positive physical properties of the building and the low proportion of gray energy speak for an examination of this material. Based on the findings of the clay samples and the knowledge about synergies and compensation potentials with other materials such as wood or recycled materials, prefabricatable hybrid nodes will be developed at the beginning of the semester, which will be realized as mock-ups during the seminar trip. The development of the nodes thus becomes the primary design element. In addition to material technology and construction issues, we will pursue a climate-based design methodology that sees the responsible use of finite resources and thus cycle-based construction and the reuse of building materials as the potential of a new, contemporary architectural expression.

A new awareness and thinking in dealing with finite resources will also let us this semester explore the material clay for its various properties. In addition to the low proportion of gray energy and the outstanding physical properties of the building material, the local availability of the material is of interest. Millions of tons of clay-containing excavated material are produced worldwide every year, for which our construction industry has no use and which therefore has to be disposed of (over 25 million tons in Switzerland alone). So why not use this unused resource to build with?

From our point of view, however, this requires new building methods that correspond to today’s standards and needs for a rational construction method and that better exploit the physical potential of the building material. Prefabrication, a hybrid clay building technique or liquid clay technology are examples of possible answers.

Lecture notes

The students will receive a reader at the beginning of the semester.
### Prerequisites / notice

- Participation in the seminar trip is recommended.
- Individual work only.
- Critiques: 12.10.21, 9.11.21, 30.11.21.

Abstract
How do we want to live? Hardly any building task in architecture is so fundamentally and so strongly determined by conventions as housing. The focus of the work in the studio is the critical and experimental examination of new forms of living in different climatic regions of Switzerland.

Objective
- Knowledge of history, theory and typology of basic elements.
- Design of new forms of housing
- Pictorial representation of complex narratives in the form of miniatures
- Constructive Details
- Experimental photography

Content
How do we want to live? Hardly any building task in architecture is so fundamentally and so strongly determined by conventions as housing. The focus of the work in the studio is the critical and experimental examination of new forms of living in different climatic regions of Switzerland. The comparatively small scale allows the projects to focus on the themes of interior space, living form and basic architectural elements.

These basic elements are understood comprehensively and mean not only structural elements such as load-bearing parts, windows, doors, stairs, but also include secondary components such as beds, tables, curtains. Is it conceivable to develop the living form starting from an architectural element or furniture? Can we imagine a habitable elevator? How would a floor plan be designed starting from a refrigerator? Who would inhabit such spaces? The basic elements represent the thingness and craftsmanship of architecture. In the discourse on social and ecological building, the importance of everyday elements is often forgotten, even though it is the things themselves that create meaning or absurdity between life and the world.

Starting with a basic element, you will analyze at the beginning of the semester the specific characteristics and the variety of manifestations in different geographical contexts. You will ask: What functions does the element serve, what histories has it gone through, what norms has it cemented, in what materials and principles of construction is it created, and what future potential can it unlock? In addition to political, social, gender, and climatic contexts, you will also address the interaction of space, body, and scale, and thus the perception, impact, and use of architecture.

The semester takes place in cooperation with Prof. Dr. Ákos Moravánszky. In workshops with the artists Taiyo Onorato and Nico Krebs, experimental images of the projects will be created.

Prerequisites / notice
Group work only.

Critiques: 19.10., 17.11., 7.12.

No extra costs.

Architectural Design V-IX: (Girot) ▪

Abstract
Does not take place this semester.

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Literature
A reader will be provided at the introduction. Furthermore, a pre-selection of relevant books will be available to the students at the ILA Library.

Architectural Design V-IX: Structure and Space - Negotiation on the Inventory (GD Menn) ▪

Abstract
The theme of the studio is in the overriding interest for the architectural resource of the housing stock on the outskirts of Switzerland. We are concerned with the conversion of an industrial building that has been disused for decades in the rural context of the Gonzen mine in Sargans. Core topic is dealing with the phenomena of structure and space as a "negotiation" on and with this inventory.

Objective
The students learn to discover a building stock in its temporal and spatial structural context, which enables them to take a critical stance and to act as a designer. You learn to formulate an architectural idea of a change of use from the existing resource and to develop it into a consistent project.
The theme of the studio is in the overriding interest for the architectural resource of the housing stock on the outskirts of Switzerland. We are concerned with the conversion of an industrial building that has been disused for decades in the rural context of the Gonzen mine in Sargans. The core topic is dealing with the phenomena of structure and space as a “negotiation” on and with this inventory.

The subject is the Malerva ore processing plant, a solitary witness to the industrial history of disused mining in the Sarganser Rhine Valley plain. The iron on the Gonzen shaped the region for centuries. After numerous scientific and technical development steps, the extraction of raw materials attained its greatest importance during the Second World War, before the decline and the cessation of operations in 1966. The Malerva ore processing and sorting plant was designed in 1940 as a three-dimensional steel framework. Its structure and shape Free of aesthetic goals or thoughts of flexibility of use, it was tailored to the vertical and horizontal processes of ore processing and the economical use of the material.

Based on this special building typology and materiality, we would like to formulate design strategies for conversion and at the same time adopt an attitude towards the location and its historicity. We are researching the original machine, which today is a space structure that has lost its purpose. We are interested in the inner regularities and the thinking of the design from the conditions of the primary structure and material and the spatial potentials from them. We are guided by questions: What architectural relationship can be established with this filigree steel skeleton and its specific shape? Which spatial strategies and potentials does it open up? How evolutionary does an architectural concept emerge from the existing structure as a further development or how much does the intervention become a reshaping and new creation?

Programmatically, we design a mixed use in which a collective space formulates the heart of the facility. This public space is a new bearer of meaning and a meaningful part of the concept based on the existing conditions.

With the projects we would like to formulate answers to the memory and the future of this cultural heritage and to include questions of sustainability. In addition to dealing with material resources, we ask whether interventions in the specific space structure open up potential for a generic, open-use structure. Is a narrative conceivable that understands the project as an intermediate form in an open-ended life cycle?

Abstract

Building value. Extensive new developments continue to happen across Zurich and its periphery, with Ersatzneubauten still presented as the most desirable option. Even when a significant built substance exists, revenue-driven development patterns usually end up prescribing its demolition and replacement.

Objective

- Through inhabitation and close observation, identify material as well as immaterial strengths, weaknesses and potentials of existing buildings and neighbourhoods
- Understand and critically engage with the financial and social reality of urban developments
- Explore how to document and represent existing spatial conditions through different media
- Challenge the omnipresent practice of replacing existing buildings, through imagining their potential contribution to a more inclusive and exciting urban landscape
- Define a personal position about the agency of the architect and architecture
- Gain confidence in the design process with an ability to be critical and conscious, bringing all the aspects of the semester together in a personal and critical discourse

Content

Trust. A firm belief in the reliability, truth, or capacity of someone or something. A belief in the self, but also in the other. A state in which one might be seen as naïve and credulous, often leading to disappointments and failure, but that can equally be read as mature and looking for opportunities. Can one trust in something one does not yet fully understand? Can trust lead to following unexpected paths, not being afraid of encountering new ways of thinking and seeing?

Building value. Extensive new developments continue to happen across Zurich and its periphery, with Ersatzneubauten still presented as the most desirable option. Even when a significant built substance exists, revenue-driven development patterns usually end up prescribing its demolition and replacement. A gesture erasing existing users and uses at the same time, as those are rarely given a place in the planned developments. So how can we trust in the value of what is there? How can we learn from the existing to propose models for the future, a future capable of accommodating all the lives that can exist in the city, including the less profitable ones?

Regensdorf. This semester, after exploring Zurich and its surroundings twice by means of walking, we will inhabit a Dorf longing to be a Stadt. Next to the Regensdorf station, a real estate operation called ZWHAUT plans 1000 new housing units, developed by Pensimo and designed by offices including Peter Märkli, Roger Bolfshauser and Lütjens Padmanabhan. We will take a complementary and alternative look at the area. In collaboration with the diploma students reflecting on the new development, including its business plan and the types that it proposes, the studio will focus on an existing conglomerate of four buildings, investigating it as a potential candidate for re-use. Our discussions will focus on alternative typologies, architectural re-appropriation, economic models, and facade concepts. Together, those research tracks will take over the existing building, using it as a fertile ground for a polyphonic and grounded reflection on the future of Regensdorf.

Inhabitation. Your studio will be located on the empty fourth floor of an existing office building: 400 m2 at the very center of the future development. Moving in will allow us to engage with the day to day life of the buildings. It will make us complicit to what we design, to get close, and personal, to potentially find presences and qualities that are often overlooked and only surface in the slowness of being-in-it-together. This will allow us to become a critical audience reflecting on the decision making strategies behind large scale developments in the Zurich agglomeration. With our concrete and situated knowledge gained by actively being there, we will reflect on alternative futures for the four existing buildings, challenging the tabula rasa approach, and the accompanying architectural interventions and strategies.

The Dept. of the Ongoing. The Dept. of the Ongoing will move in with us to install an open research room, host the lecture series You’re Not My Type and surprise us with other ghostly modes of exchange and interaction.

Building Out Loud. During an integrated seminar week, we will take it a notch up and use our building as a test site, producing 1:1 interventions, guided by the skilled carpenters of NAME and the practice of scenographer Jozef Wouters and his Brussels based Decoratelier.
### Architectural Design V-IX: Change: Towards Hydroscopic Design (A. Holtrop)

**Objective**

In this design studio, you will define your gestures of making and working with material(s) through research and experiment, and in response to the topic of the studio. You are required to produce an architecture that results from your specific engagement with the material and the spatial condition you construct with it. The architecture that results from this approach does not reference or represent something, but simply attempts to exist as a physical spatial reality in its own right.

Your research should be supported by the knowledge made available by our studio, and engaged through you with the use of available resources and facilities at departments of the ETH and from external specialists.

**Abstract**

Architecture today is, to a large extent, about controlling water, whether in the atmosphere, in the soil, or in a building. Condensation, rainwater penetration and unwanted moisture can damage a building and impact on its longevity. An architect’s response to the durability of a construction and its materiality generally consists of designing resistance against weathering caused by water.

Our society increasingly demands controlled, standardised comfort: the building envelope separates indoor and outdoor climates and ecologies; the vapour barrier keeps window openings airtight and ensures the high performance of thermal insulation. In turn, the pesticide-applied plaster prevents mould growth on the façade.

When we take all aspects of the material into consideration – the geology, the sourcing, the industry, the different properties, the craftsmanship, the specialised techniques and the cultural significance – we can deploy the full potential of the inherent qualities of the material itself and your way of working it.

**Content**

This semester, we will focus on water. We will research water as an agency continuously shaping our environment and reacting to and forming other materials. At the same time, water will also be seen as the crucial element shaping the work of an architect.

### Architectural Design V-IX: Hortus (GD Deuber)

**Objective**

The students develop a design based on the architectural theme "Hortus" with the integrated disciplines of structural design. They deal with the topic, a specific material, its constructive logic and supporting structure. The aim is to arrive at a holistic design for all designs based on individual inspiration and the logic of the material and to visualize this at the end.

**Abstract**

The students have the opportunity to examine spaces that are shaped by architectural elements. We carry out this search throughout the semester and divide it into three phases: space, structure and whole. We will delve deeply into the architectural space and the materialized elements that define that space.

**Prerequisites / notice**

Individual work and group work, whereof at least 5 weeks of group work.

Critiques: 19.-20.10 / 23.-24.11;

Costs: CHF 250.-- (besides seminar week).

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enrol for the studio.
The students have the opportunity to examine spaces that are shaped by architectural elements. We carry out this search throughout the semester and divide it into three phases: space, structure and whole. We will delve deeply into the architectural space and the materialized elements that define that space.

In a first step, elements that define the space are explored. Starting from an inspiration, rooms are designed that represent this inspiration. The rooms lead to a structure which, under the aspect of reuse, leads to its own detailed architectural project with an individual program.

The students work with working models, different types of renderings (renderings of the rooms and the structure), as well as detailed black and white CAD drawings and texts.

**Prerequisites / notice**

**Content**

They are often places along big roads, adjacent to infrastructural buildings, green spaces that do not have a clear function, or leftover spaces that are created by the parcelling and division of land. Precisely these spaces interest us this semester: the ‘unuseless spaces’.

Similarly, the landscape designer Gilles Clément writes about such spaces and their potential in his ‘Manifeste du Tiers paysage’ (2004). He calls these spaces the ‘third landscape’ and writes the following: ‘When one stops thinking of the landscape as the product of an industry, one suddenly discovers a multitude of undecided spaces without function for which it is difficult to find a name...they form a refuge for biodiversity that has been chased away everywhere else. Through their content, through the need to maintain this biodiversity or to keep its dynamics going, the third landscape takes on a political dimension. These spaces are frequently forgotten, overlooked and underdeveloped which is precisely what leaves room for freedom: freedom of experimentation for new ways of developing such spaces, emancipated from the constraints of the traditional market.

We want to think about these spaces which offer a potential for other creatures and plants: for biodiversity. In the first phase of the semester, we will study unuseless spaces in Zurich and approach them through the medium of film. At the same time, we will look at different architectural projects from history and analyse them through synthesis drawings as well as listen to presentations on possible potentials of unuseless spaces. In the second phase we will use the different analyses to develop projects that try to engage with the themes of these ‘unuseless’ land fragments, to create a habitat that is as diverse and varied as possible.

We will work with drawings, models and model photographs to illustrate the architectural and landscape ideas of the projects. We will also use synthesis drawings to summarise the different ideas of the projects. The work will take place in groups of two. The seminar week is integrated into the design studio.

**Objective**

The students should develop a narrative in the project, negotiate between different aspects of design resulting in a clear expression which synthesizes ideas into a coherent form.

**Abstract**

Artist Gordon Matta-Clark’s work ‘Reality Properties: Fake Estates’ (1973) shows a similar interest. In this work, he bought parcels of land that could not be built upon or used for real estate, formed when the land was subdivided into lots. These were narrow strips, some even narrower than a person’s shoulders, or inaccessible triangular remnants of land squeezed awkwardly between overbuilt lots. Matta-Clark was interested in these places which were worthless for the real estate market - land that had no value because it did not meet the demands of the market and was therefore technically useless.

Similarly, the landscape designer Gilles Clément writes about such spaces and their potential in his ‘Manifeste du Tiers paysage’ (2004). He calls these spaces the ‘third landscape’ and writes the following: ‘When one stops thinking of the landscape as the product of an industry, one suddenly discovers a multitude of undecided spaces without function for which it is difficult to find a name...they form a refuge for biodiversity that has been chased away everywhere else. Through their content, through the need to maintain this biodiversity or to keep its dynamics going, the third landscape takes on a political dimension. These spaces are frequently forgotten, overlooked and underdeveloped which is precisely what leaves room for freedom: freedom of experimentation for new ways of developing such spaces, emancipated from the constraints of the traditional market.

Abstract
How can we as designers radically reimagine place-making in Sarajevo by connecting the existing natural and built environment with local resources and digital infrastructures as models for sustainable living?
The watershed of the Miljacka River has the potential to unlock socio-ecological systems and multifunctional corridors, that address urban fragmentation, and Climate Action.

Objective
Climate corridors Sarajevo. Shaping public water places.

Students will emerge in our Chair’s “method-design” to step by step develop their individual prototypical design projects. They will address both architectural urban scales and will be guided to collaboratively develop a baseline scenario. Mapping, identifying existing and future challenges and opportunities, students will take the role of stakeholders and translate their demands and resources into different scenarios. They will design urbanistic concepts and translate them into an evidence-based prototypical architectural project-intervention. This prototype is the synthesis of a process in time and space on different scales. The design project will be framed as a narrative that is consequentially visualized and communicated in analogue and digital graphic representations. The project concept will be tested and upscaled through urbanistic design-policies recommendations within overlapping spatial and programmatic systems of CLIMATE - CORRIDORS.

Content
The basic thesis for this Studio Fall Semester 2010 is constructing an urban imaginary creating an interplay of a linear public space system providing identity and orientation in the Miljacka River valley of Sarajevo. Sarajevo’s culture is as diverse as its rich architecture and history of urbanization. Located on the Balkan Route, a crossroads between north and south, east and west, the city confronts us with one of the highest pollution levels of air, soil water, of any capital city in Europe. The watersheds of the Miljacka River, wells, fountains, retention infrastructures, and flood plains are our point of departure. They have the potential to unlock socio-ecological systems, multifunctional corridors, and catalytic projects, that can transform fragmented neighborhoods, offering a living system of public water-places to the inhabitants.

At the intersection of architecture, landscape, and public art, the studio envisions trans-scalar processes and interventions, addressing the cities social and ecological crisis, in support of the Sarajevo Cantonal Planning Office, applying a systemic design methodology, and responding to the urgent need for concrete projects and Climate Action. Policy recommendations and general advice for upscaling such prototypical concepts are already successful in other cities globally and apply to the Sarajevo-Case.

The design challenge includes redesigning and densifying public open space, that combines social and environmental developments into a system of architecture, urban, and landscape design networks. The transformative re-development of existing street corridors and the interplay of architecture with landscape design and concrete prototypical and small-scale design interventions is critical for bringing together segregated communities in quality public space along degraded transport corridors. Linear multifunctional corridors can strategically connect to the immediate context and subcenters with feeder routes (considering Zmaja od Bosne), participatory public spaces, markets, playgrounds, production, and creating new eco-systemic connections with increased social and ecological qualities.

Atmospheric contamination, fine dust, and CO2 have created during inversion weather one of the highest air contamination levels of any capital city in Europe compromising the health of Sarajevo’s people. Climate change is challenging necessary processes to re-planting the forest and trees of the city. The compliance with the targets and indicators of the SDGs pose considerable additional tasks to solve. In recent years, the bust and boom cycle in Sarajevo has put doubt on opportunistic international urban upgrading models linked with opportunistic investments, gentrification, and short-term gains for private investors.

We have developed a toolbox by analyzing internationally recognized developments, sometimes permanent and temporary strategies such as Chengyecheon River Park, Seoul, Isapark, Schlaacht Hof / Munich, Corredores Verdes / Medellin or Cali, communal target-plan Zurich, Closed Highways in Sao Paulo or Bogota, Etc. These spatial processes have followed a widely known practice of consolidating a sequence of transformations, short-term strategies for long-term value production. Neighborhoods are re-evaluated through investment often initiated by art, popular culture, local participation, and place-branding.

Urban- and Landscape Design can create a measurable impact in cities by increasing social justice, health, and wellbeing. The development of robust frameworks adaptable to change enable processes for regeneration with long-term operational, environmental and social benefits in response to global, local, and site-specific challenges. The role of architects is to imagine and model sustainable urban scenarios recognizing urban corridors as new possibilities and lifelines to impact meaningful and multidimensional transformative design strategies.

Lecture notes
“Method-design”: Systematically engaging students in the Studio topic, to unlock their potential and skills towards developing prototypical design resolution on an urban and architectural scale. Identifying, understanding and developing local stakeholder networks, so as to translate challenges into opportunities and negotiate diverse interests into strategic ideas for development, geo-references, inter-linked systems, diagrams and maps. Develop design concepts for urban prototypes on different scales, framed by a narrative of a process that is consequentially visualized and communicated in analog as well as digital tools. Investigative Analysis/ Local Perspective: Registering the existing; prioritizing challenges and opportunities through qualitative and quantitative information; mapping on different design scales and periods of time; configuring stakeholder groups; connecting top-down and bottom-up initiatives; idea mapping and concept mapping; designing of citizen scenarios. “Project Design”: Synthesizing between different scenarios and definition of a thesis and program between beneficiaries and stakeholders; projecting process presentation as a narrative embedded in multiple steps; describing an urban and architectural typology and prototypes; defining an urban paradigm. “Domain Shift”: Shifting and translating different domains; testing and evaluating the design in feedback loops; including the project in the Urban Toolbox.

Literature
Reading material will be provided throughout the semester, as well as references to case studies. The class material can be downloaded from the student server.

### Prerequisites / notice

Team:
- Prof. Hubert Klumpner
- Anne Graupner
- Diogo Figueiredo

In collaboration with:
- UNSA | Faculty of Architecture, University of Sarajevo
- IPDS | Institute for Planning of Development Canton Sarajevo
- Prof. Adnan Pašić, Assoc. Prof. Dr. Aida Idrizbegović Zgonić, Prof. Dr. Gordana Mimisević, Prof. Dr. Pavle Krstić
- UTPS | Urban Transformation Project Sarajevo
- Dr. Michael Walczak, Bojana Papic, Victoria Soto Magán

Skills:
- Drawing & Representation | Michael Walczak and Melanie Fessel
- Introduction to Graphic Tools: Rhinoceros 3D, V-Ray, Grasshopper, Illustrator, Photoshop and InDesign.
- Graphic Design | Integral Designers, Ruedi and Vera Baur

Elective Course | ‘ACTION! Beautiful Data - The Filmic Art of Numbers’ is offered to complete the skillset of the studio, teaching in 3D modelling, filmmaking, and animating.

### Organization:

- Architectural Design V-IX | ECTS Credits - 14
- Integrated Discipline Planning | ECTS Credits – 3

Work: Group work during research / Individual project design

Language: German, English, Spanish and Portuguese

Location: ONA, E25

Participants: max. 18 students

All inquiries can be directed to Diogo Figueiredo: figueiredo@arch.ethz.ch

### Architectural Design V-IX: Interim, Forever (A.Caruso)

| 052-1141-21L | 14 credits | 16U |

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

Improvising and adapting have a long history in the built environment and now that the time for new building is coming to an end, perhaps architects need to more fully embrace the sensibility of the interim.

Objective

Qualification to control the design process increasingly independent and with sole responsibility and to find an individual design methodology and attitude.
Refining an idea until it is precise, developing a project so that it can be materialised, managing a design through the complexity of realisation. Architecture takes a long time and there is a strong temptation to reach for the eternal. Most of the constructed environment around us emerges out of even more complex circumstances and yet often comes together more quickly and flexibly. Are there things that architects can learn from how a farmer plans their fields to be productive and sustainable, how a tailor can mend a garment so that if it acquires qualities that didn't exist in the original, how resourceful builders can make do when materials and time are in short supply, improvising and adapting having a long history in the built environment and now that the time for new building is coming to an end, perhaps architects need to more fully embrace the sensibility of the interim.

There is a long tradition of interim inhabitation, it is what squatters do, and it is acknowledged by artists when they move, like pioneers, into an unpopular quarter of the city. More recently the idea of interim inhabitation has become part of the development process, protecting empty buildings from squatters and vandalism, beginning to build the brand of what comes next. We are interested in all of these examples and wish to explore ways in which the positive qualities of the interim can be extended so that the seeming inevitability of gentrification is deferred, perhaps forever.

We will work in a series of buildings in Zurich that are currently being provisionally occupied under different legal arrangements. We will begin by closely observing and recording current conditions, learning something about the relationships between creative programme and inventive spatial practice. By deploying a series of processes; to repair, to collect, to mark, to remove, to arrange, to support, we will work to develop the current contingent situation into something more robust. In this process we will engage with the existing networks of inhabitants, building owners and spatial/material arrangement, and challenge the social, legal and aesthetic limitations of architecture.

Prerequisites / notice

Group work only.
Critiques: Dates will follow
Costs: CHF 100.-- (besides the seminar week).

Does not take place this semester.
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
Not offered in HS21.

052-1145-21L Architectural Design V-IX: Voluptas S1E7 Repetition/Difference (F.Charbonnet/P.Heiz) W 14 credits 16U F. Charbonnet, P. Heiz

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
This semester aims at both designing erratic hyper-contexts generated by hypothetical ruling incentives, and the obsessive recording of their past and present traces of erasures and becomings.

Objective
Objectives: Research & curation of contemporary concepts, articulation of a discursive argument, visual literacy & storytelling, image montage & composition, architectural drafting and projecting.

Incentives: Movies & scenario, territorial & urban scale, collectivity, situations & artefacts, socio-political dimension, critical position, contemporary conditions.

Steps: (1) Analyze a movie, research contemporary concepts, identify potentials, articulate a critical position. (2) Project an urban scenario on both the artefactual and the territorial scale, focusing on collectiveness and the socio-political aspects of society. (3) Express a critical position towards a contemporary condition by the means of such a fictive context in both image and plan. (4) Train rhetoric and argumentation, master drafting skills as well as image montage.
Architectural Design V-IX: Nothing but Flowers -

Penitimento, n. [pen-tuh-men-toh], plural pen·ti·men·ti [pen-tuh-men-tee].

Painting:
The presence or emergence of earlier images, forms, or strokes that have been changed and painted over. (https://www.dictionary.com/browse/pentimento [2021])

Repentir, s.m.
A.1. RELIG. Regret douloureux de ses péchés avec le désir de les réparer et de ne plus y retomber. Synon. contrition, repentance (véliou ou lliet). P. ext. Vil regret d'une faute, d'une erreur, d'une faiblesse. 2. P. ext. Regret d'une action quelconque.

“Since the trace is not a presence but the simulacrum of a presence that dislocates itself, displaces itself, refers itself, it properly has no site—erasure belongs to its structure. And not only the erasure which must always be able to overtake it (without which it would not be a trace but an indestructible and monumental substance), but also the erasure which constitutes it from the outset as a trace, which situates it as the change of site, and makes it disappear in its appearance, makes it emerge from itself in its production. The erasure of the early trace of difference is therefore the ‘same’ as its tracing in the text of metaphysics. […] The paradox of such a structure, in the language of metaphysics, is an inversion of metaphysical concepts, which produces the following effect: the present becomes the sign of the sign, the trace of the trace. It is no longer what every reference refers to in the last analysis. It becomes a function in a structure of generalized reference. It is a trace, and a trace of the erasure of the trace.” (J. Derrida, Margins of Philosophy, Différence, 1982 [1972])

Content:
Pursuing our rambling exploration on the lookout for urban environments beyond reasonable and more than ever considering humankind as embedded in, acting upon and dependent on its geological era, we shall look upon history’s intertwined layers and sediments as raw potential to be appropriated and composed with – joyfully disrespects scientific authenticity. The visionary Histor seeks, finds novelty in the old, rather than an unfounded assertion of the present with the past. This semester aims at both designing erratic hyper-contexts generated by hypothetical ruling incentives, and the obsessive recording of their past and present traces of erasures and becomings.

Repetition/Differenc:
invokes identity and sameness, evolution and change, patterns and habits, originality and copy, time and recurrence, beat and rhythm… all things seemingly constant, all shades of their endless variations. How may such abstract notions contribute to shape immortal processes and crystallize timeless and paradigmatic urban environments? The careful and critical consideration of architectural paragons, socio-economical dynamics, geopolitical shifts, further endowed with the lure of fiction, shall initiate new beginnings to alternate (hi)stories and cityscapes.

Prerequisites / notice
Group work only.
Introduction: 21.9.21, 10h, HIL G74
Critiques: Dates will follow.
Costs: 30 CHF per Student (besides the seminar week).

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
From the age of the dinosaurs, cars have run on gasoline
Where? Where have they gone?
Now, it’s nothing but flowers
(Talking Heads, 1988)

The studio will investigate and imagine nature in the metropolitan territory of Zurich. The results will be made public in the form of online investigative reportages, meant to inform design practices and public discourse on ecology and nature conservation.

Objective
NEW ECOLOGIES
New Eco Eologies is a studio series at Architecture of Territory dedicated to ecologising architecture. Ecological thinking, which foregrounds the interactions between organisms (or by extension between objects, or social and technical systems) and their environments, is applied in considering design practices in their social and environmental effects. The studio series is affiliated with the Future Cities Laboratory and the new Master of Advanced Studies MAS UTZ starting in the fall 2021. Citizens, experts, and fellow designers and artists will accompany us in the process.

PROCESS AND RESULTS
The semester consists of investigative journeys and intensive studio sessions. Architecture of Territory values intellectual curiosity, commitment and team spirit. We are looking for avid travellers and team workers, motivated to make strong and independent contributions.

Our approach enables students to work with a range of methods and sources pertaining to territory, including ethnographic fieldwork, interviews, literature research and essay writing, large-scale drawing techniques, photography, videography, and online publishing. Experts and guests will help us sharpen our skills and craft common agendas through debates. Students work in groups of two to three.

SEMINAR WEEK: PIONEERS OF CONSERVATION
Investigative journeys constitute the core of the project. The first studio day starts with an exploratory walk through the forested backstage of the Hängenberg. The investigations will continue throughout the seminar week, dedicated to pioneers of nature conservation. Foresters, gardeners, volunteers and veterans of nature associations, scientists, and environmental activists will be our guides. We will traverse the metropolitan territory of Zurich by foot, by bike, by bus and by train. The common trip is followed by a period dedicated to fieldwork in respective student teams. The seminar week takes place from October 24–30 (cost frame A). It is integrated, mandatory, and open to all interested students.

LECTURES SERIES: MY SPECIES
Within the lecture series ARCHITECTURE OF TERRITORY. Territorial Design running in alignment with the studio, four guest speakers engaged in fields ranging from art and landscape to bioethics and environmental philosophy, will address the theme MY SPECIES, approaching territory through the notions such as multispecies, coexistence, and diversity.

CREDITS
The semester offers the total of 19 credit points. The Design Studio with Integrated Discipline (Planning) 14+3 KP and the Seminar Week 2 KP.
We are often told that Nature is being lost, damaged and polluted, sacrificed to consumption habits and ambitions of urban development. We are told of the environmental crisis of planetary proportions, of the loss of species and the imminent collapse of the web of life. We hear appeals to preserve and respect Nature, to curb our resource use and manifest an ethos of care. Nature is the concept governing actions of individuals and societies, and yet, if we try to put our finger on “nature”, to situate it in our environments, it is slippery and far from clear. The politics of space and territory relies on both green arguments, as well as privileging of our own species. Nature is often not more than a convenient gesturing: the net loss or gain of forest; the carbon offsetting; the nature compensation, the green tech, the greenwash.

But nature is also a space of imaginary. As a concept, Nature has played a historical role for the human communities through its association with the divine, the primitive, the bestial, the corporeal, and the feminine. In Switzerland and other countries, the forming of nature conservation as a scientific discipline mirrored the industrialisation processes throughout out the XIX century as a specific reaction. Invigorated by aesthetic and patriotic sentiments, early activist movements deployed the industrial destruction of both “nature” and “homeland”. Gradually conservation efforts consolidated, working their way into institutional and land use frameworks. Much of nature conservation effort historically has been rooted in the nature-culture divide, an understanding where any product of human activity is seen as being separate from nature, and thus resulting in the production of landscapes cleared from human inhabitants and demarcated from human use. But different paradigms of conservation took hold as well. Some approaches have emphasised on the role of the human carer in the protection and a sustainable use of nature (through for example mining or logging). Others have explored rewilding of landscapes through the reintroduction of previously disappeared species.

In the seemingly pastoral, but essentially highly technological territory of Switzerland, the meaning and the role of nature is far from settled. Being woven into the territory, nature areas remain an object of multiple pressures and interests. As the failures of recent initiatives—the CO2-Gesetz, the Trinkwasser-Initiative and the Pestizidfrei-Initiative—have patently shown, there is little agreement on what kinds of nature are worth preserving, by whom, and how. As designers, we may add that, there is also a lack of environmental imagination, which ought to be explored.

In this semester we will investigate and imagine nature in the metropolitan territory of Zurich. We will analyse political, financial, cadastral and other entanglements between urban space and nature. We will engage in multispecies ethnography, tracing our relations with other species. We will engage with aesthetics, science, and the philosophy of nature. Focusing on selected sites, from the Rhine plains, through the fields of Weinfeld, the logistic valleys and leisure hilltops around Winterthur, to the forests and pastures of Zürcher Oberland, we will look at nature in its different incarnations—the protected biotopes, the nature monuments, the second natures and the third landscapes of the agglomeration, the cheap natures of industrial farming, and so on.

Students will write their own project briefs, and will develop territorial analysis and projects for the chosen sites. The takes form of a web-based investigative reportage. During the production we will work with GIS and CMS experts, a journalist, a data scientist, a videographer and a photographer. The results of the studio are delivered in the public forum, meant to inform design practices and public discourse on nature conservation.
The general aim of the course is to propose transformation strategies for existing learning environments on the campus of ETH in order to...

**Abstract**

Architecture defines the spaces in which we live and work in during every moment of our lives. We will study the large scale in which the work of an architect has an impact on the biggest possible amount of people. A house as big and complex as a whole village. The design work is understood as an investigation on the daily conditions of our times, through the media of architecture.

**Objective**

This semester the design studio will focus on the big scale. Students will develop a design based on a given competition brief and will deal with the theme through a critical approach.

Analysis of fundamental aspects of the given task, fast track design methods leading to alternative concepts should establish the strategic and factual basis for a critical understanding on how to deal with the big scale. The goal is to develop an individual and critical understanding of the topics and, just like in a real office, students will work individually towards a final collective output.

**Content**

Architecture defines the spaces in which we live and work in during every moment of our lives. We will study the large scale in which the work of an architect has an impact on the biggest possible amount of people. A house as big and complex as a whole village. The design work is understood as an investigation on the daily conditions of our times, through the media of architecture.

The brief and the site of actual competitions will be the starting point of the semester. In the studio, students will work individually during some design stages and they will work together during others. This collaboration is understood as a teamwork in which each participant has a clear task, different from the others.

Students will develop their design capacities, which relate specifically to the work in the large scale and they will develop their own individual and critical understanding of the challenges of our times. Throughout the semester there will be lectures and discussions with architects working on large commissions. Zaha Hadid Architects, Christine Binswanger, Bjarke Ingels and Ma Yansong will be guests of this semester and give some inputs.

**Prerequisites / notice**

Individual work and group work, whereof at least 3-4 weeks of group work.

Critiques: 19./20.10.; 16./17.11.

Costs: CHF 40.-- (besides the seminar week).

**052-1111-21L Architectural Design V-IX: Informal Learning Spaces**

W 14 credits 16U M. Kaijima, F. Persyn

(M. Kaijima / F. Persyn)

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 2.11.21, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

**Abstract**

What is a learning space at ETHZ? The studio supported by Innovedum, is jointly run by the Chair of Architectural Behaviorology and the NEWROPE Chair with the Chair of Cognitive Science. It develops from research and 1:1 mock-ups in HS2021 towards realizations of interventions in SS2022. Students tackle 3 environments: architecture studio space, semi-public library, and conventional classroom.

**Objective**

The general aim of the course is to propose transformation strategies for existing learning environments on the campus of ETH in order to create the appropriate conditions for reflexive learning, which is a type of learning in which one explores one's own experiences to become more conscious, open-minded, and self-critical. Students will study the existing space through the learning research methods to design and realize 1:1 mock-ups and interventions in 3 different sites of ETH to adapt the space's respective conditions to their educational purposes, and to enhance the actors' behaviors, on a human, material and natural level. Students' designs are framed within a larger understanding of learning spaces, based on theoretical and historical knowledge, and attentive site observations, as much as on the exchange with users and experts, in close collaboration with other students, teaching staff and stakeholders. They will be supported by 2 Senmonkas (Japanese experts), architect and carpenter Karl Rühle and textile designers Anne Masson and Eric Chevalier. Students further learn and improve their practical skills in the fields of research, representation and design, 1:1 detailing and building, guided jointly by both the Chair of Architectural Behaviorology and the NEWROPE Chair of Architecture and Urban Transformation. In all phases of the course, students will learn study the representation and communication tools from both chair’s expertise, such as Architectural Behaviorology, Design in Dialogue, Decision-making processes, Actor-Network drawings, sketches, models, 1:1, films or interviews, scientific report.

The learning goals correspond to the grading system of each chair. The final grade will be the average of both grades.

Introduction
Teaching and learning methods are evolving. The complexity of our lived reality demands new sets of skills and competencies to be integrated in education, especially in architecture, which is changing from a competitive model based on individual authorship to a complex, interdisciplinary challenge. Real-world problems urge universities worldwide to invest in pedagogical approaches that support exchange and reflexive learning, i.e. constant self-reflection based on our own experiences and positions. Experimenting, testing and taking strong, sometimes diverging positions need Safe Spaces that offer professional and emotional stability to turn confrontations and discussions into productive dialogues. These include informal spaces that invite a diversity of uses, where students and staff meet, exchange and inspire each other. In order to precisely integrate collaboration, self-management, positionality and collective evaluation into the teaching and learning methodology, we need spatial configurations that enable and promote diverse and flexible behavioural settings. For this reason, we collectively aim to transform and integrate informal learning environments in three existing situations at ETH Zürich:

(A) Studio space at the department of Architecture, ONA.
For this case study, 2 groups of 4 students will work on architecture studio spaces. During their education, architecture students are reflecting about a diversity of spaces and scales, often without taking into consideration their own learning environments. These spaces remain until today, with some exceptions, very generic, very often lacking attractiveness. How can the education of architecture benefit from a transformation of its spatial environment? How can this spatial transformation support students in testing their own positions regarding complex problems?

(B) Public library at the InfoCenter of the ETH Library, in the main building of ETH
ETH Library offers a range of services that are unfortunately largely unknown to users. For this case, 2 groups of 4 students will think about the following questions: How could the spatial environment of the library offer both, an understanding and a visibility of the provided services? How can the functions of a library be combined with a learning space itself? How to manage acoustic or representational issues while offering the necessary representative freshness? Students are invited to collectively think about possibilities of the future of the library considering the different expectations of departments’ staff, students, librarians and public.

(C) Classroom at the Department for Environmental Systems (D-USYS), with the Transdisciplinary Lab (TdLab)
During the Course “Tackling Environmental Problems” students of D-USYS work in groups and in close collaboration with different stakeholders for solutions of environmental issues. Their methods include role plays and performative presentations that enable participants to reflect on different positions in complex situations. 2 groups of 4 students will accompany the course and observe the spatial settings and use of a rather conventional classroom of ETH. How do staff and students work in groups in classrooms? What kind of intervention could strengthen collaboration? Which spatial configuration functions both, as a representative stage, and as a safe ground to strengthen roles and communicate information?

Lecture notes
Schedule
Phase I Week I-V: Research History, Research, Observation, Documentation and Representation of the 3 sites.
Week VI: no class during Seminar Week
Week VII-XI: Intervention Design, Implementation and Observation of 1:1 mock-ups in all 3 sites
Week XII-XIV: Translation Documentation, evaluation, reflection and translation of results into a Research Report and a 1:1 collective installation in Studio.

Assignment and deadlines
Week V: Research Drawing & Documentation, Process Book*, Design of Presentation Setting
Week XI: 1:1 Mock-up, Design Drawing, Process Book*, Mock-up Re-enactment on site
Week XIV: Mock-up collective 1:1 installation in studio, Process Book, Research Report*
*Process Book and Research Report are individual work.

Literature

Prerequisites / notice
Group and individual work, whereof at least 5 weeks group work.

Introduction: 21.09.21
Mid-term review 1: 20.10. 21
Mid-term review 2: 01.12.21
Final Review: 23.12.21

Costs: 100 CHF (besides the seminar week).

Students could work for int. Disziplin class below.
Name: Architecture and Urban Design
LV-Nr.: 051-123319L

Taught competencies

Domain A - Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Domain B - Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies not assessed
Problem-solving assessed
Project Management assessed

Domain C - Social Competencies
Communication assessed
Cooperation and Teamwork assessed
Customer Orientation assessed
Leadership and Responsibility assessed
Self-presentation and Social Influence assessed
Sensitivity to Diversity assessed
Negotiation assessed

Domain D - Personal Competencies
Adaptability and Flexibility assessed
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics not assessed
Self-awareness and Self-reflection assessed
Self-direction and Self-management assessed

<tr>
<td></td>
<td>Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.</td>

We will run the courses as follows this semester.
1. Both courses are combined. (2 x 2 ECTS points & please enter both courses)
2. Present tense lessons (online or physically according to the instructions of the school management, Mondays 2 p.m. to 4 p.m. (Course time 3D Modeling)
3. Self-study Mondays from 12 noon to 2 pm (course time 360 ° Reality to Virtuality) in self-study or whenever you can find the time.

We will provide Oculus Quest 2 glasses for each course participant. To register for the “virtual design” course, a deposit fee of CHF 200.00 is required for the Oculus Quest 2 VR glasses. This deposit must be submitted to the professorship no later than 2 weeks before the start of the course. This will also give you the Oculus Quest 2. (Maria Hil F 46/48, every Monday and Tuesday afternoon)
The glasses remain in your possession until December 20th, 2021 and you have a reserved place in the course. In the event of loss or defect without guarantee coverage, you will be charged CHF 510.00. Less the prepaid deposit of CHF 200.00
If you have your own Oculus Quest 1 & 2 VR glasses, you can also be there. When registering in the system, please provide a separate e-mail to rolle@arch.ethz.ch. Of course, there are no custody fees.
Prerequisites / notice

Enrolments need the lecturer’s allowance.

To enroll in the course, please consult the lecturer: Adi Grüninger; grueninger@arch.ethz.ch

Please send us a letter of motivation, stating your aspirations, goals / wishes for this elective.

Email to: rolle@arch.ethz.ch
CC: grueninger@arch.ethz.ch
kiryk@arch.ethz.ch

Tools where we use:
Gravity Sketch
Reality capture (3D scan program)
Oculus Quest 2
USB for Oculus Link (Beta Oculus Air)

We will use these tools and learn «design in virtual space» on the joint journey.

Prerequisites / notice

Course requirements:
Both courses are connected “360 – Reality to Virtuality” and “3D-Modeling”
Please register for both courses:
“360 – Reality to Virtuality” (052-0523-00L) and “3D-Modeling” (052-0521-00L) (2x 2 ETCS)
Classroom-teaching (online or physical meetings, Mondays, 14:00 – 16:00) Self-teaching, research etc. (Mondays 12:00 – 14:00, or whenever you have time)

Please send us your short letter of motivation to Nicolas Rolle: rolle@arch.ethz.ch
Tools:
Gravity Sketch
Photogrammetry 3D-scanning (Reality Capture)
Oculus Quest 2
Oculus Link (USB-C cable)

052-0525-00L Material-Workshop (HS) 

Abstract This elective course is not taking place in HS21.

Objective The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

Content The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

Prerequisites / notice Is not offered in HS21.

052-0535-00L Model and Design (HS)

Max. Teilnehmerzahl: 16

Abstract The course Model and Design teaches architectural model building in an explorative way through systematic experiments and the development of corresponding methods in design.

Objective The primary pursuit is an in-depth study of three-dimensional form, color, material and composition along with the practical development of your own technical and artistic competences.
### 052-0537-00L 3D printing for the Architectural Design (HS)

**Prerequisites / notice**
- Free Drawing (HS)  
- Number of participants limited to 35.

**Abstract**
Drawing is an important tool to develop and illustrate the artistic ideas and abilities of students. Different techniques and methods will be tested.

**Objective**
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

**Content**
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

**Number of participants:** Limited

**Application via e-mail:** Maude Léonard-Contant <leonard@arch.ethz.ch>

---

### 052-0549-00L Hybrid Modeling: 3D-Printing for the Architectural Design (HS)

**Prerequisites / notice**
- Free Drawing (HS)  
- Number of participants limited to 35.

**Abstract**
3D printing is a versatile representation tool for illustrating a design idea. This course teaches and practices how the design process can benefit greatly from 3D printing.

**Objective**
After the course, students will be able to use 3D printers and software programs like ArchiCAD.

**Content**
The course is suitable for complete beginners who have never used 3D printers. No previous knowledge in ArchiCAD is required. The use of ArchiCAD and 3D printing is required.

**Lecture notes**
In the first half of the semester, I will explain how to model and print an urban context and urban study.

In the second half, there will be an opportunity to participate in elective exercises or to benefit from the lecturer as a 3D printing coach for the respective design studio.

**Prerequisites / notice**
Knowledge of 3D printing technology is not required.

---

### 052-0517-21L Theory and Practice: Heterotopia, Referential Space and Spatial Effects

**Prerequisites / notice**
- Theory and Practice: Heterotopia, Referential Space and Spatial Effects

**Abstract**
In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such intertwining in current local situations and tries to think about potentials for spatial policy practice.

**Objective**
The students gain insight into the spectrum of epistemological and perceptual theories, learn to read them and analyze and critique their respective requirements. From this work an object relationship model is developing in progress, which serves self-examination in the design process as well as the evaluation of architectural situations in general and in particular. The writing of "scientific diaries" in which the contents of the colloquium are combined with the everyday experience of the students in free form, trains the concentrated result-oriented thinking in general, as well as in architectural situations. The special form of the writing of the "scientific diary" leads abstract Theory together with the experience of the students and make the knowledge creatively available in their own way.

**Content**
In 1967, Foucault showed certain entanglements of space with his concept of heterotopia; a little later, Pierre Bourdieu established a multidimensional space sociologically with his concept of field. The seminar also discusses such intertwining in current local situations and tries to think about potentials for spatial policy practice.

**Prerequisites / notice**
Cooperation in the form of discussions and scientific diary.

The additional personal work (besides the course) is about 20 working hours for the creation of a scientific journal, individual deepening and filming!

---

### 052-0533-00L New Focal Points of Construction: Steel Constructions

**Prerequisites / notice**
- New Focal Points of Construction: Steel Constructions

**Abstract**
The elective subject "New focal points of construction" investigates the complex interaction of construction elements by means of exemplary architectonic tender points such as base, wall, chamber, roof etc. The comparative analysis of built constructions serves as a basis for further development of hypothetical future constructions.

**Objective**
The target of the course is the understanding of the impacts of material, technology and construction to the architectural education of constructive points. With comparative analysis of built constructions of high architectonic relevance, by means of exemplary building elements such as base, wall, chamber, roof etc., the genesis of constructive building parts, the interaction of the building elements and stand of technique for the most of common constructive tender points is imparted. The conjunction to current constructive methods and basic conditions enables a critical evaluation of the constructive Status Quo within the contemporary producing architecture as well as a perspective to new konstruktive education.

**Content**
- Lecture:
  1. Comparative analysis for derivation and understanding of the constructive points base, wall, chamber, roof etc.
  2. Description of current level of technique, typical methods, and set of problems.
  3. Coloquium with guests of producing and processing companies.

- Exercise:
New formulation of a future constructive point as a result of a diagnostic work.

**This course (ends with «00L») can only be passed once! Please check this before signing up.

Territories of Play - Surveying Architecture Through

Game Design (HS)

2 credits

2S

P. Heiz, F. Charbonnet, F. Morpurgo Veiga

This course offers an introduction to the theoretical frame of the seminar through three lectures; by a game designer, by an architectural historian or architect, and by the seminar's tutor. The theoretical works and authors which make up the core of the seminar - Jesse Schell, Johan Huizinga and Kate Salen & Eric Zimmerman - will thus be presented and analysed, hinting at possible bridges to a critical analysis of architecture and the built environment through its decomposition into Mechanics, Aesthetics, Narrative and Technology, the four pillars of game design.

Students will be invited to select a game, dissect it according to the theoretical input previously received, and select a key aspect of it. This key aspect will in turn be used as lenses through which students should analyse and question their reality, a milieu of their own choice: from the spaces and urban situations forming their daily routine in the city, to their hometown or fetish city. From this analysis, an essay presenting and defending their hypothesis of reading of their milieu through gaming should emerge.

The writing will be conducted during the seminar's attendance time. Students are to produce a coherent, ludic publication compiling the classes' essays into an accessible survey.

Summer School: Under the Landscape - Young Makers Gathering

Does not take place this semester.

The garden project has been an integral part of the teaching curriculum at Studio Tom Emerson, involving over 300 students in its conception over the past five years. On the one hand it is a design project, a pedagogical tool, focusing on ideas of construction, reuse, renovation, rejuvenation, maintenance and subtraction, yet we also see it as a form of constant and continuing research into our interactions with the dynamic processes of time and passing seasons. Can we practice architecture, with the care of a gardener?

In this weekly elective course, the goal will be to look at repair as a possible method for a new kind of design. As a disciplinary response in an era of climatic change, it is envisioned that this study should pose a range of questions to challenge conventional building economies and the durability of the constructed environment. We will interrogate and look for ways of improving and repairing standards of construction industry ranging in scale from urban to material choices. The methods developed and gathered should become an outline conception over the past five years. On the one hand it is a design project, a pedagogical tool, focusing on ideas of construction, reuse, renovation, rejuvenation, maintenance and subtraction, yet we also see it as a form of constant and continuing research into our interactions with the dynamic processes of time and passing seasons. As part of a restoration project by the interdisciplinary research collective "Boulouki" on the Greek island of Thirasia, site-specific craft techniques are being revived. The focus of the investigation is the abandoned cave settlement Agrilia, the restoration of the natural stone path to the settlement with accompanying dry stone walls and two cisterns sealed with pozzolanic plaster.

