<td>The importance of a life-cycle-oriented approach has arrived in the Swiss construction and real estate sector. Cumulative management costs can exceed the cost of construction after just a few years. In this module, a systematic consideration of the phases and processes in the life cycle of a property takes place. Study I explores various aspects of life-cycle planning and construction.</td>

Module 1: Market, purpose and business model

Key terms: Market, purpose and business model

The aim is to use a snapshot in time to interpret one's own company and become able to assess opportunities and risks.

Content

The “company” module considers the role of organisations within the economic network of the markets and the nature of their identity. It presents the special aspects of planning offices as service providers, illustrates various types of company, and discusses companies’ lifecycle as they move from their founding to the period of planning for the succession. Both sector-specific development of management and organizational models and also the problems of obtaining access to international markets are also investigated. Alongside this, the foundations of a generally valid business model for service companies are described and key criteria are defined.

Literature

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 2: Acquisition

Key terms: Competence, communication and network

The aim is to become able to analyse and implement the processes and instruments used for acquisition in one's own company.

Content

Acquisition represents a separate project in entrepreneurial activity, since all the activities involved in obtaining a commission fall under this term. The “acquisition” module focuses on imparting basic knowledge of networking and professional dialogue. Both of these tools require an assessment of one’s own situation with regard to competence, resources and customer relations. The conversation is a direct interaction; everyone involved is both an addressee and also basically an equal interlocutor. Networking can be learned: situational “small talk,” social competence and a healthy ability to communicate can be learned.

Literature

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 3: Marketing

Key terms: Planning, positioning and identity

The aim is to become familiar with the tools used in marketing and able to use them in specific situations.

Content

Marketing means orienting company activities towards market demands. Communication between suppliers, clients and the competition plays the decisive role here. The “marketing” module illustrates the foundations of marketing planning for architects and engineers. The essential definitions are provided and the core tasks involved in marketing are described. On this basis, the