- Getting to know traditional craft techniques, the corresponding construction principles and material properties through implementation on a 1:1 scale
- Understanding of the local relationships between landscape and type of settlement
- Interdisciplinary exchange with participating specialists
- International exchange with Greek students

The interdisciplinary research collective "Boulouki" (www.boulouki.org) carries out restoration projects in Greece every year with student participation. The group, led mainly by young architects, is well networked with universities and specialists, prepares the events meticulously and tries to embed them in the local craft and social context.

As part of the workshop, the path to the abandoned cave settlement Agrilia will be restored, which is centrally located on the island of Thirasia in a valley. The natural stone paving of the path and the adjacent dry stone walls will be exposed and repaired, as will two cisterns of the water supply system. These are sealed with plaster, which has a special strength and water resistance due to its aggregates made of local pozzolan earth (Santorin earth, trass lime). The restoration work takes place in the mornings and is accompanied by local craftsmen and apprentices.

The type of settlement in Agrilia is uniquely dependent on the local (geological) conditions. The settlement should be understood in its entirety (connections between geology, agriculture, water drainage, architecture, volcanic materials, etc.). An artistic and creative examination of the local materials is also sought. For this purpose, seminars and lectures are organized in the afternoons and evenings with the participation of craftsmen, archaeologists, geoarchaeologists, agronomists, the rector of the Athens School of Art and of course architects.

Please check this before signing up.
This course (ending with «00L») can only be passed once!

In the course of organizing the workshop, it was possible to bring together older local craftsmen with young apprentices, who were taught traditional techniques for a month before.

- Representation of architecture is inextricably linked to photography since the mid 19th century. As buildings are commonly discussed on the basis of images, understanding their technical origin is key to reading and making them. By teaching students how to use a 4x5" view camera, the artist and photographer Tobias Wootton will introduce different techniques of 'thinking through the lens'.
- Knowledge of architectural photography
- History, theory and practice of photography in relation to architecture

- Course dates s. room reservations!
  - Group 1: Thursdays 16:00 - 20:00; Group 2: Fridays 14:00 - 18:00

- Students will be selected on the basis of a motivation letter.
- Deadline: 10.9.21, 12:00 h, to wootton@arch.ethz.ch.
- Please also state a preference which day suit you best:
  - Group 1: Thursday evening
  - Group 2: Friday afternoon

- Course dates s. room reservations!

- Students will be selected on the basis of a motivation letter.
- Please also state if you have a preference for the Thursday or the Friday class.
- Deadline: 17.9.21, 12:00 h, to wootton@arch.ethz.ch.

- The course deals with the question of how architects perceive architectural and urban space and how their spatial imagination can be grasped empirically. This before the tradition of comparable investigations in history and the theory of architecture. In the seminar we work with Unity.
- Students gain insight into the history and theory of scientific spatial research and architectural aesthetics as well as into the related contemporary cognitive sciences (cognitive psychology and neuroscience). They develop an original question about the perception of space and the spatial imagination of architects, which they verify in an experiment. This experiment will be realised in a video game.

- The course presents the "state of the art" of cognitive sciences and their relevance to architecture against the background of the historical analysis of architectural theory with these topics. Discussions take place on existing experiments and theories that pertain to architecture and use them to develop original, empirical experiments from which a sound understanding of architecture and design can be gained.
- Students will work also with Hololens and thus investigate upon the boundary between the experience of "real" and of "virtual" spaces.

### Autumn Semester 2021

- International exchange with participating specialists
- Understanding of the local relationships between landscape and type of settlement
- Interdisciplinary exchange with participating specialists
- International exchange with Greek students

In the course of organizing the workshop, it was possible to bring together older local craftsmen with young apprentices, who were taught traditional techniques for a month before.

H. Romakin

In this seminar, writing is taught as a craft, and text work as well as journalistic strategies for its publication are dealt with intensively. The seminar meetings will convene as often as possible in the drawing study rooms in and around Zurich, including the Archives of ETH, the Graphische Sammlung of ETH, the Kunsthaus Zurich, and the Stadthaus Zurich.

The function of drawing changed with the advent of digital modeling, which made hand drawing marginal at best to both firms and schools. The seminar considers both historical techniques of drawing as well as a range of conceptual approaches and functions, and its possible future within the altered profession of architecture.

In light of current conditions, the seminar considers both historical techniques of drawing as well as a range of conceptual approaches and functions, and its possible future within the altered profession of architecture.

It will take an interest not only in drawing as a practice, but also as a representational tool. It will adopt a critical attitude towards the traditional architectural conventions of plan, section, elevation, axonometric drawing and challenge students to think about how those conventions might be interrogated or undermined.

The chronological scope of the seminar will be very broad. The professor’s expertise is in Renaissance drawing, however the seminar aims to take advantage of the resources available in Zurich which include everything from fifteenth century drawings to the present.

Interested students will have the opportunity to take part in the conception and organization of a conference on the topic of drawing, including both architects and historians.

There will be some assigned reading, but relatively little, focused on historical techniques and special topics in the history of drawing; most of the historical background will be conveyed through the professor’s presentations and select guests, and most of the work will be drawing exercises.

Prerequisites / notice

Students will be expected to complete regular drawing assignments every other week (for a total of 5 per semester); these will be the basis of the final grade and most work will be concentrated towards the beginning and middle of the semester to avoid conflict with studio work.

Because the class will be located at various sites around Zurich, students should allow 30 minutes before or after class for travel.

Adaptability and Flexibility

When we think of postmodern architecture, we often think of concepts (‘superficiality’, ‘pastiche’, ‘simulacra’, and so on) and not so much of ‘things’. In other words, our analysis of postmodern architecture tends to focus on the immaterial and ignore all the material objects that these buildings are made of, and that distinguish them from their predecessors. This bias makes us underestimate the importance of mundane, humble ‘things’ in the design of these buildings and our lived experience of them. Because underpinning the transformation of architecture over the last fifty years was not just a generic shift in our worldview, but also the introduction of discrete technological objects which functioned as vehicles for the ideological, cultural, and societal changes that we associate with the postmodern turn.

Following this proposition, this course examines postmodern architecture through the analysis of sixteen ‘things’ and the legal, material, and technical networks attached to them: mirror, escalator, ramp, TV screen, neon lamp, plant, glue, CCTV, cladding panel, plasterboard, shipping container, vending machine, corporate art, solar panel, computer, and cinder block. We will do so by reviewing a large body of literature on the ontological, epistemological, and social politics of things and matter more in general. Readings will include key works in architectural history, semiotics, actor-network theory, new materialism, and postmodern theory. Students successfully completing the course will be able to read buildings from an object-oriented perspective.

052-0815-21L Seminar Architectural Criticism: The Other Institution, W
Part II (A. Stahl)

2 credits

A. Stahl, L. Stalder, V. Villardebo Sacchetti

Abstract

The doors of the D-Arch have been closed for over a year. We stayed at home and pretended digital teaching was still our concern. Meanwhile, over 4 million people worldwide died as a result of Corona, and the climate crisis is advancing, our construction industry is responsible for 38% of CO2 emissions. The time has never been so pressing. Let’s start critique the status quo. Let’s start writing.

Objective

In this seminar, writing is taught as a craft, and text work as well as journalistic strategies for its publication are dealt with intensively. The research materials that were put together by the students in part I of the seminar last semester will serve as a basis: We will deal with mental health issues from before and during the pandemic, as well as the absence of ecology in teaching, among others.

052-0817-21L Theory of Architecture: What Drawings Did and Do
2 credits

A. Stahl

W

C. Brothers, L. Stalder

Abstract

For centuries, architectural drawings have been at the center of the profession: how architects come up with ideas, share them with clients, and communicate with builders. The seminar takes the point of view that hand drawing can still be a useful instrument for the architect, and that the ways how may be understood in part through a study of past drawings, studied in the original.

Objective

The seminar meetings will convene as often as possible in the drawing study rooms in and around Zurich, including the Archives of ETH, the Graphische Sammlung of ETH, the Kunsthaus Zurich, and the Stadthaus Zurich.

Students will develop a knowledge of techniques of historical drawings from the Renaissance forward, as well as a conceptual understanding of their uses, and the different graphic strategies adopted by draftsmen in response to varying conditions, materials, and aims. They will also have a chance to explore a range of approaches to making their own drawings, when possible in response to the earlier drawings we examine. The course will challenge students to consider what the future role of hand drawing could be for the architect.

Content

The function of drawing changed with the advent of digital modeling, which made hand drawing marginal at best to both firms and schools. In light of current conditions, the seminar considers both historical techniques of drawing as well as a range of conceptual approaches and functions, and its possible future within the altered profession of architecture.

It will take an interest not only in drawing as a practice, but also as a representational tool. It will adopt a critical attitude towards the traditional architectural conventions of plan, section, elevation, axonometric drawing and challenge students to think about how those conventions might be interrogated or undermined.

The chronological scope of the seminar will be very broad. The professor’s expertise is in Renaissance drawing, however the seminar aims to take advantage of the resources available in Zurich which include everything from fifteenth century drawings to the present.

Interested students will have the opportunity to take part in the conception and organization of a conference on the topic of drawing, including both architects and historians.

There will be some assigned reading, but relatively little, focused on historical techniques and special topics in the history of drawing; most of the historical background will be conveyed through the professor’s presentations and select guests, and most of the work will be drawing exercises.

Prerequisites / notice

Students will be expected to complete regular drawing assignments every other week (for a total of 5 per semester); these will be the basis of the final grade and most work will be concentrated towards the beginning and middle of the semester to avoid conflict with studio work.

The seminar will be limited to 24 students; groups of 12 will visit the drawing rooms while the other group does a drawing exercise lead by a teaching assistant. Interested students should email the professor indicating the reason for their interest and any drawing experience or studio art background.

Because the class will be located at various sites around Zurich, students should allow 30 minutes before or after class for travel.

Have you ever resisted the urge to travel and tried to imagine your travel? That’s the experimental set up for the seminar. The idea is to split the participants of the seminar into two groups: travellers and non-travellers. In pairs (tandem partnerships), they will be interconnected through various media. The final outcome will be a video essay, which combines their findings.

Imagination and abstraction are important skills of the architectural profession. The seminar aims to train students in precise descriptions and to expand them with fictional content. Discussions will elaborate the advantages and disadvantages of traveling and being on-site. In the two different attentions of the students’ tandem work, the digital experience and the real experience meet. Discussed are those elements and facts that benefit or come off worse due to the different perceptions.

The seminar participants will be divided into 2 groups: A) Students who are “travellers”, i.e. who participate in a seminar trip of any professorship; and B) “non-travellers”, students who do not take a seminar trip in this semester. Mixed tandems will be formed among the participants. First, the students will be prepared for the seminar week in an architectural history introduction to research trips, discussion of texts read together. Afterwards, the seminar group will work with the tutors to identify questions and topics for the upcoming trips, and discuss possible tools and practices for “travellers” and “non-travellers”. During the seminar trip, the tandem partners are in contact with each other. Both groups are given different tasks: The “travellers” document the trip, select the collected footage and upload it to the online platform while tagging it. The “non-travellers” perform a commentary function on the resulting footage and conduct in-depth thematic research. After the seminar trip, both groups meet again in the seminar room to exchange and discuss their experiences. Together, they review and classify the footage that has been created and collected. From this, the assignment is developed and considered with the students: The hybrid journey is to be produced in the format of a video essay by the tandem partners as a semester achievement under the supervision of the tutors.

Required reading will be made available as a download for registered participants. In addition to the seminar, we assign a “Vertiefungsarbeit” for the Video essay.

Seminar 1 (23/09) – Introduction

**Objective**

Students will be introduced to the concepts of the commons and musha’, they will critically explore the theory of Hadi Al-Alawi and its Asian influences, as well as the context in which this theory was produced, and will reflect on it based on diverse experiences.
The commons has been gaining traction in architecture and beyond, including in architecture, both as theoretical framework and as self-standing subject for examination. The trailblazing work of Elinor Ostrom has won her the Nobel Prize in economics in 2009. Radical, politically engaged researchers, such as David Harvey, Massimo De Angelis, and Stavros Stavrides, have taken up the topic of the commons as an institution of revolutionary potential. This course will bring a different perspective into conversation, namely the work of Had Al-Alawi, a prominent Iraqi scholar who wrote, towards the end of the 20th century, on the concept of musha’a (an Arabic word that closely resembles the commons). Based on pan-Asian history, and focusing on Chinese and Islamic civilizations, Al-Alawi theorizes the musha’/commons and musha’/yya (communalism) as central to communism, and argues that these practices are historically rooted in Asia. In this approach, he is influenced by Maoism and its relationship to Taoism—an ancient Chinese philosophy. We will critically explore the theory of Al-Alawi, situate in its historical and intellectual context, and reflect on it in relation to various experiences and theorizations of commons and communities around the world, past and present.

**Taught competencies**

**Domain A - Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

**Domain B - Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: not assessed
- Project Management: assessed

**Domain C - Social Competencies**
- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: not assessed
- Negotiation: not assessed

**Domain D - Personal Competencies**
- Adaptability and Flexibility: assessed
- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: not assessed
- Self-direction and Self-management: not assessed

**Prerequisites / notice**

During Seminar Week. 4 days, 6 hours per day. The first hour will be dedicated to the lecture, two hours for structured group discussion, and three hours for development of work, alternatively including another 1-hour lecture. The last day will involve the student presentations of their work.

To follow
Students have to attend regularly at the seminar inside and outside of ETH, to take part in the discussions and to prepare the selected texts. Each participant has to hold an input lecture.

The seminar is limited to 20 people. There will be a waiting list.

Please note:
Around 4-5 meetings will take place outside ETH Hönggerberg and some at Graphische Sammlung ETH Zürich in the main building. Time for travel before and after the meetings is therefore necessary.

052-0835-21L Summer School: Transects Through Alpine Water Landscapes (ETH-EPFL)
For MSC ARCH students and Doctoral students.

Abstract
Through field expeditions, keynote lecture, discussion, workshops, and exchanges with experts, participants will contribute to the production of a synthetic ‘transect’ across a continuous water landscape. The transect operates as a record of relations along a set path, from the Aletsch glacier to the Rhone valley floor, revealing larger territorial logics.

Objective
Learning objectives include the acquisition of foundational conceptual knowledge related to (1) landscape, planning, and systemic design issues linked to water in the Alps, and (2) broader trans-disciplinary challenges facing water landscapes (climate change, agriculture, energy, urban drainage). Participants will also develop observational and analytical skills alongside the methodological tools of field research from architecture, landscape architecture, archaeology, geology, and surveying. The final outcome will be the production of individual field diaries and a synthetic transect discussed through formal presentation and critique.

Content
Water is a finite resource that has increasingly become a major geopolitical issue. In the European context, the Alps hold a strategic position as the ‘water tower of Europe’. Industrialization and urbanization apply significant pressure onto the water ecosystems of alpine valleys. Modifications to the flow of rivers can significantly impact downstream regions, across very extensive areas. Thus, concerted landscape management and urban planning is essential, especially as natural and man-made water systems are affected by climate change. The transect along the Massa river, from the Aletsch glacier to the Rhone valley floor, presents archetypal water management issues and opportunities. The transect is thought of as an autonomous territorial entity, which could be used as an abstract model for future systemic planning.

Fieldwork will be employed as a form of direct engagement with the landscape to document key infrastructure, such as irrigation channels, dams, and drainage systems. It will highlight specific urbanization processes and their associated ecosystem services (water retention, habitat provision, recreation). The objective is to develop a spatial, empirical, and material understanding of the landscape.

Lecture notes
Teaching involves 4 expedition days, 1 production day, and 1 final critique day. Doctoral students with relevant expertise will lead field research on expedition days, supplemented by keynote lectures by invited guest experts. Workshops will take place on site and in the seminar room at Villa Cassel. Professors from ETH and EPFL will take part in the final day of critique.

Location: Villa Cassel, 3987 Riederalp, Kanton Wallis
Duration: 6 days
Dates: 16-21 August, 2021

Participation fees cover accommodation including full board at Villa Cassel. Master students (ETH/EPFL): CHF 100; Doctoral students (ETH/EPFL): CHF 250; Doctoral/master students (external university): CHF 500. All participants are required to take part in the full 6-day summer school (2 ECTS); mountain hiking is required.

052-0851-21L Topical Questions in History and Theory of Architecture: Gendering History. Women Travellers

Abstract
This course will take the form of reading seminars in which we examine women’s travel writings of the 18th and 19th centuries for their commentary on the designed environment. While architectural histories often focus on male-dominated processes of design and production, this seminar sets out to discover architecture’s past as seen through the eyes of female travellers.

Objective
Students will gain experience in different forms of reading primary sources (close and distant) and in placing these into an appropriate context. We will explore methodological approaches linking literary analysis to lived architectural experience, expanding the canon of our discipline as we include the view of women into our understanding of 18th and 19th-century architecture. Students will be familiarized with feminist approaches, intersectionality, and marginal historiography.

Primary readings are accompanied by secondary texts on feminist and intersectional methods and embedded into practical exercises. Students will prepare short presentations, engage in reading and sketching exercises, and undertake their own ficto-descriptive writing, expanding their critical writing skills.

Prerequisites / notice
This course is aimed at students from the 5th semester onwards. It will require a set amount of reading and sessions will include intensive discussion and practical exercises, so consistent attendance is very important.
same time.

Abstract
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

Objective
We expect that students pursue their examination of the design process independently and in an original manner or that they develop a related theme from the perspective of the history of art and architecture. The work should be part of the design process and interact with it formally and in regard to content.

Content
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

052-0853-21L Architecture Beyond the Studio: Reflecting the Social and Cultural Dimensions of Design Proposals
This course is offered until end of spring 2023 semester.

Abstract
"Architecture beyond the studio" is a seminar with the aim to reflect and rethink the formal and spatial aspects of the students’ own design projects from the perspective of the Humanities and Social Sciences (HSS). Literature from the HSS is researched individually, related to the design projects in the form of a paper and presented jointly in an exhibition.

Objective
In this seminar students learn to critically reflect their practice as architects from the perspective of the humanities and social sciences (HSS). As object for these reflections serves one of the students’ own design projects. This can be an architectural project they have designed at a chair for architecture and design, an architectural practice or independently.

Content
Currently, the discipline of architecture is undergoing substantial change. Political and social aspects are again becoming more important within the profession of architecture. In the 1980s and 1990s architects legitimized their designs by recurring to their artistic abilities and individual ingenuity. Today, however, practicing architects cannot escape the social and political responsibility that comes with the design of architectural buildings. An increasing number of public as well as private developers expect architects to include considerations about the social and cultural live of prospective inhabitants in their architectural designs.

Prerequisites / notice
Against this background, the seminar "Architecture beyond the Studio" bridges the gap between architectural design and the Humanities and Social Sciences (HSS). Supported by two lecturers – with backgrounds in architecture and the social sciences – the students develop texts in which they critically reflect on spatial aspects in one of their own design projects from the perspective of the HSS.

The aim of this seminar is to enable students to better understand social, political and/or economic dimensions of spatial aspects in their architectural designs. The students’ tasks include reflexive and analytical writing, the presentation and discussion of these reflections, literature research and the production of a final text, in which they summarize their most important findings and define a theoretical position that could guide their future work as designers.

During the semester the seminar will be held as elective course (4 ECTS), including group-work, input by the tutors and individual feedback sessions. Additionally, this seminar contains two one-week-long writing workshops, which will be offered as focus work (6 ECTS) during the semester break. Next to a paper, the outcomes of this seminar will be presented in an exhibition taking place at the beginning of the following semester.

Prerequisites / notice
As the number of participants is limited, interested students are asked to send an A4 page including one image and/or one plan of a previous design project as well as 3-4 sentences describing the aspect of the design project the student wants to investigate and reflect on during this seminar. In order to register for the seminar, students have to send this document to both of the tutors of this course.

Students enrolling in this elective course are required to additionally enroll in the Focus-Work at the gta at the Chair of Prof. Philip Ursprung (063-0852-21). By successfully completing the whole seminar students receive 4 ECTS for the elective course and 6 ECTS for the focus work.

052-0855-21L Summer School: On the Threshold - Guidebooks and Visions of Rome

Abstract
The summer school explores the mediated territories between the city, its guidebook and the traveller. By adopting a selection of itineraries established by past and present guidebooks, students investigate the thresholds of Rome, between the built city and its tourists.
### Objective
By the end of the five days every group will have worked on a series of different building elements for each guide, so that by the end of the week about 25 units will be produced. As a collective critical guidebook of Rome, the units designed and written by the students will be presented in a final, one-day public exhibition and lecture on the last day. The instructors will follow the entire workflow, leading the visits, revisiting and checking the design outcomes, and coordinating the production phase.

The general aim of the week is not to present a linear or comprehensive history of the tourist guidebook, but rather to foster and implement a discourse around topics directly informed by the experience of tourism, such as everyday life, heritage, city planning, and artistic production. To this end, students will engage in in-depth analyses of specific historical periods through both scientific-synthetic and artistic-creative methods, and on a more comprehensive understandings around how to read a city, and how to critically employ a travel book. The itineraries are based on guidebooks stretching over a wide timeframe. Hence, by observing the contemporary phenomenon of tourism through a mass-social platform such as TripAdvisor, the programme introduces the topic of the Summer School from a familiar perspective, moving towards more historical and theoretical approaches as the week progresses.

The Summer School is planned for 15 international participants, ideally Master students or early career researchers, coming from different disciplines and curricula, such as architecture, applied arts, art history, literature, philosophy, sociology, photography, city studies and media studies. Use of personal laptops/tablets is expected. Students and tutors will stay at the magnificent Villa Maraini, the historical seat of the Istituto Svizzero. The fee will be 300 euro comprehensive of lunch (6 days).

This summer school is addressed to students from the 5th semester upwards.

### Content
We will dedicate one day to each of the five guidebooks, following an itinerary inspired by each publication. Details of each day’s visit will be determined and planned before the beginning of the week. By following a 'pre-determined' path, five visits through the city will be conducted during the morning. We will move and stop to linger along physical thresholds determined by various urban elements, such as monuments and buildings, observing the built environment as well as the ways in which tourists, visitors and citizens look at, interact with, admire, photograph and film places. Hence the relationship between public and private, between individual experience and collective knowledge will be investigated, documented and analyzed.

### Prerequisites / notice
This summer school is addressed to students from the 5th semester upwards.

2021-07-25 to 08.01 2021 at Istituto Svizzero Rome

### Serendipity: Sourced Waters

**Number of participants limited to 16 (due to technical equipment).**

**Course language:** English or/and German

**Abstract**

The next stop in our investigation of Zurich's water infrastructure is the spring water. Through acoustic and visual field recordings the students find a variety of ways to represent one starting point of the urban system.

**Objective**

Through the use of multimedia tools, this course will reflect on the contemporary use and perception of landscape. Analogue photography and audio recordings will be represent the core body of the work.

**Content**

Attention: The final inscription will take place on the first course date, everybody is treated the same.

After having investigated the lake water catchment and treatment plant Zürich-Lengg and Zurich’s water storage chambers the reservoirs we will put our attention with the course «Sourced Waters» on another starting point of the water infrastructure of Zürich: to the spring water source.

Far from Zurich, the glacier shaped landscape allows an usual access to lower water-carrying layers. After ten years enclosed between gravel and rock, the waters turns up in the wall of an ancient tunnel. After having investigated the lake water catchment and treatment plant Zürich-Lengg and Zurich’s water storage chambers the reservoirs we will put our attention with the course «Sourced Waters» on another starting point of the water infrastructure of Zürich: to the spring water source.

Following the fieldwork, students will work on an audiovisual composition in the analogue PhotoLab and in the AudioVisual-Lab at the ETH Hönggerberg.

Notes: The course will be limited to 16 students. Participation on the following events of the course is mandatory: Introduction, Workshop, Mid- and Final Presentations. The Chair will provide some financial support (costs for production), possible additional costs (transportation, overnight stay, food and drinks) are asked to be paid by the participants. Basic trekking experience and outdoor clothing is required.

**Prerequisites / notice**

23.09.2021: Introduction and final inscription!

02.-03.10.2021: Weekend workshop, all day, in Zurich (mandatory) [if the current state of the pandemic allows]

CORONA: Due to the pandemic and the current situation during the semester, the course may be adjusted. It is unclear at the moment whether the workshop can take place as planned. Likewise, the physical work in the laboratories will have to be adapted selectively, depending on the rules and regulations.

**Data:** 14.12.2021 12:41

**Autumn Semester 2021**
A course booklet will be provided at the first introductory meeting. For further information, please see: https://giot.arch.ethz.ch/courses/elective-courses/deep-poly

**Objective**

The elective introduces to the subject and complexity of the urbanized landscape and teaches the critical engagement with the challenges and potentials of current tendencies in Landscape Architecture. On the basis of a concrete study area, students examine the large-scale processes of reuse, reform and reinterpretation of metropolitan landscapes in Europe and develop new approaches and strategies on various scales. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. They develop a project based on the perception of place, knowledge of landscape-architectonic typologies and conception of public space. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

**Content**

The elective deals with current transformation processes of metropolitan landscapes in Europe and introduces landscape architecture design on a territorial scale. On the basis of cartographic analysis and field trips, students will develop concrete strategies for the urban landscape of the Grand Paris.

**Lecture notes**

A course booklet will be provided at the first introductory meeting. For further information, please see: https://giot.arch.ethz.ch/courses/elective-courses/deep-poly

**Literature**

A course booklet will be provided at the introduction. Furthermore, a semester apparat will be available to the students at the ILA Library.

**Prerequisites / notice**

Workshop Weekend: 9th/10th October

The course space is ETH Hönggerberg, LVML H40.8.

The assignment will be developed in groups of two.

**Language of instruction is English; assistance in English or German.**

**052-0717-21L**

**Territory of the City: Paris**

*Number of participants limited to 12.*

*Enrolment in agreement with the lecturer only.*

**Sociology: African Urbanities - A Research Seminar**

*The number of participants is limited to 40.*

**Content**

Africa is an increasingly urban continent. How is this urbanity being produced? What form is it taking? And how is it being represented?

**Objective**

Participants will be expected to engage actively in:

- identifying and presenting creative representations of African urbanity
- gaining insights into the variety of urban forms and practices in Africa
- acquiring new skills in hosting and interviewing experts
- strengthening ability to read, present and debate academic texts
- making connections between scholarly findings and artistic productions

**Prerequisites / notice**

A workbook with texts and background information is available for purchase (CHF 20.-). A digital version is also available for free.

**Sociology: African Urbanities - A Research Seminar**

*The number of participants is limited to 40.*

**Abstract**

This research seminar will explore the multiple and varied facets of African urbanity today.

**Objective**

Participants will be expected to engage actively in:

- hosting and curating discussions with guests
- debating and discussing scholarly texts
- identifying and presenting creative representations of African urbanity

**Content**

This course will unpack the range and variety of contemporary African urbanity. In doing so it will engage with both urban form and practices currently emerging, seeking to capture both their local manifestations as well as their regional, and global relevance. We will challenge the various cliché snapshots of African urbanity, as defined by a lack of infrastructure, a shortage of resources, or the informal slum. Instead, we will seek to produce a more complex portrait of African urbanity today, moving away from the city and its centre as the sole locus of urban activity, to consider the role of extended urbanisation, trans-local networks and the digital arena in shaping new urbanities.

**Literature**

The assignment will be developed in groups of two.

**Language of instruction is English; assistance in English or German.**

**052-0723-21L**

**Sociology: African Urbanities - A Research Seminar**

*The number of participants is limited to 40.*

**W** 2 credits

**S** 2G 2S

**A. Hertzog-Fraser; N. Bathla; C. Schmid**

**Abstract**

Africa is an increasingly urban continent. How is this urbanity being produced? What form is it taking? And how is it being represented?

**Objective**

Participants will be expected to engage actively in:

- hosting and curating discussions with guests
- debating and discussing scholarly texts
- identifying and presenting creative representations of African urbanity

**Content**

This course will unpack the range and variety of contemporary African urbanity. In doing so it will engage with both urban form and practices currently emerging, seeking to capture both their local manifestations as well as their regional, and global relevance. We will challenge the various cliché snapshots of African urbanity, as defined by a lack of infrastructure, a shortage of resources, or the informal slum. Instead, we will seek to produce a more complex portrait of African urbanity today, moving away from the city and its centre as the sole locus of urban activity, to consider the role of extended urbanisation, trans-local networks and the digital arena in shaping new urbanities.

**Notice**

Each session will be structured a main reading and a presentation and discussion with our guest expert. In addition to this, students will be expected to present current representations of the topic under debate. Alongside these conversations, we will read our way through a rich syllabus of both scientific articles, book chapters, and reviews. This will be complemented with an exploration of how art, film and fiction has shaped, and continues to shape current representations of urban Africa.
The course will be held in English. Participants must be able to read and speak English.

**052-0725-21L**

**Abstract**

In the turf war between quantitative and qualitative methods, we appear as mediators bridging the two sides. How can quantitative and qualitative methods complement each other rather than work in opposition?

We will encourage reflections on this by developing new forms of urban literacy integrating ethnographic research methods with quantitative data, filmmaking and other forms of digital media.

Objective

Through a combination of practical exercises in video and audio techniques in parallel with the study of seminal observation-driven texts, this course aims to equip students with the basic tools and core principles to create short but complex portraits of urban space. This semester, the focus falls on the green spaces of Zürich, looking at its trees, green corridors, heat islands, and atmospheric conditions.

This approach will be applied to experiments in the audio/visualization of quantitative data and the contextualization of qualitative data that in turn inform quantitative outputs. Through various audiovisual experiments, students will collectively speculate on ways to marry the various forms of research methods that traditionally do not intersect, creating mosaics of experimental research forms, manifested through film and audio.

Using widely available recording tools and editing software, students will turn their fieldwork into short video or audio works of about 3-5 minutes.

Content

The course will compose of lectures, practical crash courses in media use and storytelling, and fieldwork sessions. The course will be a laboratory in the creation of short media works that aim to inform the architectural design process, working between the city and the studio in ONA. Students will be expected to complete all required work within the hours that the elective meets, with few requirements outside of the class hours.

**Literature**

Seminal texts include:

- ‘Cross-Cultural Filmmaking’ (Barbash, Castaing-Taylor)
- ‘Acoustic Territories’ (LaBelle)
- ‘Ethnography: Principles in Practice’ (Hammersley, Atkinson)
- ‘Thick Description: Toward an Interpretive Theory of Culture’ (Geertz)

Taught competencies

Domain A - Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies

- Communication
- Cooperation and Teamwork
- Negotiation

Domain D - Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

**063-0761-21L**

**Abstract**

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

**Objective**

Students gain an insight into the integrated disciplines of design in architecture together with landscape architecture.

Content

Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Dependent on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.

**052-0735-21L**

**Abstract**

We design models for the future of the Berlin-Brandenburg metropolitan region. We try to think about the future of the city explicitly from the perspective of the landscape. An analysis on two levels (pedestrian perspective: field trips as well as data and plan analyzes: GIS) lays the foundation for the design discussion in the second part of the course.

**Objective**

The students examine the metropolitan region of Berlin-Brandenburg and develop new approaches and strategies for the future of the urban landscape on different scales. They will familiarize themselves with methods of perception from the perspective of pedestrians, with GIS as an analysis tool, model making as a design method, and landscape architectural plan representation. Current issues with which urban landscapes will be confronted in the future (climate, densification, mobility, etc.) are addressed. The design process is accompanied by workshops, lectures, excursions, reviews, and a workbook.
Based on an analysis of the urban landscape, the students develop models for the future of the Berlin-Brandenburg metropolitan region. The Winter School is organized and carried out together with the University of Applied Sciences Potsdam. Close cooperation between the students of both universities is sought.

The metropolitan region of Berlin-Brandenburg is expected to grow rapidly over the next few decades. Similar to other metropolitan regions in Europe, the background of current issues (land consumption, mobility, urban climate, etc.) the question is of how the development should take place.

As a starting point for the considerations, we suggest a change of perspective. The strategies and models should not be developed based on the city, but rather from the surrounding landscape. At the beginning of the Winter School, there is an intensive preoccupation with the urbanized landscape of the Großstadt region. Based on an in-depth understanding of the conditions and genesis of undeveloped space, it is important to identify potential and explore room for maneuver. On this basis, the urban landscape is to be further considered holistically.

The students work in groups of two (ETH/FHP) and focus on different Perimeters. The work process is structured in four phases:
I: research and analysis,
II: program and design,
III: development and communication,
IV: synthesis.
In the last step, the different results become one "overall picture" and theses derived. The results are then publicly debated. Communication via exhibitions, newspapers, etc.

The Winter School will take place in Berlin. Between 30.01.22 and 14.02.22.

**Abstract**

Building labels are used to certify buildings and neighbourhoods in terms of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, Minergerie, 2000-Watt-Sites). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

**Objective**

After this course, the students are able to understand and use the different certification labels. They have a clear view of what the labels take into consideration and what they don't.

**Content**

Three buildings case study will be presented.

**Literature**

All documents for certification labels as well as detailed plans of the buildings will be available for the students.

**Abstract**

Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

**Objective**

- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Knowledge of pore network model and application to two-phase invasion percolation simulation
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

**Content**

1. Introduction
   - Moisture damage: problem statement, durability
   - Applications: building materials, soil science, geoscience
2. Moisture transport: theory and application
   - Description of moisture transport
   - Determination of moisture transport properties
   - Liquid transport in cracked materials, flow and transport in deformable porous media
3. Pore network model: theory and application
   - Single- and two-phase pore network model: quasi-static and dynamic
   - Exercise on quasi-static two-phase pore network model: invasion pattern, capillary pressure curve
   - Application of pore network model in two-phase transport

**Lecture notes**

Handouts, supporting material and exercises are provided online via Moodle.

**Literature**

All material is provided online via Moodle.
Historical and Systematic Aspects of Acoustic Design in Architecture (HS) 2 credits 2G J. Strauss

Prerequisites / notice
Introductory event: 24.9., 14:00 h, HIB Open space E-Level. Participation in the introductory event is a prerequisite for this course! Structure (Lectures, field work, final presentation) will be communicated in time.

ZoomLink: https://ethz.zoom.us/j/66588100789

This course is offered in cooperation with the chairs of Gramazio/Kohler and Delbeke. It is offered the last time in HS21.

Building Process: Realization (HS) 2 credits 2G G. Habert, D. Kaushal

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict. 

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Sustainability, energy, and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Content
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

This course (ends with «00L») can only be passed once!

Building Process: Realization (HS) 2 credits 2G M. Eglin

Abstract
Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. In addition, the term process is to be depicted by means of visits to manufacturers of construction components.

Objective
The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

Autumn Semester 2021
Abstract
Selected texts from the history and theory of architecture are discussed. The focus is on the design principles of exemplary buildings for speech and music and their historical and systematic significance.
A visit to the music studio will give you the opportunity to have your own listening experience and emphasize the importance of spatial listening for the perception of architecture.

Objective
The examination of the acoustic architectural design is intended to make the design potential of acoustics clear. The sensitization for the everyday phenomena of the acoustic impression of the room as well as the orientation and localization of sound sources in the room play a prominent role. The knowledge derived from history should provide information about the success and failure of different concepts for buildings for music and speech.

Content
The starting point for the historical consideration of the acoustic architectural design is the imagination of the harmony of the spheres: the Pythagorean-Babylonian cosmos is well-formed by proportions of whole numbers and elementary geometric figures. Mediated by Plato, Aristotle and the Stoa, the four Pythagorean mathematica (astronomy; geometry; music theory; algebra) appear as a medieval training course (quadrivium) in monasteries and thus also shape Leon Battista Alberti’s idea of a well-formedness. Does Vitruvius share this Pythagorean cosmos of ideas?
Reffering to Aristoxenus, Vitruvius uses a theory of harmony for the dimensioning of sound vases in theaters, which makes the audible criterion and thus stands in opposition to the ideality of purely mathematical pitch division through the proportions of whole numbers.
Connected with this turn towards the perceptible of the inner world, Vitruvius gives us a whole series of examples of acoustic design of architecture and uses the terms sound wave, sound beam, reflection, resonance and sound coloration.
The criticism of the theories of proportion, as produced in large numbers by Vitruvianism of the Renaissance, is essentially done by Claude Perrault, whose work also includes a contribution on sound and noises (Du bruit) and tries to transcend the music theory of Pythagorean origin.

The baroque author Athanasius Kircher dealt with the formation of analogies between the eye and the ear in his work “New Hall and Thon Art” and transferred the geometric representation of light rays by Galileo Galilei to sound rays. Based on the echo phenomenon, he succeeded in describing sound reflections, bundling and scattering, which today form the basis of room acoustic simulation programs.

The collaboration between Gottfried Semper, Otto Bückwald and Richard Wagner on the development of a festival theater for Wagner’s musical dramas has become an example of the acoustic design of architecture. An extraordinary performance space was created in Bayreuth, the diffuse orchestral sound of which contrasts sharply with the distinctness and clarity of the voices. Neither the architects nor Wagner had any room acoustic parameters available for planning; but after the final visual and acoustic votes, the composer and impresario was satisfied.

It was only with the experiments of Wallace Clement Sabine, published in the “Collected Papers on Acoustics”, that the reverberation time parameter was formed and used for the new “Boston Symphony Hall” to be built. Sabine has visited and listened to European concert halls in order to find an optimal space for symphonic music.

In addition to the structures for music and speech, the “soundscape” of cities and landscapes has recently established itself as a theme of sound ecology. As a follow-up to Murray Schafer’s “Tuning of the world”, a number of studies and designs have been carried out that are intended to enable acoustic comfort in all architecturally designed rooms.

Up until now, architecture has included building and room acoustics for special structures, but today it is being expanded significantly through electroacoustics. Today, buildings can be simulated and auralized from a 3D plan, not only through ambient and elevator sounds, but also through sound systems that create spatial impression, such as in the cinema. These auxiliary tools have already become indispensable for the acoustic planning of rooms.

Prerequisites
ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

Objective
Understanding the importance of the ITA disciplines for architectural design and integration of structural thinking into the design process.

Content
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

052-0639-00L
Climate Responsive Architecture with Hive

Abstract
This Online course provides an introduction to climate-responsive design using the Hive tool and how to apply it in early building design stages. Hive allows architecture and building science students to understand the relation between architectural design, climate, comfort and energy. Hive is a plugin for the 3D modeling environment Rhino and its visual programming interface Grasshopper.

Objective
- Recall general principles of climate responsive design and examples of it.
- Utilize 3D building geometries to conduct simplified energy demand and supply simulations.
- Observe relevant physical principles and interactions between climate, energy and geometry.
- Implement passive and active concepts for Climate Responsive Design.
- Apply Hive for building design analysis and integrate it into own designs or in design courses.
- Identify and harness synergies and trade-offs between climate, energy and architectural design aspects.

Content
The course can be frequented individually, or as a prerequisite for other courses such as the master course Climate and Energy Systems 3 or architectural design studios.

Modules:
1. Course overview.
2. Introduction to climate responsive design.
3. Introduction to Rhino, Grasshopper and Hive.
4. Early solar analyses.
7. Real-world Applications and Examples.

This is a blended-learning self-paced ONLINE COURSE that can be started at any time.

Prerequisites / notice
A working Rhino 6 or 7 license is necessary.

Historic Building Archaeology and Conservation

Number Title Type ECTS Hours Lecturers
063-0961-21L Integrated Discipline HS21 in the Field Historic Building Research and Conservation (IDB) W 3 credits 2A Lecturers

Abstract
The formal framework needs to be discussed with the staff members.

Objective
A study in building research and preservation of building heritage with a clear topic.

052-0913-21L Preservation: Communicate & Exhibit

Number of participants limited to 40.

Abstract
This elective course discusses current as well as historical practices and theories of preservation. Under the title "Communicate & Exhibit", the focus in the fall semester of 2021 is on forward-looking positions on "Building in the Existing Building Stock" and how these are communicated to the public by preservation experts, architects, and curators.

Objective
This course provides students with insight into the most important theories and practices of historic preservation and ways of conveying and exhibiting them. Students can deepen their understanding of the subject and discuss issues in a group by examining a topic of their own choice.

Content
Current strategies of "building in the existing fabric" are backed by various historical theories and practices of preservation. But which architects follow - explicitly or implicitly - which theory? How do these points of view evolve through the activities of different actors in their preservation and building activities, what forms of sufficiency have been and are being practiced? What "first works" are worth showing that introduce significant architectural oeuvres as building within the existing built fabric? In the fall semester of 2021, we will explore influential approaches to preservation and examine narratives associated with them, such as resource allocation, change of use, and "modernisation". We will also analyse, discuss, and question their public communication. The insights gained will flow into the development of curatorial concepts, which will be applied and tested on the basis of a specific project site.

**052-0911-21L Repair: Making Things Better**

W 2 credits 2S S. Langenberg

**Abstract**
The lifespan of objects is decreasing not only in product design but also in architecture due to complex constructions, use of materials that are difficult to dismantle, and industrial manufacturing processes. Repairability is becoming less of a concern - replacement seems to be the norm. We need to rethink the way we build, starting already during the planning phase.

**Objective**
Traditional topics of preservation are combined with implementations of contemporary repair and FAB initiatives to raise awareness for a sustainable thinking and action. Students will learn both traditional and digital methods as well as the basic constructive and material criteria for repair. The objective is not only the hands-on repair of an object but especially the theoretical transfer to architecture.

**Content**
The elective course will discuss and examine the reparability of products and constructions. Based on a broken object of their choice, each student will first identify its defects and the reasons. Subsequently, they will develop a repair concept and carry it out under expert guidance or with the aid of digital fabrication processes. The objective is not only to restore the object to a working condition, but also to improve it through repair - if and where possible.

052-0915-21L An Example-Based Introduction into Building Archaeology

W 2 credits 2V L. Vandenabeele

This course is offered until end of HS22.

Abstract

An introduction to the scope, methodology, theoretical and practical developments of Building Archaeology (historische Bauforschung) based on a large-scale ongoing project conducted by the institute IDB under the project lead of the lecturer himself.

Objective

Introduce students to the current methodology and scope of Building Archaeology.

Content

This lecture will introduce students to the scope and methodology of Building Archaeology (historische Bauforschung). It will be given by the project leader of the ongoing project "Building history of the Basilica of St Anthony, Padua". Based on that project as a case study, but including other examples, the lecture will show how to formulate hypotheses in a BA project, how to develop a strategy of investigation, how to proceed methodologically and technologically. The course will cover surveying methods like laser scanning and 3D modeling (e.g. 3D printing, BIM for heritage), terrestrial and drone-based photogrammetry (structure from motion) and thermal imaging, as well as dating techniques like radiocarbon (14C), dendrochronology, mensiochronology (dating by statistical evaluation of brick sizes) and archival research. It will present the main project in parallel to the ongoing investigations, giving the students a unique opportunity to participate in the strategy, progress and preliminary results of an actual research project. Furthermore, the stage will be opened for an outlook on other projects, hence providing a broad overview of the field of BA and its recent developments. As the monument considered contains important historical structures from the 13th to the 18th centuries, this lecture will also offer a practical insight into Construction History.

Taught competencies

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>In the Renaissance, the practice of architecture fundamentally transformed into the design-based discipline it is now largely assumed to be. Both then and especially in nineteenth- and twentieth-century architectural history, this change was understood in opposition to “good” ancient and “bad” medieval models. This course investigates Antiquity and the Middle Ages as variously fashioned in the mind of the architect and the architectural historian. How does our understanding of these periods inform our thinking about the use of history for the contemporary architect?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>This course is a combination lecture, writing, and discussion class: one brief text per week will be read at home and discussed in the course meeting. Short critical writing assignments will be assigned in the first half of the semester, and the final assignment is a short paper due during the January exam period. Written assignments will be scheduled to accommodate studio deadlines, and may be completed in English, German, French, or Italian. Active in-class participation is required.</td>

| Abstract     | This survey course offers an introduction to urban theory for students of architecture and urban design, by exploring the past and current discourses on cities and urban development. |      |      |       |           |
### Objective
It is often said that we live in an ‘urban age’: cities are the most common habitat for the inhabitants of the world, today. Moreover, while more than half the global population lives in cities according to the reports of the UN, it is expected that within the next few decades this amount will increase to two-thirds. This ‘urban’ condition, however, cannot be generalized. Within the term ‘city’ a broad range of different urban conditions are taken together: from metropolises to suburban neighborhoods, and from shrinking (old industrial) cities to the new cities that prosper under the condition of globalisation. Nevertheless, because of the increase of the urbanized environments, the development of cities forms the topic of discussion among a wide range of people. Urban developments do concern politicians, economists, anthropologists, philosophers, citizens and activists, developers and designers. In turn, the urban realm has provoked theorists, citizens, politicians, artists and designers to think and write about its form and functioning, appearance and structure. The discourse regarding the current growth of cities has a long pedigree in history, going back to the establishment of Greek and Roman city-states. In turn, urban planners have made valuable contributions to these discussions, in writings and in actual urban design projects and proposals.

This survey course aims to offer an introduction to urban theory for students of architecture and urban design, by exploring the past and present discourses on cities and urban development. By investigating a range of topics, from politics to poverty, and from modernization to commodification, it aims to show how urban and architectural design are related to theory. The aim of the course is to challenge the question how architects and urban designers can have an influence on urban development. With this question, also students are urged to reflect upon their own position regarding architectural interventions in the urban fabric.

This course aims to offer a survey of the history and current state of urban theory for students of urban design and architecture. Weekly, one-hour lectures address one particular topic at a time (e.g. politics, public space, capital). In each lecture, this theme is investigated through three case-studies (either of particular cities or seminal contributions by theorists or designers) that highlight crucial moments in the history and developments of cities. At the same time, the case studies will be structured so as to bridge between urban theories and concrete urban situations, design reflections and political ambitions. This will help convey to students the historical pedigree of current discourses on cities, whether simultaneously gain insight the role of designers in respect to the chosen topic. Students will prepare the meetings by reading fragments from core texts on the foreground.

### Prerequisites / notice

**063-0803-02L**

H
tory and Theory of Architecture IX (Gnehm)

**W** 1 credit 1V M. Gnehm

*The course languages are German and English.*

This core course (ends with +02L+) can only be passed once! Please check this before signing up.

**Abstract**

Between Cosmos and Chaos: Gottfried Semper’s Theory of Architecture

**Objective**

Knowledge of Semper’s theory and practice in the disciplinary context of nineteenth-century historicism and present-day architectural discourse.

**Content**

The seductiveness of Semper’s theory of architecture lies not least in the fact that he exploded world art histories popularized around the mid-nineteenth century through multifarious disciplinary borrowings ranging from anthropology to aesthetics and including natural sciences and linguistics, physiology and psychology, art and industry. This parallels his linking the smallest object and detail to the largest monumental building and his addressing philosophical questions centred around architecture such as those of the relation between nature and culture, the universal and the local, the material and the immaterial, body and soul, image and language, art and interpretation. In doing so, his global scope provokes political questions regarding the relation of identity and foreignness, of the West to the rest of the world.

**Prerequisites / notice**

Please note, this is a core course and it can only be passed once during the curriculum. Please check before enrolling!

**063-0313-21L**

History of Art and Architecture V: Caractère (Character)

**W** 1 credit 1V M. Delbeke, S. de Jong

*This course is full. Please do not enroll after 9.9.2021. Thank you.*

**Abstract**

This course is a reading class in which the architectural category of ‘caractère’ or character - a key concept in the 18th century but of great relevance until today - will be examined by a close reading of several key texts, from the late 1700s up until today. Independent reading and vivid discussion in class make up this course’s character.

**Objective**

Deepen basic knowledge, improve ability to critically read and analyze texts of architectural theory, and understand shifts in architectural thinking.

**Content**

‘Caractère’ or character is not only a quality applied to human beings. It is also a category of architectural discourse, developed in the 18th century when architects and theorists were seeking new ways to talk about and judge buildings, pushing architectural discourse beyond Vitruvian categories to which it had been tied for centuries before. This reading class will closely examine key texts that discuss the phenomenon of a building’s ‘character’ from the 1700s up until today. The weekly assigned texts (in the original French, English or German) will be read at home and then discussed in class. Independent reading and vivid participation in class are a fundamental prerequisite. In addition, there will be weekly written assignments, which all will be graded. A final written assignment at the end of the semester will be graded as well. To pass the course, students will have to read each assigned text, and hand in all written assignments on time.

### 063-0911-00L Future Monuments

This core course (ends with «00L») can only be passed once! Please check this before signing up.

**ITA Pool Introduction to courses within the institute ITA:**
8.9.21, 10-11h, HIB Open Space.

**Abstract**
Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

**Objective**
In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensively justify their own positions within the context of preservation. Our goal here is to foster students' communication skills and the culture of discussion.

**Content**
The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. This core conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures. In addition to dealing with historical buildings, the course is also dedicated to younger (and very young) objects and inventories - for in addition to the preservation of already listed objects, the selection and inventorisation of future protected objects is also one of the core tasks of heritage conservation.

Abstract
This course conveys an introduction into methods of urban research in social sciences through lectures and accompanying exercises. It treats the basic principles of scientific research, literature research, different forms of participant observation, qualitative interviews (expert interviews and ethnographic interviews), and the analysis of urban qualities.

Objective
This course aims at enabling students of architecture to use sociological analysis as basis for concrete projects in architecture and urban design. It is based on a specific set of methods that is applied in design studios (integrated disciplines) as well as in the master thesis (supplementary discipline sociology).

</tr>
</tbody>
</table>

Abstract
This lecture series sets up an agenda for widening the disciplinary field of architecture and urbanism from their focus on the city, or the urban in the narrow sense, to wider territorial scales, which correspond to the increasing scales of contemporary urbanisation. It discusses the concepts of territory and urbanisation, and their implications for the work of architects and urbanists.

Objective
The course will enable students to critically discuss concepts of territory and urbanisation. It will invite students to revisit the history of architects' work engaging with the problematic of urbanising territories and territorial organisation. The goal is to motivate and equip students to engage with territory in the present day and age, by setting out our contemporary urban agenda.

The lectures are animated by a series of visual and conceptual exercises, usually on A4 sheets of paper. All original student contributions will be collected and bound together, creating a unique book-object. Some of the exercises are graded and count as proof of completion.
Within the theme My Species, the four guest speakers engaged in fields ranging from art and landscape representation to bioethics and environmental philosophy, will approach territory through the notions such as multispecies, coexistence, and diversity. With a more-than-human perspective on the territory, the guest speakers will elaborate their take on “telling horrible stories in beautiful ways,” debate “the dignity of plants,” expound upon “mankind’s fascination to better the world,” and confer “the non-human turn” and what is to come after.

#### Number of participants limited to 60.

To participate in this course it is recommended that the student has previously taken the courses Tragwerksentwurf I-IV. This core course (ending with «00L») can only be passed once! Please check before signing up.

ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h.
ONLINE.
ZoomLink: https://ethz.zoom.us/j/66588100789

#### Abstract

Determination of the internal forces and description of the behaviour of load-bearing structures with the help of graphic statics. Design of details and simple dimensioning of these structures. Discussion of reference structures, illustration of the interaction of the structure and the architectural design. Application of all that in an own design.
Objective
Understanding of the relationship between internal forces and the design of load-bearing systems and their connection details. Creative integration of what has been learned into an open design task.

Content
Determination of the internal forces and description of the behaviour of load-bearing structures with the help of graphic statics. Design of details and simple dimensioning of these structures. Discussion of reference structures, illustration of the interaction of the structure and the architectural design. Application of all that in an own design.

Teaching Languages: English and German.

063-0607-00L Energy- and Climate Systems III
This core course (ending with «00L») can only be passed once! Please check before signing up.
ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.
ZoomLink: https://ethz.zoom.us/j/66588100789

Abstract
The course ‘Energy- and Climate Systems III’ introduces computational design and analysis methods and tools for climate responsive architectural design. Exercises throughout the semester allow applying new concepts learnt in exemplary architectural design tasks.

Objective
By the end of this course, students will be able to:
- compare and assess passive and active design strategies for bioclimatic buildings
- analyze environmental site characteristics for its climate and (solar) energy potentials
- apply computational simulation tools to support performance-driven designs
- translate design ideas into parametric models and into optimization problems
- synthesize learnt content of the course in exemplary architectural design tasks, serving as a basis for the students’ future design studios and projects

Content
1. Concepts of climate responsive design
2. Computational analysis methods
   - Climate and site analysis
   - Daylight, airflow and energy simulations
   - Energy supply systems optimization models
3. Computational methods for performance driven design
   - Parametric design
   - Sensitivity and uncertainty analysis
   - Single and multi-objective optimization
4. Exercises and walkthroughs
5. Invited expert speakers and panel discussion

Prerequisites
ITA Pool - information event on the courses offered at the institute ITA: Wednesday 8th September 2021, 10-11 h, ONLINE.
ZoomLink: https://ethz.zoom.us/j/66588100789

Recommendations:
MSc Arch: Successful participation in the course ‘Energie- und Klimasysteme I + II’.
MSc MIBS / Eng: Successful participation in the course ‘Building Systems’.

All students need to be capable of working with ‘Rhino / Grashopper’ modelling software on ‘Windows’ or willing to acquire the necessary skills before or during the course and are recommended to have completed the online blended learning course ‘Climate responsive architecture with Hive’.

151-8007-00L Urban Physics

Abstract
Urban physics: wind, wind comfort, pollutant dispersion, natural ventilation, driving rain, heat islands, climate change and weather conditions, urban acoustics and energy use in the urban context.

Objective
- Basic knowledge of the global climate and the local microclimate around buildings
- Impact of urban environment on wind, ventilation, rain, pollutants, acoustics and energy, and their relation to comfort, durability, air quality and energy demand
- Application of urban physics concepts in urban design

Content
- Climate Change. The Global Picture: global energy balance, global climate models, the IPCC process. Towards regional climate scenarios: role of spatial resolution, overview of approaches, hydrostatic RCMs, cloud-resolving RCMs
- Urban micro climate and comfort: urban heat island effect, wind flow and radiation in the built environment, convective heat transport modelling, heat balance and ventilation of urban spaces - impact of morphology, outdoor wind comfort, outdoor thermal comfort,
- Urban energy and urban design. Energy performance of building quarters and cities, decentralized urban energy production and storage technologies, district heating networks, optimization of energy consumption at district level, effect of the micro climate, urban heat islands, and climate change on the energy performance of buildings and building blocks.
- Wind driving rain (WDR): WDR phenomena, WDR experimental and modeling, wind blocking effect, applications and moisture durability
- Pollutant dispersion, pollutant cycle : emission, transport and deposition, air quality
- Urban acoustics, noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation
The course lectures and material are provided online via Moodle. For MIBS Master students 151-8011-00L Building Physics Theory & Application is a pre-requisite for this course or instructor permission. For others no prior knowledge is required.

Autumn Semester 2021
Students are invited to identify and investigate their own specific case studies that pertain to this theme. The Studio will teach students to develop a new teaching form for the history and theory of architecture. Students will be familiar with theories and practices of attention, they will learn to take position in a field, they will practice argumentation and increase their writing skills.

Our aim is to increase the knowledge and sensitivity of architecture students toward the issue of attention, to make their voices heard and paying attention: a collective manifesto.

Attention is a rare commodity. How do we deal with attention? How is it manipulated? Who pays?

Students produce autonomous texts.

Our Studio aims to increase the knowledge and sensitivity of architecture students toward the issue of attention, to make their voices heard and paying attention: a collective manifesto.

The application deadline is Wednesday, September 8, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

The application deadline is Wednesday, September 8, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

The theme of this History Research Studio is 'Female Agency in Architecture before 1850'. The Studio aims at exploring the crucial role women played in the birth, life and afterlife of buildings in the early modern period. We will study female patronage, authorship, and criticism in architecture.

The structure of the studio will follow an input-exchange-output model. All members of the chair will provide input, to both the theme and method, as well as examples and references of research. There is also room for students to read and discuss together with the material prepared for them (short texts, summaries and reading lists) and the materials they found. Weekly group meetings and individual supervision by the chair members will help students in academic research and writing. Exchanges with the researchers at the chair are also beneficial to further develop their research themes and teaching.

Women acquired a major role in architectural patronage in eighteenth-century France and England, when they came to independently design and commission innovative mansions and dwellings. They stand in a tradition of major female builders in early-modern (sixteenth- and seventeenth-century) Italy and in Ottoman Turkey. The relationship between architect and patron surfaces in different types of buildings commanded by women: stately residences (hôtels urbains) and emerging types as pavilions and petites mansions. These women excited their influence in the various aspects of the design process. Female patrons used their expertise in determining the layouts of their dwellings and in arranging spaces that reflected as much their daily lives as special occasions. They tell us about women's lifestyles, their use of specific spaces, and the expression such spaces should have, as well as about their social and economic situations. While many of these patrons were women of fortune, from aristocracy, the period also sees a changing female clientele emerge with collectors, artists, dancers, actresses, writers and mistresses (the Petit Trianon for Madame de Pompadour for example). Furthermore, in this period women thrilled to design and construction, and in drawing up plans for new buildings, when acting as a patron. Both as a patron and as a user of buildings women acted as a critical voice of how to design architecture from the point of view of the user of architectural spaces, be it in a domestic or a more public setting.

This Master Studio invites students to adopt female agency as a primary investigative territory to critically examine the ways in which architecture is produced, conceptualised and historiscised in a particular cultural and historical context. It was in a wide array of media that constituted architectural debate that the female voice was heard and influenced the larger debate. By examining the female perspective of this studio aims to open up the corpus and historiography of thinking about buildings.

While we understand the necessity of a canonical history the Studio actively searches and tests approaches and methods of enquiry that challenge that canon and propose a different history. By examining the professional, artistic, authorial and cultural role of women in architecture the courses and meetings of the semester will offer an opportunity to look afresh at architectural history and theory of the early modern period.

A student can only register once for a “Fachsemester” during the Master studies!

For further information, please see: https://ursprung.arch.ethz.ch/courses/who-cares/information
Prerequisites / notice
Places for this Subject Semester are limited. Please send your candidacy by email (a 300-word motivation letter and a 300-word statement on your topic of interest) to: professur.delbeke@gta.arch.ethz.ch
See also the website of the chair: https://delbeke.arch.ethz.ch/courses

Deadline for application is Wednesday, September 8, 2021, 20.00h. You will receive a message on your acceptance for the Fachsemester by Thursday, September 9, 2021, 14.00 h. This means rejected students can then still choose a design class for HS 2021.

A student can only register once for a Subject Semester during the Master studies!

063-0953-21L Subject Semester HS21 in the Field of Historic Building Research and Conservation (IDB, Prof Holzer)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Friday September 3, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Abstract
The subject semester (to choose out of two topics) includes the individual, independent processing of a specific task, whereby the relevance of the respective discipline is examined with regard to the specific architectural and design aspects of the task.

Objective
The subject semester includes the individual, independent processing of a specific task, whereby the relevance of the respective discipline is examined with regard to the specific architectural and design aspects of the task.

Content
The subject of the semester is defined by the chair and published on the website:

https://holzer.arch.ethz.ch/en/education/Fachsemester.html

Prerequisites / notice
A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Sunday December 26, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Wednesday, January 26, 2022, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

The requirements for this subject semester are interest in the material as well as experience with and knowledge of historical wooden structures and the methods of building research.

Ideally, the student has heard Prof. Holzer’s lectures on construction history or does so during the semester. It is also beneficial to have attended the case studies exercise.

063-0655-21L Subject Semester (Fachsemester) HS21 in the Field of Technology in Architecture (ITA, Prof. Schlüter)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is Wednesday, September 1, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Friday, September 3, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Abstract
In this research semester, we address the topic of Zero Emissions Building Design, which integrates aspects of energy, materials and technology, human behaviour and comfort into architectural design, aspiring synergetic design solutions.

Objective
After successfully concluding the research semester students can identify concepts and relevant design parameters for Zero Emissions Building Design and develop integrated architectural design strategies. They know how to select and use appropriate simulation and analysis tools to qualify and quantify their design solutions and visualize their concepts using both technical schematics as well as architectural drawings and visualizations.
First, students will be introduced to core concepts of Zero Emissions Building Design and discuss leading works and examples on a global scale. In combination with excursions and site visits (if possible), a catalogue of criteria and metrics for the development of their integrated design concepts will be developed.

Participants will work on an urban retrofit case study in a moderate climate. The analysis departs at analyzing the site, its climate, the status quo of the building and relevant architectural/urban parameters. After assessing the potentials for reducing energy demand and local renewable energy supply, students will develop integrated design concepts targeting zero carbon over the building lifecycle, both for building operation and construction/materials.

Using low-barrier modelling, simulation and optimization toolsets (preferably Rhino / Grasshopper, HIVE, etc.) the design concepts will be assessed and discussed both numerically as well as architecturally / aesthetically. For further development, students choose one component or aspect central to their design concept.

Students will document the process and the results both numerically as well as architecturally, which will then be discussed with a final jury.

The working mode is an individual design research studio with weekly group meetings and reviews. We expect good base knowledge on sustainable construction and energy- and climate systems. Prior knowledge in parametric design tools (Rhino) and/or simulation is a plus.

A student can only register once for a "Fachsemester" during the Master studies!

Apply with CV, concise motivation letter and your current Transcript of Records before September 1, 2021, to: ilias.hischier@arch.ethz.ch

Your participation in the Subject semester will be confirmed by September 3, 2021.

#### Abstract

Housing Commons and the City: Zurich

Focuses on the housing commons of Zurich, namely collectively owned, non-profit forms of housing ownership (e.g. cooperatives). In the ways that they have been produced, managed, used, maintained, and appropriated, housing commons offer new perspectives to think about contemporary urban challenges such as densification, housing demand, and sustainability.

#### Objective

The Research Studio has two objectives. First, to develop an ‘Archaeology’ of Zürich’s housing commons. In this part, the work of the urban historian or theoretician is understood as an archaeological venture. The collective residential stock, as well as the integrated common facilities that often accompany it, will be systematically analyzed as the outcome of codes and as reliant on established practices of ‘commoning’. The result will be a catalogue of city’s cooperative and related networks, illustrating how these provide frameworks for ‘commoning’ and how, as urban figures, they are integrated into and impact upon the city fabric.

Secondly, we will develop an ‘Assemblage’ of Zürich’s housing commons by scrutinizing how they are experienced, practised, and developed in the city. To this end, we will analyze the character and role of cooperative and not-for-profit housing, be they in the inner city fabric (historically so-called ‘colonies’), in the city’s fast-densifying residential and post-industrial suburbs (‘settlements’), as well as newer forms of housing ideology indirectly indebted to the social movements of the 1980s, and exploring new forms of communal living and typological innovation through the historical legal framework of housing cooperatives. We will investigate the relations between typological definition and commoning practices, and the negotiations they entail between experts and non-experts, formal and informal agencies, the city and grassroots action groups.

The result of the Research Studio will be a Retroactive Manifesto for the city of Zürich, in which the past, present and future roles of housing commons in the city will be discussed, as a more comprehensive project for the city as we know it and as it might evolve.

#### Content

Housing Commons and the City: The Case of Zurich

This Research Studio focuses on the housing commons of Zurich. By ‘housing commons’ we mean various collectively owned, non-profit forms of housing ownership such as associations, public (municipal) housing, and cooperatives, all formats that have built up the backbone of the city’s affordable housing policy since the early 1990s. A long-standing alliance with the local government, financial subsidies historically ratified in popular referendums, and the possibility of leasing city-owned land for development have rendered housing commons prominent, in a housing sector otherwise dominated by market rental and private ownership. About a quarter of the city’s residential stock qualify as collectively owned housing, a ratio set up to increase to a third by 2040. In a city where 1-person households still make up almost half of the entire residential stock, housing commons are exemplary as models for sustainable densification and typological innovation.

In this research studio we will explore how housing commons have been produced, managed, used, maintained, and appropriated, how are they represented in the city, how they are iconographically or typologically distinguished from the housing on the market. We are particularly interested in how housing commons have contributed to ease the chronic housing shortage in the city, and might continue to do so in the future? We hold that housing commons offer us new perspectives to think about contemporary challenges such as densification, a growing housing demand, and sustainable urban living.

Cities have always been places based on common resources and common practices. While designing and constructing the architecture of the city, architects, urban designers, builders, and inhabitants have had to engage with common resources located in particular places and geographies: inherited common-pool resources (water, nature, air); material common-pool resources (clay, brick, stone, wood); and immaterial common-pool resources (craft, knowledge). This understanding of the city, as related to common resources and practices, has gained renewed attention, as neoliberalism replaces ever-shrinking welfare structures, and global urbanization is accompanied by rising inequality. It is not only architects and urban designers who are again becoming interested in alternative principles of governing common resources, but also political movements and society at large. Some of these issues – generally called ‘the commons’ – have also received growing academic attention in the last decades within the fields of critical urban studies, urban history, urban geography and the social sciences. This Research Studio continues the studio’s investigations into the rich history of ‘the commons’ in the city of Zürich by focusing on its residential infrastructures. The ‘housing commons’ will be investigated from architectural, urban, typological, environmental and material perspectives. We will explore how common practices and resources have affected their development in the city, and conversely how the built housing commons enable and structure common practices. The research will unlock an alternative reading of the urban and architectural qualities of the built environment of the city.
Methodology: Exploring the Tools and Knowledge of the Architect

The main hypothesis of the Research Studio is that historical and theoretical research can gain from a profound use of the tools and knowledge of an architect. During the Research Studio students will employ specific architectural tools, such as drawing, writing, and model making to explore historical and theoretical realities. Students will be urged to explore various methods of composing analytical and interpretative drawings. They will reflect upon the capacity of drawing methods from the field of architecture, such as plan drawing, sectional drawings, mappings, serial visions, public drawings, diagramming and perspective representations to act as tools of historical and theoretical research. At the same time, they will be asked to investigate various analytical and interpretative modes of scale-model making. Students may work with different types of models (structural models, mass models, counter form models, landscape and territorial models) as ways to historically or theoretically explore the reality of the city.

Far from being simple graphic or artefactual restitutions of the city, these drawings and models will create morphological, thematic or theoretical links between various occurrences in the city. These methods of drawing and model making will be combined with more conventional investigative techniques in the fields of history and theory such as discourse analysis, iconographic studies and compositional investigation, to support a better historical or theoretical understanding of specific occurrences and conditions in the city of Zürich. Students will also be stimulated to use their spatial, formal, material and constructive architectural knowledge to offer alternative historical or theoretical interpretations of the reality that they encounter in the archives, in the library or in the city. They will be asked to activate their specific spatial, typological, compositional, technical, material and constructive expertise to probe into the various historical layers of the architecture of the city in newfangled ways.

Within the general theme of housing commons, students will be guided to identify their own sub-theme, as well as explore their own different methodologies of doing research. During the Research Studio students will confront their empirical knowledge (about space, typology, composition, technique, material and construction), pertaining to the autonomy of architecture, with other types of knowledge (on politics, economy, the social and cultural) that belong to the heteronomy of architecture. In the relation between autonomous and heteronomous knowledge, a new understanding of the city will be constructed. The combination of these tools and methods will offer an in-depth mode of historical and theoretical research, wherein the students will retro-actively explore the spatial, formal, material and constructive features of a particular situation to uncover and reconstruct the logics that have led to a certain urban condition. On the basis of this research, students will be able to develop an architectural hypothesis of the developments in the city of Zürich.

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline is Wednesday 8th September, 2021, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 9, 2021, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class.

Self-dependent work.

Enrollment on agreement with the chair only.

Meetings as required and after consultation with the chair (Wednesdays).

The collective and individual projects together will offer an alternative reading, which retro-actively traces the urban territory and architectural quality of the city of Zürich back to the local common resources and common practices. The different materials – texts, drawings, models – will be combined in an atlas, which presents this alternative reading to a larger audience.

Self-direction and Self-management assessed

Autumn Semester 2021

052-1201-21L Preparation Semester Free Master Thesis HS21 W 14 credits 16A Lecturers

Preparation semester for a self-determined Master thesis within the Department of Architecture. of ETH Zurich.

Self-dependent development of a program, according to which one intends to realize a free master thesis in the following semester.

Focus Work

Realization in the respective fields of the institutes. Definition of topics by professors, in consultation with the students. The content may also refer to an elective course.

The performance assessment comprises either a purely written examination followed by an oral examination or a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and knowledge gained.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

Field of Historic Building Research and Conservation

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

Performance assessment: Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.
### Field of Design and Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

### Field of History and Theory of Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by a comprehensive examination. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.

### Field of History and Theory of Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

**Performance assessment:** Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.

At least one focus work is a written work followed by an oral exam. The written work fulfills the criteria of a scientific paper in a formal sense. In addition to the design, crafting or drawing part, it also includes a written description of the question, methodology and possibly gained knowledge.

A creative, crafting or graphic focus work is shown in a public exhibition, a purely written focus work is accessible to the public.
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis.

The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term "dropout".

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one "in-depth study" course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

### Field of Landscape Architecture and Urban Studies

**Abstract**

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

The documents for the lecture will be provided at the moodle.

Obligatory literature:

Recommended literature:

Goverance models:

Planning models:

EU as a political context:

Territorial cooperation in Europe:

Planning families and cultures:

Planning systems in Europe:

- European transnational initiatives

Only for master students, otherwise a special permission by the lecturer is required.

Domain A - Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Domain B - Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed

Domain C - Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed
- Negotiation: assessed

Domain D - Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

Field of Technology in Architecture

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

Performance assessment: Purely written examination followed by an oral examination OR a creative, manual or drawing work, including a description, followed by an oral examination.
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis. The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved. The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations). If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

Prerequisites / notice
The subjects can be proposed by the students. In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Ultimate deadline to unsubscribe or enroll for the Master Thesis is 17.11.2021. Deleting a reservation after this date is prohibited.

The master’s thesis is the completion of the Master's degree.

It shows the students’ ability to work independently and is a proof of the successful completion of their studies.

The Master’s thesis is supervised by a design professor D-ARCH. The students can choose one of the topics presented by the D-ARCH or - after approval by the head of the work - a free, self-chosen topic. Further details are regulated in Articles 31-38.

### Electives

Number of participants limited to 21.

This doctoral seminar organised by the D-BAUG platform on data science and machine learning aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Students will:
- Critically read scientific papers on the recent developments in machine learning
- Put the research in context
- Present the contributions
- Discuss the validity of the scientific approach
- Evaluate the underlying assumptions
- Evaluate the transferability/adaptability of the proposed approaches to own research
- (Optionally) implement the proposed approaches.
With the increasing amount of data collected in various domains, the importance of data science in many disciplines, such as infrastructure monitoring and management, transportation, spatial planning, structural and environmental engineering, has been increasing. The field is constantly developing further with numerous advances, extensions and modifications.

The course aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Each student will select a paper that is relevant for his/her research and present its content in the seminar, putting it into context, analyzing the assumptions, the transferability and generalizability of the proposed approaches. The students will also link the research context of the selected paper to their own research, evaluating the potential of transferring or adapting it. If possible and applicable, the students will also implement the adapted algorithms. The students will work in groups of three students, where each of the three students will be reading each other’s selected papers and providing feedback to each other.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

</tr>
</tbody>
</table>

Objective
Understanding the dynamics of large-scale atmospheric flow

Content
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

701-1251-00L Land-Climate Dynamics

W 3 credits  2G  S. I. Seneviratne, R. Padrón Flasher

Number of participants limited to 36.
Priority is given to the target groups:
- Master Environmental Science,
- Master Atmospheric and Climate Science and
- PhD D-USYS
until September 20th, 2021.
Waiting list will be deleted September 27th, 2021.

Abstract

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective

The students can understand the role of land processes and associated feedbacks in the climate system.

Lecture notes

Powerpoint slides will be made available

Prerequisites / notice

Prerequisites: Introductory lectures in atmospheric and climate science

and/or

Atmospheric Composition and Cycles

701-1239-00L | Aerosols I: Physical and Chemical Principles | W | 4 credits | 2V+1U | M. Gysel Beer, D. Bell, E. Weingartner

Abstract

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Objective

Physical and chemical principles:
The students...
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

Experimental methods:
The students...
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

Environmental impacts:
The students...
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- are aware of the health impacts of atmospheric aerosols.

701-1233-00L Stratospheric Chemistry

W 4 credits  2V+1U  T. Peter, G. Chiado

Abstract

The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects, especially the ozone depletion caused by FCKW in mid-latitude and polar regions as well as the coupling with the greenhouse effect.
Objective

The students will understand the gas phase reactions in the stratosphere as well as reactions and processes in aerosol droplets and polar stratospheric clouds.

The students will understand the most important aspects of stratospheric dynamics and the greenhouse gas effect in troposphere and stratosphere.

The students will also acquire a good understanding of the coupling between stratospheric ozone and climate change.

Furthermore, they will practise to explain fundamental concepts in stratospheric chemistry by means of scientific paper presentations.

Content

Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and termolecular reactions, photo-dissociation.

Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Chemical reactions of the oxygen species with nitric oxides, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion cycles. Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chlorine activation.

Lecture notes

Documents are provided in the contact hours.

Literature

Prerequisites / notice

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.

★★ Climate History and Paleoclimatology

Number

Title

Type ECTS Hours

W 3 credits

2G

H. Stoll, I. Hernández Almeida, H. Zhang

Objective

1. Overview of elements of the climate system and earth energy balance

2. The Carbon cycle - long and short term regulation and feedbacks of atmospheric CO2. What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years? What are the drivers and feedbacks of transient perturbations like at the latest Paleocene? What drives CO2 variations over glacial cycles and what drives it in the Anthropocene?

3. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? When is the most recent time of sea level higher than modern, and by how much? What lessons do these have for the future?

4. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems? Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?

5. The Ocean heat transport - How stable or fragile is the ocean heat conveyor, past and present? When did modern deepwater circulation develop? Will Greenland melting and shifts in precipitation bands, cause the North Atlantic Overturning Circulation to collapse? When and why has this happened before?

★★ Hydrology and Water Cycle

Title

Type ECTS Hours

W 3 credits

2G

S. I. Seneviratne, R. Padrón Flasher

Objective

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Prerequisites / notice

Powerpoint slides will be made available

Abstract

The students can understand the role of land processes and associated feedbacks in the climate system.

Prerequisites: Introductory lectures in atmospheric and climate science

701-1253-00L

Analysis of Climate and Weather Data

Does not take place this semester.

Abstract

An introduction into methods of statistical data analysis in meteorology and climatology. Applications of hypothesis testing, extreme value analysis, evaluation of deterministic and probabilistic predictions, principal component analysis.

Students participate in the theoretical concepts and purpose of methods, can apply them independently and know how to interpret results professionally.

Objective

Students understand the theoretical foundations and probabilistic concepts of advanced analysis tools in meteorology and climatology. They can conduct such analyses independently, and they develop an attitude of scrutiny and an awareness of uncertainty when interpreting results. Participants improve skills in understanding technical literature that uses modern statistical data analyses.

The course introduces several advanced methods of statistical data analysis frequently used in meteorology and climatology. It introduces the theoretical background of the methods, illustrates their application with example datasets, and discusses complications from assumptions and uncertainties. Generally, the course shall empower students to conduct data analysis thoughtfully and to interpret results critically.

Topics covered: exploratory methods, hypothesis testing, analysis of climate trends, measuring the skill of deterministic and probabilistic predictions, analysis of extremes, principal component analysis and maximum covariance analysis.

The course is divided into lectures and computer workshops. Hands-on experimentation with example data shall encourage students in the practical application of methods and train professional interpretation of results.

R (a free software environment for statistical computing) will be used during the workshop. A short introduction into R will be provided during the course.

Lecture notes
- Documentation and supporting material:
  - slides used during the lecture
  - exercise sets and solutions
  - R-packages with software and example datasets for workshop sessions

All material is made available via the lecture web-page.

Literature
For complementary reading:

Prerequisites / notice
Prerequisites: Basics in exploratory data analysis, probability calculus and statistics (incl linear regression) (e.g. Mathematik IV: Statistik (401-0624-00L) and Mathematik VI: Angewandte Statistik für Umweltwissenschaften (701-0105-00L)). Some experience in programming (ideally in R). Some elementary background in atmospheric physics and climatology.

651-4053-00L Boundary Layer Meteorology 4 credits 3G M. Rotach, P. Calanca

Abstract
The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. The course starts by providing the theoretical background and reviewing idealized concepts. These are contrasted to real world applications and discussed in the context of current research issues.

Objective
Overall goals of this course are given below. Focus is on the theoretical background and idealized concepts. Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer Flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

Content
- Introduction
- Turbulence
- Statistical tratment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

Lecture notes
available (i.e. in English)

Literature

Prerequisites / notice
Umwelt-Fluiddynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

102-0468-10L Watershed Modelling 6 credits 4G P. Molnar

Abstract
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

Objective
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many practical applications. A comprehensive exercise block builds on the lectures with a series of 5 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 60% by performance in the graded exercises and 40% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Content
The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns. The final part (D) of the course provides open classroom discussion and simulation of a round-table discussion between modellers and clients about using watershed models in a case study.

Lecture notes
There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature
Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice
Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences), Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Electives
The students are free to choose individually from the entire course offer of ETH Zürich and the universities of Zürich and Bern.

Weather Systems and Atmospheric Dynamics
Courses are only offered in Spring Semester.

Climate Processes and Feedbacks
Two additional courses are offered in Autumn Semester by University of Berne.
This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic theory, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

Objective
Understanding the dynamics of large-scale atmospheric flow

Content
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Lecture notes
Dynamics of large-scale atmospheric flow

Literature

Prerequisites / notice
Physics I, II, Environmental Fluid Dynamics

651-4057-00L Climate History and Palaeoclimatology

Abstract
Climate history and palaeoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

Objective
The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

Content
1. Overview of elements of the climate system and earth energy balance
2. The Carbon cycle - long and short term regulation and feedbacks of atmospheric CO2. What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years? What are the drivers and feedbacks of transient perturbations like at the latest Palocene? What drives CO2 variations over glacial cycles and what drives it in the Anthropocene?
3. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? When is the most recent time of sea level higher than modern, and by how much? What lessons do these have for the future?
4. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in general monsoon systems? Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?
5. The Ocean heat transport - How stable or fragile is the ocean heat conveyor, past and present? When did modern deepwater circulation develop? Will Greenland melting and shifts in precipitation bands, cause the North Atlantic Overturning Circulation to collapse? When and why has this happened before?

701-1257-00L European Climate Change

Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:
- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

Objective
At the end of this course, participants should:
- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.

Content
Contents:
- global context;
- observational data sets, analysis of climate trends and climate variability in Europe;
- global and regional climate modeling;
- statistical downscaling;
- key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects;
- projections of European and Alpine climate change

Lecture notes
Slides and lecture notes will be made available at http://www.iac.ehzedu.ch/edu/courses/master/electives/european-climate-change.html

Prerequisites / notice
Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

Atmospheric Composition and Cycles

Abstract
The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their impact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

Objective
The students gain general knowledge of the technical processes resulting in air pollution and study the methods used for air pollution control. The students can identify major air pollution sources and understand the methods for measuring pollutants, collecting and analyzing data. The students can suggest and evaluate possible control methods and equipment, design control systems and estimate their efficiency and efforts.

The students know the different strategies of air pollution control and are familiar with their scientific fundamentals. They are able to incorporate goals concerning air quality into their engineering work.
The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. The course starts by providing the theoretical background and reviewing idealized concepts. These are contrasted to real world applications and discussed in the context of current research issues.

Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).

Discussion of the technical possibilities to solve the actual air pollution problems.

Sedimentology II: Biological and Chemical Processes

Reconstruction of time scales is critical for all Quaternary studies in both Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture, we focus on the last 50 ka and the methods that are most frequently used for dating Quaternary sediments and landforms in this time range.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

The grading of students is based on in-class exercises and end-semester examination.

Climate History and Paleoeclimatology

Two courses are offered in Autumn Semester at University of Berne. ETH courses are only offered in Spring Semester.

Fall Semester 2021

651-4041-00L Sedimentology I: Physical Processes and Sedimentary Systems

Abstract
Sediments preserved a record of past landscapes. This course focuses on understanding the processes that modify sedimentary landscapes with time and how we can read this changes in the sedimentary record.

Objective
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

Content
Details on the program will be handed out during the first lecture. We will attribute the papers for presentation on the 26th, so please be here on that day!

Literature
The sedimentary record of sea-level change
Angela Coe, the Open University.

Prerequisites / notice
The grading of students is based on in-class exercises and end-semester examination.

651-4043-00L Sedimentology II: Biological and Chemical Processes in Lacustrine and Marine Systems

Prerequisite: Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).

Abstract
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective
-You will understand chemistry and biology of the marine carbonate system
-You will be able to relate carbonate mineralogy with facies and environmental conditions
-You will be familiar with cool-water and warm-water carbonates
-You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
-You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
-You will be able to use geological archives as source of information on global change
-You will have an overview of marine sedimentation through time

Content
-carbonates, chemistry, mineralogy, biology
-carbonate sedimentation from the shelf to the deep sea
-carbonate facies
-cool-water and warm-water carbonates
-organic-carbon and black shales
-C-cycle, carbonates, Co2 : CO2 sources and sink
-Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
-marine sediments trough geological time
-carbonates and evaporites
-lacustrine carbonates
-economic aspects of limestone

Lecture notes
no script. scientific articles will be distributed during the course

Literature
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

Prerequisites / notice
The grading of students is based on in-class exercises and end-semester examination.

651-4901-00L Quaternary Dating Methods

Abstract
Reconstruction of time scales is critical for all Quaternary studies in both Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture, we focus on the last 50 ka and the methods that are most frequently used for dating Quaternary sediments and landforms in this time range.

Content
1. Introduction: Time scales for the Quaternary, Isotopes and decay
2. Radiocarbon dating: principles and applications
3. Cosmogenic nuclides: 3He,10Be, 14C, 21Ne, 26Cl, 36Cl
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology and ice cores chronologies
7. Cs-137 and Pb-210 (soil, sediments, ice core)
8. Summary and comparison of results from several dating methods at specific sites

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, accelerator (AMS) facility.

Visit to Limno Lab and sampling a sediment core
Optional (individual): 1-5 days hands-on radiocarbon dating at the C14 lab at ETH Hoenggerberg

Required: attending the lecture, visiting laboratories, handing back solutions for problem sets (Exercises)
The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale. Students learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

The course provides an introduction into quantitative analysis of groundwater flow and solute transport. It is focussed on understanding, formulating, and solving groundwater flow and solute transport problems. Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems. Students are able to formulate simple, practical groundwater flow and solute transport problems. c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change. The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales.
This seminar focuses on the technical, economic, and political challenges of dealing with water allocation and pollution problems in large international river systems. The students will understand the basics of gas phase reactions and of reactions and processes in aerosols and clouds. The students will also acquire a good understanding of atmospheric environmental problems including air pollution, tropospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

Objective

Ability to (1) understand the causes and consequences of water scarcity and water pollution problems in large international river systems; (2) understand ways and means of addressing such water challenges; and (3) analyse when and why international efforts in this respect succeed or fail.

Abstract

This seminar focuses on the technical, economic, and political challenges of dealing with water allocation and pollution problems in large international river systems. It examines ways and means through which such challenges are addressed, and when and why international efforts in this respect succeed or fail.

Literature

Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

Prerequisites

Students are also welcome. The course is open to Master and PhD students from any area of ETH. ISTP students who take this course should also register for the course 860-0012-01L - Cooperation and conflict over international water resources; In-depth case study.

Prerequisites

The definition of prerequisites is part of the admission procedure for the master studies. You are informed by the admission office as to what courses of the section «prerequisites» you have to catch up with. You are accredited for these courses in the electives block of the master studies.

Atmospheric Chemistry |

Abstract

The lecture provides an introduction to atmospheric chemistry at bachelor level. It introduces the fundamentals of gas phase reactions, the concept of solubility and reactions in aerosols and in clouds. It explains the chemical and physical processes responsible for global (e.g. stratospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

Objective

The students will understand the basics of gas phase reactions and of reactions and processes in aerosols and clouds. The students will understand the most important chemical processes in the troposphere and the stratosphere. The students will also acquire a good understanding of atmospheric environmental problems including air pollution, tropospheric ozone formation, stratospheric ozone destruction and the relationship between air pollution and climate change.
The students are able to

- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain how mountains influence the atmospheric flow on different scales
- to explain what processes are responsible for the role of moist adiabatic processes for weather systems in general
- to understand how stable water isotopes are useful in this context

Students also learn to classify radiosonde data, to use the thermodynamic chart (tephigrams) and to identify cloud base, cloud top, and available convective energy in them. Atmospheric mixing processes are introduced for fog formation. The concept of the air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed. With these basics, the different forms of precipitation formation (convective vs. stratiform) is discussed as well as the formation and different stages of severe convective storms.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

The lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture.

On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solutions. Participation is recommended.

701-0473-00L Weather Systems W 3 credits 2G M. A. Sprenger, F. Scholder-Aemisegger

Abstract
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Objective
The students are able to
- explain the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain how mountains influence the atmospheric flow on different scales
- to explain what processes are responsible for the role of moist adiabatic processes for weather systems in general
- to understand how stable water isotopes are useful in this context

701-0475-00L Atmospheric Physics W 3 credits 2G U. Lohmann

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation especially prediction of thunderstorm development, aerosol physics as well as artificial weather modification.

Objective
Students are able
- to explain the mechanisms of thunderstorm formation using knowledge of thermodynamics and cloud microphysics.
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

Content
The course starts with introducing selected concepts of thermodynamics for atmospheric processes. The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayton equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to classify radiosonde data, to use the thermodynamic chart (tephigrams) and to identify cloud base, cloud top, and available convective energy in them. Atmospheric mixing processes are introduced for fog formation. The concept of the air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed. With these basics, the different forms of precipitation formation (convective vs. stratiform) is discussed as well as the formation and different stages of severe convective storms.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

The lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture.

On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solutions. Participation is recommended.

701-0461-00L Numerical Methods in Environmental Sciences W 3 credits 2G C. Schär, C. Zeman

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.
Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. A hands-on approach will be emphasized rather than abstract concepts.

### Numerical Modelling in Fortran

**Abstract**

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**

Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Lecture notes**

See [http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html](http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html)

**Taught competencies**

- Domain A - Subject-specific Competencies: Techniques and Technologies, assessed
- Domain B - Method-specific Competencies: Media and Digital Technologies, assessed
- Problem-solving, assessed

**Content**

- Observational datasets, observation and detection of climate change;
- Underlying physical processes and feedbacks;
- Numerical and statistical approaches;
- Currently available projections.

**Prerequisites / notice**

- Students have only minimal programming experience, for example with MATLAB scripts.
- A hands-on approach will be emphasized rather than abstract concepts.
- The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes.
- Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Python (previous experience not necessary: a Python introduction is given). Example programs and graphics tools are supplied.
The course will develop along the following outline:

- Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.
- Glaciology and hydropower
- Ocean biogeochemical dynamics: "Global Biogeochemical Cycles and Climate" (701-1317-00L)

If you plan to take this course, please contact one of the professors according to your interest.

- atmospheric chemistry (Prof. T. Peter)
- atmospheric dynamics (Prof. H. Wernli)
- atmospheric physics (Prof. U. Lohmann)
- climate modeling (Prof. C. Schär)
- climate physics (Prof. R. Knutti)
- land-climate dynamics (Prof. S. Seneviratne)
- atmospheric circulation (Prof. S. Schemm)
- paleoclimates (Prof. H. Stoll)
- ocean biogeochemical dynamics (Prof. N. Gruber)

**Abstract**
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

**Objective**
The objectives of the course are to:

- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

**Content**
The course will develop along the following outline:

- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

**Lecture notes**
Digital lecture handouts will be distributed prior to each class.

**Literature**
Links to relevant literature will be provided during the classes.

**Prerequisites / notice**
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

**Taught competencies**

- Domain A - Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- Domain B - Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: assessed
  - Problem-solving: assessed

- Domain C - Social Competencies
  - Project Management: not assessed
  - Communication: not assessed
  - Cooperation and Teamwork: assessed
  - Customer Orientation: not assessed
  - Leadership and Responsibility: not assessed
  - Self-presentation and Social Influence: not assessed
  - Sensitivity to Diversity: not assessed
  - Negotiation: not assessed

- Domain D - Personal Competencies
  - Adaptability and Flexibility: not assessed
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: assessed
  - Self-awareness and Self-reflection: not assessed
  - Self-direction and Self-management: assessed

**Course Catalogue of ETH Zurich**
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

### 651-1077-00L

**Quantification and Modeling of the Cryosphere:**

**Dynamic Processes (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**ECTS:** 3 credits

**Prerequisites / notice:**

High school mathematics and physics knowledge required.

**Objective:**

Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

**Content:**

Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff. Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).

**Literature:**

Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

**Copies/pdf of scientific papers will be distributed during the course references in skript**

**Seminar in Glaciology**

Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

**Lecturers:**

M. Berg, F. Hammes, S. Bouchet, L. Winkel

**Prerequisites / notice:**

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes

### Minor in Biogeochemistry

</tr>
</tbody>
</table>

**Abstract**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective**

In-depth knowledge of selected topics in Glaciology. Introduction to different types of scientific presentation. Improve ability of the discussion of scientific topics.

**Content**

Geogenic and cosmogenic radionuclides (sources, decay chains); stable isotopes in biogeochemistry (natural abundance, fractionation); geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes**

Copies/pdf of scientific papers will be distributed during the course

**Prerequisites / notice**

Active participation is expected with presence at the sessions. Only a limited number of participants can be accepted. One of the following courses should be taken as preparation:

- 651-3561-00L Kryosphäre
- 101-0289-00L - Applied Glaciology
- 651-4101-00L Physics of Glaciers

**Lecturers**

PhD students of Glaciology.

**Prerequisites / notice**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

**Content**

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

**Objective**

The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

**Content**

(i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

**Lecture notes**

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

**Prerequisites / notice**

Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

The lecture 701-1315-00L Biogeochemistry of Trace Elements is a prerequisite for attending the laboratory course 701-1331-00L Trace Elements Laboratory, or students must be concurrently enrolled in 701-1315-00L Biogeochemistry of Trace Elements in the same semester.

---

Abstract
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective
The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes
Handouts will be distributed

Literature
Will be mentioned in handouts

701-1346-00L Carbon Mitigation

Priority is given to the target groups: Bachelor and Master Environmental Sciences and PhD Environmental Sciences until September 21st, 2021. Waiting list will be deleted October 1st, 2021.

Abstract
Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Priority is given to PhD students D-USYS.

All participants will be on the waiting list at first. Enrollment is possible until 15 September 2021. The waiting list is active until 17 September. All students will be informed on 19 September, if they can participate in the lecture. The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, how to secure broader impact of research? They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content
The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Literature will be made available to the participants.

The following open access article builds a core element of the course:

Further, this collection of tools will be used
https://naturalsciences.ch/topics/co-producing_knowledge

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00): 29 September, 27 October, 10 November, 24 November, 8 December

No enrollment possible after October 1st, 2021.

Abstract
The course teaches concepts and methodologies of sustainability assessment. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability. The format of the course is seminar-like, interactive.

Objective
At the end of the course, students:
- know core concepts of sustainable development, main features of social justice in the context of sustainability, a selection of methodologies for the assessment of sustainable development
- have a deepened understanding of the challenges of trade-offs between the different dimensions of sustainable development and their respective impacts on individual and societal decision-making
The course is structured as follows:
- overview of rationale, objectives, concepts and origins of sustainable development (approx. 15%)
- overview of the concept of social justice as guiding principle of the social dimension of sustainability (approx. 20%)
- analysis of a selection of concepts and methodologies to assess sustainable development in a variety of contexts (approx. 65%)

Handouts are provided.

Selected scientific articles and book-chapters

Students of this course may also be interested in the course transdisciplinary case study (tdCS) in the Spring semester (701-1502-00L)

The UN World Water Development Reports provide a broad overview of the topic: http://www.unesco.org/new/en/natural-sciences/environment/water/wwap/

Communication

Handouts of the lecture

Cooperation and Conflict Over International Water Resources

The course is open to Master and PhD students from any area of ETH.

Priority for Science, Technology, and Policy MSc.

The UN World Water Development Reports provide a broad overview of the topic: http://www.unesco.org/new/en/natural-sciences/environment/water/wwap/

This is a research seminar at the Master level. PhD students are also welcome.

The course is structured as follows:

1. Ability to (1) understand the causes and consequences of water scarcity and water pollution problems in large international river systems; (2) understand ways and means of addressing such water challenges; and (3) analyse when and why international efforts in this respect succeed or fail.

2. Ability to apply hedging strategies and evaluate methods of risk management.

3. In-depth case study.

4. Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.

Students are also welcome.

This is a research seminar at the Master level. PhD students are also welcome.

The course is open to Master and PhD students from any area of ETH.

Priority for Science, Technology, and Policy MSc.

The UN World Water Development Reports provide a broad overview of the topic: http://www.unesco.org/new/en/natural-sciences/environment/water/wwap/

This is a research seminar at the Master level. PhD students are also welcome.

The course is open to Master and PhD students from any area of ETH.

Priority for Science, Technology, and Policy MSc.
Renewable Energy Technologies

A list of relevant literature is available at the chair.

Energy and Climate Systems I

The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The master programme is supervised by a professor of the D-ERDW or of the Institute for Atmosphere and Climate (IAC, D-USYS), a professor who teaches in the module subjects or a senior scientist who is on the list of "competent leaders of master theses" of the D-ERDW or of the D-USYS (associated with the IAC).

Objective

The master programme will be completed by a master thesis on a topic selected from the subject range of the chosen major programme. Students are to prove their skills in working autonomously on a scientific project.

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

<table>
<thead>

<td>S. I. Seneviratne</td>
</tr>
</tbody>
</table>

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Objective

Students have a basic understanding of the global energy balance, radiation budget, boundary, layer, atmosphere, ocean, biosphere, land-surface coupling, cryosphere, carbon cycle, climate variability, climate of the past and anthropogenic climate change, and they are able to apply this to solve simple quantitative problems and answer qualitative questions.

### Prerequisites / notice

Teaching: Reto Knutti, several keynotes to special topics by other professors

Course taught in german, slides in english

<table>

</tr>
</tbody>
</table>

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Objective

The learning target of this lecture is a general overview on the most important processes of atmospheric chemistry and the various problems of the anthropogenic change in the structure of Earth's atmosphere.

Content

- Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical C3 formation, role and budget of H0x, dry and wet deposition
- Aerosols and clouds: chemical, primary and secondary aerosol sources, phase transfer kinetics, solubility and hygroscopicity, N2O5 chemistry, SC2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

Prerequisites / notice

Basic courses in chemistry and physics are expected

<table>

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This course looks into scientific theories and also empirical. T. Braas, 3S
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings - Understanding of research methods used in the empirical human sciences
Human Intelligence
Lecturers
1 credit
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of
Cognitively Activating Instructions in MINT Subjects
E. Stern
P. Edelsbrunner
2 credits
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching
Thematische Schwerpunkte:
- Get to know cognitively activating instructions in MINT subjects
- Understanding of the research methods used in the empirical human sciences
- Understanding of the role of intelligence in the school
- Understanding of the role of motivation in the school
- Understanding of the role of interindividual differences in the learning ability and their causes: Intelligencetheories, Geschlechtsunterschiede beim Lernen
Lernformen:
Lecture notes
Literature
Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Lehrprediplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.
851-0240-22L Coping with Psychosocial Demands of Teaching (EW4 W DZ) ■ 2 credits 3S U. Markwalder, S. Maurer, S. Peteranderl-Rüschoff
Number of participants limited to 20.
The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.
Abstract
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching
Objective
- (1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).
- (2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).
851-0242-06L Cognitively Activating Instructions in MINT Subjects ■ W 2 credits 2S R. Schumacher
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.
Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction
Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.
851-0242-07L Human Intelligence W 1 credit 1S E. Stern
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Number of participants limited to 30.
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW1)".
Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.
Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education
851-0242-08L Research Methods in Educational Science W 1 credit 2S P. Edelsbrunner, T. Braas, C. M. Thurn
Number of participants limited to 30.
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW1)".
Abstract
Literature from the learning sciences is critically discussed with a focus on research methods.
At the first meeting, working groups will be assembled and meetings with those will be set up.
In the small groups, students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0242-11L Gender Issues In Education and STEM ■ W 2 credits 2S M. Berkowitz Biran, T. Braas, C. M. Thurn
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Prerequisite: students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

Objective
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher's work.

Content
Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

Prerequisites / notice
Pre-requisite: Successful participation in the course 851-0240-00L Human Learning (EW1).

Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content
Thematiche Schwerpunkte:
Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Konstruktion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen
Lernformen:

Lecture notes
Folien werden zur Verfügung gestellt.

Literature

Prerequisites / notice
This course is only apt for students who intend to enrol in the programs “Lehrdiplom” or “Didaktisches Zertifikat”. It is about learning in childhood and adolescence.

851-0238-01L Support and Diagnosis of Knowledge Acquisition Processes (EW3) ■
Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3) and for students who intend to enrol in the “Teaching Diploma”.
Prerequisites: successful participation in 851-0240-00L “Human Learning (EW1)”.

Abstract
In this seminar, students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
(1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
(2) You have a basic understanding about psychological test theory and can appropriately administer tests.
(3) You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

851-0242-01L Coping with Psychosocial Demands of Teaching (EW4) ■
Enrolment possible with Teaching Diploma matriculation, except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW4.

Understanding research methods used in the empirical human sciences

Students learn and practice techniques and skills for coping with psychosocial demands of teaching.

R. Schumacher

Cognitively Activating Instructions in MINT Subjects

The focus of all classes on educational psychology is on scientific insights which help to reflect on instructional learning. In order to...
### Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:

- **1 credit**

1. **Formation of Knowledge in STEM Fields in Primary**
   - Understand research methods used in the empirical educational sciences
   - Future teachers will learn to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

   **Content**
   - Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:
     - Forest Soil: The soil in the focus of the climate
     - Photosynthesis/Climate change: The tracks in the forest

   **Objective**
   - Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

### 851-0229-00L Using Outdoor Education

**Number of participants limited to 40.**

**Abstract**
In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

**Objective**
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

**Content**
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

**Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.**

### 851-0204-08L Using Outdoor Education

**Number of participants limited to 30.**

**Abstract**
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

**Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).**

**Prerequisite:** students should be taking the course 851-0240-00L Human Learning (EW1) in parallel, or to have successfully completed it.

### 851-0242-08L Gender Issues In Education and STEM

**Number of participants limited to 30.**

**Abstract**
In this seminar, we introduce some of the major gender-related issues in the context of education and science learning, such as the under-representation of girls and women in science, technology, engineering and mathematics (STEM). Common perspectives, controversies and empirical evidence will be discussed.

**Objective**
- To familiarize students with gender issues in the educational and STEM context and with controversies regarding these issues
- To develop a critical view on existing research and perspectives.
- To integrate this knowledge with teacher's work.

**Content**
- Why do fewer women than men specialize in STEM (science, technology, engineering and mathematics)? Are girls better in language and boys better in math? These and other questions about gender differences relevant to education and STEM learning have been occupying researchers for decades. In this seminar, students learn about major gender issues in the educational context and the different perspectives for understanding them.

The seminar builds on the active participation of students in reading, presenting and critically discussing selected papers in the field. We focus on empirical research and integrate implications for the classroom context. In a final small-group assignment, students integrate and elaborate on the topics learned in the seminar.

**Prerequisite:** Successful participation in the course 851-0240-00L Human Learning (EW1).

### 851-0240-27L Supervising and Assessing Matura Theses

**Number of participants limited to 20.**

**Abstract**
This course prepares prospective teachers to supervising and assessing scientific projects at upper secondary school level, particularly Matura theses in STEM subjects at Gymnasium.

**Objective**
1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.
2. Determining and promoting a successful work process.
3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.

**Prerequisite:** successful participation in 851-0240-00L "Human Learning (EW1)."

### 851-0228-00L Formation of Knowledge in STEM Fields in Primary and Secondary School

**Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).**

**Abstract**
The event includes a block seminar as well as an assistance period in a primary or secondary school. It is part of a project with the goal of an exchange of expertise: ETH LD students assist primary and secondary school teachers in STEM lessons.

**Objective**
- Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for LD students. The assistantship provides didactic experience and exposure to a different school level (more heterogeneous groups such as for example low-performing to very high-performing Children, language problems etc.)

**Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.**
To be able to perceive the special situation of the vocational learners in their double burden of occupation and school and to take it into account pedagogically.

LD students learn more about potentials and deficits of students. They get to know better the early stages of knowledge as well as the formation of misconceptions of students in their subject area. The seminar with assistantship includes three phases: In the block seminar misconceptions in the own subject as well as theoretical inputs from developmental and cognitive psychology are discussed (takes place partially in English). During the assistantship, a teaching task defined by the primary and secondary teachers is actively taken on in a class.

At the end there is the writing of a final report, which includes the description of the knowledge level of the students. This seminar is only suitable for LD students who can flexibly adapt to the needs of students from lower grades.

We learn from our mistakes, or rather, we hope that we do. Another way to say this is that we can learn from failure. But, what does "failure" mean? And, what, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects thinking, knowledge, creativity, problem-solving, and motivation.

Objective
- To critically read and analyze articles on research that addresses failure in learning
- Participate in in-class problem-solving activities around research in failure
- Discuss and reflect upon topics in both online and face-to-face formats
- Engage in activities through the online platform
- Complete a final paper on a subtopic related to failure in learning

By the end of the course, the students should be able to:
- Demonstrate a critical understanding of the role that failure plays in learning
- Discuss how and why failure can benefit learning
- Discuss how and why failure does not facilitate learning
- Apply understanding to a related sub-topic

Content
We learn from our mistakes, or rather, we hope that we do. Another way to say this is that we can learn from failure. But, what does "failure" mean? What, how, and why do we learn from failure? This course covers research from the cognitive, educational, and learning sciences that addresses the role of failure in human learning. Students will critically examine how failure affects development of knowledge, creativity, problem-solving, and general thinking and learning. More specifically, they will have the opportunity to question and evaluate the potential relationships between the facets around failure within individual, interactional, cultural, societal, and global contexts through seminal readings and problem-solving activities. Students from any discipline are welcome to this course to learn more about how failure can be harnessed to improve our knowledge, capabilities, innovations, teamwork, and contribute to the larger global world.

The course is held as 2 separate courses with each a maximum of 30 students: one course in German and one course in English.

**Abstract**
Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

**Objective**
Learn about recent research results in structural engineering.

**Abstract**
The Institute for Geotechnical Engineering invites distinguished speakers from research and practice, nationally and internationally. The colloquia are directed towards staff and students from Universities as well as engineers and scientists working in industry. Details can be obtained from www.igt.ethz.ch by following Events & Public Events. Some colloquia are available via webcast.

**Objective**
Learn about recent research results in geotechnics.

Autumn Semester 2021
Page 159 of 2152
This class introduces students to basic features of construction and real estate law.

**Introduction (most important sources of construction and real estate law), SIA (Swiss Society of Engineers and Architects) Design Engineering Services Contract, SIA-Norm 118 (SIA General Terms and Conditions for Construction Services), liability of designers/civil engineers, construction insurance, property law for civil engineers, sale of land, contaminated sites, statutory mortgage for contractors, public procurement, litigation in construction and real estate, the civil engineer as expert.**

**Lecture notes**

There are ‘Lecture Notes’ (in German) for this course.

</tbody>
</table>

**Abstract**

Basics: Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power

Statics: Groups of forces, moments, equilibrium of rigid bodies, reactions at supports, parallel forces, center of gravity, statics of systems, principle of virtual power, trusses, frames, forces in beams and cables, friction

**Objective**

The understanding of the fundamentals of Statics for engineers and their application in simple settings.

**Content**

Basics: Position of a material point; velocity; kinematics of rigid bodies; translation, rotation, planar motion; forces, action-reaction principle, internal and external forces, distributed forces; mechanical power.

Statics: equivalence and reduction of groups of forces; rest and equilibrium; basic theorem of statics; kinematic and static boundary conditions, applications to supports and clamps of rods and beams; procedures for determination of forces at supports and clamps; parallel forces and centre of gravity; statics of systems, solution using basic theorem and using the principle of virtual power, statically indeterminate systems; statically indeterminate truss structures, ideal truss structures, nodal point equilibrium, methods for truss force determination; friction, static friction, sliding friction, friction at joints and supports, rolling resistance; forces in cables; beam loading, force and moment vector.

**Abstract**

We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

**Objective**

Learning to model scientific problems using partial differential equations and developing a good command of the mathematical tools that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

**Content**

Classification of partial differential equations

Study of the Heat equation general diffusion/parabolic problems using the following tools through Separation of variables as an introduction to Fourier Series.

Systematic treatment of the complex and real Fourier Series

Study of the wave equation and general hyperbolic problems using Fourier Series, D’Alembert solution and the method of characteristics.

Laplace transform and it's uses to differential equations

Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.

Application of Laplace transform for beam theory will be discussed.

Time permitting, we will introduce the Fourier transform.

---

Lecture notes will be provided

large part of the material follow certain chapters of the following first two books quite closely.

The course material is taken from the following sources:

Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers

Prerequisites / notice

Analysis I and II, insbesondere, gewöhnliche Differentialgleichungen.

assessed

- Understanding the response of elastic beam and frame structures

Title

1. Motion of a single particle: kinematics (trajectory, velocity, acceleration), forces and torques, constraints, active and reaction forces, balance of linear and angular momentum, work-energy balance, conservative systems, equations of motion.

2. Motion of systems of particles: internal and external forces, balance of linear and angular momentum, work-energy balance, rigid systems of particles, particle collisions, mass accretion/loss.

3. Motion of rigid bodies in 2D and 3D: kinematics (angular velocity, velocity and acceleration transfer, instantaneous center and axis of rotation), balance of linear and angular momentum, work-energy balance, angular momentum transport, inertial vs. moving reference frames, apparent forces, Euler equations.

5. Introduction to waves and vibrations in deformable elastic bodies: local form of linear momentum balance, waves and vibrations in slender elastic rods.

Lecturers

B. Sudret

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Content

- Independent analysis of the basic geotechnical problems.
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams
- Deformations in Euler-Bernoulli and Timoshenko beams
- Energy theorems
- Statically indeterminate systems (Force method)

Lecture notes

Bruno Sudret, “Einführung in die Baustatik” (2018)

Additional course material will be available on the web page:

101-0113-00L Theory of Structures I  O  5 credits  3V+2U  B. Sudret

Abstract

Introduction to structural mechanics, statically determinate beams and frame structures, trusses, stresses and deformations, statically indeterminate beams and frame structures (force method)

Objective

- Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Understanding the basics of continuum mechanics
- Computation of stresses and deformations of elastic structures
- Ability to apply the force (flexibility) method for statically indeterminate structures

Content

- Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams
- Deformations in Euler-Bernoulli and Timoshenko beams
- Energy theorems
- Statically indeterminate systems (Force method)

Abstract

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

Objective

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

Content

Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Soil improvement; Safety considerations.

Theoretical foundation and constructional features of the design and construction of steel and steel-concrete composite structures. Multi-

Slides, in English, are made available some days before each lecture.

Steel Structures II
-J.-P. Lebet, M. Hirt: Steel Bridges, Conceptual and Structural Design of Steel and Steel-Concrete Composite Bridges, EPFL Press

Students will expand the knowledge acquired during "Steel Structures I" and learn how to apply these skills to the design of more complex building and bridge steel and composite structures. They will acquire the fundamental background for the phenomena of plate buckling and fatigue and learn how to apply it to practical design tasks. In addition, students will learn to appreciate the importance of questions of detailing, fabrication, erection and cost calculation for the effective design of steel and composite structures.

After completion of the year-long course in Steel Structures I-II, students will have at their disposal a wide and detailed set of skills concerning the modern practice for steel and composite structures design and have a deep understanding of its theoretical & scientific background. The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about the most current developments and see how these are used to shape the future practice in the structural engineering field.

The lecture Steel Structures II complements the knowledge acquired in part I by providing students with additional theoretical and practical knowledge, e.g. on the design of steel and composite structures against fatigue, plate buckling, as well as on the structural modelling and analysis of more complex building and bridge structures. These more theoretical topics will be exemplified and illustrated by applications to real problems in the design of bridges and multi-storey building structures. Finally, the course will provide detailed insight into aspects pertaining to structural detailing, fabrication, erection and cost estimation for constructional steelwork.

Content overview:
- Structural forms, analysis techniques and modelling of multi-storey buildings and bridges.
- Structural analysis (deformations, internal forces, stresses and strains) in steel-concrete composite girders considering the effects of creep, shrinkage and shear deformations.
- Elastic and plastic longitudinal shear transfer mechanisms and effects
- Plate buckling of unstiffened and stiffened panels
- Fatigue resistance and safe life assessment; phenomenon and design approaches
- Special topics of steel connection design
- Detailing, drafting, fabrication and erection, cost determination in constructional steelwork

Lecture notes
Lecture notes and slides. Worked Examples with summary of theory. Design aids and formula collections. Videos of lectures.

Literature
- J.-P. Lebet, M. Hirt: Steel Bridges, Conceptual and Structural Design of Steel and Steel-Concrete Composite Bridges, EPFL Press
- Stahlbaukalender (various editions), Ernst & Sohn, Berlin
- Special topics of steel connection design
- Fatigue resistance and safe life assessment
- Fatigue phenomena and design approaches
- Fatigue phenomena and design approaches
- Fatigue phenomena and design approaches
- Fatigue phenomena and design approaches

Prerequisites / notice
The content of steel structures I is a prerequisite

Public Transport and Railways
- J. Nash, H. Orth, S. Schranil

Fundamentals of public and collective transport, in its different forms. Categorization of performance dimensions of public transport systems, and their implications to their design and operations.

Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies. Teaches students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on various perspective and stakeholders.

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.

Fundamentals: Infrastructures and vehicle technologies of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks.

Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings

Vehicles: Classification, design and suitability for different goals

Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.

Operations: Passenger/Supply requirements for line operations; timetabling, measures of realized operations, capacity

Lecture notes
Lecture notes

Slides, in English, are made available some days before each lecture.

Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur: System- und Netzplanung
The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:
- how to structure the large amount of information that is often associated with attempting to modify complex systems
- how to set goals and define constraints in the engineering of complex systems
- how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking
- how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future
- how to assess values of benefits to stakeholders that are not in monetary units
- how to assess whether it is worth obtaining more information in determining optimal solution
- how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture
- the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses.

The weekly lectures are structured as follows:
1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems. A high-level overview of the main principles of System Engineering. An introduction to the example that we will be working with through most of the course. The expectations of your efforts throughout the semester.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. Analysis – 1/5 – The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, display, weighting, and expected value.
6. Analysis – 2/5 – The idea behind the supply and demand curves and revealed preference methods.
7. Analysis – 3/5 – The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. Analysis – 4/5 – The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Marginal rates of return and internal rates of return.
9. Analysis – 5/5 – How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Evaluation of solutions – Regardless how sophisticated an analysis is, it requires that decision makers stand back and critically evaluate the results. This week we discuss the aspects of evaluating the results of an analysis.
11. Operations research – 1/4 – Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. This week we discuss linear programming and the simplex method.
13. Operations research – 3/4 – How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
14. Operations research – 4/4 – How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches. The quantitative analyses requires the use of Excel. An introduction to Excel will be provided in one of the help sessions.

Lecture notes
- The lecture materials consist of a script, the slides and example calculations in Excel.
- The lecture materials will be distributed via Moodle two days before each lecture.

Literature
- Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

Prerequisites / notice
This course has no prerequisites.
The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and managing water resources.

Prerequisites / notice
Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

- Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters).
- Frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work and to apply engineering working methods. The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

**Abstract**

This course is designed to lay down the foundation of the different concepts, techniques, and tools for successful project management of construction projects.

**Objective**

The goal is that at the end of this course students should have a good understanding of the different project management knowledge areas, the phases required for successful project management, and the role of a project manager. To demonstrate this, students will work in groups in different case studies to apply the concepts, tools and techniques presented in the class.

Two 3 to 4 hours sessions towards the end of the lecture series will introduce a practical project to allow the teams to demonstrate the tools and techniques learned during the semester. The course will have a final quiz that will be graded.

**Content**

The main content of the course is summarized in the following topics:

- Project and organization structures
- Project scheduling
- Resource management
- Project estimating
- Project financing
- Risk management
- Project Reporting
- Interpersonal skills

**Literature**

The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

**Prerequisites / notice**

Relevant readings will be recommended throughout the course (and made available to the students via Moodle).

**ECTS**

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding "Design and Building Process MIBS" is a brief manual for prospective architects and engineers covering the competencies and the presentation of the Project Proposal as well as a final exam (50% exam and 50% project report and presentation). Homework will not be graded but your final report and presentation will consist mostly of your homework assignments consolidated and put in a report and presentation format.

---

**Data:** 14.12.2021 12:41

Autumn Semester 2021
Objective

Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
- general introduction of transport, modes, technologies,
- system design and line planning for different situations,
- mathematical models for design and line planning,
- timetabling and tactical planning, and related mathematical approaches,
- operations, and quantitative support to operational problems,
- evaluation of public transport systems.

Content

- Basics for line transport systems and networks
- Passenger/Supply requirements for line operations
- Objectives of system and network planning, from different perspectives and users, design dilemmas
- Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
- Matching demand and modes
- Line planning techniques
- Timetabling principles
- Allocation of resources
- Management of operations
- Measures of realized operations
- Improvements of existing services

Lecture notes

- Lecture slides are provided.

Abstract

Infrastructure Management 1: Process 0 6 credits 3G B. T. Adey

Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.
There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will
- understand the main tasks of an infrastructure manager and the complexity of these tasks,
- understand the importance of setting goals and constraints in the management of infrastructure,
- be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
- be able to develop and evaluate simple management strategies for individual infrastructure assets,
- be able to develop and evaluate intervention programs that are aligned with their strategies,
- understand the principles of guiding projects and evaluating the success of projects,
- be able to formally model infrastructure management processes, and
- understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.

### Content

The weekly lectures are structured as follows:

1. **Introduction**: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.
2. **Positioning infrastructure management in society**: As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.
3. **Setting goals and constraints** – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.
4. **Predicting the future** – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.
5. **Help session 1**
6. **Determining and justifying general interventions** - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.
7. **Determining and justifying monitoring** - Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.
8. **Converting programs to projects / Analysing projects** – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.
9. **Help session 2**
10. **Ensuring good information** – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.
11. **Evaluating a well-run organization** – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.
12. **Describing the IM process** – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.
13. **Evaluating the IM process** – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.
14. **Help session 3 and submission of project report.**

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least the use of Excel. Some students, however, prefer to use Python or R.

### Literature

- The lecture materials consist of handouts, the slides, and example calculations in Excel.
- The lecture materials will be distributed via Moodle two days before each lecture.

### Prerequisites / notice

This course has no prerequisites.

101-0517-10L Construction Management for Tunneling W 3 credits 2G H. Ehrbar

Abstract
- Construction methods for conventional tunneling in loose material and in hard rock conditions (tunnel, shaft and cavern construction)
- Construction methods for mechanical excavation
- Decision criteria for the selection of tunneling method
- Construction facilities, logistics and construction management

Objective
Transfer of practical knowledge regarding
- Selection of tunneling methods
- Execution and working cycles in conventional and mechanical tunneling
- Management of the muck and of materials
- Quality control and monitoring during construction
- Occupational health and safety requirements and environmental requirements
- Maintenance

The students will be enabled to work on an underground construction project in the preliminary and final design phase as a planner (taking into account contractor's considerations).

Content
General basics
- Codes SIA 196, SIA 197, SIA 198, SIA 118/198
- Knowledge of the tunneling methods
- Decision-making principles for the selection of the tunneling method
- Construction site logistics (transport, ventilation, cooling, water, material management)
- Construction materials

Conventional tunneling
- Excavation methods (full breakout / partial breakout)
- Rock support
- Impermeabilisation
- Inner lining

Mechanical tunneling
- Open TBM (Gripper TBM), rock support concepts
- Shield TBM's in rock and loose ground

Inner lining
- Impermeabilisation and drainage
- Inner lining
- Cable ducts

101-0524-00L Lean, Integrated and Digital Project Delivery W 4 credits 3G D. Hall

Abstract
This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.

Objective
By the end of the course, students will be able to plan and manage the lean, integrated, and digital project delivery of a construction project.

1. Apply the fundamental theories of lean production to the context of construction management. This includes the ability to describe the three views of production: transformation, flow and value generation; evaluate the benefits of a pull production system compared to push production systems; evaluate how production variability and uncertainty contributes to work-in-process and 'waste'; and apply the concepts of lean production to several construction management tools including the Last Planner System, Pull Planning, Target Value Design, and Takt Planning.

2. Understand the fundamentals of Virtual Design and Construction and Building Information Modeling. This includes the ability to prepare a model breakdown structure capable of integrating project information for all stakeholders; describe the upcoming transition to a common data environment for BIM that will use platforms such as Autodesk Forge; and describe the barriers to successful implementation of BIM within construction and design firms.

3. Plan and schedule an integrated '3D' scope schedule cost model using the Tri-Constraint Method. This includes the ability to understand the TCM algorithm, apply parametric logic to the creation of a virtual model for construction production; and evaluate the limitations of the critical path method when compared to resource- and space-constrained scheduling.

4. Evaluate benefits of integrated project governance compared to the organization of traditional construction project delivery systems. This includes the ability to evaluate the risks, benefits and considerations for integrated teams using multi-party relational contracts that cross disciplinary and firm boundaries; and explain to others the 'elements' of integrated projects (e.g. colocation, early involvement of key stakeholders, shared risk/reward, collaborative decision making).
The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects. HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g. colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects. For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, just time time planning, production tracking, and target value design. For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and “5D and 6D” models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocaiton, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

The class will be presented in a "flipped classroom" environment where students will be required to do readings or watch video before class. In-class activities will act to reinforce and expand upon these primary concepts.

If possible due to COVID restrictions, students will be expected to attend a half-day workshop on the Last Planner System. The date of this workshop will be provided at a later point in time.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice.

This course provides an introduction to the notion of sustainable development when applied to our built environment. In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict. This course provides an introduction to the notion of sustainable development when applied to our built environment. At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction. After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world

- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Literature
Relevant literature will be stated during the lectures

Prerequisites / notice
Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.

The lecture contains at least one presentation from practice.

101-0369-00L Forensic Geotechnical Engineering
W 3 credits 2G A. Puzrin
Prerequisites: successful participation in "Geotechnical Engineering" (101-0315-00L) or an equivalent course.

Abstract
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Objective
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Content
Failure due to the loading history
Failure due to excessive settlements
Failure due to the leaning instability
Bearing capacity failure
Excavation failure
Failure in the creeping landslides
Failure evolution in submarine landslides
Construction in the landslide influence zone
Delayed failure in snow avalanches

101-0517-10L Construction Management for Tunneling
W 3 credits 2G H. Ehrbar

Abstract
- Construction methods for conventional tunneling in loose material and in hard rock conditions (tunnel, shaft and cavern construction)
- Construction methods for mechanical excavation
- Decision criteria for the selection of tunneling method
- Construction facilities, logistics and construction management

Objective
Transfer of practical knowledge regarding
- Selection of tunneling methods
- Execution and working cycles in conventional and mechanical tunneling
- Management of the muck and of materials
- Quality control and monitoring during construction
- Occupational health and safety requirements and environmental requirements
- Maintenance

The students will be enabled to work on an underground construction project in the preliminary and final design phase as a planner (taking into account contractor's considerations).
This course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures, may be addressed time-permitting.

After passing this course students will be able to:

1. Explain the equilibrium of continuous structural elements.
2. Formulate mechanical models of continuous prismatic structural elements.
3. Analyze the axial, shear, bending and torsion load-deformation response of prismatic structural elements and structures assembled using these elements.
4. Determine the state of forces and deformations in rods, beams, frame structures, arches, cables and rings under combined mechanical and thermal loading.
5. Use the theory of continuous structures to design structures and understand the basis for structural design code provisions.

This is the third course in the ETH series on theory of structures. Building on the material covered in previous courses, this course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures may be addressed if time permits. The course provides the theoretical background and engineering guidelines for practical structural analysis of modern structures.

Electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions. Lectures are streamed live and recorded on the ETH Video Portal.

Working knowledge of theory of structures, as covered in ETH course Theory of Structures I (Baustatik I) and Theory of Structures II (Baustatik II) and ordinary differential equations. Basic knowledge of structural design of reinforced concrete, steel or wood structures. Familiarity with structural analysis computer software and computer tools such as Matlab, Mathematica, Mathcad or Excel.

Familiarity with structural analysis computer software and computer tools such as Matlab, Mathematica, Mathcad or Excel.

This course supplements the courses Structural Concrete I and II regarding the analysis and dimensioning of reinforced and prestressed concrete structures. It focuses on limit analysis methods for girders, discs, slabs and shells, particularly regarding their applicability to the safety assessment of existing structures and their computer-aided implementation.

Enhancement of the understanding of the load-deformation response of reinforced and prestressed concrete; refined knowledge of models and ability to apply them to general problems, particularly regarding the structural safety assessment of existing structures; awareness of, and ability to check, the limits of applicability of limit analysis methods; knowledge of models suitable for computer-aided structural design and ability for critical use of structural design software.
Content Fundamentals (structural analysis, theorems of limit analysis, applicability of limit analysis methods); shear walls and girders (stress fields and truss models, deformation capacity, membrane elements with yield conditions and load-deformation behaviour, computer-aided structural design); slabs (equilibrium solutions, yield conditions, shear and punching shear); fibre reinforced concrete (mechanical behaviour, applications); long term effects; fire behaviour.

Objective

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

Abstract

Expand the theoretical background and practical knowledge in the design of steel and composite structures. Special composite construction and detailing: partial connection, serviceability. Fire design. Cold-formed steel design. Crane girders; masts; tanks & silos. Structural glazing and lightweight cable-supported structures.

Objective

In Steel Structures III, students will deepen and expand their theoretical background and practical knowledge of the design and construction of steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. Students will learn how to solve complex structural engineering tasks in larger building projects, e.g. through the use and correct design of large-span slim-floor girders and ultra-slim composite columns, or the use of glazing and cable structures as principal load-carrying components. They learn how steel structures behave under fire conditions and how they can be protected and designed accordingly. Finally, students learn about the fundamental aspects governing the design of specialty steel structures, such as thin-walled cold-formed sections, crane girders, masts and storage tanks.

Content

Steel Structures III provides in-depth theoretical background and practical knowledge on advanced design topics in steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. The course discusses the use and design of large-span slim-floor girders and ultra-slim composite columns, as well as the use of glazing and cable structures as principal load-carrying components. The design of steel structures under elevated temperatures (fire conditions) is treated, as well as special topics of design for serviceability. In addition, fundamental concepts of the design of cold-formed steel framed structures are discussed. Finally, the course will give an overview on the design of specialty steel structures, such as crane girders, masts and storage tanks.

Lecture notes Slides and lecture notes. Worked examples. Handouts and formula collections.

Abstract Structural reliability and risk analysis aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro- codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design are discussed. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.
Structural Dynamics and Vibration Problems  

**Abstract**

Fundamentals of structural dynamics are presented. Computing the response of elastic single and multiple DOF structural systems subjected to harmonic, periodic, pulse, and impulse is discussed. Practical solutions to vibration problems in flexible structures under diverse excitations are developed.

**Objective**

After successful completion of this course the students will be able to:

1. Explain the dynamic equilibrium of structures under dynamic loading.
2. Use second-order differential equations to theoretically and numerically model the dynamic equilibrium of structural systems.
4. Compute the dynamic response of structural system to harmonic, periodic, pulse, and impulse excitation using time-history and response-spectrum methods.
5. Use dynamics of structures to identify the basis for structural design code provisions related to dynamic loading.

**Content**

This is a course on structural dynamics, an extension of structural analysis for loads that induce significant inertial forces and vibratory response of structures. Dynamic responses of elastic and inelastic single-degree-of-freedom and multiple-degree-of-freedom structural systems subjected to harmonic, periodic, pulse, and impulse excitation are discussed. Theoretical background and engineering guidelines for practical solutions to vibration problems in flexible structures caused by humans, machinery, wind or explosions are presented.

**Literature**

- S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-V0.92-107.

**Prerequisites**

Basic course on probability theory and statistics

**Lecture notes**

Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

**101-0157-00L Moisture Transport in Porous Media**

**Abstract**

Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

**Objective**

- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Knowledge of pore network model and application to two-phase invasion percolation simulation
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

**Content**

1. Introduction

   Moisture damage: problem statement, durability
   Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application

   Description of moisture transport
   Determination of moisture transport properties
   Liquid transport in cracked materials, flow and transport in deformable porous media

3. Pore network model: theory and application

   Single- and two-phase pore network model: quasi-static and dynamic
   Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

**Literature**

**101-0157-00L Fibre Composite Materials in Structural Engineering**

**Abstract**

Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

**Objective**

At the end of the course, you shall be able to:

1. Design advanced FRP composites for your structures,
2. To consult owners and clients with necessray testing and SHM techniques for FRP structures,
3. Continue your education as a phd student in this field.

**Content**

052-0609-00L Energy and Climate Systems I W 2 credits 2G A. Schlüter

Abstract

The first semester of the annual course focuses on physical principles, component and systems for the efficient and sustainable heating, cooling and ventilation of buildings on different scales and the interaction of technical systems with architectural and urban design.

Objective

The lecture series focuses on the physical principles and technical components of relevant systems for an efficient and sustainable climatisation and energy supply of buildings. A special focus is on the interrelation of supply systems and architectural design and construction. Learning and practising methods of quantifying demand and supply allows identifying parameters relevant for design.

Content

1. Introduction and overview
2. Heating and cooling systems in buildings
3. Ventilation

Lecture notes

101-0617-02L Computational Science Investigation for Material Mechanics W 4 credits 2S D. Kammer, F. Wittel

Abstract

Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage and failure with advanced finite element methods.

Objective

Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly non-linear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. Starting from the failed state, we will investigate potential causes and find the conditions that resulted in failure. For doing so, you will learn how to predict it with the Finite Element Method (FEM). To correctly assess failure, plastic behavior and size effects, originating from the underlying material microstructure, need to be considered. You will learn how to deal with plasticity in FEM and how you can get information from the heterogeneous material scale into your FEM framework.

Content

1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM: Comsol)
5 On the nature of failure - Physics of damage and fracture
6 Cracks and growth in structures (LEFM and beyond)

101-0427-01L Public Transport Design and Operations O 6 credits 4G F. Corman, F. Leutwiler

Abstract

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
- general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches
- operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes
Lecture slides are provided.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

101-0437-00L  Traffic Engineering  O  6 credits  4G  A. Kouvelas

Abstract
Fundamentals of traffic flow theory and control.

Objective
The objective of this course is to fully understand the fundamentals of traffic flow theory in order to effectively manage traffic operations. By the end of this course students should be able to apply basic techniques to model different aspects of urban and inter-urban traffic performance, including congestion.

Content
Introduction to fundamentals of traffic flow theory and control. Includes understanding of traffic data collection and processing techniques, as well as data analysis, traffic modeling, and methodologies for traffic control.

Lecture notes
The lecture notes and additional handouts will be provided during the lectures.

Literature
Additional literature recommendations will be provided during the lectures.

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis. Interim lab sessions take place regularly to guide and support students with the applied part of the course.

Lecture notes
Moodle platform (enrollment needed)

Literature

In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation. The program is taught in English and we provide 11 different experts/lecturers.

The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport.

Ideal foundation for Aviation II - Management of Air Transport.

The lecture is planned as class teaching with live-streaming and recordings.

The course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

Overview of the technical characteristics of railway systems
- Knowledge about the design and construction principles of rail vehicles
- Interrelationships between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebssysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
Betriebszentrale SBB, Zürich Flughafen
Reparatur und Unterhalt, SBB Zürich Altstetten
Fahrzeugfertigung, Stadler Bussnang

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice
Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahinfrastruktur.

101-0509-00L Infrastructure Management 1: Process

Abstract
Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.

Objective
There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will
• understand the main tasks of an infrastructure manager and the complexity of these tasks,
• understand the importance of setting goals and constraints in the management of infrastructure,
• be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
• be able to develop and evaluate simple management strategies for individual infrastructure assets,
• be able to develop and evaluate intervention programs that are aligned with their strategies,
• understand the principles of guiding projects and evaluating the success of projects,
• be able to formally model infrastructure management processes, and
• understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.
This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and how urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine the use of Excel. Some students, however, prefer to use Python or R. The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least 14 weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.

2. Positioning infrastructure management in society. As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.

3. Setting goals and constraints – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.

4. Predicting the future – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.

5. Help session 1

6. Determining and justifying general interventions - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.

7. Determining and justifying monitoring – Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.

8. Converting programs to projects / Analysing projects – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.

9. Help session 2

10. Ensuring good information – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.

11. Ensuring a well-run organization – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.

12. Describing the IM process – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.

13. Evaluating the IM process – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.

14. Help session 3 and submission of project report.

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least 14 credits.

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

This course has no prerequisites.
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

101-0247-01L | Hydraulic structures II | O | 6 credits | 4G | R. Boes

**Abstract**
Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design with regard to economy and safety are provided.

**Objective**
Knowledge of hydraulic structures and their function within hydraulic systems. Skills for the layout and design of hydraulic structures with regard to economy and safety.

**Content**
Weirs: Weir stability, gates, inflatable dams, appurtenant structures, fish up- and downstream passages.
Conduits: Design of headraces, pressure shafts, and penstocks, constructive details and construction.
Power plants: Power house and turbine types, design, structure, construction.
Dams: Types, appurtenant structures (temporary diversions, spillways, bottom and low-level outlets), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, measures in the foundation, mass concrete, RCC dams, reservoir sitation and sediment management, dam surveillance.
Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.

**Lecture notes**
Course slides will be made available to students prior to each class.

**Literature**
Course slides will be made available to students.

101-0267-01L | Numerical Hydraulics | O | 3 credits | 2G | M. Holzner

**Abstract**
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

**Objective**
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

**Content**
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

**Lecture notes**
Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

**Literature**
Given in lecture.

101-0258-00L | River Engineering | O | 3 credits | 2G | V. Weitbrecht, I. Schalko, K. Sperger

**Abstract**
The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.
At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

In the second part of the lecture, the methods will be explained to quantify the load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river revitalization project at the Alpine Rhine in Austria and Switzerland.

Content

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

Prerequisites / notice

Recommended lectures:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.

101-0468-10L Watershed Modelling W 6 credits 4G P. Molnar

Abstract

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with practical exercises (experiments).

Objective

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 5 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 60% by performance in the graded exercises and 40% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Content

The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGis, Q-Gis) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns. The final part (D) of the course provides open classroom discussion and simulation of a round-table discussion between modellers and clients about using watershed models in a case study.

Lecture notes

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice

Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGis (Q-Gis).

Abstract

This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

Objective

When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

Content

Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Part 2 - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

Part 3 - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes

Digital lecture notes, interactive Julia notebooks, online material.

Literature

Links to relevant literature will be provided during classes.
Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (e.g., Matlab, Python, Julia); advanced programming skills are a plus.

151-8015-00L  Moisture Transport in Porous Media  W  3  G  J. Carmeliet, L. Fei, J. Huang, J. Zhao

Abstract
Moisture transport and related degradation processes in porous materials; experimental determination of moisture transport properties; theory and application of pore network model for two-phase transport in porous media; flow in cracked and deformable porous media.

Objective
- Basic knowledge of moisture transport and related degradation processes in porous materials  
- Knowledge of experimental determination of moisture transport properties  
- Knowledge of pore network model and application to two-phase invasion percolation simulation  
- Application of knowledge to moisture transport in cracked materials and flow in deformable porous media

Content
1. Moisture transport: theory and application  
Moisture damage: problem statement, durability  
Applications: building materials, soil science, geoscience  

2. Moisture transport: theory and application  
Description of moisture transport  
Determination of moisture transport properties  
Liquid transport in cracked materials, flow and transport in deformable porous media

3. Pore network model: theory and application  
Single- and two-phase pore network model: quasi-static and dynamic  
Exercise on quasi-static two-phase pore network model: invasion pattern, capillary pressure curve  
Application of pore network model in two-phase transport

Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

Literature
All material is provided online via Moodle.

151-0353-00L  Mechanics of Composite Materials  W  4  2V+1U  P. Ermanni, G. Pappas, M. Sakovsky

Abstract
Focus is on laminated fibre reinforced polymer composites. The courses treats aspects related to micromechanics, elastic behavior of unidirectional and multidirectional laminates, failure and damage analysis, design and analysis of composite structures.

Objective
To introduce the underlying concept of composite materials and give a thorough understanding of the mechanical response of materials and structures made from fibre reinforced polymer composites, including elastic behaviour, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content
The course is addressing following topics:  
- Introduction  
- Elastic anisotropy  
- Micromechanics aspects  
- Classical Laminate Theory (CLT)  
- Failure hypotheses and damage analysis  
- Analysis and design of composite structures  
- Variable stiffness structures

Lecture notes
Script, handouts, exercises and additional material are available in PDF-format on the CMASLab webpage resp on moodle.  
https://moodle-app2.let.ethz.ch/course/view.php?id=2610

Literature
The lecture material is covered by the script and further literature is referenced in there.

**Abstract**

**Advances in Building Materials**
The course on Advances in Building Materials provides an introductory overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

**Objective**

In this course, the students will gain a broad overview of the use of materials in the building sector, with a particular focus on concrete and wood. Current limitations and in particular sustainability related challenges will be detailed with the objective of laying the grounds to discuss future developments anticipated in this field.

**Content**

This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course of the specialization on Numerical Mechanics of Materials. The course also addresses master students in Materials Science and other study programs interested in deepening their understanding of application-relevant properties of engineering materials and sustainability related challenges.

The following topics are covered:
1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

**Lecture notes**
Handouts will be provided for each lecture.

---

**Abstract**

**Computational Science Investigation for Material Mechanics**
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage and failure with advanced finite element methods.

**Objective**

Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. Starting from the failed state, we will investigate potential causes and find the conditions that resulted in failure. For doing so, you will learn how to predict it with the Finite Element Method (FEM). To correctly assess failure, plastic behavior and size effects, originating from the underlying material microstructure, need to be considered. You will learn how to deal with plasticity in FEM and how you can get information from the heterogeneous material scale into your FEM framework.

**Content**

1. Introduction to (numeric) forensic engineering
2. The nature of engineering problems (governing equations)
3. Numerical recipes for dealing with non-linear problems
4. Multi-field problems (HTM; Comsol)
5. On the nature of failure - Physics of damage and fracture
6. Cracks and growth in structures (LEFM and beyond)
7. A practical approach to LEFM with FEM (Abaqus)
8. Introduction to metal plasticity
9. Damage and fracture in heterogeneous materials
10. Mechanics of fatigue
11. Visco-elastic failure
12. Student - Project presentation

**Lecture notes**
Will be provided during the lecture via moodle.

**Literature**
Will be provided during the lecture.
All documents for certification labels as well as detail plans of the buildings will be available for the students. Hours

A script will be given out at the beginning of the course. Building labels are used to certify buildings and neighbourhoods in terms of sustainability. Many different labels have been developed and

The course will give Engineering students a comprehensive overview and enduring understanding of the techniques, processes, tools and terminology to manage the Project Triangle (time, cost, Quality) and to organize, analyze, control and report a complex project from start of Project Execution to Project Completion. Responsibilities will be detailed in each phase of the execution. A student after completing the course will have the understanding of the Project Management duties, responsibilities, actions and decisions to be done during the Execution phase of a complex project.

- to use operation research methods to find optimal solutions to infrastructure management problems
- to use preventive maintenance models, such as block replacement, periodic preventive maintenance with minimal repair, and preventive maintenance based on parameter control, to determine when, where and what should be done to maintain infrastructure

Explanation of the principal models of preventative maintenance, including block replacement, periodic group repair, periodic maintenance with minimal repair and age replacement, and when they can be used to determine optimal intervention strategies

The slides from the presentations will be made available.

Number of participants limited to 25

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), Label SNBS, MINERGIE-ECO and 2000-Watt-Site (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criterion on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

The alternance of working session on one specific criterion for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus points (operation, energy, mobility, daylight, indoor air quality).

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criterion on one of the case studies presented before. Design-Integrated Life Cycle Assessment

W  3 credits  2G  G. Habert

Abstract
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

Objective
The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:
1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

Content
The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand
The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:

1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Lecture notes
As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
Prerequisite: Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.

The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.

101-0577-00L
An Introduction to Sustainable Development in the Built Environment

O  3 credits  2G  G. Habert, D. Kaushal

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. In 2016, other political bodies made these changes more difficult to predict. What does it mean for the built environment?

This course provides an introduction to the notion of sustainable development when applied to our built environment

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Abstract
Deepen the knowledge on selected topics of underground construction as well as learning working out conceptual solutions of complex problems.

Objective
Lecture: Deepen the knowledge on selected topics of underground construction.
Exercises: Conceptual solutions of complex problems.

Content
Caverns: Geometry, construction methods, support.
Shafts: Construction methods, support.
Urban tunnelling: Boundary conditions, system choice, alignment, design.
Field measurements: Principles, monitoring layout, applications, interpretation.
Cut and cover tunnels: Modelling, design.
Exercising conceptual solution of complex tunnelling problems based upon discussion of current tunnel cases with particularly demanding problems in small groups.

Lecture notes
Autographieblätter

Prerequisites / notice
Prerequisite: BSc course "Tunnelling", MSc courses "Tunnelling I" and "Tunnelling II".

101-0339-00L  Environmental Geotechnics  W  3 credits  2G  M. Plötze

Abstract
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.
Introduction in landfill design and engineering with focus on barrier- and drainage systems and lining materials, evaluation of geotechnical problems, e.g. stability

Objective
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.
Introduction in landfill design and engineering with focus on barrier- and drainage systems as wellas lining materials, evaluation of geotechnical problems, e.g. stability

Autumn Semester 2021  
Page 191 of 2152
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Useful (optional) Reading:

Prerequisites:
- 101-0158-01, Method of Finite Elements I (FS)
- A good knowledge of Python is necessary for attending this course.

Prerequisites / notice

After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.

Content

1. Introduction: Overview of seismic isolation; review of structural dynamics and earthquake engineering principles. Viscoelastic behavior.
2. Linear theory of seismic isolation
3. Types of seismic isolation devices - Modelling of seismic isolation devices – Nonlinear response analysis of seismically isolated structures in Matlab
4. Behavior of rubber isolators under shear and compression
5. Behavior of rubber isolators under bending
6. Buckling and stability of rubber isolators
7. Code provisions for seismically isolated buildings

Lecture notes

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes: reading material, and (optional) exercise problems and solutions.

Literature

There is no single textbook for this course. However, most of the lectures are based on parts of the following books:

- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017
- Design of seismic isolated structures: from theory to practice, Farzad Naeim and James M. Kelly, John Wiley & Sons, 1999
- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011

Prerequisites / notice

101-0157-01 Structural Dynamics and Vibration Problems course, or equivalent, or consent of the instructor. Students are expected to know basic modal analysis, elastic spectrum analysis and basic structural mechanics.
Content

The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester: a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

Theory:

Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project:

Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students’ ability to integrate architectural considerations into their structural design.

101-0121-00L Fatigue and Fracture in Materials and Structures W 4 credits 3G E. Ghafouri, A. Taras

Abstract

The fundamentals in fatigue and fracture mechanics, which are used in different engineering disciplines (e.g., for mechanical, aerospace, civil and material engineers) will be discussed. The focus will be on fundamental theories (based on fracture mechanics) that model fatigue damage and crack propagation.

Objective

In this course, the students will learn:

* Linear elastic and elastic-plastic fracture mechanics.
* Modern computer-based techniques (using ABAQUS Finite Element Package) to simulate cracks in both bulk materials and bonded joints/interfaces.
* Laboratory fatigue and fracture tests on details with cracks.

Content

The course starts with a discussion on the importance of fatigue and fracture in different engineering disciplines such as mechanical, aerospace, civil and material engineering domains. The preliminary topics that are covered in this course are:

I) Fatigue of materials:

* Mechanisms of fatigue crack initiation in (ductile and brittle) metals.
* Crack initiation under uni-axial high-cycle fatigue (HCF) loadings: Wöhler (S-N) curves, constant life diagram approach (mean-stress effects), rainflow analysis and Miner’s damage rule.
* Crack initiation under multi-axial HCF loadings: multi-axial fatigue mechanisms, critical plane approach (critical distance theory), equivalent stress approach, proportional and non-proportional loading.

II) Fracture mechanics:

* ELinear elastic fracture mechanics (LEFM): limits of LEFM, stress intensity factors, crack opening displacement, mixed-mode fracture, etc.
* Elastic-plastic fracture mechanics: Irwin and Dugdale models, plastic zone shapes, crack-tip opening displacement and J-integral.
* Fatigue crack growth (FCG): FCG models, Paris’ law, cyclic plastic zones, crack closure effects. This also includes FE modeling of the FCG and laboratory tests (at Empa).

III) Introduction to cohesive zone models (CZMs):

* Advantages and disadvantages of CZMs compared to fracture mechanics.
* Different bond-slip models for the bonded joints/interfaces.

IV) Computer laboratory to simulate cracks and debonding problems:

* Finite Element (FE) modeling of complex details with cracks.
* FE simulations of debonding problems using CZMs.
* Computer laboratory: FE training and exercises using (the student edition of) the ABAQUS FE Package.

V) Introduction to fatigue and fracture design in civil structures. Different methods for fatigue strengthening will be discussed.

VI) Visits to the Empa (Swiss Federal Laboratories for Materials Science and Technology) in Dübendorf, and “Laboratory Competition”. The students will:

* Visit different small-scale and large-scale fatigue testing equipment.
* Get to know different ongoing fatigue- and fracture-related projects.
* Witness and help to conduct a fatigue test on a steel plate with a pre-crack and a fracture test on an adhesively-bonded joint.
* Compare the experimental results with their own calculations (from the fracture theories).
* “Laboratory Competition” at Empa: the students with the closest predictions will win the “Empa Laboratory Competition” and will be awarded by a prize.

Lecture notes

Lectures are based on the lecture slides and the handouts, which will be given to the students during the semester.

Prerequisites / notice
Note 1: A basic knowledge on mechanics of structures and structural analysis (i.e., stress-strain analysis and calculations of internal deformations, strains and stresses within structures) is recommended and will be helpful in the course.

Note 2: Laboratory demonstrations and fatigue/fracture tests at the Structural Engineering Research Laboratory of Empa in Dübendorf. This includes laboratory tours and showcasing the Empa large-scale 7-MN fatigue testing machine for bridge cables, different fatigue and fracture testing equipment for structural components, etc.

Abstract
Consolidation and supplementation of the basic knowledge acquired in Timber Structures I + II. Treatment of current topics and innovations in timber engineering. Structural design and refurbishment of complex timber structures with high requirements for earthquake resistance, sound insulation and fire protection. Description, analysis and discussion of an existing timber structure in groups.

Objective
In-depth understanding of the theoretical and design aspects of timber construction. Dimensioning, structural design, optimisation and refurbishment of complex timber structures with high requirements for earthquake resistance, sound insulation and fire protection.

Content
Multi-storey timber buildings (general, cross laminated timber, high-rise buildings, fire protection, sound insulation), Post-tensioned timber constructions, building with hardwood, robustness of timber structures, earthquake-resistant timber structures, maintenance and renovation of structures.

Timber Structures I + II

Abstract
The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

Objective
After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

Content
This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
The lectures will cover the following contents:
- Basic principles and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Design project:
The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

Lecture notes
The lectures are based on lecture slides and handouts.

Literature
Recommended and supplementary literature:

Prerequisites / notice
Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.
Objective

This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.

Upon completion of the course, the students will be able to:
1. understand main ML background theory and methods
2. assess a problem and apply ML and DL in a computational framework accordingly
3. Incorporating scientific domain knowledge in the SciML process
4. Define, Plan, Conduct and Present a SciML project

Content

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
1. Fundamentals of Machine and Deep Learning (ML / DL)
2. Incorporation of Domain Knowledge into ML and DL
3. ML training, validation and testing pipelines for academic and research projects

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Literature

Suggested Reading:

</table>

The course is based on the following questions:

How do we deal with complex issues in planning?
- Forms of knowledge, half-knowledge and not knowing
- Occurrence and explanation patterns for irrational behaviour
- Spatial research and planning practice
- Planning maxims
- Mapping complex topics in research questions

How do we generate knowledge about complex issues?
- Methods for scientific data generation
- Applied handling of quantities and probabilities
- Estimating despite uncertainties
- Opportunities of digitisation in planning (Participation, BigData)

How do we react to complex questions in planning?
- Methods of scientific data analysis
- Making decisions despite incomplete information
- Dealing with robustness and fragility

More specifically, the lectures focus on the following topics (NB: Some content units will be presented in English, they are marked with *asterisk below)
- (Half-) knowledge/behaviour/irrationalities
- Initial situation: Solving complex problems
- Behavioural patterns, occurrence and explanation patterns for irrational behaviour
- Methods for solving complex tasks in planning practice
- Spatial research and planning practice - connections, differences, overlaps
- Challenges in the solution of complex tasks: System delimitation, interdisciplinarity, retrospective vs. prospective approach (descriptive vs. action-oriented, "reflected scenario building")
- Planning maxims
- *Methodology in spatial research
- *Research design
- *Research questions (types of research questions; research questions, hypotheses and theories); justification of research question
- Data generation methods (interviews and questionnaires, ethnography and observation, documents, official statistics)
- Dealing with quantities, estimations, anchor effect
- Importance of scales and key figures in planning
- Estimation methods
- Danger of the anchor effect
- Digitalization in planning
- New data sources and sizes
- Opportunities and challenges through digitisation in planning
- Data analysis methods (quantitative and qualitative data; quantitative analysis of survey data; qualitative analysis - content analysis, discourse analysis, case study, comparative research)
- *Research ethics
- Decisions based on incomplete information
- Dealing with complex systems/roughness
- *Role of science in planning - the perspective of both research and practice

101-0491-00L Agent Based Modeling in Transportation

6 credits

W 4G

M. Balac

Abstract
This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in teams.

Objective
At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform practical transportation studies
This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based microsimulation, where different statistical methods used in the process will be introduced and explained
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g., creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
- Car following models
- Lane change models
- Calibration and validation methodology

Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibration, analyze and presentation) across the semester. A mid-term and final examination of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The lecture notes and additional handouts will be provided before the lectures. Additional literature recommendations will be provided at the lectures.

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.
This course will provide an introduction to the methods and tools that can be used to determine optimal inspection and intervention strategies and work programs for infrastructure.

Upon successful completion of this course students will be able:
- to use preventive maintenance models, such as block replacement, periodic preventive maintenance with minimal repair, and preventive maintenance based on parameter control, to determine when, where and what should be done to maintain infrastructure
- to take into consideration future uncertainties in appropriate ways when devising and evaluating monitoring and management strategies for physical infrastructure
- to use operation research methods to find optimal solutions to infrastructure management problems

Part 1:
Explanation of the principal models of preventative maintenance, including block replacement, periodic group repair, periodic maintenance with minimal repair and age replacement, and when they can be used to determine optimal intervention strategies

Part 2:
Explanation of preventive maintenance models that are based on parameter control, including Markovian models and opportunistic replacement models

Part 3:
Explanation of the methods that can be used to take into consideration the future uncertainties in the evaluation of monitoring strategies

Part 4:
Explanation of how operations research methods can be used to solve typical infrastructure management problems.

A script will be given out at the beginning of the course.

Class relevant materials will be distributed electronically before the start of class.

A copy of the slides will be handed out at the beginning of each class.

Successful completion of IM1: 101-0579-00 Evaluation tools is a prerequisite for this course.

101-0419-02L 
Railway Infrastructures 2 

Abstract
Track geometry including calculation and measuring as well as related data systems; clearance profiles; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; environmental aspects in track construction; track diagnostics and forecast; track maintenance and related methods

Objective
The lecture gives a deeper insight into track geometry including clearance profile, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content
1 - Track geometry
Track geometry including calculation and measuring as well as related data systems; clearance profiles

2 - Interaction
Interaction between track and vehicles, vehicle dynamics

3 - Railway Track
Stress; track construction including special features of railway bridges and tunnels

4 - Environmental aspects in track construction
Fundamentals; noise protection; vibration protection

5 - Diagnostics, maintenance strategies
Track diagnostics and forecast; maintenance strategies

Literature
A list with related technical literature will be handed out.

The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.
Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacial mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

101-1249-00L Hydraulics of Engineering Structures W 3 credits 2G I. Albayrak, F. Evers

Abstract
Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Objective
Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower

Content

1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stilling basin
5. Backwater curves
6. Weirs & End overfall
7. Sidewir & Side channel
8. Bottom opening, Venturi & Culverts, Restrictors, Inverted siphons
9. Fall manholes & Vortex drop
10. Supercritical flow & Special manholes
11. Aerated flows & Low level outlets
12. Hydraulics of sediment bypass tunnels
13. Vegetated flows - Introduction & Application
14. Summary

102-0215-00L Urban Water Management II W 4 credits 2G M. Maurer, P. Staufer

Abstract

Objective
Consolidation of the basic procedures for design and operation of technical networks in water engineering.

Content

Demand Side Management versus Supply Side Management
Optimierung von Wasserverteilnetzen
Kalkausfällung, Korrosion von Leitungen
Hygiene in Verteilnetzen
Siedlungshydrologie: Niederschlag, Ablussbildung
Instationäre Strömungen in Kanalisationen
Stofftransport in der Kanalisation
Einleitbedingungen bei Regenwetter
Versickerung von Regenwasser
Generelle Entwässerungsplanung (GEP)

Lecture notes
Written material will be available digital.

Prerequisites / notice
Prerequisite: Introduction to Urban Water Management
Abstract

Objective
To recognise and understand channel and hillslope processes and their interactions. To learn about methods of hazard analysis and of technical and bioengineering protection measures and their assessment. Determination of critical loads and design of protective structures. Assessment of spatial and future developments with and without protective measures.

Major in Materials and Mechanics

Number Title Type ECTS Hours Lecturers
101-0639-01L Science and Engineering of Glass and Natural Stone in Construction W 3 credits 2G F. Wittel, T. Wangler

Abstract
The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.
Objective

Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with;
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application;
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background;
- explain the major deterioration mechanisms in natural stone and how this relates to durability;
- analyze material combinations and appraise their application in future products as well as integration in existing constructions;
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Content

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of vitrification. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW).

Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Lab 1: Durability of natural stone (FW/TW)

Lab 2: Fracture of glass (FW/TW)

Will be handed out in the lectures

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.

101-0659-01L Durability and Maintenance of Reinforced Concrete W 4 credits 2V U. Angst, Z. Zhang

Abstract

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.
After this course you will have profound understanding about:

- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:

- current engineering approaches for durability design (according to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies

Possible future problems for durability that may arise with modern materials and construction technologies

- Socio-economic challenges related to ageing infrastructures
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:

- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Lecture notes

The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Literature

The course is based on the book

Slides of the lectures will be distributed in advance

Prerequisites / notice

The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:

Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:

We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0689-00L Shrinkage and Cracking of Concrete: Mechanisms and Impact on Durability

W 3 credits 2V P. Lura, M. Wyrzykowski

Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.
This course begins with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal, and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be stressed and explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal curing by means of saturated lightweight aggregates and superabsorbent polymers.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, which are needed for the calculations of self-induced stresses and risk of cracking.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g., chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time.

As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

Concrete is generally viewed as a long-lasting construction material. However, the durability of a concrete structure can be jeopardized by shrinkage-induced cracking. In addition to being unsightly, cracks have the potential to act as weak planes for further distress or as conduits for accelerated ingress of aggressive agents that may reduce durability.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to cracking at early ages, unless special precautions are taken. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions.

Specific topics covered by the course:
- Hydration
- Microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Creep and relaxation
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregates and superabsorbent polymers
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability
- Self-healing of cracks

Lecture notes
For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

Literature
Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

<td>15</td>
<td>Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.</td>
<td>In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro- and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.</td>
<td><em>This course offers no introduction to commercial software.</em></td>

<tr>
<td>Learning target is a fundamental understanding of the dominating wood machining processes, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products. Finally, the digital transformation process, which will affect all sectors of the wood industry with impact on the entire value chain and business models will be covered. It will be illustrated how production processes will become more flexible, efficient and less resource demanding.</td>
<td>The general introduction shows the economic relevance of the resource wood in a global, European and Swiss context and reflects aspects of sustainability in wood production and certification. In terms of bulk wood products a specific focus is laid on sawn timber production and drying processes. With regard to wood veneer production, steaming, veneer cutting and assembly to veneer lumber products are presented. Further the common technologies for the production of particle boards and fibre boards as well as paper will be discussed. In the following, the topics are related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products. In a further part, the lecture deals with the most important digital technologies, e.g., Internet of Things, artificial intelligence and their impact on the wood industry on the basis of illustrative examples. At the end of the lecture an excursion to a Swiss wood manufacturer is planned, in order to facilitate practical experience.</td>
<td>Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Objective

This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

Lecture notes

The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Useful (optional) Reading:

Prerequisites / notice

Prerequisites:
-101-0158-01  Method of Finite Elements I (FS)
- A good knowledge of Python is necessary for attending this course.

Taught competencies

Domain A - Subject-specific Competencies
Concepts and Theories

Domain B - Method-specific Competencies
Analytical Competencies

Domain C - Social Competencies
Cooperation and Teamwork

Domain D - Personal Competencies
Critical Thinking

Upon completion of the course, the participants will be able to:
- Fracture Mechanics
- Nonlinear Dynamics
- Geometric Nonlinearity (Large Displacement Problems)
- Material Nonlinearity (Plasticity)

The course specifically covers the treatment of the following phenomena:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

</table>
This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.

By the end of the course, students will be able to plan and manage the lean, integrated, and digital project delivery of a construction project.

Students will know they are able to achieve this overall course goal when they can:

1. Understand the fundamentals of Virtual Design and Construction and Building Information Modeling. This includes the ability to prepare a model breakdown structure capable of integrating project information for all stakeholders; describe the upcoming transition to a common data environment for BIM that will use platforms such as Autodesk Forge; and describe the barriers to successful implementation of BIM within construction and design firms.

2. Evaluate benefits of integrated project governance compared to the organization of traditional construction project delivery systems. This includes the ability to evaluate the risks, benefits and considerations for integrated teams using multi-party relational contracts that cross disciplinary and firm boundaries; and explain to others the 'elements' of integrated projects (e.g. colocation, early involvement of key stakeholders, shared risk/reward, collaborative decision making).

3. Plan and schedule an integrated ‘SD’ scope schedule cost model using the Tri-Constraint Method. This includes the ability to understand the TCM algorithm, apply parametric logic to the creation of a virtual model for construction production; and evaluate the limitations of the critical path method when compared to resource- and space-constrained scheduling.

4. Understand the benefits of collaborative decision making. This includes the ability to describe the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production to several construction management tools including the Last Planner System, Pull Planning, Target Value Design, and Takt Planning.

1. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

2. For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

3. The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the requirements of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

**Objective**:

- **Tunnelling I**: Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.
- **Structural Reliability and Risk Analysis**: Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.
- **Traffic Engineering**: Fundamentals of traffic flow theory and control.
- **Transport Planning Methods**: The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

**Content**:

- **Tunnelling I**: Conventional excavation methods (full face, top heading and bench, side drift method, ...)
- **Structural Reliability and Risk Analysis**: The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. The framework of risk analysis allows one to incorporate the uncertainty in decision making.
- **Traffic Engineering**: Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.
- **Transport Planning Methods**: The ecosystem of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

**Prerequisites / notice**:

- **Traffic Engineering**: Basic course on probability theory and statistics.
- **Transport Planning Methods**: Special permission from the instructor can be requested if the student has not taken Verkehr III - Road Transport Systems 6th Sem. BSc (101-0415-00L)

**Lecture notes / Literature**:

- **Tunnelling I**: Empfehlungen, Domain A - Subject-specific Competencies, Domain B - Method-specific Competencies.
- **Structural Reliability and Risk Analysis**: Lecture notes, Lecture notes and additional handouts will be provided during the lectures.
- **Traffic Engineering**: Slides of the lectures are available online every week. Additional literature recommendations will be provided during the lectures.
- **Transport Planning Methods**: Additional handouts will be provided during the lectures.
Content

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

Agent Based Modeling in Transportation

W 6 credits 4G M. Balac

Abstract

This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in teams.

Objective

At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform practical transportation studies

Content

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:
1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained. Here the open-source egasim framework used at ETH Zurich to set up agent-based models will be introduced
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

Literature

Agent-based modeling in general
MATSim

Prerequisites / notice

Additional relevant readings, primarily scientific articles, will be recommended throughout the course.

There are no strict preconditions in terms of which lectures the students should have previously attended. However, knowledge of basic statistical theory is expected, and experience with at least one high-level programming language (Java, R, Python, or other) is recommended.

101-0507-00L

Infrastructure Management 3: Optimisation Tools

W 6 credits 2G B. T. Adey

Abstract

Does not take place this semester.

Objective

Upon successful completion of this course students will be able:
- to use preventive maintenance models, such as block replacement, periodic preventive maintenance with minimal repair, and preventive maintenance based on parameter control, to determine when, where and what should be done to maintain infrastructure
- to take into consideration future uncertainties in appropriate ways when devising and evaluating monitoring and management strategies for physical infrastructure
- to use operation research methods to find optimal solutions to infrastructure management problems

Content

Part 1:
Explanation of the principal models of preventative maintenance, including block replacement, periodic group repair, periodic maintenance with minimal repair and age replacement, and when they can be used to determine optimal intervention strategies

Part 2:
Explanation of preventive maintenance models that are based on parameter control, including Markovian models and opportunistic replacement models

Part 3:
Explanation of the methods that can be used to take into consideration the future uncertainties in the evaluation of monitoring strategies

Part 4:
Explanation of how operations research methods can be used to solve typical infrastructure management problems.

Lecture notes

A script will be given out at the beginning of the course.
Class relevant materials will be distributed electronically before the start of class.
A copy of the slides will be handed out at the beginning of each class.

Prerequisites / notice

Successful completion of IM1: 101-0579-00 Evaluation tools is a prerequisite for this course.
Numerical Hydraulics

Objective

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available software such as BASEMENT for non-steady shallow water flows are used.

Lecture notes

Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

Method of Finite Elements II

Abstract

The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

"This course offers no introduction to commercial software.

Objective

This course overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity.

In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the following phenomena:

- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:

- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

Computational Science Investigation for Material Mechanics

Abstract

Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage and failure with advanced finite element methods.

Objective

Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. Starting from the failed state, we will investigate potential causes and find the conditions that resulted in failure. For doing so, you will learn how to predict it with the Finite Element Method (FEM). To correctly assess failure, plastic behavior and size effects, originating from the underlying material microstructure, need to be considered. You will learn how to deal with plasticity in FEM and how you can get information from the heterogeneous material scale into your FEM framework.

Content

1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM; Comsol)
5 On the nature of failure - Physics of damage and fracture
6 Cracks and growth in structures (LEFM and beyond)
7 A practical approach to LEFM with FEM (Abaqus)
8 Introduction to metal plasticity
9 Damage and fracture in heterogeneous materials
10 Mechanics of fatigue
11 Visco-elastic failure
12 Student -Project presentation

Lecture notes

Will be provided during the lecture via moodle.

Literature

Will be provided during the lecture.
101-0185-01L
CAD for Civil Engineers

Abstract
Introduction to computer aided design and drafting in 2D and 3D with examples from structural engineering

Objective
Point in time of enrolment of course is decisive.

Having followed the course, students are able to develop a 2D-structure (formwork drawing) and they know the principle of a reinforcement module. They have also got an introduction to a 3D program (reinforcement in 3D).

Above all they practice spatial sense and acquire contextual knowledge as future superiors of draftsmen and designers.

Prerequisites / notice
Familiarity with MATLAB and / or Python is advised.

101-0250-00L
Solving Partial Differential Equations in parallel on GPUs

Abstract
This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

Objective
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

Content
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Part 2 - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

Part 3 - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

101-0139-00L
Scientific Machine and Deep Learning for Design and Construction in Civil Engineering

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.

Content
The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

101-0120-00L
Structural Glass Design and Facade Engineering

Abstract
Number of participants is limited to 30.

Objective
- Assess a problem and apply ML and DL in a computational framework accordingly
- Incorporating scientific domain knowledge in the SciML process
- Define, Plan, Conduct and Present a SciML project
- Understand main ML background theory and methods
- Apply your new skills in a final project;
- Learn about main simulation performance limiters.
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

101-0139-00L
Scientific Machine and Deep Learning for Design and Construction in Civil Engineering

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction in civil engineering. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide graduate level introduction into Machine and especially scientific Machine Learning for applications in the design and construction phases of projects from civil engineering.

Content
The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Literature
Marc Peter Deisenroth, A Aldo Faisal, and Cheng Soon Ong Mathematics for Machine Learning

Prerequisites / notice
Familiarity with MATLAB and / or Python is advised.

101-0120-00L
Structural Glass Design and Facade Engineering

Abstract
Number of participants is limited to 30.

Objective
- Assess a problem and apply ML and DL in a computational framework accordingly
- Incorporating scientific domain knowledge in the SciML process
- Define, Plan, Conduct and Present a SciML project
- Understand main ML background theory and methods
- Apply your new skills in a final project;
- Learn about main simulation performance limiters.
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Content
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Part 2 - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

Part 3 - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.
There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines exist independently of each other. This can be attributed to the complexity and diversity of the problem and the need for flexibility. It is, however, important to note that these codes and guidelines are often developed in isolation and without consultation with each other. This can lead to conflicting recommendations and a lack of consistency in the implementation of these codes and guidelines.

The course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students with the knowledge required to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

**Lectures:**

The lectures will cover the following contents:

- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

**Design exercises:**

The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specific details of numerical calculation procedures are exemplified with the software Abaqus.

**Design project:**

The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

**Literature**

Recommended and supplementary literature:

**Prerequisites / notice**

Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.
Content

The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.

2. Positioning infrastructure management in society. As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.

3. Setting goals and constraints – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.

4. Predicting the future – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.

5. Help session 1

6. Determining and justifying general interventions - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.

7. Determining and justifying monitoring - Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.

8. Converting programs to projects / Analysing projects – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.

9. Help session 2

10. Ensuring good information – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.

11. Ensuring a well-run organization – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.

12. Describing the IM process – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.

13. Evaluating the IM process – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.

14. Help session 3 and submission of project report.

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least the use of Excel. Some students, however, prefer to use Python or R.

Lecture notes

- The lecture materials consist of handouts, the slides, and example calculations in Excel.
- The lecture materials will be distributed via Moodle two days before each lecture.

Literature

- This course has no prerequisites.

Prerequisites / notice

- Appropriate literature will be handed out when required via Moodle.

Taught competencies

- Domain A - Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- Domain B - Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: assessed
  - Problem-solving: assessed
  - Project Management: assessed

- Domain C - Social Competencies
  - Communication: not assessed
  - Cooperation and Teamwork: not assessed
  - Customer Orientation: not assessed
  - Leadership and Responsibility: not assessed
  - Self-presentation and Social Influence: not assessed
  - Sensitivity to Diversity: not assessed
  - Negotiation: not assessed

- Domain D - Personal Competencies
  - Adaptability and Flexibility: not assessed
  - Creative Thinking: not assessed
  - Critical Thinking: not assessed
  - Integrity and Work Ethics: not assessed
  - Self-awareness and Self-reflection: not assessed
  - Self-direction and Self-management: not assessed

Microscopic Modelling and Simulation of Traffic Operations

W 3 credits 2G M. Makridis

Abstract

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.

Objective
The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content
In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun. Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:
- Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
- Calibrating and validating the simulation model.
- Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Lecture notes / literature
The lecture notes and additional handbooks will be provided before the lectures. Additional literature recommendations will be provided at the lectures.

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

101-0123-00L Structural Design

Abstract
The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form and the forces within it by promoting the development of designed projects.

Objective
After successfully completing this course the students will be able to:
1. Critically question structural design concepts of historical and contemporary references
2. Use graphic statics and strut-and-tie models based on the theory of Plasticity to describe the load bearing behavior of structures
3. Understand different construction technologies and have an awareness of their potential for structural design
4. Use contemporary digital tools for the design of structures in equilibrium
5. Design an appropriate structural system for a given design task taking into account architectural considerations

Content
The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester: a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

Theory
Graphic statics is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

Design Project
Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students' ability to integrate architectural considerations into their structural design.

102-0468-10L Watershed Modelling

Abstract
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).
Objective
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 5 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 60% by performance in the graded exercises and 40% by a seminar-end oral examination (30 mins) on watershed modelling concepts.

Content
The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple-bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns. The final part (D) of the course provides open classroom discussion and simulation of a round-table discussion between modellers and clients about using watershed models in a case study.

Lecture notes
There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature
Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice
Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

101-0121-00L
Fatigue and Fracture in Materials and Structures

Abstract
The fundamentals in fatigue and fracture mechanics, which are used in different engineering disciplines (e.g., for mechanical, aerospace, civil and material engineers) will be discussed. The focus will be on fundamental theories (based on fracture mechanics) that model fatigue damage and crack propagation.

Objective
In this course, the students will learn:

- Linear elastic and elastic-plastic fracture mechanics.
- Modern computer-based techniques (using ABAQUS Finite Element Package) to simulate cracks in both bulk materials and bonded joints/interfaces.
- Laboratory fatigue and fracture tests on details with cracks.

Content
The course starts with a discussion on the importance of fatigue and fracture in different engineering disciplines such as mechanical, aerospace, civil and material engineering domains. The preliminary topics that are covered in this course are:

I) Fatigue of materials:
- Mechanisms of fatigue crack initiation in (ductile and brittle) metals.
- Crack initiation under uni-axial high-cycle fatigue (HCF) loadings: Wöhler (S-N) curves, constant life diagram approach (mean-stress effects), rainflow analysis and Miner's damage rule.
- Crack initiation under multi-axial HCF loadings: multi-axial fatigue mechanisms, critical plane approach (critical distance theory), equivalent stress approach, proportional and non-proportional loading.

II) Fracture mechanics:
- Linear elastic fracture mechanics (LEFM): limits of LEFM, stress intensity factors, crack opening displacement, mixed-mode fracture, etc.
- Elastic-plastic fracture mechanics: Irwin and Dugdale models, plastic zone shapes, crack-tip opening displacement and J-integral.
- Fatigue crack growth (FCG): FCG models, Paris’ law, cyclic plastic zones, crack closure effects. This also includes FE modeling of the FCG and laboratory tests (at Empa).

III) Introduction to cohesive zone models (CZMs):
- Advantages and disadvantages of CZMs compared to fracture mechanics.
- Different bond-slip models for the bonded joints/interfaces.

IV) Computer laboratory to simulate cracks and debonding problems:
- Finite Element (FE) modeling of complex details with cracks.
- FE simulations of debonding problems using CZMs.
- Computer laboratory: FE training and exercises using (the student edition of) the ABAQUS FE Package.

V) Introduction to fatigue and fracture design in civil structures. Different methods for fatigue strengthening will be discussed.

VI) Visits to the Empa (Swiss Federal Laboratories for Materials Science and Technology) in Dübendorf, and “Laboratory Competition”. The students will:
- Visit different small-scale and large-scale fatigue testing equipment.
- Get to know different ongoing fatigue- and fracture-related projects.
- Witness and help to conduct a fatigue test on a steel plate with a pre-crack and a fracture test on an adhesively-bonded joint.
- Compare the experimental results with their own calculations (from the fracture theories).
- Laboratory Competition “Laboratory Competition” at Empa: the students with the closest predictions will win the “Empa Laboratory Competition” and will be awarded by a prize.

Lecture notes
Lectures are based on the lecture slides and the handouts, which will be given to the students during the semester.

Literature

Prerequisites / notice
Note 1: A basic knowledge on mechanics of structures and structural analysis (i.e., stress-strain analysis and calculations of internal deformations, strains and stresses within structures) is recommended and will be helpful in the course.

Note 2: Laboratory demonstrations and fatigue/fracture tests at the Structural Engineering Research Laboratory of Empa in Dübendorf. This includes laboratory tours and showcasing the Empa large-scale 7-MN fatigue testing machine for bridge cables, different fatigue and fracture testing equipment for structural components, etc.

Infrastructure asset management is the process used to ensure that infrastructure provides adequate levels of service for specified periods of time. This course provides an overview of the process, from setting goals to developing intervention programs to analyzing the process itself. It consists of weekly lectures and a group project. Additionally, there is a weekly help session.
Objective

There are a large number of efforts around the world to obtain more net benefits from infrastructure assets. This can be seen through the proliferation of codes and guidelines and the increasing amount of research in road infrastructure asset management. Many of these codes and guidelines and much of the research, however, are focused on only part of the large complex problem of infrastructure asset management.

The objective of this course is to provide an overview of the entire infrastructure management process. The high-level process described can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. It also enables a clear understanding of where computer systems can be used to help automate parts of the process. Students can use this process to help improve the specific infrastructure management processes in the organisations in which they work in the future.

More specifically upon completion of the course, students will
- understand the main tasks of an infrastructure manager and the complexity of these tasks,
- understand the importance of setting goals and constraints in the management of infrastructure,
- be able to predict the deterioration of individual assets using discrete states that are often associated with visual inspections,
- be able to develop and evaluate simple management strategies for individual infrastructure assets,
- be able to develop and evaluate intervention programs that are aligned with their strategies,
- understand the principles of guiding projects and evaluating the success of projects,
- be able to formally model infrastructure management processes, and
- understand the importance of evaluating the infrastructure management process and have a general idea of how to do so.

Content

The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management, with emphasis on the consideration of the benefits and costs of infrastructure to all members of society, and balancing the need for prediction accuracy with analysis effort. The expectations of your throughout the semester, including a description of the project.

2. Positioning infrastructure management in society: As infrastructure plays such an integral part in society, there is considerable need to ensure that infrastructure managers are managing it as best possible. A prominent network regulator explains the role and activities of a network regulator.

3. Setting goals and constraints – To manage infrastructure you need to know what you expect from it in terms of service and how much you are willing to pay for it. We discuss the measures of service for this purpose, as well as the ideas of quantifiable and non-quantifiable benefits, proxies of service, and valuing service.

4. Predicting the future – As infrastructure and our expectations of service from it change over time, these changes need to be included in the justification of management activities. This we discuss the connection between provided service and the physical state of the infrastructure and one way to predict their evolution over time.

5. Help session 1

6. Determining and justifying general interventions - It is advantageous to be able to explain why infrastructure assets need to be maintained, and not simply say that they need to be maintained. This requires explanation of the types of interventions that should be executed and how these interventions will achieve the goals. It also requires explaining which interventions are to be done if it is not possible to do everything due to for example budget constraints. This week we cover how to determine optimal intervention strategies for individual assets, and how to convert these strategies into network level intervention programs.

7. Determining and justifying monitoring - Once it is clear how infrastructure might change over time, and the optimal intervention strategies are determined, you need to explain how you are going to know that these states exist. This requires the construction of monitoring strategies for each of asset. This week we focus on how to develop monitoring strategies that ensure interventions are triggered at the right time.

8. Converting programs to projects / Analysing projects – Once programs are completed and approved, infrastructure managers must create, supervise and analyse projects. This week we focus on this conversion and the supervision and analysis of projects.

9. Help session 2

10. Ensuring good information – Infrastructure management requires consistent and correct information. This is enabled by the development of a good information model. This week we provide an introduction to information models and how they are used in infrastructure management.

11. Ensuring a well-run organization – How people work together affects how well the infrastructure is managed. This week we focus on the development of the human side of the infrastructure management organisation.

12. Describing the IM process – Infrastructure management is a process that is followed continually and improved over time. It should be written down clearly. This week we will concentrate on how this can be done using the formal modelling notation BPMN 2.0.

13. Evaluating the IM process – Infrastructure management processes can always be improved. Good managers acknowledge this, but also have a plan for continual improvement. This week we concentrate on how you can systematically evaluate the infrastructure management process.

14. Help session 3 and submission of project report.

The course uses a combination of qualitative and quantitative approaches. The quantitative analysis required in the project requires at least the use of Excel. Some students, however, prefer to use Python or R.

Lecture notes
- The lecture materials consist of handouts, the slides, and example calculations in Excel.

Literature
- The lecture materials will be distributed via Moodle two days before each lecture.

Prerequisites / notice
- Appropriate literature will be handed out when required via Moodle.
- This course has no prerequisites.
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

The overarching goal of the course is to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:
1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation
4. Work as a team to assess and improve the environmental performance of a building project
5. Be able to assess the environmental performance of a building project
6. Be able to assess the environmental performance of a building project

Part I: Exercises with lectures on demand
The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:
1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Part II: Project-based learning
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:
1) Introduction to Rhinoceros 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

The course will be structured into two parts, each making up about half of the semester.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.

**101-0249-00L**  
**Hydraulic Engineering: Selected Topics**  
W  3 credits  2S  R. Boes  
Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.  

**Abstract**  
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

**Objective**  
The overarching goal of the course is to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

**Content**  
Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, materials in dam building, possible problems at reservoirs like natural hazards by impulse waves, the hydraulics of spillways and intake structures at dams and weirs and the area of conflict between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects at the national and international level.

**Lecture notes**  
Lecture notes will be available online.

**Literature**  
will be specified in the lecture

**Prerequisites / notice**  
External speakers will be involved to present current topics and projects in Switzerland and abroad.

---

**101-0608-00L**  
**Design-Integrated Life Cycle Assessment**  
W  3 credits  2G  G. Habert  

**Abstract**  
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

**Objective**  
The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:
1) Know the methodology of LCA
2) Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3) Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

**Content**  
The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand  
The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:
1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Part II: Project-based learning  
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:
1) Introduction to Rhinoceros 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

**Prerequisite:** Sustainable construction (101-0577-00L). Otherwise a special permission by the lecturer is required.

The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly the departments ARCH, BAUG, ITET, MAVT, MTEC and UWIS.

No lecture will be given during Seminar week.

### Abstract
Deepend the knowledge on selected topics of underground construction as well as learning working out conceptual solutions of complex problems.

### Objective
Lecture: Deepen the knowledge on selected topics of underground construction. 
Exercises: Conceptual solutions of complex problems.

### Content
Caverns: Geometry, construction methods, support. 
Shafts: Construction methods, support. 
Urban tunnelling: Boundary conditions, system choice, alignment, design. 
Field measurements: Principles, monitoring layout, applications, interpretation. 
Cut and cover tunnels: Modelling, design. 
Exercising conceptual solution of complex tunnelling problems based upon discussion of current tunnel cases with particularly demanding problems in small groups.

### Lecture notes
Autographieblätter

### Literature
Empfehlungen

### Prerequisites / notice
Prerequisite: BSc course "Tunnelling", MSc courses "Tunnelling I" and "Tunnelling II".

### Taught competencies
| Domain A - Subject-specific Competencies | Concepts and Theories | assessed |
| Domain B - Method-specific Competencies | Techniques and Technologies | assessed |
| | Analytical Competencies | assessed |
| | Decision-making | assessed |
| | Problem-solving | assessed |

### Abstract
Overview of soil behaviour 
Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples
Consolidation theory and typical applications in practice 
Triaxial & direct shear tests: consolidation & shear, drained & undrained response 
Plasticity theory & Critical State Soil Mechanics, Cam Clay 
Application of plasticity theory

### Objective
Extend knowledge of theoretical approaches that can be used to describe soil behaviour to enable students to carry out more advanced geotechnical design and to plan the appropriate laboratory tests to obtain relevant parameters for coupled plasticity models of soil behaviour.
A further goal is to give students the wherewithal to be able to select an appropriate constitutive model and set up insitu stress conditions in preparation for subsequent numerical modelling (e.g. with finite elements).
Overview of soil behaviour
Discussion of general gaps between basic theory and soil response
Stress paths in practice & in laboratory tests
Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples
Consolidation theory for incremental and continuous loading oedometer tests and typical applications in practice
Triaxial & direct shear tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory

Lecture notes
Printed script with web support
Exercises

Literature
http://geotip.igt.ethz.ch/

Prerequisites / notice
Lectures will be conducted as Problem Based Learning within the framework of a case history
Virtual laboratory in support of 'hands-on' experience of selected laboratory tests

Pre-requisites: Basic knowledge in soil mechanics as well as knowledge of advanced mechanics
Laboratory equipment will be available for 60 students. First priority goes to those registered for the geotechnics specialty in the Masters, 2nd year students then first year students, doctoral students qualifying officially for their PhD status and then 'first come, first served'.

<tr>
<td></td>
<td>- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Typologies and design of structural systems for transparent façades;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Requirements and functions for transparent facades.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Design exercises</td>
<td>The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Design project</td>
<td>The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.</td>

Part 1 - Discovering a modern parallel computing ecosystem

This course aims to cover state-of-the-art methods in modern parallel Graphical Processing Unit (GPU) computing, supercomputing and code development with applications to natural sciences and engineering.

Prerequisites / notice
Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

101-0250-00L
Solving Partial Differential Equations in parallel

Objective
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

Content
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn about the diffusion process and how to solve it;
- Understand the practical challenges of parallel and distributed computing: (multi-)GPUs, multi-core CPUs;
- Learn about software development tools: git, version control, continuous integration (CI), unit tests.

Part 2 - Developing your own parallel algorithms
- Implement wave propagation (or more advanced physics);
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Implement efficient iterative algorithms;
- Implement shared (on CPU and GPU) and, if time allows, distributed memory parallelisation (multi-GPUs/CPUs);
- Learn about main simulation performance limiters.

Part 3 - Final project
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Literature
Links to relevant literature will be provided during classes.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

4 credits
W 3G 6th sem

101-0659-01L
Durability and Maintenance of Reinforced Concrete

Objective
After this course you will have profound understanding about:
• the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
• the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:
• current engineering approaches for durability design (according to standards) and their limitations
• refined models for durability design and service life predictions
• preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
• the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
• methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
• repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
• possible future problems for durability that may arise with modern materials and construction technologies

Content
Socio-economic challenges related to ageing infrastructures
Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:
• We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Lecture notes
The course is based on the book Corrosion of steel in concrete - prevention diagnosis repair (WILEY 2013) by L. Bertolini, B. Elsener, P. Pedeleferi and R. Polder

4 credits
W 2V 2nd sem
The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0677-00L Concrete Technology

Abstract
Opportunities and limitations of concrete technology. Commodity and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as
- self compacting concrete
- fiber reinforced concrete
- fast setting concrete
- fair faced concrete
- recycled concrete
- new research in digital fabrication with concrete

Lecture notes
Slides provided for download.

101-0427-01L Public Transport Design and Operations

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective

Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:

- General introduction of transport, modes, technologies, system design and line planning for different situations, timetabling and tactical planning, and related mathematical approaches
- Operations, and quantitative support to operational problems, evaluation of public transport systems.

Content

- Basics for line transport systems and networks
- Passenger/Supply requirements for line operations
- Objectives of system and network planning, from different perspectives and users, design dilemmas
- Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

- Planning process, from demand evaluation to line planning to timetables to operations
- Matching demand and modes
- Line planning techniques
- Timetabling principles
- Allocation of resources
- Management of operations
- Measures of realized operations
- Improvements of existing services

Lecture notes

- Lecture slides are provided.

101-0524-00L Lean, Integrated and Digital Project Delivery W 4 credits 3G D. Hall

Abstract

This course is an introduction to innovative construction project delivery through three strategies: integrated information, integrated organization, and integrated processes. Students will be introduced to project and production management concepts such as Lean Construction, Building Information Modeling, the Tri-Constraint Method, & Integrated Project Delivery.

The construction industry is continually seeking to deliver High-Performance (HP) projects for their clients. HP buildings must meet the criteria of four focus areas – buildability, operability, usability, and sustainability. The project must be buildable, as measured by metrics of cost, schedule, and quality. It must be operable, as measured by the cost of maintaining the facility for the duration of its lifecycle. It must be usable, enabling productivity, efficiency and well-being of those who will inhabit the building. Finally, it must be sustainable, minimizing the use of resources such as energy and water. Buildings that succeed in all four of these areas can be considered HP projects.

HP buildings require the integration of building systems. However, the traditional methods of planning and construction do not use an integrated approach. Project fragmentation between many stakeholders is often cited as the cause of poor project outcomes and the reason for poor productivity gains in the construction industry. In response, the construction industry has turned to new forms of integration in order to integrate the processes, organization, and information required for high performance projects.

This course investigates emerging trends in the construction industry – e.g., colocation, shared risk/reward contracts, lean construction methods, and use of shared building information models (BIM) for virtual design and construction (VDC) – as a way to achieve HP projects. For integrated processes, students will be introduced to the fundamentals of lean construction management. This course will look at the causes of variability in construction production and teach the theory of lean production for construction. Processes and technologies will be introduced for lean management, such as the last planner system, takt time planning, production tracking, and target value design. For integrated information, students will be introduced to the fundamentals of virtual design and construction, including how to use work breakdown structures and model breakdown structures for building information modeling, and the fundamentals and opportunities for 4D scheduling, clash detection, and “5D and 6D” models. Future technologies emerging to integrate information such as the use of Autodesk Forge will be presented. Students will have the opportunity to discuss barriers in the industry to more advanced implementation of BIM and VDC.

For integrated organization, students will study the limitations of the construction industry to effectively organize for complex projects, including the challenges of managing highly interdependent tasks and generating knowledge and learning within large multi-organizational project teams. One emerging approach in North America known as IPD will be studied as a case example. Students will explore the benefits of certain ‘elements’ of IPD such as project team colocation, early involvement of trade contractors, shared risk/reward contracts, and collaborative decision making.

The course will also include several guest lectures from industry experts to further demonstrate how these concepts are applied in practice. Lecture Presentation slides will be available for viewing and download the day before each lecture.

The class will be presented in a "flipped classroom" environment where students will be required to do readings or watch video before class. In-class activities will act to reinforce and expand upon these primary concepts.

If possible due to COVID restrictions, students will be expected to attend a half-day workshop on the Last Planner System. The date of this workshop will be provided at a later point in time.

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.
### Workshop on Sustainable Building Certification

<td><strong>Abstract</strong></td>
<td>The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a realistic road network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario. Upon completion of the course, the students will:</td>

</table>
The goal of the course is to introduce the civil engineering students to Structural Design, which is regarded as a discipline that relates structural behavior, construction technologies and architectural concepts. The course encourages the students to understand the relationship between the form of a structure and the forces within it by promoting the development of designed projects.

### Objective
After successfully completing this course the students will able to:
1. Critically question structural design concepts of historical and contemporary references.
2. Use graphic statics and strut-and-tie models based on the Theory of Plasticity to describe the load bearing behavior of structures.
3. Understand different construction technologies and have an awareness of their potential for structural design.
4. Use contemporary digital tools for the design of structures in equilibrium.
5. Design an appropriate structural system for a given design task taking into account architectural considerations.

### Content
The goal of the course is to introduce the civil engineering students to Structural Design, which is understood as a discipline that relates structural behavior, construction technologies and architectural concepts. Hence, the course encourages the students to develop an intuitive understanding of the relationship between the form of a structure and the forces within it by promoting the development of designed projects, in which the static and architectural aspects come together. The course is structured in two main parts, each developed in half of a semester; a mainly theoretical one (including the teaching of graphic statics) and a mainly applied one (focused on the development of a design project by the students using digital form-finding tools).

### Theory

- **Graphic statics** is a graphical method developed by Prof. Karl Culmann and firstly published in 1864 at ETH Zurich. In this approach to structural analysis and design, geometric construction techniques are used to visualize the relation between the geometry of a structure and the forces acting in and on it, represented by geometrically dependent form and force diagrams.

- The course will firstly review the main principles of graphic statics through a series of frontal lectures and discuss the relationship to analytical statics. Graphic statics is then used as an operative tool to design structures in equilibrium based on the lower bound theorem of the Theory of Plasticity. Additionally, the course will introduce contemporary methodologies and tools (parametric CAD software) for the interactive application of equilibrium modelling in the form of short workshops. The students will familiarize with the topic by solving exercises and confronting themselves with simple design tasks.

### Design Project

Specific structural design approaches and design methodologies based on graphic statics and references from construction history will be introduced to the students by means of seminars and workshops. By developing a design project, the students will apply these concepts and techniques in order to become proficient with open design tasks (such as the design of a bridge, a large span hall or a tower). At the end of the semester, the students present their projects to a jury of internal and external critics in a final review. The main criterion of evaluation is the students’ ability to integrate architectural considerations into their structural design.

### Literature

- "Faustformel Tragwerksentwurf" (PhD Holzner)
- "The art of structures, Introduction to the functioning of structures in architecture" (Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2015, ISBN 978-3-421-04012-1)
Objective
Promote independent, structured and scientific work; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content
The project work is supervised by a professor. Students can choose from different subjects and tasks.

Prerequisites /
notice
The project work requires normally 250 to 300 hours of work.

Abstract
Only students who fulfill the following criteria are allowed to begin with their master thesis:
- successful completion of the bachelor programme;
- fulfilling of any additional requirements necessary to gain admission to the master programme.

Objective
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Design Thinking: Human-Centred Solutions to Real World Challenges
W
5 credits
5G
S. Brusoni

Abstract
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Information and application: http://sparklabs.ch/
Objective
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders (empathy).
- Engage in collaborative ideation with a multidisciplinary team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Content
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validate them through quick iterations of prototyping and testing using different tools and materials. The students will work in a multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Prerequisites / notice
Open mind, ability to manage uncertainty and to work with students from various background. Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Abstract

Lecture notes

Course slides will be made available to students prior to each class.
Course slides will be made available to students.
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become the examples, most for understanding how they have taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

The learning material, available via https://moodle-app2.let.ethz.ch/, is comprised of:
- Toolbox 'Reader' with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

Recap of former SDL courses:

In Ostana, a clear connection is between the local identity (culture, traditions, visions) which is formed by Occitan culture (food, music, dance, language), traditional stone building architecture which is under pressure to carefully evolve with new needs for carbon-neutral and net-positive buildings, and the Monte Viso landscape. How does a re-growing economy that should be regenerative and circular by design, correlate with innovation in architecture, with population growth and associated challenges in mobility, waste systems and supplies, with growing tourism, new agro-forestry practices like industrial hemp and Paulownia, while impacts of climate change are clearly visible? How does the community design a vision that is based on cooperation on different governance scales, balancing local identity and urgently needed international innovation?

Deliverables & output: This SDL course RE:GENERATE builds upon related work from former courses hosted and lead by the MonViso Institute (i.e. on social innovation, mobility, architecture and local identity, tourism, circular economy, land use change) to develop and design foundations for an extension of the existing, visualized and partly quantified systems map, that will support ongoing and future innovation processes in this community. The focus now is on the urban integrated into new, regenerative business models of the alpine, and in regenerative relation between both as a model for the future. This course will thus develop an extended graphical systems map from the alpine to the urban, backed up by a technical report, and connected with the existing systems maps of Ostana and the surrounding valley.

Autumn Semester 2021
Page 227 of 2152
Literature

Prerequisites / notice

Depending on the Covid situation, some part of the course will be virtual via Zoom, using a Miro design board. If possible, we will do a field trip. Some travel costs may apply.

Students need to be motivated to design in teams on the preparation of the deliverables, a systemic strategy map and a written report.

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**Autumn Semester 2021**

**Page 229 of 2152**
551-0125-00L  
Fundamentals of Biology I: From Molecules to the Biochemistry of Cells  
Abstract: The lecture provides an introduction to the basics of biochemistry and molecular biology as well as evolutionary principles. The focus is on bacteria and archaea under consideration of universal concepts. The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

Objective: Introduction to calculus in one dimension. Building simple models and analysing them mathematically.

Content:
- Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.
- Functions of one variable: introduction to calculus in one dimension. Building simple models and analysing them mathematically.

401-0271-00L  
Mathematical Foundations I: Analysis A  
Abstract: Introduction to calculus in one dimension. Building simple models and analysing them mathematically. Further reading suggestions will be indicated during the lecture.

Objective: Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Content: Functions of one variable: introduction to calculus in one dimension. Building simple models and analysing them mathematically.

529-0001-00L  
Introduction to Computer Science  
Abstract: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.

Objective: Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content: Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation; Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.

Lecture notes: Script booklet (copies of powerpoint slides, in English), distributed at first or second lecture.

402-0043-00L  Physics I  O  4 credits  3V+1U  J. Home

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids) Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

Lecture notes
The lecture follows the book “Physics” by Paul A. Tipler.

Literature
Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

401-0643-13L  Statistics II  O  3 credits  2V+1U  M. Kalisch

Abstract
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective

529-0051-00L  Analytical Chemistry I  O  3 credits  3G  D. Günther, M.-O. Ebert, G. Schwarz, R. Zenobi

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods: Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling. IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes
Script will be for the production price

Literature
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Excercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

535-0521-00L  Pharmacology and Toxicology I  O  2 credits  2V  U. Quitterer, J. Abd Alla

Abstract
The two-semester lecture course will provide a detailed understanding of the fundamentals of drug action and the mechanisms of action and therapeutic use of the important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

Objective
The lectures will provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

Content
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drug classes. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

Lecture notes
A script is provided for each lecture. Scripts define important course contents but do not replace the lectures.

Literature
Recommended reading:

The classic textbook in Pharmacology:
Goodman and Gilman’s The Pharmacological Basis of Therapeutics

Prerequisites / notice
Voraussetzungen: Abschluss Grundstudium

Examination Block 2

529-0016-00L BCB III: Organic Chemistry O 8 credits 12P J. W. Bode

Abstract
Laboratory course in Organic Chemistry for students of "Biochemistry - Chemical Biology"

Objective
Introduction into basic techniques used in the organic laboratory. Understanding organic reactions through experiments.

Content
Part I: Basic operations such as the isolation, purification, and characterization of organic compounds: distillation, extraction, chromatography, crystallization, IR (UV/1H-NMR)-spectroscopy for the identification of the constitution of organic compounds.

Part II: Organic reactions: preparative chemistry. From simple, one-step to multi-step syntheses. The syntheses include classic Organic Chemistry as well as methods widely used in a Chemical Biology context.

ECTS  European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
### Introductory Course in Neuroscience I (University of Zurich)

**No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.**

**UZH Module Code: SPV0Y005**

**Mind the enrolment deadlines at UZH:**

**Abstract**

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Objective**

The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level.

**Content**

1) Human Neuroanatomy I&II  
2) Comparative Neuroanatomy  
3) Building a central nervous system I&II  
4) Synapses I&II  
5) Glia and more  
6) Excitability  
7) Circuits underlying Emotion  
8) Visual System  
9) Auditory & Vestibular System  
10) Somatosensory and Motor Systems  
11) Learning in artificial and biological neural networks

**Prerequisites / notice**

For doctoral students of the Neuroscience Center Zurich (ZNZ).

---

### Rate-Controlled Separations in Fine Chemistry

**Abstract**

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology, and in energy-related applications.

**Objective**

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Content**

The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

**Lecture notes**

Handouts during the class

**Literature**

Recommendations for text books will be covered in the class

**Prerequisites / notice**

Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

---

### Applied Statistical Regression

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**

A script will be available.
In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

- Self-direction and Self-management: not assessed

551-1619-00L Structural Biology

Abstract
The course consists of a series of research seminars on Structural Biology, Biochemistry and Biophysics, given by both scientists of the National Center of Competence in Research (NCCR) in Structural Biology and external speakers. Information on the individual seminars is provided on the following websites:
http://www.structuralbiology.uzh.ch/educ002.asp
http://www.biol.ethz.ch/dbiol-cal/index

Objective
The goal of this course is to provide doctoral and postdoctoral students with a broad overview on the most recent developments in biochemistry, structural biology and biophysics.

851-0180-00L Research Ethics

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will:
- Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
- Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;
I. Introduction to Moral Reasoning

1. Ethics - the basics
1.1 What ethics is not... 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRDP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity 1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more...).

Taught competencies

376-1581-00L Cancer: Fundamentals, Origin and Therapy

Z 2 credits 2G H. Nägeli

Abstract

Objective
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

Content
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions.

The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. The role of tumor microenvironments and phenomena like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment. Additional information is given during the lecture.

Literature
Prerequisites / notice
Taught competencies
The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

401-5640-00L ZuKoS: Seminar on Applied Statistics
- Z Dr
- 0 credits
- 1K

Abstract
About 5 talks on applied statistics.

Objective
See how statistical methods are applied in practice.

Content
There will be about 5 talks on how statistical methods are applied in practice.

Prerequisites / notice
This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.

551-1109-00L Seminars in Microbiology
- Z Dr
- 0 credits
- 2K
- S. Sunagawa, W.-D. Hardt, M. Künzler, J. Piel, J. Vorholt-Zambelli

Abstract
Seminars by invited speakers covering selected microbiology themes.

Objective
Discussion of selected microbiology themes presented by invited speakers.

501-0620-00L Statistical Consulting
- Z Dr
- 0 credits
- 0.1K
- M. Kalisch, L. Meier

Abstract
The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons.

Objective
Advice for analyzing data by statistical methods.

Content
Students and researchers can get advice for analyzing scientific data, often for a thesis. We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!

Prerequisites / notice
This is not a course, but a consulting service. There are no exams nor credits.

Contact: beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

551-0512-00L Current Topics in Molecular and Cellular Neurobiology
- Z Dr
- 2 credits
- 1S
- U. Suter

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes
Presentation will be made available after the seminar.

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).
Seminar series on technical aspects of high-resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

none

Progress Reports in Microbiology and Immunology
Students must sign up via secr.micro.biol.ethz.ch

Presentation and discussion of current research results in the field of Microbiology and Infection Immunology

Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims

J. Piel, W.-D. Hardt, A. Oxenius, J. Vorholt-Zambelli

This seminar series is targeted at Master students and PhD students conducting research projects in the field of biomolecular NMR in solution.

This compulsory course is required only once. It may be taken in autumn as course 551-0120-00 "Plant Biology Colloquium (Autumn Semester)" or in spring as course 551-0120-01 "Plant Biology Colloquium (Spring Semester)".

Current topics in Molecular Plant Biology presented by internal and external speakers from academia.

Getting insight into actual areas and challenges of Molecular Plant Biology.

This seminar series is targeted at Master students and PhD students conducting research projects in the field of biomolecular NMR in solution.

Introduction and discussion of advanced methods for recording and analysis of NMR data with biological macromolecules.

Seminar series on technical aspects of high-resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules. This seminar series is targeted at Master students and PhD students conducting research projects in the field of biomolecular NMR in solution.

This course is a seminar series on current research topics within the Institute of Molecular Health Sciences. The course introduces the participants to recent developments in the fields of molecular health sciences. Approval of the responsible lecturer necessary for participation.

Abstract
Lecture Series about topics of space research and exploration consisting of individual talks given by different leading experts from industry and academia.

Objective
Attending students will
• experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more
• be familiarized with the Swiss space research and industry sector
• improve their communication skills by broadening their research horizon
• have the opportunity for direct learning by posing questions to experts

Content
The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The ‘Lecture Series: Space Research and Exploration’ aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lecture, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers include:
21.09.: Prof. Sascha P. Quanz (ETH Zürich); Professor for Exoplanets
28.09.: Dr. Anna Kubik (ETH Zürich); Senior Scientist for Orbital Dynamics
12.10.: Dr. Andrea Fortier (University of Bern); CHEOPS Instrument Scientist
19.10.: Prof. Volker Gass (EPFL Lausanne); Director of Space Innovation
26.10.: Dr. Hendrik Kolvenbach (ETH Zürich); Postdoctoral Researcher for Space Robotics
02.11.: Deborah Müller (RUAG Space); Director of Innovation & Business Development
16.11. & 21.12.: Prof. Claude Nicollier (EPFL Lausanne); Professor Emeritus, EPFL and former Astronaut
23.11.: Dr. Adrian Glauser (ETH Zürich); Senior Scientist for Astronomical Instrumentation
30.11.: Prof. Louise Harra (ETH Zürich); Professor of Solar Astrophysics
17.12.: Prof. Didier Queloz (ETH Zürich / Cambridge); Professor for Exoplanets

ECTS
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

The newly conceived lecture is supported by scripts.

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics and elements of quantum mechanics

Objective
Students know and understand the basic ideas of the scientific description of nature. They understand the fundamental concepts and laws of mechanics and they are able to apply them in practical problems. They know the concepts of quantization and quantum numbers.

Content
1. Description of Motion
2. The laws of Newton
3. Work and energy
4. Collision problems
5. Wave properties of particles
6. The atomic structure of matter

401-0291-00L Mathematics I

Abstract
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

Objective
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.
## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsrate
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralrechnung (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:
* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

**Abstract**
Information about the practical course will be given on the first day.

Register in myStudies as early as possible, because the fire protection courses take place separately before the internship starts.

**Objective**
- Knowledge of the basic chemical laboratory methods
- Basic knowledge of the scientific approach in experimenting
- Observation and interpretation of chemical processes
- Keeping of a laboratory journal
Content
- Simple chemical working techniques/methods
- Separation techniques
- Physical measurements: mass, volume, pH
- Ionic solids (salts)
- Acid/base chemistry, buffers
- Redox reactions
- Metal complexes
- Titration methods and quantitative spectrometry
- Introduction to qualitative analysis

Lecture notes
Course manual in German (is handed out to the students at the begin of the lessons)
Language: German, English upon request

Literature
Wiley

is a suitable textbook.

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi, plants and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi, plants and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Abstract
The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective
For each of the techniques covered in the course, the students will be able to explain:

a) the physical, chemical and biological principles underlying the technique,
b) the requirements for the sample,
c) the type of raw data collected by the technique,
d) the assumptions and auxiliary information used in the interpretation of the data and
e) how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content
The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:
- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes
The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.

Abstract
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Objective
Learn the basic techniques for the preparation and purification of organic compounds.

Deepen the understanding of reaction mechanisms.

Content
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses) from the following classes of reactions: 1. nucleophilic substitution at C(sp3), 2. elimination or electrophilic addition to C=C, 3. electrophilic aromatic substitution, 4. oxidation, 5. reduction, 6. Grignard reaction, 7. synthesis of a carboxylic acid derivative, 8. Aldol-, Claisen-, Mannich-, Michael reaction or Robinson annulation.

Introduction to database searches (Reaxys, SciFinder).

Lecture notes
Documentation will be handed out at the beginning of the course.

Literature
1) P. Wörfel, M. Bitzer, U. Claus, H. Felber, M. Hübel, B. Vollenweider, Laborpraxis (Bd. 1: Einführung, allgemeine Methoden; Bd. 2: Messmethoden; Bd. 3: Trennungsmethoden; Bd. 4: Analytische Methoden); Birkhäuser Verlag; Basel; 1990.

Prerequisites / notice
The basic reactions of Organic Chemistry and their mechanisms should be known (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

As a prerequisite, all participants need to pass the "Safety Test HCI Chemie_V2 English" (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

Safety concept: https://chab.ethz.ch/studium/bachelor1.html

The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometric analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

Objective
Knowledge of the theoretical basis of the methods for nucleic acid sequence analysis, mass spectrometry based protein and proteome analysis and advanced light and fluorescent imaging methods, and an understanding of the application of these principles in experimental biology.

Content
The course will consist of lectures covering the theoretical and technical base of the respective analytical methods and exercises where typical applications of the methods in modern experimental biology are discussed.

Lecture notes
Materials supporting the lectures and exercises will be made available via Moodle.

401-0643-13L
Statistics II

Objective
Verifivation von Statistikmethoden. Nach dem detaillierteren Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective

Lecture notes
none

Literature
mandatory: "Biochemistry", Autoren: Berg/Tymoczko/Stryer, Palgrave Macmillan, International edition (the English version will be preordered at the Polybuchhandlung)

Prerequisites / notice
Some of the lectures are given in the English language.

551-1323-00L
Fundamentals of Biology II: Biochemistry and Molecular Biology

Objective
The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Objective
Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycans, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

Lecture notes
none

Literature

Prerequisites / notice
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

551-1003-00L
Methods of Biological Analysis

Abstract
The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometric analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

Abstract
The goal of the course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students will have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students will have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes
The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the nethz (Moodle). Some of the lectures are given in the English language.

Prerequisites / notice
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

529-1023-00L
Physical Chemistry I (for Biology and Pharmacy)

Abstract
This course is offered for the last time in autumn 2021.

Abstract

Prerequisites / notice
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

#### Abstract

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).
Lecturers:
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

As a prerequisite, all participants need to pass the “Safety Test HCI Chemie V2 English” (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

Safety concept: https://chab.ethz.ch/studium/bachelor1.html

Objective
Learn the basic techniques for the preparation and purification of organic compounds.
Learn to take accurate notes of the experiments and to write reports.
Deepen the understanding of reaction mechanisms.

Content

Course: Molecular Life of Plants

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

---

Course: Microbiology (Part I)

**Abstract**
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses

---

Course: Cellular Biochemistry (Part I)

**Abstract**
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Lecture notes**
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management
Objective

The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice

Course participants have already acquired basic programming skills in Python and R.

Block Courses

Registration for Block courses is mandatory. Please register under https://www.uzh.ch/zoolmed/ssl-dir/Blockkurse_UNIETH.php. Registration period: from 26.07.2021 to 13.08.2021

Please note the ETH admission criteria for the admission of ETH students to ETH block courses on the block course registration website under "allocation".

Block Courses in 1st Quarter of the Semester

Abstract

This laboratory course has a focus on current research topics in our laboratory related to metabolic engineering, the general understanding of metabolism, and is partially focused on one carbon metabolism. Projects will be conducted in small groups.

Objective

The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

Content

The course and will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab.

Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

Lecture notes

None

Literature

Will be provided at the beginning of the course.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract

Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pili by electron microscopy.

Objective

The course should enable students to understand concepts of protein expression, purification and the characterisation of biomolecular interactions. In addition, students will learn some basic principles of X-ray crystallography and electron microscopy.

Content

The students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:
• Purification, biophysical characterisation and structure determination of pilins
• Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:
• Cloning and mutagenesis
• Recombinant or endogenous protein production in E. coli or Legionella
• Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
• Protein crystallisation and crystal optimisation
• Visualisation of bacterial pili by electron microscopy (negative stain or cryo electron microscopy)
• DNA binding experiments
• Enzymatic activity measurements
• In silico structural analyses using PyMOL and Chimera

Prerequisites / notice

There are no special requirements for this course.

551-1415-00L Image-Based Drug Screening in Human Blood for Personalized Medicine

Number of participants limited to 6.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich. Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected
-All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract

Image based screening allows to measure in high throughput the phenotype of millions of individual cells to external perturbations. We have recently shown that image-based screening in human blood can help to find active treatments for patients with blood cancers. In this course we will take the students through the entire workflow (to the extent that biosafety regulations allow it).

Objective

Take the students through the entire workflow from experimental design, to screen, to imaging and analysis.
-Learn to design an image-based screening experiment
-Observe human blood sample handling
-Perform immunofluorescence & automated confocal microscopy
-Image analysis and result interpretation
-Result presentation

Abstract
Introduction to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems.

Objective
The aim of our course is to introduce the students to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems. Emphasis is given to:
• Establishment of nuclear identity and nuclear-cytoplasmic communication
• Reorganization of the nucleus in aging
• Animal cells during the generation of cell diversity and neuronal differentiation

By the end of the course, based on lectures, literature reading and practical lab work, the students will be able to formulate open questions concerning the function of the nucleus. Thus, the students will know about the mechanisms and consequences of nuclear-cytoplasmic compartmentalization, nuclear positioning, DNA clustering in the nucleus and cytoplasm during cell divisions and aging.

Content
During this block-course, the students will:
- learn how organelles establish and maintain identity with a focus on the nucleus
- discover the evolutionary and functional plasticity of the nucleus
- design, apply, evaluate and compare experimental strategies

Student - in groups of 2 or max. 3 - will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lectures and technical notes will be given and informal discussions held to provide you with the theoretical background.

Literature
Documentation and recommended literature (review articles) will be provided during the course.

Block Courses in 2nd Quarter of the Semester
From 14.10.2021 bis 5.11.2021

Abstract
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective
Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current lab techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Content
Research projects on the model pathogen Salmonella.

Lecture notes
none.

Literature
Literature will be selected with reference to the assigned research project.
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

**Abstract**

Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

**Objective**

Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.

**Content**

Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

**Lecture notes**

Unterlagen zum Kurs werden abgegeben.

**Literature**

**Prerequisites / notice**

Der Blockkurs findet an der Eidg. Forschungsanstalt WSL in Birmensdorf statt. Der Wald vor der Haustüre des Institutes macht diesen Kurs besonders praxisnah.

Erreichbarkeit mit Tram 14 bis Triemli, danach PTT-Bus 220 oder 350 bis Birmensdorf Sternen/WSL, oder mit S9 bis Birmensdorf SBB und mit PTT-Bus eine Station in Richtung Zürich bis Birmensdorf Sternen/WSL.

---

The course will introduce the students to the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

**Abstract**

The course will introduce the students to the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

**Objective**

The aim of the course is to expose the students to a wide range of modern research areas encompassed by the field of membrane biology.

**Content**

Students will be engaged in research projects aimed at understanding the biological membranes at the molecular, organellar and cellular levels. Students will design and perform experiments, evaluate experimental results, analyze the current scientific literature and understand the relevance of their work in the context of the current state of the membrane biology field.

**Lecture notes**

No script

**Literature**

The recommended literature, including reviews and primary research articles, will be provided during the course.

**Prerequisites / notice**

The course will be taught in English. All general lectures will be held at ETH Hoenggerberg. Students will be divided into small groups to carry out experiments at ETH or at the Paul Scherrer Institute. Travel to the Paul Scherrer Institute will be by public transportation.
General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected
- All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged
- Any additional rules for individual courses have to be respected
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
This course aims to provide students with a comprehensive overview of computational methods for sequence analysis and assist with developing skills for application of computational approaches by experimental scientists in the life sciences.

Objective
Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Students will have the opportunity to advance their knowledge in programming by focusing on algorithms for genome and gene sequence analysis. A major goal of the course will be to lead the student to an independent and empowered attitude towards computational problems. For reaching this goal the students will work on an implementation of a solution for a set real-world problem in genome and sequence analysis under guided supervision.

Content
- Understanding the information in biological sequences and quantifying similarity
- Introduction to algorithms for sequence comparison and searches
- Implementation of sequence comparisons and searches in Python
- Accessing data formats associated with genome sequence analysis tasks
- Understanding the anatomy of a real world sequence analysis project
- Applying tools for sequence alignment and estimating error rates
- Ability to implement a solution to a problem in sequence analysis using Python
- Accessing genome annotation and retrieving relevant information in Pandas
- Application of Genomic intervals and arrays for sequence analysis with HTSeq

The course will consist of a series of lectures, assignments for implementing elementary tasks in Python, project development and discussion workshops, and a half week of practical work implementing a Python script as a solution to a real world problem associated with sequence analysis. At the end of the course students will explain their solutions and demonstrate the functionality of their implementations, which will then be discussed and commented on by the group. It is expected that students will be able to apply the knowledge to improve on concrete problems.

Prerequisites / notice
- It is recommended to bring your own computer with a Python installation to the course
- Simple computers can be provided
- Programming basics with Python

551-1143-00L Analysis of Human T and B Cell Responses to Infectious Agents
Number of participants limited to 15.

W 6 credits 7P F. Sallusto, R. Geiger, D. Latorre

The enrolment is done by the D-BIOL study administration.

Abstract
Students actively participate in ongoing research projects on the analysis of human T and B cell response to pathogens and vaccines. They will be tutored in small groups by doctoral students and postdocs. In a lecture series, the theoretical background for the projects will be provided and the students will have the opportunity to present their projects and discuss recent publications.

Objective
To learn current methodologies in human immunology through experimental work in the lab. To learn current concepts through lectures and discussion of original papers. Requirement for obtaining the credit points: oral presentation of the research project in a ppt format.

551-0359-00L Plant Biochemistry
Number of participants limited to 15.

W 6 credits 7P S. C. Zeeman, B. Pfister

The enrolment is done by the D-BIOL study administration.

Abstract

Objective

entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected.
-All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged.
-Any additional rules for individual courses have to be respected.
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
In this block course, students actively participate in ongoing research projects on plant metabolism and are tutored by doctoral students and postdocs. The theoretical background of the projects is provided in a lecture series. Finally, students discuss their projects and results during an interactive poster session.

Objective
Through supervision in small groups (either individually or in groups of two) students learn to conduct experiments in molecular plant biology, interpret the results, record them and communicate them to peers. Students also gain an insight into the larger context of their projects and how they are planned in the longer term.

Content
Participation in a project from the following list is possible: 1) Photosynthesis: How is photosynthesis regulated and how is photoassimilated carbon distributed in plants? 2) Biology of chloroplasts: How do chloroplasts develop and how is their function coordinated with that of the whole cell? 3) Starch biosynthesis and degradation: How are complex, semi-crystalline starch granules produced from monosaccharides and how are they broken down again to release energy?

Lecture notes
No script

Literature
Descriptions of the possible projects including individual reading suggestions will be handed out beforehand.

Abstract
Fundamentals (theoretical and practical) in phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases.

Objective
Insight into ongoing research projects

Content
Experiments within ongoing phytopathological research projects
Macro- and microscopic diagnostic of plant diseases

Theoretical courses:
Fundamentals of phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases

Lecture notes
Teaching language is English and German. Will be distributed at the beginning of the course.

529-0739-01L Biological Chemistry B: New Enzymes from Directed Evolution Experiments
Number of participants limited to 12.
During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions.

Objective
All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

Content
The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

Literature
General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

Prerequisites / notice
This laboratory course will involve experiments that require a tight schedule and, particularly in the second half, very long (!) working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information see http://www.kast.ethz.ch/teaching.html, from where you can also download a flyer.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich. Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
-Whenever possible the distance rules have to be respected -All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
-The installation and activation of the Swiss Covid-App is highly encouraged
-Any additional rules for individual courses have to be respected
-Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

**Objective**

Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

**Prerequisites and Literature**

Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

**Course Information**

- **Number of participants:** limited to 7.
- **Course Format:** The course consists of lectures, seminars, and practical lab projects. Students will perform physiological in vivo studies as well as biochemical experiments.
- **Assessment:** Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.
- **Language:** This course will be taught in English.

---

**551-1515-00L Insulin Signaling**

Number of participants limited to 12.

The enrolment is done by the D-BIOL study administration.

**Abstract**

Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

**Objective**

The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

**Prerequisites**

It is recommended to attend the course Lebensmittel-Mikrobiologie (752-4005-00L) as a preparation. The course can only be booked via the Biology Student secretariat.

**General safety regulations for all block courses:**

- Whenever possible the distance rules have to be respected.
- All students have to wear masks throughout the course. Please keep reserve masks ready. Surgical masks (IIIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged.
- Any additional rules for individual courses have to be respected.
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

**752-4020-00L Experimental Food Microbiology for Biologists**

Number of participants limited to 12.

Prerequisites: It is recommended to attend the course Lebensmittel-Mikrobiologie (752-4005-00L) as a preparation.

The course can only be booked via the Biology Student secretariat.

**Abstract**

Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of foodborne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

**Objective**

Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

**Content**

Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

**Lecture notes**

Handouts were provided at the start of the course.

**Literature**

- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)
- Süßmuth et al.: "Mikrobiologisch-Biochemisches Praktikum" (Thieme)

**Prerequisites and Literature**

Important information!
During the course we will work with the food-borne pathogen Listeria monocytogenes. Listeria monocytogenes represents a particular threat to pregnant women. Due to biosafety reasons participation is not allowed in case of pregnancy.
The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:
The COVID certificate is mandatory at ETH Zurich.
Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected
- All students have to wear masks throughout the course.
Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged
- Any additional rules for individual courses have to be respected
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract
Proteins that seem to have evolved to help stabilize meiosis to temperature and/or polyploidy in plants.

Objective
To learn techniques in protein structure prediction, functional prediction and evolutionary analyses (bioinformatic), as well as protein purification from e. coli, insect cell, and/or cell-free systems, and analysis of e.g. interactions with DNA, thermostability, etc...

Content
Guided research projects to study the biochemical consequences of adaptive evolution in a variety of proteins. Mostly the focus is on proteins that seem to have evolved to help stabilize meiosis to temperature and/or polyploidy in plants.

Lecture notes
Will be provided, as appropriate, during the course.

Literature
Will be provided during course.

Abstract
Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

Objective
Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

Content
Research project on bacteria that produce bioactive natural products (e.g., Streptomycetes, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g., PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.

Lecture notes
none.

Literature
Will be provided for each of the projects at the beginning of the course.

Abstract
Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of byrophytes; knowledge of common species; skills in the determination of bryophytes; field trip.

Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss fern species; field trips.

Objective
Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of byrophytes; knowledge of common species; skills in the determination of bryophytes.

Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss fern species.

Content
Bryophytes: Systematics and morphology of hornworts, liverworts and mosses and special themes such as ecology, biogeography, diversity and endangerment of bryophytes; one full-day field trip.

Ferns: Life cycle and morphology; evolutionary groups of ferns and lycopods; mating systems, micro- and macroevolution; ecology; full-day and half-day field trips.

Lecture notes
Hand-outs will be distributed.

Literature

Prerequisites / notice
Students have to present a poster on a special theme. Gradate according to poster presentation and contributions during the course.

## Introduction to the Diversity of Current RNA Research

### Abstract

Introduction to the diversity of current RNA research at all levels from structural biology to systems biology using mainly model systems like *S. cerevisiae* (yeast), mammalian cells.

### Objective

The students will obtain an overview about the diversity of current RNA research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

### Literature

Documentation and recommended literature will be provided at the beginning and during the course.

### Prerequisites / Notice

The course will be taught in English.

---

### Parallels Between Tissue Repair and Cancer

#### 551-1511-00L

| Number of participants limited to 20.
| The enrolment is done by the D-BIOL study administration.

**Abstract**

This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer.

**Objective**

To learn the cellular and molecular principles underlying tissue repair processes, in particular in the skin and in the liver, and the parallels and differences to cancer. To learn modern technologies in Molecular and Cellular Biology as well as Histology and to use these technologies to study questions related to mechanisms underlying tissue repair and cancer.

**Content**

This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cells, as well as analysis of murine and human tissues.

The course combines practical work with lectures, discussions, project preparations and presentations.

**Lecture notes**

### Growth Control and Aging

#### 551-0371-00L

| Number of participants limited to 8.
| The enrolment is done by the D-BIOL study administration.

**Abstract**

Organisms have to control their growth in accordance with environmental conditions. Interestingly, the pathways regulating growth often also affect aging. This course focuses on the analysis of growth regulation in yeast, *Drosophila*, and mammalian cells and on its connection to aging. The participants will perform experiments to study insulin/TOR signaling as a key regulator of growth and aging.
Objective

The aims of the block course are that participants

(I) understand the function and evolution of insulin/TOR signaling

(II) learn how genetic approaches in different organisms contribute to the understanding of complex processes such as aging and cancer in humans

(III) will get familiarized with reading and discussing research articles

(IV) get a first exposure to current research.

Content

The block course consists of

(I) experiments:

Teams of two students each will join research labs to work on current projects focusing on aging and growth regulation in budding yeast, Drosophila and mammalian cells. The students will present their projects and results to their colleagues.

(II) lectures on growth regulation and aging in yeast, Drosophila and mammals.

(III) journal clubs to discuss recent literature.

Lecture notes

Lecture handouts

Literature

Original research articles will be discussed during the course.

551-1403-00L Imaging Bacterial Cells in a Native State by Electron Cryotomography

Number of participants limited to 15.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:

- The COVID certificate is mandatory at ETH Zurich.
- Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected
- All students have to wear masks throughout the course.
- Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged
- Any additional rules for individual courses have to be respected
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract

The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to macromolecular resolution. In a small group, students will perform wet lab experiments, data collection with state-of-the-art equipment, data processing and analyses. The key method and its application in bacterial cell biology will be introduced by lectures

https://www.mol.biol.ethz.ch/groups/pilhofer_group/

551-1417-00L In Vivo Cryo-EM Analysis of Dynein Motor Proteins

Number of participants limited to 5.

The enrolment is done by the D-BIOL study administration.

General safety regulations for all block courses:

- The COVID certificate is mandatory at ETH Zurich.
- Only students who have a Covid certificate, i.e. who have been vaccinated, have recovered or have been tested, are entitled to attend courses in attendance.
- Whenever possible the distance rules have to be respected
- All students have to wear masks throughout the course.
- Please keep reserve masks ready. Surgical masks (IIR) or medical grade masks (FFP2) without a valve are permitted. Community masks (fabric masks) are not allowed.
- The installation and activation of the Swiss Covid-App is highly encouraged
- Any additional rules for individual courses have to be respected
- Students showing any COVID-19 symptoms are not allowed to enter ETH buildings and have to inform the course responsible.

Abstract

Motor proteins convert chemical energy into mechanical motion. In this block course, we study dynein motor proteins in cilia. Dynein causes conformational change upon ATP hydrolysis and finally generate ciliary bending motion. Participants will analyze cryo-EM data of cilia and visualize in vivo 3D structure of dynein to learn how motor proteins function in the cell.
Objective

The goal of this course is to be familiar with structural biology techniques of cryo-electron tomography and single particle cryo-EM studies on motor proteins. The main focus is 3D image analysis of cryo-EM datasets acquired by highest-end microscopes. Participants will learn structure-function relationship at various scales: how the conformational change of motor proteins causes mechanical force and generates cellular motility.

Content

Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins, how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyze localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion.

In this course, we study dyneins in cilia. Cilia are force-generating organelles, made by nine microtubules and thousands of dyneins. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics.

The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneins, microtubules and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance of cilia preparation from green algae, cryo-EM data collection using an electron microscope in PSI and site-visit of highest-end electron microscope facility in ETH.

Lecture notes

Scripts will be distributed during the course.

Literature

An overview is given in the following review articles. Further literature will be indicated during the course.

Abstract

Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective

Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current lab techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Content

Research projects on the model pathogen Salmonella.

Lecture notes

none.

Literature

Literature will be selected with reference to the assigned research project.

Block Courses in the 1st Half of the Semester

From 21.9.2021 to 5.11.2021

highly encouraged - Any additional rules for individual
courses have to be respected - Students showing any
COVID-19 symptoms are not allowed to enter ETH
buildings and have to inform the course responsible.

Abstract
This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with
rivers, groundwater, and lakes.
This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as
excursions.

Objective
During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to
understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work.
During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems.
You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge.
After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates, and freshwater algae) in
Switzerland and the most important identification traits.

Content
The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture:
The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution
patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems; important aspects regarding ecosystem metabolism and
habitat properties of freshwaters; applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:
The practical part includes an excursion to Greifensee and a 3-day-excursion to the river Glatt in Niederuzwil, where you independently
perform small research projects.
Additionally, you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to
know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how
these organisms are used in research and practice. (language: German, translation of the most important things during the course
possible)

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
The maximal participating number of biology students is 14.

This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on
the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in
contemporary research and prepares for future studies in the course of semester and master projects.

Objective
- Understanding mammalian development
- Introduction to stem cells systems
- Working with cultured cells
- Translational aspects of mammalian cell biology

Content
The course will consist of a series of lectures, essay assignments, project development and discussion workshops, and 2 and a half week
of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an
exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to
concrete problems.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**
- During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

**Objective**
- Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

**Content**
- Den Studierenden bietet das Einführungspraktikum einen Einblick in den Berufsalltag einer Lehrperson.

**Literature**
- Wird von der Praktikumsklehrperson bestimmt.

</tbody>
</table>

**Abstract**
- The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

**Objective**
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

**Literature**
- Wird von der Praktikumsklehrperson bestimmt.

**Prerequisites / notice**
- Findet in der Regel am Schluss der Ausbildung, vor Ablegung der Prüfungslektionen statt.

**Abstract**
- In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

**Objective**
- On the basis of a specified topic, the candidate shows that they are in a position - to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle.
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

- Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area.
- Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons.
- Students can perform, off the cuff, 12 school experiments (which they have tested themselves), from the different subject areas, and conduct these correctly in technical terms. They can incorporate these experiments in their tuition in a didactically meaningful manner.
- By contrast to the Subject Specialisation 1 and 2 course units, these are "basic tests" and do not involve the implementation of current research topics. The students' compilations are available in a data archive.

2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

Hand out of course material.

- Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Participants of the course Research Ethics will
- Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
- Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people's arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;

- Number of participants limited to 40
- Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

I. Introduction to Moral Reasoning

1. Ethics - the basics
1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in Research Ethics

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 Ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity 1.5 Selection of study participants – the concept of vulnerability 1.6 Favourable risk/benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Prerequisites / notice
What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!);
1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time!) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…).

Taught competencies
Domain A - Subject-specific Competencies
- Concepts and Theories assessed
- Analytical Competencies assessed
- Decision-making assessed
- Problem-solving assessed

Domain B - Method-specific Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection assessed

Domain C - Social Competencies

Domain D - Personal Competencies

701-0015-00L Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement
W 2 credits 2S M. Stauffacher, C. E. Pohl, B. Vienni Baptista

All participants will be on the waiting list at first. Enrollment is possible until 15 September 2021. The waiting list is active until 17 September. All students will be informed on 19 September, if they can participate in the lecture.
The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, how to secure broader impact of research? They learn to critically reflect their own research project in its societal context and on their role as scientists.
The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research

This course will take place fully online. Course units have three components:

1. A pre-recorded lecture by Prof. Bernauer, available via Moodle, for all course units

2. Reading assignments, available via Moodle, for a few selected course units

3. Online meetings (via Zoom) for all course units on Mondays at 16:30 – 18:00, where we discuss your questions concerning the lecture and reading assignments and focus in greater depth on a particular facet of the respective course unit, on occasion with a guest (to be announced a few weeks ahead of the respective course unit).

You must watch the lecture and complete the reading assignment for the respective unit ahead of the online meeting. The online meeting will be recorded and made available via Moodle.

To facilitate your planning, the course is organized in terms of weekly units.

Lecture notes
Assigned reading materials and slides will be available via Moodle.

Abstract
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, the sensory organs, the neuromuscular system, the cardiovascular system and the respiratory system.

Objective
Basic knowledge of human anatomy and physiology basics of clinical pathophysiology.

Content

Anatomy and Physiology I (fall term):
Basics of cytology, histology, embryology; nervous system, sensory organs, muscles, cardiovascular system, respiratory system

Anatomy and Physiology II (spring term):
digestive tract, endocrine organs, metabolism and thermoregulation, skin, blood and immune system, urinary system, circadian rhythm, reproductive organs, pregnancy and birth.

Prerequisites / notice
Requirements: 1st year, scientific part.
Part of the course is read and checked in English.

752-4001-00L Microbiology | E- | 2 credits | 2V | M. Ackermann, M. Schuppler, J. Vorholt-Zambelli |

Abstract
Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Content

Lecture notes
Wird von den jeweiligen Dozenten ausgegeben.

Literature
Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms

551-0127-01L Plants and Fungi | E- | 4 credits | 3G | S. C. Zeeman, M. Künzler, O. Y. Martin |

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi and plants.

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity
2. Students can explain how the internal and external structures of fungi and plants function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi and plants. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi and plants have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Campbell “Biology”, 11th Edition

Prerequisites / notice
Some lecture are held in English.

</tr>
<tr>
<td></td>
<td>Abstract</td>
<td></td>
<td></td>
<td></td>
<td>This course presents the theoretical and empirical approaches used to understand the ecological processes structuring communities. Central problems in community ecology including the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes, and how this predictive science informs conservation and management decisions.</td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>Upon completing the course, students will be able to: Understand the factors determining the outcome of species interactions in communities, and how this information informs management. Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions. Understanding the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity. Use population and community models to predict the stability of interactions between predators and prey and between different competitors. Understand the conceptual basis of predictions concerning how ecological communities will respond to climate change. Discuss the types of conceptual advances ecology as a science can realistically achieve, and how these relate to the applications of the discipline.</td>

|              | The number of participants is limited to 30. |      |      |       |                         |
| Abstract     | This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes lectures, small group discussions and outside readings. |      |      |       |                         |
| Objective    | The aim of the course is to gain an understanding of how insects have specialised and adapted to occupy diverse environmental niches and become vital to ecosystem processes. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions and examining insect ecology in an evolutionary context. |      |      |       |                         |
| Lecture notes | Provided to students through Moodle. Selected required readings (peer reviewed literature). Optional recommended readings with additional information. |      |      |       |                         |

| 401-0625-01L | Applied Analysis of Variance and Experimental Design | W    | 5 credits | 2V+1U | L. Meier |
| Abstract     | Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power. |      |      |       |                         |
| Objective    | Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R. |      |      |       |                         |
| Content      | Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power. |      |      |       |                         |
| Prerequisites / notice | The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held. |      |      |       |                         |

| 401-0649-00L | Applied Statistical Regression | W    | 5 credits | 2V+1U | M. Dettling |
| Abstract     | This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis. |      |      |       |                         |
| Objective    | The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling. The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data. |      |      |       |                         |
| Content      | The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies. |      |      |       |                         |
| Lecture notes | A script will be available. |      |      |       |                         |
| Literature   | Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis |      |      |       |                         |
| Prerequisites / notice | The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held. |      |      |       |                         |

At the end of the course...

Domain A - Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Domain B - Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies assessed
- Problem-solving assessed
- Project Management not assessed

Domain C - Social Competencies
- Communication assessed
- Cooperation and Teamwork not assessed
- Customer Orientation not assessed
- Leadership and Responsibility not assessed
- Self-presentation and Social Influence not assessed
- Sensitivity to Diversity not assessed
- Negotiation not assessed

Domain D - Personal Competencies
- Adaptability and Flexibility assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection not assessed
- Self-direction and Self-management not assessed

701-0301-00L Applied Systems Ecology

Objective
At the end of the course...
- you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.
- you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).
- you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.
- you understand the importance of ecosystem services for society.
- you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.
- you have reflected on ecology as a young discipline at the heart of significant applied questions.

Content
This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Lecture notes
Case descriptions, commented glossary and a list of literature and further resources per case.

Prerequisites / notice
Schulze et al. (2005) Plant Ecology; Springer.

401-6215-00L Using R for Data Analysis and Graphics (Part I)
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should “automatically” make you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=15518

---

401-6217-00L Using R for Data Analysis and Graphics (Part II) W 1.5 credits 1G M. Mächler

Abstract
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on “Using R... (Part I)”, but can be taken independently if the basics of R are already known.

Objective
The students will be able to use the software R efficiently for data analysis, graphics and simple programming.

Content
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options
- Extending basic R: packages

Lecture notes

Prerequisites / notice
Basic knowledge of R equivalent to “Using R .. (part 1)” (= 401-6215-00L) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should “automatically” make you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=15522

---

751-4504-00L Plant Pathology I W 2 credits 2G B. McDonald

Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Content  
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  
Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  
Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  
Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  
Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  
Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 7  

Week 8  
Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  
Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 11  

Week 12  

Week 13  
Cultural control methods: fertilizers, crop rotations.

Week 14  
Open lecture.

Lecture notes  
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

636-0017-00L  
Computational Biology  
W  
6 credits  
3G+2A  
T. Vaughan

Abstract  
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective  
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content  
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes  
Lecture slides will be available on moodle.

Literature  
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course ‘Introduction to Programming’, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date. For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lemeinheit.view?semkez=2018W&amp;ansicht=KATALOGDATEN&amp;lemeinheitid=123546&amp;lang=d, e, or working through the script provided as part of this R course.

701-1471-00L
Ecological Parasitology

W 3 credits 1V+1P J. Jokela, C. Vorburger

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objective
1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

Content
Lectures:
1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Ecology and evolution of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

Waiting list will be deleted on October 1st, 2021.

701-1427-00L
Experimental Evolution

W 4 credits 2S G. Velicer, A. Hall

Does not take place this semester. Semester change.

This lecture will be offered in Spring Semester 2022 for the next time.

Abstract
Students will analyze experimental evolution literature covering a wide range of questions, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal.

Objective
Course objectives:
1) become familiar with a diverse sample of experimental evolution literature,
2) gain understanding of the strengths and limitations of experimental evolution for addressing evolutionary questions relative to other forms of evolutionary analysis, and
3) gain the ability to effectively design and analyze evolution experiments that address fundamental or applied questions in evolutionary biology.

Content
Experimental evolution is a powerful and increasingly prominent approach to investigating evolutionary processes. Students will analyze experimental evolution literature covering a diverse range of topics, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Literature
Primary research papers and review articles.

Prerequisites / notice
701-0245-00 Evolutionary Analysis (or equivalent).

701-1703-00L
Evolutionary Medicine for Infectious Diseases

W 3 credits 2G A. Hall

Number of participants limited to 35.

Waiting list will be deleted October 3rd, 2021.

Abstract
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (~ 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature
The focus is on primary literature, but for some parts the following text books provide good background information:

Schmid Hempel 2011 Evolutionary Parasitology
Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

636-0009-00L
Evolutionary Dynamics

W 6 credits 2V+1U+2A N. Beerenswinkel

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.
Objective

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

Content

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

Lecture notes

No.

Literature

Prerequisites / notice

Prerequisites: Basic mathematics (linear algebra, calculus, probability)

Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories (assessed)

Domain B - Method-specific Competencies
- Analytical Competencies (assessed)
- Problem-solving (assessed)

Domain C - Social Competencies
- Communication (not assessed)
- Cooperation and Teamwork (not assessed)

Domain D - Personal Competencies
- Critical Thinking (assessed)
- Self-direction and Self-management (not assessed)

| 551-0309-00L | Concepts in Modern Genetics               | W    | 6    | 4V    | Y. Barral, D. Bopp, A. Hajnal, O. Voinnet |
| Abstract    | Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH. |
| Objective   | Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html |
| Content     | Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference. |
| Lecture notes | Scripts and additional material will be provided during the semester. |

| Abstract    | This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming. |
| Objective   | The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference. |
| Lecture notes | The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data. |
Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.
Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Elective Major: Microbiology and Immunology

Taught competencies

Domain A - Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Domain B - Method-specific Competencies
Analytical Competencies not assessed
Decision-making assessed
Media and Digital Technologies not assessed
Problem-solving assessed
Project Management not assessed

Domain C - Social Competencies
Communication not assessed
Cooperation and Teamwork not assessed
Customer Orientation not assessed
Leadership and Responsibility not assessed
Self-presentation and Social Influence not assessed
Sensitivity to Diversity assessed
Negotiation not assessed

Domain D - Personal Competencies
Adaptability and Flexibility not assessed
Creative Thinking not assessed
Critical Thinking assessed
Integrity and Work Ethics not assessed
Self-awareness and Self-reflection assessed
Self-direction and Self-management assessed
This course provides a detailed understanding of - development of T and B cells - the dynamics of an immune response during acute and chronic infection - mechanisms of immunopathology - modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

- Immunology III
- Current Topics in Molecular and Cellular Neurobiology
- Cutting Edge Topics: Immunology and Infection Biology

551-1153-00L
Systems Biology of Metabolism

W 4 credits 2V

U. Sauer, N. Zamboni, M. Zampieri

Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

551-1171-00L
Immunology: From Milestones to Current Topics

W 4 credits 2S

B. Ludewig, J. Kisielow, A. Oxenius, L. Tortola, University lecturers

Number of participants limited to 20.

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content
Milestones and current topics of innate immunity, antigen presentatino, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Lecture notes
Original and review articles will be distributed by the respective lecturer.

Literature
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

551-1303-00L
Cellular Biochemistry of Health and Disease

W 4 credits 2S

V. Korkhov, T. Ishikawa, M. Jagannathan, R. Kroschewski, G. Neurohr, M. Peter, A. E. Smith, B. Snijder, K. Weis

Number of participants limited to 20.

Abstract
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. Students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

Objective
Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

Content
Original and review articles will be distributed by the respective lecturer.

Literature
The literature will be provided during the course

Prerequisites / notice
The course will be taught in English.

752-4009-00L
Molecular Biology of Foodborne Pathogens

W 3 credits 2V

M. Loessner, M. Schmelcher, M. Schupppler, E. Wetter Slack

Abstract
The course includes hands-on classroom work and lab exercises that cover the molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.
Objective

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content

Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature

Recommendations will be given in the first lecture

Prerequisites / notice

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break !
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Papillin and papisin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course ‘Introduction to Programming’, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date http://www.cbb.ethez.ch/news-events.html
For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethez.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&ansicht=KATALOGDATEN&lerneinheitId=123546&lang=d, or working through the script provided as part of this R course.

701-1703-00L Evolutionary Genetics W 6 credits 4V T. Städler, A. Widmer, S. Fior, M. C. Fischer, J. Stapley

Number of participants limited to 35.

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Abstract
The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Content
The focus is on primary literature, but for some parts the following text books provide good background information:

- M. Loessner
- T. Städler

Number
752-4005-00L Food Microbiology I W 3 credits 2G M. Loessner

Abstract
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

Waiting list will be deleted October 3rd, 2021.

M. C. Fischer, J. Stapley

Autumn Semester 2021

Page 287 of 2152
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and central carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses
- Senescence

**551-0311-00L Molecular Life of Plants**  
**Objective**

The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**551-0307-00L Molecular and Structural Biology I: Protein Structure and Function**

- D-BIOL students are obliged to take part I and part II (next semester) as a two-semester course

**Objective**

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**551-0309-00L Concepts in Modern Genetics**

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**551-0319-00L Cellular Biochemistry (Part I)**

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Information for UZH students: Please enrol at ETH for this module: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

**Lecture notes Literature**

- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.
- Current topics: References will be given during the lectures.

**Literature**

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1299-00L  Introduction to Bioinformatics

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4G</th>
</tr>
</thead>
</table>

Abstract

This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

Objective

The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

Content

Ethics:

Case studies to learn about applying ethical principles in human genomics research

Genomics:

Genetic variant calling

Analysis and critical evaluation of genome wide association studies

Metagenomics:

Reconstruction of microbial genomes

Microbial community compositional analysis

Quantitative metagenomics

Network bioinformatics:

Inference of molecular networks

Use of networks for interpretation of (gen)omics data

Imaging:

High throughput single cell imaging

Image segmentation

Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice

Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferably running the latest versions of Windows or MacOSX.
Students will be guided to choose their papers based on recent literature published less than 1 year prior in a relevant journal.

D. Bopp, A. Hajnal, Current Topics in Metabolism and Disease

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and metabolism of diseases. The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology and medicine. The student should be able to grasp what the authors wanted to learn i.e. their hypothesis and their goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides him/her with practice in public speaking.

Presentations will be made available after the seminars.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular processes. In addition, the students will be able to describe the spatial and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance. Every participant is expected to take part in the discussion and to ask questions. At each meeting, all students are expected to read and prepare the paper beforehand. Each paper presented will be announced one week in advance of the presentation.

Lecture notes

Presentations will be made available after the seminars.

Literature

Students will be guided to choose their papers based on recent literature published less than 1 year prior in a relevant journal.

Lecture notes

Scripts and additional material will be provided during the semester.

551-0317-00L | Immunology I | W | 3 credits | 2V | M. Kopf, A. O xenius

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.
**Content**

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

**Prerequisites / notice**

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

**Taught competencies**

**Domain A - Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Domain B - Method-specific Competencies**

- Analytical Competencies: not assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: not assessed

**Domain C - Social Competencies**

- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

**Domain D - Personal Competencies**

- Adaptability and Flexibility: not assessed
- Creative Thinking: not assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: not assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

**551-1299-00L Introduction to Bioinformatics**

**W 6 credits 4G**

**Abstract**

This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include: genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

**Objective**

The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

**Content**

**Ethics:**

- Case studies to learn about applying ethical principles in human genomics research

**Genomics:**

- Genetic variant calling
- Analysis and critical evaluation of genome wide association studies

**Metagenomics:**

- Reconstruction of microbial genomes
- Microbial community compositional analysis
- Quantitative metagenomics

**Network bioinformatics:**

- Inference of molecular networks
- Use of networks for interpretation of (gen)omics data

**Imaging:**

- High throughput single cell imaging
- Image segmentation
- Automatic analysis of drug effects on single cell suspension (chemotyping)

**Prerequisites / notice**

Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

**Title**

- Current Topics in Molecular and Cellular Neurobiology

**Type**

- W

**ECTS**

- 2

**Hours**

- 1S

**Lecturers**

- U. Suter

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes
Presentations will be made available after the seminars.

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

---

**551-0571-00L**  
*From DNA to Diversity (University of Zurich)*

*No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.*

**UZH Module Code:** BIO336

*Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html*

**Abstract**
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

**Objective**
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

**Key skills:**
- By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

**Lecture notes**
Presentations will be made available after the seminars.

**Prerequisites / notice**
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

**551-1117-00L**  
*Cutting Edge Topics: Immunology and Infection Biology*

*Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO636 at UZH.*

*Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html*

**Abstract**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Objective**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.
The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

**Content**
Immunology and infection biology.
The specific topics are variable and depend each semester on the list of invited experts.

**Lecture notes**
Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

**Literature**
Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.

---

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the

<table>
<thead>
<tr>
<th>227-0939-00L</th>
<th>Cell Biophysics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abstract</td>
<td>Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.</td>
</tr>
<tr>
<td>Objective</td>
<td>Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.</td>
</tr>
<tr>
<td>Objective of this course</td>
<td>To show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy. Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.</td>
</tr>
<tr>
<td>By the end of the course</td>
<td>Students will also learn to critically evaluate the concepts of making an assumption and making an approximation.</td>
</tr>
</tbody>
</table>
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Lecture notes

Theory and corresponding exercises are merged together during the classes.

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

376-1305-01L Neural Systems for Sensory, Motor and Higher Brain Functions

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO343 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract

The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective

The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content

The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

376-1305-00L Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: BIO344

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.
Objective
On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development
- apply principles of molecular, cellular, and developmental biology
to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

Key skills
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular, and developmental biology to the developing nervous system.

Content
The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz as BIC0344

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
None. Bring something to write and your student ID

551-1423-00L Concepts in Modern Genetics
W 2 credits 1S to be announced

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Stoffel Lab in the Institute of Molecular Health Sciences, will present a comprehensive presentation of a recent paper published in a top ranking international peer reviewed journal that relates to metabolism and disease.

Objective
The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology, and medicine. The student should be able to grasp what the authors wanted to learn i.e. their hypothesis and their goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides him/her with practice in public speaking.

Content
Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance. Every participant is expected to take part in the discussion and to ask questions. At each meeting, all students are expected to read and prepare the paper beforehand. Each paper presented will be announced one week in advance of the presentation.

Lecture notes
Presentations will be made available after the seminars.

Literature
Students will be guided to choose their papers based on recent literature published less than 1 year prior in a relevant journal.

Elective Major: Molecular Health Sciences

Elective Compulsory Concept Courses

See D-BIOL Master Studies Guide
Content

Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Abstract
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

Objective
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Content
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

Literature
The literature will be provided during the course

Prerequisites / notice
The course will be taught in English.

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.
Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to participate in the discussion and ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be available after the seminars.

Lecture notes

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-1153-00L Systems Biology of Metabolism

Number of participants limited to 15.

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Script and original publications will be supplied during the course.

551-1177-00L ImmunoLOGY: From Milestones to Current Topics

Milestones in Immunology: on old concepts and modern experiments

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the debate. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Original and review articles will be distributed by the respective lecturer.

Literature
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle- app2.let.ethz.ch/course/view.php?id=15568

572-5000-00L Microbiology of Foodborne Pathogens

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococci). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students. Recommendations will be given in the first lecture.

Autumn Semester 2021 Page 298 of 2152
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

**Prerequisites / notice**

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without break!

752-6101-00L

**Dietary Etiologies of Chronic Disease**

**W 3 credits 2V**

M. B. Zimmermann

**Abstract**

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Lecture notes**

There is no script. Powerpoint presentations will be made available on-line to students.

**Literature**

To be provided by the individual lecturers, at their discretion.

**Prerequisites / notice**

No compulsory prerequisites, but prior completion of the courses “Introduction to Nutritional Science” and “Advanced Topics in Nutritional Science” is strongly advised.

376-0300-00L

**Translational Science for Health and Medicine**

**W 3 credits 2G**

J. Goldhahn, C. Wolfrum

**Abstract**

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Objective**

After completing this course, students will be able to understand:

- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

**Content**

What is translational science and what is it not?

- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

701-1703-00L

**Evolutionary Medicine for Infectious Diseases**

**W 3 credits 2G**

A. Hall

**Abstract**

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

**Objective**

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

**Content**

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

**Literature**

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

**Prerequisites / notice**

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

636-0108-00L

**Biological Engineering and Biotechnology**

**W 4 credits 3V**

M. Fussenegger

**Abstract**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Content**

**Lecture notes**

Handout during the course.

551-1407-00L

**RNA Biology Lecture Series I: Transcription & Processing & Translation**

**W 4 credits 2V**

F. Allain, N. Ban, U. Kutay, further lecturers

**Abstract**

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Objective**

The students should obtain an understanding of these processes, which are at work during gene expression.
### 551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

<table>

</tr>
</tbody>
</table>

**Abstract**

The course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**

The students will learn about the methods used to study non-coding RNAs, computational approaches to miRNAs, micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology.

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

### 551-1423-00L Current Topics in Metabolism and Disease

<td>O</td>
<td>2</td>
<td>1S</td>
<td>to be announced</td>
</tr>
</tbody>
</table>

**Abstract**

The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology and medicine. The students should be able to grasp what the authors wanted to learn i.e. their hypothesis and goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. Furthermore, the student should discuss alternative approaches and future experiments. Each student will present one paper during the course, which provides him/her with practice in public speaking.

**Objective**

Each student will present at least once during the semester. The presentation includes an introduction to the field of the paper, a critical description of the main results, a summary of the main points and a discussion of their significance. Each participant is expected to take part in the discussion and to ask questions. At each meeting, all students are expected to read the paper beforehand. Each paper presented will be announced one week in advance of the presentation.

**Prerequisites / notice**

Literature

Presentations will be made available after the seminars.

**Type**

Students will be guided to choose their papers based on recent literature published less than 1 year prior in a relevant journal.

**Abstract**

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Stoffel Lab in the Institute of Molecular Health Sciences, will present a comprehensive presentation of a recent paper published in a top ranking international peer reviewed journal that relates to metabolism and disease.

**Objective**

The course introduces the students to recent developments in the fields of metabolism and disease. It also supports the development of analytical skills, including critical reading of scientific literature, being able to present and critically discuss scientific experiments, point out technical limitations, and placing recent discoveries in the broader context of biology, physiology and medicine. The students should be able to grasp what the authors wanted to learn i.e. their hypothesis and goals, why the authors chose the experimental approach and methods used, the strengths and weaknesses of the experiments, the quality of the data presented, the conclusions drawn, and how the work fits into the wider literature in the field. **Abstract**

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

**Objective**

Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

**Content**

Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

**Prerequisites / notice**

The literature will be provided during the course

The course will be taught in English.

### Elective Compulsory Concept Courses

Autumn Semester 2021
Page 300 of 2152
Molecular and Structural Biology I: Protein Structure and Function

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes**
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

**Literature**
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

---

**Concepts in Modern Genetics**

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

---

**Prerequisites / Literature**

**Computational Systems Biology**
- Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

---

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

401-0649-00L

**Content**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

**Literature**

- Fox (2008): *Applied Regression Analysis and GLMs*
- Montgomery et al. (2006): *Introduction to Linear Regression Analysis*

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

**Taught competencies**

- Domain A - Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
- Domain B - Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: assessed
  - Problem-solving: assessed
  - Project Management: not assessed
- Domain C - Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: not assessed
  - Customer Orientation: not assessed
  - Leadership and Responsibility: not assessed
  - Self-presentation and Social Influence: not assessed
  - Sensitivity to Diversity: not assessed
  - Negotiation: not assessed
- Domain D - Personal Competencies
  - Adaptability and Flexibility: assessed
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: assessed
  - Self-awareness and Self-reflection: not assessed
  - Self-direction and Self-management: not assessed

529-0041-00L

**Content**

Modern mass spectrometry, hyphenated methods, and chemometrics.

**Abstract**

Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

**Objective**

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

**Content**

Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

**Lecture notes**

Lecture notes will be made available online.

**Literature**

Information about relevant literature will be available in the lecture & in the lecture notes.

**Prerequisites / notice**

Exercises are an integral part of the lecture. Prerequisites:
- 529-0051-00 "Analytische Chemie I (3. Semester)"
- 529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!

Literature

Prerequisites / notice

Participants need a good command of

- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

### 551-0313-00L Microbiology (Part I)

- **Abstract**: Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- **Objective**: This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- **Content**: Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- **Lecture notes**: Scripts and additional material will be provided during the semester.
- **Prerequisites / notice**: The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

### 551-0317-00L Immunology I

- **Abstract**: Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.
- **Objective**: Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.
- **Content**: - Introduction and historical background - Innate and adaptive immunity, Cells and organs of the immune system - B cells and antibodies - Generation of diversity - Antigen presentation and Major Histoincompatibility (MHC) antigens - Thymus and T cell selection - Autoimmunity - Cytotoxic T cells and NK cells - Th1 and Th2 cells, regulatory T cells - Allergies - Hypersensitivities - Vaccines, immune-therapeutic interventions
- **Literature**: - Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020
- **Prerequisites / notice**: For D-BiOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

### 529-0731-00L Nucleic Acids and Carbohydrates

- **Abstract**: Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
- **Objective**: Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
- **Content**: Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
- **Literature**: Mainly based on original literature, a detailed list will be distributed during the lecture.

**Abstract**
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics:

- Plant genome organization and evolution
- Plant functional genomics and systems biology
- Plant genome engineering and editing
- Seed development and embryogenesis
- Root apical meristem: structure, function and hormone regulation
- Shoot apical meristem: structure, function and hormone regulation
- Mobilization of seed reserves
- Heterotrophic to autotrophic growth
- Chloroplast biogenesis and light perception
- Photosynthetic and central carbon metabolism
- Integration of carbon and nitrogen metabolism
- Principles of RNA silencing
- MicroRNAs: discovery and modes of action
- RNA silencing and pathogen defense
- RNA silencing movement, amplification and trans-generational silencing
- Plants and the environment
- Plant-pathogen interactions: pathogen attack, first layers of plant defense and plant responses
- Senescence

Current topics: References will be given during the lectures.

**Abstract**

- The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will be able to assess options for action in view of requirements from the economy, environment and society. Further, they will learn to elaborate on current issues in pest management, and to critically evaluate case studies.

**Data:** 14.12.2021 12:41  
**Autumn Semester 2021**  
**Page:** 308 of 2152
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

**Lecture Topics and Tentative Schedule**

**Week 1**  
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

**Week 2**  
Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

**Week 3**  
Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

**Week 4**  
Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

**Week 5**  
Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

**Week 6**  
Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

**Week 7**  

**Week 8**  
Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

**Week 9**  
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

**Week 10**  
Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

**Week 11**  

**Week 12**  

**Week 13**  
Cultural control methods: fertilizers, crop rotations.

**Week 14**  
Open lecture.

Lecture notes  
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-0319-00L | Cellular Biochemistry (Part I) | W    | 3    | 2V    | U. Kutay, G. Neurohr, M. Peter, K. Weis, I. Zemp |

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Content
The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Lecture notes
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Computational Systems Biology
This course focuses on the concepts of classical and modern genetics and genomics.

W., D. Bopp, A. Hajnal,

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover

Introduction to Bioinformatics

Hours
Microbiology (Part I)
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

2V
The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging.

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Lecture notes

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/program-courses/special-students/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes

Updated handouts will be provided during the class.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-1299-00L
Abstract
This course introduces principle concepts, the state-of-the-art and methods used in some major fields of Bioinformatics. Topics include:
genomics, metagenomics, network bioinformatics, and imaging. Lectures are accompanied by practical exercises that involve the use of common bioinformatic methods and basic programming.

Objective
The course will provide students with theoretical background in the area of genomics, metagenomics, network bioinformatics and imaging. In addition, students will acquire basic skills in applying modern methods that are used in these sub-disciplines of Bioinformatics. Students will be able to access and analyse DNA sequence information, construct and interpret networks that emerge though interactions of e.g. genes/proteins, and extract information based on computer-assisted image data analysis. Students will also be able to assess the ethical implications of access to and generation of new and large amounts of information as they relate to the identifiability of a person and the ownership of data.

Content
Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation
Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice

Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferentially running the latest versions of Windows or MacOSX.

Content
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Literature

636-0706-00L Spatio-Temporal Modelling in Biology

Abstract
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

Objective
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content
1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Dynamical Systems
4. Cell-cell Signalling (Dr Boaretto)
5. Travelling Waves
6. Turing Patterns
7. Chemotaxis
8. Mathematical Description of Growing Biological Systems
9. Image-Based Modelling
10. Tissue Mechanics
11. Cell-based Tissue Simulation Frameworks
12. Plant Development (Dr Dumont)
13. Growth Control
14. Summary

Lecture notes
All lecture material will be made available online
https://www.bsse.ethz.ch/cobi/teaching/636-0706-00L_Spatial_Modelling_in_Biology.html

Literature
The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

Murray, Mathematical Biology, Springer
Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
Keener and Sneyd, Mathematical Physiology, Springer
Fall et al. Computational Cell Biology, Springer
Szallasi et al, System Modeling in Cellular Biology, MIT Press
Wolkenhauer, Systems Biology
Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice
The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
The course will be given as a mixture of lectures, original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.
**Objective**

By the end of this course, students should be able to:
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

**Key skills:**
- By the end of this module, each student should be able to:
- present and discuss a relevant evolutionary topic in an oral presentation.
- select and integrate key concepts in animal evolution from primary literature.
- participate in discussions on topics presented by others.

---

**636-0009-00L**  
**Evolutionary Dynamics**  
**W 6 credits 2V+1U+2A**  
**N. Beerenwinkel**

**Abstract**

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.

**Objective**

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

**Content**

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

**Cell Biophysics**  
**W 6 credits 4G**  
**T. Zambelli**

**Abstract**

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

**Objective**

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytokskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

**Content**

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elastcity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

---

**Lecture notes**

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

---

**Literature**

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

| Abstract       | Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS). |
| Objective      | Introduction to classical (atomicistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations. |
| Content        | Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS). |
| Lecture notes  | The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture). |
| Literature     | See: www.csms.ethz.ch/education/CSBMS |
| Prerequisites / notice | Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark). |

| 401-0649-00L   | Applied Statistical Regression                   | W    | 5 credits | 2V+1U | M. Detting |
| Abstract       | This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis. |
| Objective      | The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling. |
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Domain B - Method-specific Competencies

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Prerequisites / notice

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

The course is offered during the second part of the semester and which can be taken independently from Part I.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

Part II of the course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Prerequisites / notice

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=15518
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Prerequisites / notice
Exercises are an integral part of the lecture.

Prerequisites:
529-0051-00 *Analytische Chemie I (3. Semester)*
529-0058-00 *Analytische Chemie II (4. Semester)*
(or equivalent)

### 529-0243-01L Transition Metal Catalysis: From Mechanisms to Applications

**W** 6 credits  3G  B. Morandi

- Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint

- Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

- Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

- Slides will be uploaded 1-2 days before each lecture on [http://morandi.ethz.ch/education.html](http://morandi.ethz.ch/education.html)

- Primary literature and review articles will be cited during the course.

- The following textbooks can provide useful support for the course:

- Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACIII

- Special requirement: each participant will have to come up with an independent research proposal to be presented orally (or handed in in written form) at the end of the semester. A dedicated workshop will be organized in the middle of the semester to introduce the students to proposal writing and presentation.
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation. 

**Abstract**

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

**Content**

Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

**Lecture notes**

Lecture notes will be made available online.

**Literature**

Information about relevant literature will be available in the lecture & in the lecture notes.

**Prerequisites / notice**

Exercises are an integral part of the lecture.

**Taught competencies**

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Domain C - Social Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

**551-1407-00L**  
**RNA Biology Lecture Series I: Transcription & Processing & Translation**  
**W 4 credits 2V**  
**F. Allain, N. Ban, U. Kutay, further lecturers**

**Abstract**

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Objective**

The students should obtain an understanding of these processes, which are at work during gene expression.

**Content**

Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, miRNA surveillance & miRNA turnover; signal transduction & RNA.

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

**551-1409-00L**  
**RNA Biology Lecture Series II: Non-Coding RNAs:**  
**W 4 credits 2V**  
**J. Hall, M. Stoffel, further lecturers**

**Abstract**

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**

The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**

Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

### Advanced Methods and Strategies in Synthesis

**Abstract**

Knowledge of modern methods in asymmetric stereocontrol, enantioselective catalysis, and organic reaction mechanisms.

**Objective**

Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; cross coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primarily literature including identification of trends, key predecessors, and emerging topics will be emphasized.

**Lecture notes**

will be provided in class and online

**Literature**

Suggesting Textbooks

### Cell Biophysics

**Abstract**

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

**Objective**

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

**Content**

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns
- Sequences and evolution

Theory and corresponding exercises are merged together during the classes.

**Lecture notes**

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

**Literature**

**Prerequisites / notice**

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNA, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes**
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

**Literature**
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

**Abstract**
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalization of biochemical processes.

**Lecture notes**
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bcc.biol.ethz.ch)

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Content
Ethics:
Case studies to learn about applying ethical principles in human genomics research

Genomics:
Genetic variant calling
Analysis and critical evaluation of genome wide association studies

Metagenomics:
Reconstruction of microbial genomes
Microbial community compositional analysis
Quantitative metagenomics

Network bioinformatics:
Inference of molecular networks
Use of networks for interpretation of (gen)omics data

Imaging:
High throughput single cell imaging
Image segmentation

Automatic analysis of drug effects on single cell suspension (chemotyping)

Prerequisites / notice
Course participants have already acquired basic programming skills in Python and R.

Students will bring and work on their own laptop computers, preferably running the latest versions of Windows or MacOSX.

Recommended Elective Courses (for all Master Majors)

Number of participants limited to 40

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract
Students are able to identify and critically evaluate moral arguments, to analyse and to solve moral dilemmas considering different normative perspectives and to create their own well-justified reasoning for taking decisions to the kind of ethical problems a scientist is likely to encounter during the different phases of biomedical research.

Objective
Participants of the course Research Ethics will
• Develop an understanding of the role of certain moral concepts, principles and normative theories related to scientific research;
• Improve their moral reasoning skills (such as identifying and evaluating reasons, conclusions, assumptions, analogies, concepts and principles), and their ability to use these skills in assessing other people’s arguments, making decisions and constructing their own reasoning to the kinds of ethical problems a scientist is likely to encounter;

Content
I. Introduction to Moral Reasoning
1. Ethics - the basics
1.1 What ethics is not… 1.2 Recognising an ethical issue (awareness) 1.3 What is ethics? Personal, cultural and ethical values, principles and norms 1.4 Ethics: a classification 1.5 Research Ethics: what is it and why is it important?

2. Normative Ethics
2.1 What is normative ethics? 2.2 Types of normative theories – three different ways of thinking about ethics: Virtue theories, duty-based theories, consequentialist theories 2.3 The plurality of normative theories (moral pluralism); 2.4 Roles of normative theories in “Research Ethics”

3. Decision making: How to solve a moral dilemma
3.1 How (not) to approach ethical issues 3.2 What is a moral dilemma? Is there a correct method for answering moral questions? 3.3 Methods of making ethical decisions 3.4 Is there a “right” answer?

II. Research Ethics - Internal responsibilities
1. Integrity in research and research misconduct
1.1 What is research integrity and why is it important? 1.2 What is research misconduct? 1.3 Questionable/Detrimental Research Practice (QRP/DRP) 1.4 What is the incidence of misconduct? 1.5 What are the factors that lead to misconduct? 1.6 Responding to research wrongdoing 1.7 The process of dealing with misconduct 1.8 Approaches to misconduct prevention and for promoting integrity in research

2. Data Management
2.1 Data collection and recordkeeping 2.2 Analysis and selection of data 2.3 The (mis)representation of data 2.4 ownership of data 2.5 Retention of data 2.6 Sharing of data (open research data) 2.7 The ethics of big data

3. Publication ethics / Responsible publishing
3.1 Background 3.2 Criteria for being an author 3.3 Ordering of authors 3.4 Publication practices

III. Research Ethics – External responsibilities
1. Research involving human subjects
1.1 History of research with human subjects 1.2 Basic ethical principles – The Belmont Report 1.3 Requirements to make clinical research ethical 1.4 Social value and scientific validity
1.5 Selection of study participants – the concept of vulnerability
1.6 Favourable risk-benefit ratio 1.7 Independent review - Ethics Committees 1.8 Informed consent 1.9 Respect for potential and enrolled participants

2. Social responsibility
2.1 What is social responsibility? a) Social responsibility of the individual scientist b) Social responsibility of the scientific community as a whole; 2.2 Participation in public discussions: a) Debate & Dialogue b) Communicating risks & uncertainties c) Science and the media 2.3 Public advocacy (policy making)

3. Dual use research
3.1 Introduction to Dual use research 3.2 Case study – Censuring science? 3.3 Transmission studies for avian flu (H5N1) 3.4 Synthetic biology

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.
Prerequisites / notice

What are the requirements?
First and foremost your strong willingness to seriously achieve the main learning outcomes as indicated in the Course Catalogue (specific learning outcomes for each module will be provided at the beginning of the course). For successfully completing the course Research Ethics, the following commitment is absolutely necessary (but not sufficient) (observed success factors for many years!):

1. Your regular presence is absolutely required (so please no double, parallel enrollment for courses taking place at the identical time) connected with your active participation during class, e.g. taking notes, contributing to discussions (in group as well as in plenary class), solving exercises.
2. Having the willingness and availability of the necessary time for regularly preparing the class (at least 1 hour per week, probably even more…)

Taught competencies

Domain A - Subject-specific Competencies
Concepts and Theories assessed
Domain B - Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Problem-solving assessed
Domain C - Social Competencies
Communication assessed
Cooperation and Teamwork assessed
Domain D - Personal Competencies
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics assessed
Self-awareness and Self-reflection assessed

Research Projects (for all Master Majors)

Research projects neither accepted nor registered nor approved will not be credited.

**ECTS**

- European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Microrobotics

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

The course is taught in English.

The lecture will be taught in English.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum

- From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.
- Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.
- Self-assembly and directed assembly of 2D and 3D structures.

(II) Interaction Forces on the Micro and Nano Scale

Course format:

- Lectures and Mini-Review presentations: Thursday 10-13
- Homework: Mini-Review (compulsory continuous performance assessment)

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

Microsystems I: Process Technology and Integration

Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and devices by a sequence of defined processing steps (process flow).

The course is taught in English.

The lecture will be taught in English.

As rigorous and profound presentation of the mathematical framework |
G. Dell’Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer |

As account of those formidable years |
G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc. |

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II". |

A solid base of Analysis I & II as well as of Linear Algebra is really helpful. |

IMPORTANT: Wed 22.9, 29.9, and 22.12 are lectures (NOT exercises!). Please, look at the details in moodle!
### Taught competencies

**Domain A - Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: not assessed

**Domain B - Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: not assessed
- Problem-solving: assessed
- Project Management: assessed

**Domain C - Social Competencies**
- Communication: not assessed
- Cooperation and Teamwork: not assessed
- Customer Orientation: not assessed
- Leadership and Responsibility: not assessed
- Self-presentation and Social Influence: not assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

**Domain D - Personal Competencies**
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Leadership and Responsibility: assessed
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed
- Negotiation: not assessed

**227-0385-10L Biomedical Imaging**
- **W** 6 credits 5G
- **S. Kozerke, K. P. Prüssmann**

**Abstract**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Content**
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

**Lecture notes**
Lecture notes and handouts

**Literature**

**Prerequisites / notice**
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

---

**227-0386-00L Biomedical Engineering**
- **W** 4 credits 3G
- **J. Vörös, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong**

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Content**

Practical and theoretical exercises in small groups in the laboratory.

**Lecture notes**
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

---

**227-0393-10L Bioelectronics and Biosensors**
- **W** 6 credits 2V+2U
- **J. Vörös, M. F. Yanik**

**Abstract**
The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

**Objective**
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

Autumn Semester 2021
Page 329 of 2152
Deep Learning in Artificial and Biological Neuronal Networks

L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

The course requires an open attitude to the interdisciplinary approach of bioelectronics. The main goal of this course is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes
The lecture slides will be provided as a PDF after each lecture.
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or TensorFlow, although these tools used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).

2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

**Abstract**

Mathematical methods in signal processing and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.

II. Learning linear and nonlinear functions and filters: neural networks, kernel methods.

III. Structured statistical models: hidden Markov models, factor graphs, Kalman filter, Gaussian models with sparse events.

**Objective**

The course is an introduction to some basic topics in signal processing and machine learning.

**Content**

**Lecture notes**

Lecture notes.

**Prerequisites / notice**

- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory

**Prerequisites / notice**

This course was replaced by "Introduction to Estimation and Machine Learning" and "Advanced Signal Analysis, Modeling, and Machine Learning".

**Abstract**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enclaves and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Content**

This course consists of the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

**Abstract**

Introduction to molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.

2. The concept of biocompatibility.

3. Introduction into methodology used in biomaterials research and application.

4. Introduction to different material classes in use for medical applications.

**Content**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Literature**

Handouts are deposited online (moodle).

(available online via ETH library)

Handouts and references therein.
Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

▶▶▶ Recommended Elective Courses

These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

Objective

After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

Literature

will be available on the moodle.

Taught competencies

Domain A - Subject-specific Competencies

Concepts and Theories assessed

Techniques and Technologies assessed

Domain B - Method-specific Competencies

Analytical Competencies assessed

Decision-making assessed

Problem-solving assessed

Domain C - Social Competencies

Communication assessed

Cooperation and Teamwork assessed

Customer Orientation assessed

Leadership and Responsibility assessed

Self-presentation and Social Influence assessed

Sensitivity to Diversity assessed

Domain D - Personal Competencies

Adaptability and Flexibility assessed

Creative Thinking assessed

Critical Thinking assessed

Integrity and Work Ethics assessed

Self-awareness and Self-reflection assessed

Self-direction and Self-management assessed

227-1033-00L Neuromorphic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots.

Preference is given to students that require this class as part of their major.

Information for UZH students:

Enrolment to this course unit only possible at ETH. No enrolment to module INI404 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree/courses/special-students/special-students-university-of-zurich.html

Abstract

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective

Understanding of the characteristics of neuromorphic circuit elements.

Content

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice

Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-0166-00L Analog Integrated Circuits

Abstract

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Content

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc.; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors. The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Lecture notes

Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

227-0447-00L Image Analysis and Computer Vision

Abstract

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Course material Script, computer demonstrations, exercises and problem solutions

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password etc.

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

The course language is English.
Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will team up with medical students to find solutions to a biomedical challenge. In the process, they will be supervised both by lecturers from ETH Zurich and the University of Zurich, receiving coaching customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Handouts and relevant literature will be provided.

IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding available experimental results.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Theory and corresponding exercises are merged together during the classes.

No lecture notes because the two proposed textbooks are more than exhaustive!

An extra hour (Mon 17.00 o'clock - 18.00) will be proposed via zoom to solve together the exercises of the previous week.

!!!
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main Frontiers in Nanotechnology

The objectives of this course are:

Concepts and Theories

Communication

Physical Modelling and Simulation

This seminar deals with the development of clinically relevant computational tools and/or their application to psychology and psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their application to problems in psychology and psychosomatics.

This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to psychology and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters.

Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Autumn Semester 2021
Page 336 of 2152
Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

Abstract

Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content

Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
  Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
  Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
  Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
  Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces
Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

- Students of higher semesters and PhD students of
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

W 2 credits 2V E. Delamarche

Abstract

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.
Content

Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic devices enable physical and chemical processes to be controlled with exquisite precision and in an fast and efficient manner. This course introduces the underlying concepts, features and applications of microfluidic systems in the chemical and life sciences.

Objective

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

Content

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small Volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Prerequisites / notice

The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature

There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

### Biological Methods for Engineers (Basic Lab) ■

#### Number of participants limited to 10.

#### Abstract
- The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

#### Objective
- The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

#### Content
- The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

227-0965-00L Micro and Nano-Tomography of Biological Tissues
W 4 credits 3G M. Stamparoni, F. Marone Welford

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The course includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Will be indicated during the lecture.

227-0311-00L Qubits, Electrons, Photons W 6 credits 3V+2U T. Zambelli

Abstract
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Content
Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Literature
- Hachette Book Group USA

Supplementary material will be uploaded in Moodle.

- (as rigorous and profound presentation of the mathematical framework) G. Dell’Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer
- (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.
The lecture slides will be provided as a PDF after each lecture.

### 227-0421-00L Deep Learning in Artificial and Biological Neuronal Networks

**Abstract**

Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

### Objective

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g., simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

### Content

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

### Lecture notes

The lecture slides will be provided as a PDF after each lecture.

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1. The number of participants is limited to 120 students (MSc and PhDs).
2. Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

### 227-0967-00L Computational Neuroimaging Clinic

**Prerequisite**: Successful completion of course "Methods & Models for fMRI Data Analysis", "Translational Neuromodeling" or "Computational Psychiatry"

**Abstract**

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that are brought to this meeting from the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.

**Objective**

1. Consolidation of theoretical knowledge (obtained in the following courses: 'Methods & models for fMRI data analysis', 'Translational Neuromodeling', 'Computational Psychiatry') in a practical setting.
2. Acquisition of practical problem solving strategies for computational modeling of neuroimaging data.

**Content**

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that are brought to this meeting from the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.
K. Stephan, M. Cook, B. Grewe, T. Delbrück

This course aims at bridging the gap between mathematical modelers and clinical neuroscientists by teaching computational techniques in understanding computation by neurons and neuronal circuits. One of the great challenges of science is to understand how the brain processes information and learns from experience. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the fundamental concepts of computation, learning, and decision-making. The course not only provides theoretical background, but also demonstrates open source software in application to concrete examples. Furthermore, practical exercises provide in-depth exposure to different software packages. Please see http://www.translationalneuromodeling.org/cpcourse/ for details.

**Objective**

To provide in-depth knowledge of the theoretical foundations of SPM and DCM and of their practical application to empirical fMRI data.

**Content**

This course teaches state-of-the-art methods and models for fMRI data analysis in lectures and exercises. It covers all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of clinical studies in psychiatry and neurology. Practical exercises serve to consolidate the skills taught in lectures.

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**

Understanding the characteristics of neuromorphic circuit elements.

**Content**

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

**Abstract**

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

**Objective**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, math, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enforcements and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.
The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include Quantitative Flow Visualization, Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of H-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

**227-2037-00L**

**Physical Modelling and Simulation**

**W** 6 credits 4G  J. Smajic

**Abstract**

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

**Objective**

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. **151-0105-00L**

**Quantitative Flow Visualization**

**W** 4 credits 3G  T. Rösgen

**Abstract**

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

**Objective**

Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.

**Content**

Fundamentals of optics, flow visualization and electronic image acquisition. Frequently used image processing techniques (filtering, correlation processing, FFTs, color space transforms). Image Velocimetry (tracking, pattern matching, Doppler imaging). Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography). Laser induced fluorescence. (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping. Wall shear and heat transfer measurements. Pattern recognition and feature extraction, proper orthogonal decomposition.

**Lecture notes**

Handouts will be made available.

**Prerequisites / notice**

Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills. Language: German on request.

**151-0605-00L**

**Nanosystems**

**W** 4 credits 4G  A. Stemmer

**Abstract**

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

**Objective**

Familiarize students with basic science and engineering principles governing the nano domain.

**Content**

The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately. Familiarity with basic concepts of quantum mechanics is expected. Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

**Literature**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein

**Physics in Medical Research: From Atoms to Cells**

This course covers some of the fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling, geometry representation and texture mapping, we will move on to the physics of light transport, acceleration structures, appearance modeling and Monte Carlo integration. We will apply these principles for computing light transport of direct and global illumination due to surfaces and participating media. We will end with an overview of modern image-based capture and image synthesis methods, covering topics such as geometry and material capture, light-fields and depth-image based rendering.

**Computer Graphics**

This course covers fundamental concepts of modern computer graphics. We will end with an overview of modern image-based capture and image synthesis methods, covering topics such as geometry and material capture, light-fields and depth-image based rendering.

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

**Prerequisites / notice**

Lectures and Mini-Review presentations: Thursday 10-13

Homework: Mini-Review
(compulsory continuous performance assessment)

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

252-0543-01L **Computer Graphics**

W 8 credits 3V+2U+2A

Does not take place this semester.

**Abstract**

This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

**Objective**

At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students’ curiosity to explore the field of computer graphics in subsequent courses or on their own.

**Content**

This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling, geometry representation and texture mapping, we will move on to the physics of light transport, acceleration structures, appearance modeling and Monte Carlo integration. **Lecture notes**

Books:
- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Physically Based Rendering: From Theory to Implementation

**Literature**

- Know the commonly used methods in biostatistics
- Perform simple data analysis with R
- Understand measurement of agreement, causality versus association.

**Prerequisites / notice**

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual

Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

402-0674-00L **Physics in Medical Research: From Atoms to Cells**

W 6 credits 2V+1U  B. K. R. Müller

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopolies.

465-0953-00L **Biostatistics**

W 4 credits 2V+1U

Does not take place this semester.

**Abstract**

The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement, causality versus association.

**Objective**

- Know the commonly used methods in biostatistics
- Perform simple data analysis with R

227-0976-00L **Computational Psychiatry & Computational Psychosomatics**

W 2 credits 4S  K. Stephan

**Number of participants limited to 24.**

Information for UZH students:
Enrolment to this course unit only possible at ETH Zurich. No enrolment to module BMT20002.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-
courses/special-
students/special-students-university-of-zurich.html

Abstract
This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and
psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational
scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

Objective
Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their
application to problems in psychiatry and psychosomatics.

Content
This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to
psychiatry and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with
focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters.

Literature
For additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at
https://www.tnu.ethz.ch/en/teaching

Prerequisites / notice
Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed
the course “Computational Psychiatry” (Course number 227-0971-00L).

| 227-0945-00L   | Cell and Molecular Biology for Engineers I                             | W    | 3    | 2G    | C. Frei   |
| Abstract       | This course is part I of a two-semester course.  
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology. |
| Objective      | After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested. |
| Content        | Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.  
In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II).  
For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication.  
These written documents will be graded and count as 40% for the final grade. |
| Literature     | Lecture notes and handouts

| Abstract       | The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory. |
| Objective      | The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology. |
| Content        | The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology. |
| Prerequisites / notice | Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority. |
Taught competencies

Domain A - Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Domain B - Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Domain C - Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Domain D - Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Biomechanics

Track Core Courses

During the Master programme, a minimum of 12 CP must be obtained from track core courses.

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but other examples of image processing using deep neural nets are given.

**Course includes study design, measurement techniques, clinical testing, accessing movement data and analysis as well as modeling.**

### Micro and Nano-Tomography of Biological Tissues

**W.** X. Welford, M. Stampanoni, F. Marone Welford

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

**Objective**

- Introduction to the basic concepts of X-ray tomographic imaging. Image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications

**Content**

Synchrontron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

**Lecture notes**

Available online

**Literature**

Will be indicated during the lecture.

---

### Multiscale Bone Mechanics

**W.** C. List, P. Schütz

Imaging and computing methods are key to advances and innovation in medicine. This course introduces established fundamentals as well as modern techniques and methods of imaging and computing in medicine.

**Objective**

1. Understanding and practical implementation of biosignal processes methods for imaging
2. Understanding of imaging techniques including radiographic imaging, radiographic imaging systems, computed tomography imaging, diagnostic ultrasound imaging, and magnetic resonance imaging
3. Knowledge of computing, programming, modelling and simulation fundamentals
4. Computational and systems thinking as well as scripting and programming skills
5. Understanding and practical implementation of emerging computational methods and their application in medicine including artificial intelligence, deep learning, big data, and complexity
6. Understanding of the emerging concept of personalised and in silico medicine
7. Encouragement of critical thinking and creating an environment for independent and self-directed studying

**Content**

Imaging and computing methods are key to advances and innovation in medicine. This course introduces established fundamentals as well as modern techniques and methods of imaging and computing in medicine. For the imaging portion of the course, biosignal processing, radiation imaging, radiographic imaging systems, computed tomography imaging, diagnostic ultrasound imaging, and magnetic resonance imaging are covered. For the computing portion of the course, computing, programming, and modelling and simulation fundamentals are covered as well as their application in artificial intelligence and deep learning; complexity and systems medicine; big data and personalised medicine; and computational physiology in and silico medicine.

The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup: in the first part (TORQUEs: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lectureads may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will form small groups to acquire additional knowledge using online, python-based activities via JupyterHub or additionally distributed material and discuss their findings in teams. Learning outcomes will be reinforced with weekly Moodle assignments, to be completed during the flipped classroom portion.

**Lecture notes**

Stored on Moodle

**Prerequisites / notice**

Lectures will be given in English.
Continuum Mechanics I

The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscous elasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Content
Anisotropic elasticity, Linear elastic and linear viscous material behavior, Viscoelasticity, Micro-macro modelling, Laminate theory, Plasticity, Viscoplasticity, Examples of engineering applications, Comparison with experiments.

Lecture notes
yes

Theory of Robotics and Mechatronics

This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Objective
Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Content
An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

Lecture notes
available.

Microrobotics

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

Nanosystems

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

Objective
Familiarize students with basic science and engineering principles governing the nano domain.
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately. Familiarity with basic concepts of quantum mechanics is expected.

Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Course format:
Lectures and Mini-Review presentations: Thursday 10-13
Homework: Mini-Review
(compulsory continuous performance assessment)

Each student selects a paper (list distributed in class) and expands the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper. Each Mini-Review will be presented both orally and as a written paper.

151-0905-00L Medical Technology Innovation - From Concept to Clinics
4 credits
W 4 credits 3P I. Herrmann

Abstract
Project-oriented learning on how to develop technological solutions to address unmet clinical needs.

After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role. Course format will be available on the moodle.

Prerequisites / notice

Homework: Mini-Review
(compulsory continuous performance assessment)

4 credits
W 4 credits 3P I. Herrmann

Learning outcomes:
- Domain A - Subject-specific Competencies
  - Concepts and Theories
  - Analytical Competencies
  - Decision-making
  - Problem-solving
  - Communication
  - Leadership and Responsibility
  - Sensitivity to Diversity
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

376-1103-00L Frontiers in Nanotechnology
4 credits
W 4 credits 4V V. Vogel, further lecturers

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers. Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies. The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

</tr>
</tbody>
</table>

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
- Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  - Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces
Handouts are deposited online (moodle).

Biocompatible Materials

The course covers the following topics:

K. Maniura

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Introduction into different material classes in use for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Integrating academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Handouts are deposited online (moodle).
Handouts and references therein.

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

**Abstract**
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and how they can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

**Objective**

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

**Content**

Mostly formal lectures (2 x 45 min), with a 2 hour visit of the Binng and Rohrer Nanotechnology Center (Rueschikon) and introduction to cleanroom and micro/nanotechnology instruments, last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 10 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- hobby electronics, making a device for 10$ and controlling it using a smartphone.

**Prerequisites / notice**
The nanotech center and labs visit at IBM would be mandatory, as well as attending the student project presentations.

376-1720-00L Application of MATLAB in the Human Movement Sciences

**Abstract**
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

**Objective**
Students will acquire the ability to independently load, plot and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

**Content**
Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parametrisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

**Literature**
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

**Prerequisites / notice**
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1974-00L Colloquium in Biomechanics

**Abstract**
Current topics in biomechanics presented by speakers from academia and industry.

**Objective**
Getting insight into actual areas and problems of biomechanics.

376-2017-00L Biomechanics of Sports Injuries and Rehabilitation

**Abstract**
This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

**Objective**
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

**Content**
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

**Lecture notes**
Handouts will be made available.

**Prerequisites / notice**
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

402-0674-00L Physics in Medical Research: From Atoms to Cells

**Abstract**
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epithelial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultraviolet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

465-0953-00L Biostatistics W 4 credits 2V+1U

Abstract
The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement, causality versus association.

Objective
- know the commonly used methods in biostatistics
- perform simple data analysis with R

| Abstract | This course is part I of a two-semester course. The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology. |
| Objective | After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested. |
| Content | Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells. |
| Literature | Scripts of all lectures will be available. |
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

### Taught competencies

#### Domain A - Subject-specific Competencies
- **Concepts and Theories**: assessed
- **Techniques and Technologies**: assessed

#### Domain B - Method-specific Competencies
- **Analytical Competencies**: not assessed
- **Decision-making**: assessed
- **Media and Digital Technologies**: not assessed
- **Problem-solving**: assessed
- **Project Management**: not assessed

#### Domain C - Social Competencies
- **Communication**: assessed
- **Cooperation and Teamwork**: assessed
- **Customer Orientation**: not assessed
- **Leadership and Responsibility**: not assessed
- **Self-presentation and Social Influence**: not assessed
- **Sensitivity to Diversity**: not assessed
- **Negotiation**: not assessed

**Abstract**

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

**Content**

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques.

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Prerequisites**: Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

By the end of this course the participants will be able to:

- interpret the 5 Rs of radiation oncology in the context of the hallmarks of cancer
- understand factors which underpin the differing radiosensitivities of different tumors
- follow rational strategies for combined treatment modalities of ionizing radiation with targeted agents
- understand differences in the radiation response of normal tissue versus tumor tissue
- understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).

**Lecture notes and handouts**: Lecture notes and handouts will be provided.

**Prerequisites / notice**: Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming.

**Literature / notice**: Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

**Supplementary material will be uploaded in Moodle.**

**Abstract**

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Objective**

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefit of patients and the society.

**Content**

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**

A script will be provided.

- For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

**Abstract**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: PHY471

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html

**Objective**

This lecture will provide a detailed introduction to radiotherapy treatment planning. The course considers the physical interactions of radiation in tissue, the mathematical aspects of treatment planning and additional aspects of central importance for radiotherapy planning.

Students shall develop a thorough understanding of the foundations of radiotherapy from a physics and mathematics perspective, focusing on algorithmic components. After completing the course students should be able to implement the main components of a radiotherapy treatment planning system.
Radiography is one of the main treatment options against cancer. Today, more than 50% of cancer patients receive radiation as part of their treatment. Modern radiotherapy is a highly technology driven field.

Research and development in medical physics has improved the precision of radiotherapy substantially. Using intensity-modulated radiotherapy (IMRT), radiation can be delivered precisely to tumors while minimizing radiation exposure of healthy organs surrounding the tumor. Thereby, medical physics has provided radiation oncologists with new curative treatment approaches where previously only palliative treatments were possible. This lecture will provide a detailed introduction to radiotherapy treatment planning and will consists of three blocks:

1. The first part of the course considers the physical interactions of radiation in tissue. The physical interactions give rise to dose calculation algorithms, which are used to calculate the absorbed radiation dose based on a CT scan of the patient.

2. The second part considers the mathematical aspects of treatment planning. Mathematical optimization techniques are introduced, which are used in intensity-modulated radiotherapy to determine the external radiation fields that optimally irradiate the tumor while minimizing radiation dose to healthy organs.

3. The third part deals with additional aspects of central importance for radiotherapy planning. This includes biomedical imaging techniques for treatment planning and target delineation as well as image registration algorithms.

The lectures are followed by computational exercises where students implement the main components of a radiotherapy treatment planning systems in two dimensions in Matlab.

Prerequisites:
Basic programming skills in Matlab (or willingness to learn) are needed for the exercises. Basic knowledge of calculus is needed, approximately corresponding to the 3rd year of a bachelor degree in physics, mathematics, computer science, engineering or comparable discipline.

|           | Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers. Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.
|           | The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries. Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.
|           | Content                      |      |      |       |
|           | Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.
|           | Lecture notes                |      |      |       |
|           | All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics. |      |      |       |
Introduction into molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Abstract
Physics in Medical Research: From Atoms to Cells

Objective
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and anisotropies of biopsies.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

636-0108-00L

Abstract
Biological Engineering and Biotechnology

Objective
Biological and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Handout during the course.
### Lecturers
Main topics of the course include:

**Microrobotics**

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

**Medical Technology Innovation - From Concept to Communication**

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**3P Concepts and Theories**

The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

**Adaptability and Flexibility**

After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

**Analytical Competencies**

Project-oriented learning on how to develop technological solutions to address unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. The lecture will be taught in English.

---

### Recommended Elective Courses

*These courses are particularly recommended for the Molecular Bioengineering track. Please consult your track advisor if you wish to select other subjects.*

| 227-0311-00L| Qubits, Electrons, Photons | W    | 6    | 3V+2U | T. Zambelli |
| **Abstract**| In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis). Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics. |
| **Objective**| Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition! |
| **Content**| • Lagrangian and Hamiltonian: Symmetries and Poisson Brackets |
| | | • Postulates of QM: Hilbert Spaces and Operators |
| | | • Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator |
| | | • Spin: Qubits, Bloch Equations, and NMR |
| | | • Entanglement |
| | | • Symmetries and Corresponding Operators |
| | | • Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands |
| | | • Harmonic Oscillator: Creation and Annihilation Operators |
| | | • Identical Particles: Bosons and Fermions |
| | | • Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER |
| | | • Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener |
| **Lecture notes**| No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive! |

!!!!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM and correspondingly recorded (link in Moodle) !!!!!!

Supplementary material will be uploaded in Moodle.

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

IMPORTANT: Wed 22.9, 29.9, and 22.12 are lectures (NOT exercises!). Please, look at the details in moodle!

- Self-direction and Self-management assessed

### 227-0385-10L Biomedical Imaging

**Abstract**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Content**
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

**Lecture notes**
Lecture notes and handouts

**Literature**
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

**Prerequisites / notice**
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

### 227-0386-00L Biomedical Engineering

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Content**

**Lecture notes**
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

**AND**
https://lbb.ethz.ch/education/biomedical-engineering.html

---

Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will introduce the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

The course introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques are discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics. The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It brings together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

### Content

**L1. Bioelectronics history, its applications and overview of the field**
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

**L2. Fundamentals of quantum and classical noise in measuring biological signals**

**L3. Biomeasurement techniques with photons**

**L4. Acoustics sensors**
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

**L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes**

**L6. Optical biosensors**
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

**L7. Basic notions of molecular adsorption and electron transfer**
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

**L8. Potentiometric sensors**
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

**L9. Amperometric sensors and bioelectric potentials**
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

**L10. Channels, amplification, signal gating, and patch clamp Y4**

**L11. Action potentials and impulse propagation**

**L12. Functional electric stimulation and recording**
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

**L13. Neural networks memory and learning**

### Literature

- Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)
- Michaelis-Menten equation, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).

### Prerequisites / notice

The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, Michaelis-Menten equation, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).

### Objective

During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

### Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

### Content

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

### Lecture notes

Available online

### Literature

Will be indicated during the lecture.
Objective

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content

After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will team up with medical students to find solutions to a biomedical challenge. In the process, they will be supervised both by lecturers from ETH Zürich and the University of Zurich, receiving coaching customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Lecture notes

Handouts and relevant literature will be provided.

Prerequisites / notice

IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.

327-0505-00L Surfaces, Interfaces and their Applications I

W 3 credits 2V+1U N. Spencer, M. P. Heuberger, L. Isa

Abstract

After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of tribology (friction, lubrication, and wear) and corrosion.

Objective

To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems.

Content

Introduction to Surface Science

Surface Forces (static and dynamic)

Adsorbates on Surfaces

Surface Thermodynamics and Kinetics

The Solid-Liquid Interface

Electron Spectroscopy

Vibrational Spectroscopy on Surfaces

Scanning Probe Microscopy

Introduction to Tribology

Introduction to Corrosion Science

327-1101-00L Biominalization

W 2 credits 2V K.-H. Ernst

Abstract

The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.

Objective

Biominalization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biomineralization (BM) / types of biominerals and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phase / modern experimental methods for studying BM phenomena / inter-, intra, extra- and epicellular BM / organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / sintering / photosynthesis / calcite and aragonite / calcium and iron storage / impact of BM on lithosphere and atmosphere / evolution / taxonomy of organisms.

Content

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biomineralization
4. Control of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. Silica
11. Iron storage and mineralization
376-1622-00L  
**Practical Methods in Tissue Engineering**  
*W* 5 credits 4P  
M. Zenobi-Wong, S. J. Ferguson, S. Grad, S. Schürle-Finke  
Number of participants limited to 12  

**Abstract**  
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.  

**Objective**  
Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.  

**Prerequisites / notice**  
A Windows laptop (or Windows on Mac) is required for certain of the lab modules.

402-0341-00L  
**Medical Physics I**  
*W* 6 credits 2V+1U  
P. Manser  

**Abstract**  
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiologically and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.  

**Objective**  
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.  

**Content**  
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy, and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.  

**Lecture notes**  
A script will be provided.  

**Prerequisites / notice**  
For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

529-0240-00L  
**Chemical Biology - Peptides**  
*W* 6 credits 3G  
H. Wennemers  

**Abstract**  
An advanced course on the synthesis, properties and function of peptides in chemistry and biology. Knowledge of the synthesis, properties and function of peptides in chemistry and biology.  

**Objective**  
Advanced peptide synthesis, conformations, properties and interaction, peptide-based medicines, peptide technologies, peptides in asymmetric catalysis.  

**Content**  
Citations from the original literature relevant to the individual lectures will be assigned weekly.  

**Literature**  

529-0615-01L  
**Biochemical and Polymer Reaction Engineering**  
*W* 6 credits 3G  
P. Arosio  

**Abstract**  

**Objective**  
The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.  

**Content**  
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation modeling. Model and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.  

**Lecture notes**  
Scripts are available on the web page of the Arosio-group: http://www.arosigroup.ethz.ch/education.html  

**Literature**  

535-0423-00L  
**Drug Delivery and Drug Targeting**  
*W* 2 credits 1.5V  
J.-C. Leroux, A. Steinauer  

**Abstract**  
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.  

**Objective**  
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the challenges and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.  

**Content**  
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.  

**Lecture notes**  
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.  

**Literature**  

Further references will be provided in the course.

636-0507-00L Synthetic Biology II

W 8 credits 4A S. Panke, Y. Benenson, J. Stelling

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course

Prerequisites / notice
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

Other Elective Courses
These courses may be suitable for the Molecular Bioengineering track. Please consult your track advisor.

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Abstract
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content
- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

227-0945-00L Cell and Molecular Biology for Engineers I

W 3 credits 2G C. Frei

This course is part I of a two-semester course.
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content
Lectures will include the following topics (part I and II): DNA, chromosomes, genome engineering, RNA, proteins, genetics, synthetic biology, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer and stem cells.

In addition, 4 journal clubs will be held, where recent publications will be discussed (2 journal clubs in part I and 2 journal clubs in part II). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 40% for the final grade.

Lecture notes
Scripts of all lectures will be available.

Literature

Taught competencies

**Domain A - Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed

**Domain B - Method-specific Competencies**
- Analytical Competencies not assessed
- Decision-making assessed
- Media and Digital Technologies not assessed
- Problem-solving assessed
- Project Management not assessed

**Domain C - Social Competencies**
- Communication not assessed
- Cooperation and Teamwork assessed
- Customer Orientation not assessed
- Leadership and Responsibility not assessed
- Self-presentation and Social Influence not assessed
- Sensitivity to Diversity not assessed
- Negotiation not assessed

**Domain D - Personal Competencies**
- Adaptability and Flexibility assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics not assessed
- Self-awareness and Self-reflection not assessed
- Self-direction and Self-management not assessed

227-0949-00L Biological Methods for Engineers (Basic Lab) W 3 credits 5P C. Frei

Number of participants limited to 10.

Abstract
The course during 7 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Prerequisites / notice
Enrollment is limited and students from the Master’s programme in Biomedical Engineering (BME) have priority.

Taught competencies

**Domain A - Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed

**Domain B - Method-specific Competencies**
- Analytical Competencies assessed

</tbody>
</table>

This strongly recommended prerequisite for Semester Projects and Master Theses at D-ITET (MSc BME, MSc EEIT, MSc EST).

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.
Objective
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content
* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the “in this paper” paragraph, the scientific part, the summary, Equations, Figures).
* Topic 2: Power Point Presentations.
* Topic 3: Citation Rules and Citation Software.
* Topic 4: Guidelines for Research Integrity.

Literature
ETH "Citation Etiquette", see www.plagiate.ethz.ch.

Prerequisites / notice
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

227-1772-10L Semester Project 0 12 credits 20A Professors
Registration in mystudies required!

Abstract
The semester project is designed to train the students in solving specific biomedical engineering problems. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor.

Objective
see above

227-1772-20L Semester Project 2 W 12 credits 20A Professors
Only for Programme Regulations 2020.
Registration in mystudies required!

Abstract
The semester project is designed to train the students in solving specific biomedical engineering problems. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor.

Objective
see above

227-1750-00L Internship in Industry W 12 credits Professors
Only for Biomedical Engineering MSc (Programme Regulations 2020).

Abstract
The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective
see above

227-1760-00L Research Project (long) W 24 credits 40A Professors
Only for Biomedical Engineering MSc (Programme Regulations 2020).

Abstract
The aim of the long research project is to perform a larger (exploratory) scientific study or a larger development project in a team. The duration of this project is at least four months (full-time) and it is finished with a report and/or prototype.

Objective
see above

Master's Thesis

227-1101-00L How to Write Scientific Texts E- 0 credits U. Koch
Strongly recommended prerequisite for Semester Projects and Master Theses at D-ITET (MSc BME, MSc EEIT, MSc EST).

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Prerequisites / notice
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

227-1700-00L Master's Thesis O 30 credits 40D Professors
Admission only if all the following apply:
a. bachelor program successful completed;
b. any additional requirements necessary to gain admission to the master program BME have been successfully completed;
c. both the semester project and (if applicable) the internship successfully completed.

Registration in myStudies required!
Abstract
The masters program culminates in a six months research project which addresses a scientific research question on one's chosen area of specialization. The masters thesis is supervised by a program-affiliated faculty member and the topic must be approved by the track advisor.

Objective
see above

Abstract
This course provides an overview of modern concepts of bioengineering across different levels of complexity, from single molecules to systems, microscaled reactors to production environments, and across different fields of applications.

Objective
Students will be able to recognize major developments in bioengineering across different organisms and levels of complexity and be able to relate it to major technological and conceptual advances in the underlying sciences.

Content
Molecular and cellular engineering; Synthetic biology: Engineering strategies in biology; from single molecules to systems; downscaling bioengineering; Bioengineering in chemistry, pharmaceutical sciences, and diagnostics, personalized medicine.

Lecture notes

Practical Training

All listed lab courses are mandatory.

For Students in Biotechnology Master, Programme Regulation 2021: 16 ECTS in this category are mandatory.

For Students in Biotechnology Master, Programme Regulation 2017: 14 ECTS in this category are mandatory.
Critical Thinking

This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of:

Lab Course: Microsystems and Microfluidics in Biology

- T. Horn

Objective

- to understand the technical and physical principles of light microscopes and flow cytometers
- to have hands-on experience in the use of these technologies to analyze image real samples
- to be able to run a basic analysis of the data and images obtained with flow cytometers and microscopes
- to get introduced to liquid handling (pipetting) robotics and learn how to implement a basic workflow

Content

The practical course will have five units at 2 days each (total 10 days):

1. Flow Cytometry:
   a. Introduction to Flow Cytometry
   b. Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
   c. Flow cytometry sample preparation
   d. Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells
2. Light microscopy
   a. Learn how to build a microscope and understand the underlying physical principles
   b. Learn how to use a modern automated wide field fluorescence microscope
   c. Use this microscope to automatically acquire images of a cell culture assay to analyze the dose-dependent effect of a drug treatment
3. Image Analysis
   a. Introduction to the fundamentals of image analysis
   b. Learn the basics of the image analysis software Fiji/ImageJ
   c. Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise
4. Laboratory Automation
   a. Introduction to the basics of automated liquid handling/ lab robotics
   b. See examples on using lab automation for plasmid library generation and cell cultivation
   c. Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems
5. Presentations
   a. Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.
   b. Presentations and discussion in form of a Colloquium

The following knowledge is required for the course:

- basic laboratory methods
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic biology of cells (cell anatomy and physiology)

Lab Course: Microbial Biotechnology

- M. Held

Objective

The practical course will consist of a set of 4 experiments.

- to get introduced to liquid handling (pipetting) robotics and learn how to implement a basic workflow
- to be able to run a basic analysis of the data and images obtained with flow cytometers and microscopes

Notes and guidelines will be provided at the beginning of the course.

Prerequisites / notice

- basic biology of cells (cell anatomy and physiology)
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic laboratory methods

The practical course will consist of a set of 4 experiments.

For each experiment, the student will be required to:

- understand the theoretical concept behind the experiment
- plan the experiment
- engineer the devices
- execute the experiments and acquire data
- evaluate and analyze the data
- report and discuss the results

A good quality of the final report will be expected and be an important criterion.
Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

### Objective

Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

### Content

**Block A: Handling and preparation of microbial libraries**

D1: Introduction to microbiological cultures and monoseptic working techniques.

D2: Plasmid-based expression systems and variation of XFP synthesis levels via site-directed RBS mutagenesis.

**Block B: Library screening**

D3: In vivo screening for XFP expression levels.

D4: Analysis of XFP levels via SDS-PAGE analysis. RBS-sequencing.

**Block C: Hit recovery and validation**

D5: In silico analysis of RBS variants.

D6: Cellular XFP content for selected variants at different culture conditions.

**Block D: Data analysis and presentation**

D7: Protein expression analysis. Q&A for reports and presentations.

D8: Final presentations and wrap-up.

### Lecture notes

Material will be provided during the course.

### Literature

### Advanced Courses

Students need to acquire a total of 24 ECTS in this category. The list of advanced courses is a closed list; no other course can be added to this category.

#### Biomelecular-Orientated

### Abstract

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and systems and all related microfabrication processes.

### Objective

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

### Content

Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

### Lecture notes

Handouts in English

### Literature

### Prerequisites / notice

Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitiorium of fundamental physics and quantum theory at the semester beginning can be offered.

### Taught competencies

- Domain A - Subject-specific Competencies: Concepts and Theories assessed
- Domain B - Method-specific Competencies: Analytical Competencies assessed
- Domain C - Social Competencies: Communication assessed
- Domain D - Personal Competencies: Critical Thinking assessed

### 636-0104-00L Biophysical Methods

<table>

### Abstract

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

### Objective

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course, the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electronic microscopy: Scanning electron microscopy, transmission electron microscopy, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunnelling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application, Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes
Hand out will be given to students at lecture.

Literature
Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

Prerequisites / notice
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

636-0105-00L Introduction to Biological Computers  W  4 credits  3G  Y. Benenson

Abstract
Biological computers are man-made biological networks that interrogate and control cells and organisms in which they operate. Their key features, inspired by computer science, are programmability, modularity, and versatility. The course will show how to rationally design, implement, and test biological computers using molecular engineering, DNA nanotechnology and synthetic biology.

Objective
The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms
* Introduce basic theories of computation
* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include:
- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly
* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations
* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Lecture 1. Introduction: what is molecular computation (part I)?
* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines
1st hour
* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour
* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation
* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing
* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly
* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes
* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits
* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I
* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II
* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I
* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II
* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits
* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics
* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
Biomolecular Nanotechnology is a broad field that focuses on the study and science of biological materials including DNA, RNA and proteins at length scales below 10 nm. This is a broad overview of the topic with a focus on current research themes.

The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

Tentative list of topics:

1. Distance functions
2. Classification
3. Clustering
4. Feature Selection

Lecture material will be provided in form of slides.

Basic understanding of mathematics, as taught in basic mathematics courses at the Bachelor's level, is assumed.
Literature

Representative literature:
(1) Alberts, Molecular Biology (Ch.2 Cellular chemistry).
(2) Ratner, Biomaterials Science (Ch. 2, 3, 2.4 Polymers & hydrogels).
(3) Walsh, Protein Biochemistry, (Ch. 2, Protein Structure).

636-0117-00L Mathematical Modelling for Bioengineering and Systems Biology

Abstract
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

Objective
The course enables students to formulate, analyse, and simulate mathematical models of biochemical networks. To this end, the course covers basic mathematical concepts and tools to explore biochemical reaction dynamics as well as basic concepts from dynamical systems theory. The course aims to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

Content
Biochemical Reaction Modelling

636-0118-00L Introduction to Dynamical Systems with Applications to Biology

Abstract
Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and qualitative features of this change is the topic of dynamical systems theory. Dynamical systems arise naturally in virtually all scientific disciplines including physics, biology, chemistry and engineering. This course is a broad introduction to the topic dynamical s

Objective
The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using matlab will be used to demonstrate various concepts

Content
A dynamical view of the world; the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; line analysis; classification of linear systems; Liapunov functions and nonlinear stability: cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts

Lecture notes
Will be provided as needed.

Literature

636-0118-00L Mathematical Modelling for Bioengineering and Systems Biology

Prerequisites / notice
Prerequisites: Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors); Matlab programming.

636-0109-00L Stem Cells: Biology and Therapeutic Manipulation

Abstract
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

Content
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

636-0123-00L Problem-Based Approach to Spatial Biology

Abstract
This course entails lectures in tissue physiology, spatial methodologies and grantsmanship. In the project part, small working groups will perform the entire scientific process around formulating a research proposal with the aid of tutors.

Objective
The students will understand the current state of research and novel methodologies in spatial biology and tissue physiology. They will obtain the necessary toolkits to independently identify open research problems in various areas of spatial biology, to address these problems with suitable experimental strategies, and to formulate their approach in a research proposal.

Content
We will use a problem-based approach to explore the way in which single cells collaborate within tissues to achieve their common functions. A thorough comprehension of these tissue components is crucial for advancing our knowledge of normal homeostasis and pathophysiology; disrupted cellular interactions can lead to decreased tissue function or even carcinogenesis.

The project work will be conducted in small groups in guidance of tutors. Each group will focus on a different topic in spatial biology and will review the corresponding literature. They will identify open problems of interest in this area and will summarize their findings in a short, written review. The students will then develop an appropriate experimental strategy to address a question of interest and write a research proposal that features their approach. The final stage of the project work enable the students to practice the presentation of their research proposals and critical evaluation.
Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The

Abstract

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

Content

Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

Lecture notes

Handouts in English

Literature

Prerequisites

Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

Taught competencies

Domain A - Subject-specific Competencies
  - Concepts and Theories

Domain B - Method-specific Competencies
  - Analytical Competencies

Domain C - Social Competencies
  - Communication

Domain D - Personal Competencies
  - Critical Thinking

The information on the web can be updated until the beginning of the semester.

Courses will be provided during the course.

This course requires independent group work.

Abstract

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

Content

The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunnelling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

**Abstract**

Data Mining, the search for statistical dependencies in large databases, is of utmost important in modern society, in particular in biological and medical research. This course provides an introduction to the key problems, concepts, and algorithms in data mining, and the applications of data mining in computational biology.

**Objective**

The goal of this course is to train the students to gain an understanding of data mining problems and algorithms to solve these problems, in particular in biological and medical applications.

**Content**

The goal of the field of data mining is to find patterns and statistical dependencies in large databases, to gain an understanding of the underlying system from which the data were obtained. In computational biology, data mining contributes to the analysis of vast experimental data generated by high-throughput technologies, and thereby enables the generation of new hypotheses.

In this course, we will present the algorithmic foundations of data mining and its applications in computational biology. The course will feature an introduction to popular data mining problems and algorithms, reaching from classification via clustering to feature selection. This course is intended for both students who are interested in applying data mining algorithms and students who would like to gain an understanding of the key algorithmic concepts in data mining.

Content

The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Literature

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

Prerequisites / notice

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

636-0901-00L Computational Biology W 3 credits 2V 4+2A T. Vaughan

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyloodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place at D-BSSE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date http://www.cbb.ethz.ch/news-events.html

For the Zurich-based students without R experience, we recommend the R course http://www.vzv.ethz.ch/Vorungsverzeichnis/erleineinheit/view?semkez=2016W&ansicht=KATALOGDATEN&erleineinheitid=123546&lang=de, or working through the script provided as part of this R course.

636-0901-00L Advanced Immunology I W 2 credits 2V external organisers

636-0901-00L Molecular Medicine I W 2 credits 2V external organisers

636-0901-00L Spatio-Temporal Modelling in Biology W 4 credits 3G D. Iber

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.
Objective

Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content

1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Dynamical Systems
4. Cell-cell Signalling (Dr Boareto)
5. Travelling Waves
6. Turing Patterns
7. Chemotaxis
8. Mathematical Description of Growing Biological Systems
9. Image-Based Modelling
10. Tissue Mechanics
11. Cell-based Tissue Simulation Frameworks
12. Plant Development (Dr Dumont)
13. Growth Control
14. Summary

Lecture notes

All lecture material will be made available online

https://www.bsse.ethz.ch/cobi/teaching/636-0706-00L_Spatial_Modelling_in_Biology.html

Literature

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessarily to follow the course:

- Murray, Mathematical Biology; Springer
- Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
- Keener and Sneyd, Mathematical Physiology, Springer
- Fall et al, Computational Cell Biology, Springer
- Szallasi et al, System Modeling in Cellular Biology, MIT Press
- Wolkenhauer, Systems Biology
- Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

636-0510-00L Proteomics and Drug Discovery Research

| Credit | W | 2 credits | 2V | external organisers |

636-0119-00L Introduction to Statistics and R

| Credit | W | 6 credits | 3G+2A | J. Kuipers |

Abstract

This course offers a practical introduction to the fundamentals of data analysis and R

Objective

To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

Content

Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

Lecture notes

Lecture slides will be available

Prerequisites / notice

Access to Rstudio with some markdown and tidyverse packages installed.

Abstract

This is a voluntary programming course BEFORE the start of the semester (September 2021). It is addressed primarily at students of the MSc Biotechnology (and MSc CBB). Other students may send a request to participate to: student-admin@bsse.ethz.ch

Objective

The goal of this course is to give students, who have no prior programming background, a solid introduction to algorithm development and its successive implementation in a programming language. For students with previously acquired programming skills, the course will serve as a reinforcement of key aspects of structured programming in addition to providing a well-rounded introduction to MATLAB, R and Python.

Content

The course is structured in four main pillars:

- Logical thinking: Translating a problem into a conceptual sequence of computational steps. For example: [Problem] What is the GC content of a given DNA string? [Logical steps]
  i) Iterate through all nucleotides in the DNA string, one by one
  ii) Count the Cs or Gs
  iii) Divide the count of Cs or Gs by the length of the DNA string
  iv) Report the result.

- Writing code: Full introduction to the MATLAB programming languages (R and Python will also be covered). Solutions to all exercises will be provided in MATLAB, R and Python. Creation of programming projects with an integrated development environment (IDE).
- Primer of Unix commands: Command-line examples on how to access servers and computing resources at the D-BSSE. Submission of a request to participate to: student-admin@bsse.ethz.ch

Lecture notes

Available on course website (Moodle):

https://moodle-app2.let.ethz.ch/course/view.php?id=15235

Publicly available material (links will be posted on the course website)
Objective
After this course, the student is expected to understand and be able to apply the basics of supramolecular chemistry: host-guest interactions, host design, self-assembly and simple enzyme mimetics.

Content
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course. We will first cover the basic concepts of supramolecular chemistry: non-covalent interactions, host-guest chemistry, binding constant determination and binding strength. Subsequently, we will take a closer look at how to bind different species: cations, anions and neutral organic molecules. Towards the end of the semester, we will cover self-assembly processes and applications of supramolecular structures as simple enzyme mimetics.

Lecture notes
The lecture slides are provided online via ADAM. No additional literature is required. If additional information is desired, the book “Supramolecular Chemistry” by Jonathan W. Steed and Jerry L. Atwood (John Wiley & Sons) is recommended.

<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Digital transformation is more than digitisation of existing processes and information</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Independently of the building industry, Module 1 initially provides information about the characteristics of digitalisation through its principles and rules, enabling the participants to independently recognise the short-term and long-term changes that are resulting from it.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The first module addresses the topic of digitalisation and digital transformation in a holistic sense. It is much more than converting documents into PDFs or using software. It is about transforming processes, resources and information into a consistent and efficient digital system to make life easier for employees and customers. This journey always involves change. From the perspective of other industries, we first build up a basic understanding and discuss the opportunities and risks.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>How do the experiences of other industries help us? What can be derived from them? Why is BIM only a small part and why is the future of BIM not BIM?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Literature recommendations at <a href="http://www.bauprozess.arch.ethz.ch">www.bauprozess.arch.ethz.ch</a> and <a href="http://www.kompetenz.arch.ethz.ch">www.kompetenz.arch.ethz.ch</a></td>
<td></td>
<td></td>

<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: &quot;Behaviour for Collaboration&quot; - Structural questions on collaboration and the patterns of behaviour.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>In Module 2, we break from the theoretical idea of a purely technology-based, better collaboration and look at the situation realistically in order to be able to understand and develop new solutions and requirements.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The usual approach towards digital transformation is to train people to use new technologies. In contrary, we ask for the specific challenges and problems people have with change. We learn to understand viewpoints of different partners within building projects and new solutions to specific problems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>Literature recommendations at <a href="http://www.bauprozess.arch.ethz.ch">www.bauprozess.arch.ethz.ch</a> and <a href="http://www.kompetenz.arch.ethz.ch">www.kompetenz.arch.ethz.ch</a></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>072-0103-00L</td>
<td>Module 3: Foundation of Automation</td>
<td>O</td>
<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Managed data, semantics and file formats</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Module 3 we leave behind the negative images from the early days of automation. A gloomy and misanthropic image of automation - both a bliss and a curse. We get to know the positive sides and learn to apply them. How do we become a sustainable &quot;Formula 1&quot;?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>What does it take to be able to work together in a digitally networked environment? How many &quot;techie genes&quot; are needed to work efficiently and effectively with structured data? The third module gives an insight into the principles of data architectures, data formats, attributes and platform technology. Machine readability as an important requirement but also as a clear challenge e.g. to security requirements.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>Literature recommendations at <a href="http://www.bauprozess.arch.ethz.ch">www.bauprozess.arch.ethz.ch</a> and <a href="http://www.kompetenz.arch.ethz.ch">www.kompetenz.arch.ethz.ch</a></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>072-0104-00L</td>
<td>Module 4: Foundation of Value Creation</td>
<td>O</td>
<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Added value of digital transformation, distributed data management, digital twin, logistics and robotics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Using specific examples, Module 4 illustrates the foundations and versatility of building information modeling (BIM), enabling participants to deal with the concepts, applications and mechanisms involved.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>&quot;Highway to hell or highway to haven&quot; - the question of a clear and simple roadmap is always at the heart of a digital transformation. &quot;Value creation&quot; is a central goal. Digitalisation is often seen as a strategy from the productivity gap. The fourth module shows how strategic goals can be developed in a roadmap and implemented in practice and how the individual shareholders and stakeholders participate.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>Literature recommendations at <a href="http://www.bauprozess.arch.ethz.ch">www.bauprozess.arch.ethz.ch</a> and <a href="http://www.kompetenz.arch.ethz.ch">www.kompetenz.arch.ethz.ch</a></td>
<td></td>

<tr>
<td>072-0105-00L</td>
<td>Module 5: New Business Modelle</td>
<td>O</td>
<td>1</td>
<td>2G</td>
<td>A. Paulus</td>
</tr>
<tr>
<td></td>
<td>Only for CAS ARC in Digital and MAS in Architecture, Real Estate, Construction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Key terms: Business models, cultural change, disruption, evolution, lean methods</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Module 5 focuses on cultural change, innovation, disruption or evolution? In this last model, we learn to question and discover what the 17 Sustainable Goals mean for our industry.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>As a final module, new business models are discussed and explored. Examples will be used to explore patterns and interfaces and to analyse what is needed today and in the future for a successful and sustainable development of the sector. How can innovative ideas move us forward? What can we learn from design thinking? Why is it important for people to have useful and understandable measurable values? How do the 17 Sustainable Goals influence our industry?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>

ECTS  European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Module 3: Economic Interest

With more than CHF 3,585 billion (excluding land), Switzerland is the largest national capital. It grows by around 4.7 per cent each year, but key words: construction and real estate market, micro and macro environment.

Objective
In Module 1, by interpreting the snapshot of one’s own enterprise and opportunities and dangers to appreciate.

Content
Introductory module “Enterprise” considers the role of organizations in the economic network of markets and their identity. It presents the peculiarities of planning offices as a service provider, shows different types of companies and discusses the business cycle from founding to succession planning. In addition, the branch-specific development of leadership and organizational models as well as the problem of access to international markets are examined. Accompanying the basics of a general business model for service companies are taught and key criteria defined.

Lecture notes
Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature
Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 4: Course of Action

Building and breaking off is understood as an energy and material flow.

Objective
The participants understand a property in the context of a life cycle.

Content
The structure and nomenclature of the interventions in the stock are presented and models for the registration and calculation of the various depths of intervention in dealing with a existing property and their effects are known.

Lecture notes
Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature
Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 5: Life Cycle and Resources

Does not take place this semester.

Objective
Preservation of value, increase in value, destruction of value and replacement construction.

Content
The participants understand a property in the context of a life cycle.

Lecture notes
Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature
Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

<td>The “company” module considers the role of organisations within the economic network of the markets and the nature of their identity. It presents the special aspects of planning offices as service providers, illustrates various types of company, and discusses companies’ life-cycle as they move from their founding to the period of planning for the succession. Both sector-specific development of management and organizational models and also the problems of obtaining access to international markets are also investigated. Alongside this, the foundations of a generally valid business model for service companies are described and key criteria are defined.</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Acquisition represents a separate project in entrepreneurial activity, since all the activities involved in obtaining a commission fall under this term. The “acquisition” module focuses on imparting basic knowledge of networking and professional dialogue. Both of these tools require an assessment of one’s own situation with regard to competence, resources and customer relations. The conversation is a direct interaction: everyone involved is both an addressee and also basically an equal interlocutor. Networking can be learned: situational “small talk,” social competence and a healthy ability to communicate can be learned.</td>

<tr>
<td></td>
<td>Marketing means orienting company activities towards market demands. Communication between suppliers, clients and the competition plays the decisive role here. The “marketing” module illustrates the foundations of marketing planning for architects and engineers. The essential definitions are provided and the core tasks involved in marketing are described. On this basis, the way in which a marketing plan is developed is explained and strategic and operational marketing planning is described in detail. The topics of branding and the opportunities represented by press and public relations work for architects and planners round out the “marketing” module.</td>

| 344-0100-00L | CAS Module in Advanced Materials and Processes  
Only for CAS in Advanced Materials and Processes.  
The enrolment is done by the MaP executive office. | O    | 12 credits | 26A   | Professors      |

### Abstract

CAS AMaP participants are offered a MaP professor as a mentor together with whom they design their study plan along an individually-specified focus area in 'Advanced Materials and Processes'. Building on the individual expertise, interests and needs of the participants, the customised CAS AMaP module consists of the elements (i) research project, (ii) courses and lectures, (iii) knowledge transfer.

### Objective

The CAS AMaP module is fully customisable, building on the expertise of technical specialist professionals and aims at:
- training skills at the frontiers of the current state of research in Advanced Materials and Processes,
- deepening technical know-how with state-of-the-art knowledge in the specified focus area, and
- advancing practical competencies in the impart of expertise and knowledge transfer across disciplines and educational levels.

### Content

Depending on individual interests and needs of the technical specialist professionals, the CAS AMaP module consists of the elements:
I. conducting a research project in the mentor’s group, addressing fundamental, development or applied problems, considering theoretical and/or experimental aspects,
II. individual schedule of courses and lectures with state-of-the-art knowledge, and
III. sharing of know-how in, e.g. seminars and interactive formats, thereby enhancing bidirectional knowledge transfer.

Abstract
The autumn course covers landslides in the broader sense, large slope movements and flowing mass movements in soil and rock. The course provides current and new knowledge needed for classification, determination of the relevant processes and estimation of the temporal behaviour of geological mass movements.

Objective
The participants learn which investigations and measurements can be used to improve the hazard analysis in a targeted manner, especially for more complex slope instabilities.

|          | Nonparametric and Resampling Methods      | Z    | 2 credits | 2G    | L. Meier, D. Kuonen |
|          | Special Students “University of Zurich (UZH)” in the |      |         |       |                   |

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

For classical parametric models there exist optimal statistical estimators and test statistics whose distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics.

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

**Spatial Statistics**

Does not take place this semester.
Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

**Objective**

The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

**Content**

After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging; mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

**Lecture notes**

Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

**Literature**

**Data Mining**

Does not take place this semester.
Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

**Abstract**

Block course only on prediction problems, aka "supervised learning".

Part 1, Classification: logistic regression, linear/quadratic discriminant analysis, Bayes classifier; additive and tree models; further flexible ("nonparametric") methods.

Part 2, Flexible Prediction: additive models, MARS, Y-Transformation models (ACE,AVAS); Projection Pursuit Regression (PPR), neural nets.

"Data Mining" is a large field from which in this block course, we only treat so called prediction problems, aka "supervised learning".

**Content**

Part 1, Classification, recalls logistic regression and linear / quadratic discriminant analysis (LDA/QDA) and extends these (in the framework of 'Bayes classifier") to (generalized) additive (GAM) and tree models (CART), and further mentions other flexible ("nonparametric") methods.

Part 2, Flexible Prediction (of continuous or "class" response/target) contains additive models, MARS, Y-Transformation models (ACE, AVAS); Projection Pursuit Regression (PPR), neural nets.

**Lecture notes**

The block course is based on (German language) lecture notes.
Prerequisites / notice
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

447-6273-00L Bayes Methods

W 2 credits 2G

Abstract
conditional probability; bayes inference (conjugate distributions, HDP-areas; linear and empirical bayes); determination of the a-posteriori distribution through simulation (MCMC with R2Winbugs); introduction to multilevel/hierarchical models.

Content
Bayes statistics is attractive, because it allows to make decisions under uncertainty where a classical frequentist statistical approach fails. The course provides an introduction into bayesian methods. It is moderately mathematically technical, but demands a flexibility of mind, which should not underestimated.

Literature

Prerequisites / notice
Prerequisite: Basic knowledge of statistics; Knowledge of R.

447-6191-00L Statistical Analysis of Financial Data

W 2 credits 1G

Abstract

Objective
Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.

CAS in Applied Information Technology
The CAS takes place in Autumn Semester only.

| Module |
|---|---|---|---|---|
| Number | Title | Type | ECTS | Hours | Lecturers |
| 265-0100-00L | Foundations of Programming | O | 3 credits | 2A | L. E. Fässler |

**Abstract**
The initial module offers a practical introduction to some basic concepts and techniques for information processing as well as practical applications of them. The programming language are Python and SQL.

**Objective**
Students learn...
- how to encode a problem into a program, test the program, and correct errors.
- to understand and improve existing code.
- to implement mathematical models as a simulation.

**Content**
The following programming concepts are introduced during this module:

1. Variables, data types
2. Condition check, Loops, logics
3. Arrays
4. Functions
5. Matrices
6. Data management (SQL)

In the practical part of the course, students work on small programming projects with a context from natural sciences. Electronic tutorials are available as preparation.

**Prerequisites / notice**
No prior knowledge is required for this course. It is based on application-oriented learning. The students spend most of their time working through programming projects and discussing their results with teaching assistants. To learn the programming basics there are electronic tutorials available.

**Abstract**
In this module, basic paradigms and techniques in working with data will be discussed, especially towards data security, managing data decentrally, and learning from data.

**Objective**
Participants learn about some important computer science concepts necessary for data science. They understand some of these concepts in detail and see the mathematics behind them.

**Content**
Participants will get an introduction to key computer science concepts underlying current and upcoming technology. The module in particular covers cryptography and digital signatures, networking and distributed algorithms, distributed ledger technology, as well as machine learning (supervised and unsupervised learning). Each topic will be discussed in two different ways: (i) a hands-on and in-depth introduction that allows participants to gain a technical understanding of key ideas. This is supported by simple and concrete examples as well as programming assignments; (ii) a context part that addresses the challenges and limitations encountered in practical applications.

**Abstract**
This module offers practical knowledge in visual information processing and human computer interactions.

**Objective**
Participants understand basic concepts of visual recognition and human-computer interaction systems.

**Content**
The first part of the module will cover basic theoretical knowledge on visual recognition systems of the last two decades, mostly focusing on the most recent advancements in deep learning and convolutional neural networks. The theoretical knowledge will be supported with practical sessions that will allow participants to gain hands-on experience with most commonly used tools and deepen their understanding of the key concepts. The second part provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

**Abstract**
This integration module for CAS "Applied Information Technology" links technical understanding of technology with business strategy based on a set of case studies from practice.

**Objective**
Participants will learn how technology affects businesses and practical issues when using new technologies in incumbent organizations based on a set of case studies.

**Content**
Participants will explore how new information technologies change different aspects of a business, and learn how to evaluate specific risks, costs, and benefits of such technologies. The module will shed light on success factors and common pitfalls when implementing new technologies and respective business changes, and it will specifically address the communication between technical experts and business management. The studied cases are currently planned to focus on artificial intelligence, IoT including edge and cloud computing, blockchain and distributed ledger technologies, and cybersecurity and data protection regulations (subject to change).

</table>

**Abstract**

This course provides an introduction to research & development, both as a general activity and as a dedicated function within a corporation. Participants will learn how to organize, conduct and manage individual R&D projects as well as groups of projects. We will also look at the various roles that R&D serves within a corporation and how choices regarding the organization of R&D align with these roles.

**Objective**

The aim of this course is to develop the participants’ ability to articulate a coherent plan for R&D activities linked to the business needs of a corporation, including the ability to explain convincingly the rationale, structure, resources and intended outcomes of the R&D.

**Abstract**

The Innovation Opportunity Analysis course is designed as a practical introduction to evaluating technology-based innovation opportunities in a corporate setting. The course will cover several fundamental innovation frameworks and principles before diving deeper into individualized content using the principle of Guided Learning.

**Objective**

The primary goal of the course is to develop the skills needed for identifying technology-based innovation opportunities and for planning successful innovation projects. An additional goal is to prepare participants for their Master's thesis and for lifelong learning in technology-based innovation.

**Abstract**

This module prepares participants to conduct an experimental project in an ETH lab beginning in the following January as part of the MAS in Applied Technology programme. Participants will prepare a plan and design for the experimental project under the direction of the CAS Programme Director and the relevant ETH lab.

**Objective**

The goal is for participants to learn standard procedures for the planning and design of experiments and to gain practical experience in planning and designing an individual experimental project.

**ECTS**

- European Credit Transfer and Accumulation System
- Special students and auditors need special permission from the lecturers.
This is the first knowledge module in the CAS ELTV. In this module we (1) introduce all participants to the CAS and ETH, (2) get to know in more detail the projects of the participants and how lean innovation plays a role, and (3) discuss important considerations of strategy formation in technology ventures.

### Objective
This module enables participants:
- To understand and select from commercialization strategies available to them (e.g., licensing, partnering, and vertical integration) and respective business model choices
- Assess and generate development options for key internal enabling factors such as IP strategy and key resources and capabilities
- Understand different market research and developments tools (lean start-up vs. technology broadcasting) and select appropriate methods and related KPIs

### Content
This module focuses on elements of entrepreneurial strategy formation and implementation in nascent markets and/or industries. Participants will study commercial options available to them, e.g., technology broadcasting, licensing and partnering, and vertical integration, which is complemented by a practical view on IP strategy, driven by business strategy rather than arbitrary choices. The module also includes the introduction to lean innovation methods incl. agile product development methods and core tools of the lean startup approach.

### Prerequisites / notice
This module is only for CAS ELTV participants.

### Lecture notes
See Online Platform

### Literature
See Online Platform

---

This is the second knowledge module within the CAS ELTV. During this module, we will discuss important themes concerning entrepreneurial team formation and management and practice elements in interactive workshops.

### Objective
This module enables participants:
- To understand key requirements for new venture leadership and how to build effective governance structures for the founding team
- To select and implement approaches and methods to structure productive work relationships within an emerging firm.
- To understand and build the organizational foundations for successful professionalizing of venture operations

### Content
This module zooms in on the design and management of new venture teams in technology-based companies as well as the role of leadership in building successful venture teams. Key contents in this module comprise founder contracts, successful governance structures, and approaches to team performance management. This module also allows participants to understand requirements for venture leadership and professionalizing venture operations as well as building productive work relationship within their emerging firm.

### Prerequisites / notice
This module is only for CAS ELTV participants.

### Lecture notes
See Online Platform

### Literature
See Online Platform

---

This is the third knowledge module within the CAS ELTV. During this module, we will discuss important themes concerning entrepreneurial team formation and management and practice elements in interactive workshops. The module will be extended by intermediary project review meetings.

### Objective
This module enables participants:
- To understand customer needs and the respective markets
- To practice and optimize successful communication with and towards existing and future customers (e.g., strategic selling, key account management, communication tools)
- To understand and use different pricing techniques for technology products and services, both in B2C and B2B contexts,
- To select appropriate strategies to build up effective sales channels and calculate and optimize respective funnel KPIs and assess the implications on the venture's business model and organization (e.g., lead management, funnel metrics, etc.)

### Content
This module exposes participants to important customer development and market research strategies, with the goal to build competencies in several customer- facing activity domains of the growing venture. Key module themes span the pricing of technology products and services, both in B2C and B2B contexts, the effective build-up of sales channels and funnels, and the successful communication to existing as well as future customers.

### Business & Leadership Development

- **Number**: 373-0200-00L
- **Title**: Business Development of Technology Ventures I
- **Type**: O
- **ECTS**: 2 credits
- **Hours**: 2P
- **Lecturers**: B. Clarysse

This module is the first part of the Business Coaching track of the CAS ELTV. The module offers a structured process through which participants develop their business projects. All projects receive regular guidance from a dedicated coach.

### Objective
This module enables participants:
- To identify key unknowns and important progress measures for their respective business case and implement effective means and tools to further develop their business case
- To understand the view of potential customers and implement their feedback to improve the business case
- To effectively communicate and enroll other important venture constituents (mentors, advisors, employees, investors, etc.) in the venture
This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches and startup mentors will interact regularly with the participants, offer guidance on how to strategize and implement compelling business cases, feedback on specific challenges, and participants' activities with the goal to strengthen the ability of the participant to garner needed resources for their undertakings.

<tr>
<td>Abstract</td>
<td>This is the first module of the Leadership Development &amp; Coaching track of the CAS ELTV. In this module, participants take stock of their current situation and goals and develop specific action points. This process is supported by experienced leadership coaches.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This module enables participants:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To identify current gaps in the personal management skills and competencies and develop meaningful goals and plans to fill those gaps</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To implement effective exercises and practices to improve the participants' leadership capacity</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To effectively communicate and manage key constituents, notably employees and key advisors in a venture project</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This module focuses on the development needs of participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach them along a personal development plan, and feedback participants on specific challenges and activities with the goal to strengthen the participants' leadership capability and people skills.</td>
<td></td>
<td></td>

<tbody>
<tr>
<td>Abstract</td>
<td>This module focuses on the development needs for both the participants' presentation and resource mobilization skills. The participants are asked to bring all learnings from the CAS and defend in engaging manner their business projects. This defense is typically delivered in presence of external investors or venture stakeholders who will challenge the project and potentially offer future support.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This module enables participants:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To reflect upon and integrate important and relevant elements from the CAS into the venture project</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To practice effective business communication and venture pitching skills</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- To receive and handle challenging feedback from important venture constituents.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches will interact regularly with the participants, offer guidance on how to strategize and implement compelling business cases, feedback on specific challenges, and participants' activities with the goal to strengthen the ability of the participant to garner needed resources for their undertakings.</td>

**Registration only through the NADEL administration office.**

**Abstract**
The course aims at strengthening the capacity in portfolio management for VET, skills development and active labor market policies. It deals with basic issues and challenges of Vocational Education and Training (VET) in Developing Countries. In view of the many of school leavers VET has to place itself between the contradicting intensions of quality education and short-term training interventions.

**Objective**
The participants are able to:
- Assess project proposals and ongoing project regarding their relevance and suitability in the specific country context
- Explain strengths and weaknesses of the opposing approaches "dual apprenticeship" and "competency based training" as well as synergies and incompatibilities between the two
- Describe the competent use of tools currently applied in VET

**Content**
- Basic concepts and terms
- Differences and commonalities between VET and neighboring systems
- Planning, assessment of VET interventions with different objectives: economic development, poverty alleviation, creation of self-employment or systems development
- VET as a cooperation system of stakeholders with different duties, interests and competencies
- Background, potential use and limitations of (national) qualification frameworks
- Half-day visit to important actors of the Swiss VET landscape

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with NADEL secretariate.

**Registration only through the NADEL administration office.**

**Abstract**
The course provides a deeper understanding of the methodological foundations of results-oriented planning and steering of development projects. Together with the participants, we reflect on the situation-specific application of instruments for project planning and the development of a monitoring system, which makes it possible to adapt and steer projects.

**Objective**
The course participants are able to describe the processes and concepts of project planning and monitoring using the correct technical terminology, to initiate an analysis of the initial situation, to elaborate a monitoring system, and to adaptively steer the implementation of projects.

**Content**
- Basic concepts of result-oriented project management
- Instruments and resources for project planning, including the elaboration of a "logframe matrix" and results chain
- Instruments and resources for project monitoring, and for the development of a monitoring system, including indicators to assess objectives achievement and steer the Project
- 'Write' and structure results-oriented Project reports

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL.

**Registration only through the NADEL administration office.**

**Abstract**
The course gives an introduction to the most important methods for rigorous impact analysis of development programs and projects. The course is designed to both cover the most fundamental methods of impact analysis and introduce real world case studies from national, international and non-governmental development organizations and asks how rigorous impact analysis has influenced their policies.

**Objective**
Participants understand the most important methods of impact analysis. They are able to conduct small scale studies to evaluate the impact of their own programs as well as manage larger impact evaluations for their organizations. Participants are able to use the results of own and external impact studies.

**Content**
- Introduction to rigorous impact analysis; Case studies and their policy implications; Introduction to the required statistical knowledge; Potentials and limitations of quantitative analysis; Experimental and quasi-experimental methods; Relevant and feasible indicators for the measurement of outcomes and impacts; Data collection and analysis; Project management of an impact analysis.

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with NADEL secretariate.

Leveraging Private Impact Investors in Development Cooperation

This two-day course demystifies impact investing for people working in development cooperation. The course provides an introduction to the political economy of the Corporate Social Responsibility discourse, voluntary governance and the role of social entrepreneurship. The course conveys basic knowledge of methods and instruments for the financial management and the economic analysis of development projects. Students of the course must fulfill requirements specified on the homepage of NADEL.

Abstract

This course seeks to increase the participants' understanding of the multifaceted and dialectic relationships between civil society, governments and private sector. It equips participants with knowledge and tools required for a strategic interaction between private sector organizations and development agencies. The course enables participants to contribute effectively to policy debates on the role of private sector actors and development.

Objective

This course goes beyond awareness raising of personal cultural characteristics and recognizing cultural values within development concepts. It unfolds traces of colonialism and power structures in day to day live and the aid industry. It promotes searching and initiating practical examples of aid interventions and similar initiatives.

Content

- Decoloniality key terms and concepts
- Conceptions of and alternatives to development (cooperation)
- Cultural (self-) awareness, diversity
- The role of culture in aid / development cooperation
- Implications of decolonialism for aid policy making and practice

865-0064-00L

Decolonizing Aid

Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

Registration only through the NADEL administration office.

865-0070-00L

The Private Sector and Development Organizations: Building Successful Alliances

Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

Registration only through the NADEL administration office.

865-0021-00L

Fraud and Corruption: Prevent, Detect, Investigate, Sanction

Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

865-0006-00L

Leveraging Private Impact Investors in Development Cooperation

Only for MAS/CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation. Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

Registration only through the NADEL administration office.

Abstract

Students of the course must fulfill requirements specified on the homepage of NADEL.
Objective
This two-day course demystifies impact investing for people working in development cooperation. Impact investing—the idea that it is possible to “do good” as well as make money with certain types of investment—is changing the landscape of development cooperation. Impact investing is growing rapidly and development agencies and non-governmental organizations increasingly seek to leverage private investor resources. But many development actors are not accustomed to working with private investors, and are uneasy about their profit motivation and modes of operation. The course provides an introduction to the terminology and instruments involved in impact investing and evaluates developmental opportunities and trade-offs.

Content
Key topics
- Defining impact investing and understanding its importance for development
- Different types of impact investor and their incentives
- Overview of instruments such as loans, equity investments, syndication and impact bonds
- How to define and measure “impact”
- Techniques used by development agencies to leverage private investor resources
- Considering what impact investing can and cannot achieve for development goals

865-0041-00L Natural Resource Governance and Development: W 3 credits 3S F. Brugger, further speakers
Policies and Practice
Only for CAS in Development and Cooperation students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

Abstract
First introductory, online phase of an advanced-level multi-stakeholder course with the main goal to introduce analytical tools of political economy to enhance understanding of the crucial impact of politics and power on policy outcomes.

Objective
The first phase of the course will be introductory, allowing participants to start interacting with their peers, access videos and other materials as well as engage in scheduled live sessions to refresh their knowledge and skills.

Content
Topics covered:
• Discovery and allocation of resource rights
• The political economy of natural resource extraction
• Fiscal regimes and taxation
• Managing natural resource revenues and investment
• State Owned Companies governance
• Environmental and social impacts of extraction
• Corruption and accountability

Prerequisites / notice
• Live Lecture September 27 2pm CET
• Live Lecture September 28 2pm CET
• 29 Sept - 31 Oct Self-study phase (without live lectures).
• Nov 8 - Nov 19 Live Phase (each live lecture 2pm CET and additional program sessions in the morning and/or afternoon CET).

Autumn Semester 2021
Page 412 of 2152
Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
   - "Risk": assets, threats, vulnerabilities, risk
   - Risk assessment: quantitative and qualitative
   - Safeguards
   - Generic risk analysis procedure
   - The OCTAVE approach
   - Example of qualitative risk assessment
11. Threat modeling
   - Overview
   - Safety engineering basics: FMEA and FTA
   - Security impact analysis in the design phase
   - Modeling security threats: attack trees
   - Examples and experience
12. Evaluation criteria
   - NIST special papers
   - ISO/IEC 27000
   - Common criteria
   - BSI baseline protection
13. Guest lecture
   - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
- Prerequisite: Class on Information Security
Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics, and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

---

**252-0543-01L Computer Graphics**

**W** 8 credits 3V+2U+2A

Does not take place this semester.

Abstract

This course covers some of the fundamental concepts of computer graphics generation of photorealistic images from digital representations of 3D scenes and image-based methods for recovering digital scene representations from captured images.

Objective

At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students’ curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content

This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling, geometry representation and texture mapping, we will move on to the physics of light transport, acceleration structures, appearance modeling and Monte Carlo integration. We will apply these principles for computing light transport of direct and global illumination due to surfaces and participating media. We will end with an overview of modern image-based capture and image synthesis methods, covering topics such as geometry and material capture, light-fields and depth-image based rendering.

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Books:

- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Multiple view geometry in computer vision
- Physically Based Rendering: From Theory to Implementation

Prerequisites / notice

Prerequisites:

- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

---

**252-0546-00L Physically-Based Simulation in Computer Graphics**

**W** 5 credits 2V+1U+1A

V. da Costa de Azevedo, B. Solenthaler, B. Thomaszewski

Abstract

This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective

This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content

The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice

Prerequisites:

- Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

---

**252-1407-00L Algorithmic Game Theory**

**W** 7 credits 3V+2U+1A

P. Penna

Abstract

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Objective

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
Content
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don’t care about others, and the same is true for computational load or download rates. Game theory provides a mathematical model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google’s Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes
Lecture notes will be posted on the website shortly after each lecture.

Prerequisites / notice
Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

252-1411-00L Security of Wireless Networks W 6 credits 2V+1U+2A S. Capkun, K. Kostiainen
Abstract
Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

Objective
After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.

Content

252-1414-00L System Security W 7 credits 2V+2U+2A S. Capkun, A. Perrig
Abstract
The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

252-1425-00L Geometry: Combinatorics and Algorithms W 8 credits 3V+2U+2A B. Gärtner, E. Welzl, M. Hoffmann, M. Wettstein
Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Content
Planar and geometric graphs, embeddings and their representation (Whitney’s Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in Rd, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chazan’s Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
yes

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

252-3005-00L Natural Language Processing W 5 credits 2V+2U+1A R. Cotterell

This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course. Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departements interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2021

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  
  Advanced Machine Learning  
  https://ml2.inf.ethz.ch/courses/aml/

  https://las.inf.ethz.ch/teaching/pai-f18

263-3845-00L  Data Management Systems  
W  8 credits  3V+1U+3A  G. Alonso

Abstract  The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective  The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content  The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature  The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

Prerequisites / notice  The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

Taught competencies  Domain A - Subject-specific Competencies  Concepts and Theories assessed  Techniques and Technologies assessed

263-3840-00L  Informal Methods  
W  5 credits  2G+2A  D. Cock

Abstract  Formal methods are increasingly a key part of the methodological toolkit of systems programmers - those writing operating systems, databases, and distributed systems. This course is about how to apply concepts, techniques, and principles from formal methods to such software systems, and how to get into the habit of thinking formally about systems design even when writing low-level C Code.

Objective  This course is about equipping students whose focus is systems with the insights and conceptual tools provided by formal methods, and thereby enabling them to become better systems programmers.

Content  By the end of the course, students should be able to seamlessly integrate basic concepts form formal methods into how they conceive, design, implement, reason about, and debug computer systems.

The goal is not to provide a comprehensive introduction to formal methods - this is well covered by other courses in the department. Instead, it is intended to provide students in computer systems (who may or may not have existing background knowledge of formal methods) with a basis for applying formal methods in their work.

This course does not assume prior knowledge of formal methods, and will start with a quick review of topics such static vs. dynamic reasoning, variants and invariants, program algebra and refinement, etc. However, it is strongly recommended that students have already taken one of the introductory formal methods course at ETH (or equivalents elsewhere) before taking this course - the emphasis is on reinforcing these concepts by applying them, not to teach them from scratch.

Instead, the majority of the course will be about how to apply these techniques to actual, practical code in real systems. We will work from real systems code written both by students taking the course, and practical systems developed using formal techniques, in particular the verified seL4 microkernel will be a key case study. We will also focus on informal, pen-and-paper arguments for correctness of programs and systems rather than using theorem provers or automated verification tools; again these latter techniques are well covered in other courses (and recommended as a complement to this one).

263-4500-00L  Advanced Algorithms  
W  9 credits  3V+2U+3A  M. Ghaffari, G. Zuzic

Abstract  This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

Objective  This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

Content  The lectures will cover a range of topics, tentatively including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms, and derandomization.

Lecture notes  https://people.inf.ethz.ch/gmohsen/A221/

Prerequisites / notice  This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations, E.g., having passed the course Algorithms, Probability, and Computing (APC) is highly recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

**Objective**
- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

**Content**
The course will cover topics spanning four broad themes with a focus on the first two themes:
1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.
Foundations of Reinforcement Learning

Abstract

Reinforcement learning (RL) has been in the limelight of many recent breakthroughs in artificial intelligence. This course focuses on theoretical and algorithmic foundations of reinforcement learning, through the lens of optimization, modern approximation, and learning theory. The course targets M.S. students with strong research interests in reinforcement learning, optimization, and control.

Objective

This course aims to provide students with an advanced introduction to RL theory and algorithms as well as bring them near the frontier of this active research field.

By the end of the course, students will be able to
- Identify the strengths and limitations of various reinforcement learning algorithms;
- Formulate and solve sequential decision-making problems by applying relevant reinforcement learning tools;
- Generalize or discover "new" applications, algorithms, or theories of reinforcement learning towards conducting independent research on the topic.

Content

Basic topics include fundamentals of Markov decision processes, approximate dynamic programming, linear programming and primal-dual perspectives of RL, model-based and model-free RL, policy gradient and actor-critic algorithms, Markov games and multi-agent RL. If time allows, we will also discuss advanced topics such as batch RL, inverse RL, causal RL, etc. The course keeps strong emphasis on in-depth understanding of the mathematical modeling and theoretical properties of RL algorithms.

Lecture notes

Lecture notes will be posted on Moodle.

Literature

Dynamic Programming and Optimal Control, Vol I & II, Dimitris Bertsekas
Algorithms for Reinforcement Learning, Csaba Czepevsári

Prerequisites / notice

Students are expected to have strong mathematical background in linear algebra, probability theory, optimization, and machine learning.

263-5902-00L

Computer Vision

Abstract

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve these.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

263-5905-00L

Mixed Reality

Abstract

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective

After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision(graphics/HMI) research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice

Prerequisites include:
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

636-0007-00L

Computational Systems Biology

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational approaches to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Lecture notes

http://www.csb.ethz.ch/education/lectures.html

Methodologies to analyze the cases and create final presentations. Short overview of each case.

The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Current Topics in Information Security

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speculation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). We provide an R tutorial and help sessions during the first two weeks of class to learn the required skills. However, in case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSEE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place at D-BSEE from Wednesday, September 12 to Friday, September 14, i.e. BEFORE the official semester starting date

http://www.cbb.ethz.ch/news-events.html

For the Zurich-based students without R experience, we recommend the R course http://www.vvz.ethz.ch/Vorlesungsverzeichnis/lerneinheit.view?semkez=2018W&aansicht=KATALOGDATEN&lerneinheitId=123546&lang=d e, or working through the script provided as part of this R course.

Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.

Objective

Participants understand the different viewpoints for IT-decisions in practice, including technical and business aspects, can effectively analyze IT questions from the different viewpoints and facilitate decision making.

Content

Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

Lecture notes

Successful completion of Lecture "Case Studies from Practice".

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Abstract

The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Objective
Content
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

Literature
The reading list will be published on the course web site.

</table>
Objective
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

263-5156-00L Beyond iid Learning: Causality, Dynamics, and Interactions
Number of participants limited to 60.
The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
Many machine learning problems go beyond supervised learning on independent data points and require an understanding of the underlying causal mechanisms, the interactions between the learning algorithms and their environment, and adaptation to temporal changes. The course highlights some of these challenges and relates them to state-of-the-art research.

Objective
The goal of this seminar is to gain experience with machine learning research and foster interdisciplinary thinking.

Content
The seminar will be divided into two parts. The first part summarizes the basics of statistical learning theory, game theory, causal inference, and dynamical systems in four lectures. This sets the stage for the second part, where distinguished speakers will present selected aspects in greater detail and link them to their current research.

Keywords: Causal inference, adaptive decision-making, reinforcement learning, game theory, meta learning, interactions with humans.

263-3713-00L Advanced Topics in Human-Centric Computer Vision
Numbers of participants limited to 20.
The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modelling of detailed human activities.

Objective
The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

Content
The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

Presenter: Give a presentation about the paper that you read in depth.

Reviewer: Perform a critical review of the paper.

Prerequisites / notice
All other students: read the paper and submit questions they have about the paper before the presentation.
Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

Taught competencies
Domain B - Method-specific Competencies
Analytical Competencies assessed
Domain C - Social Competencies
Communication assessed
Domain D - Personal Competencies
Critical Thinking assessed
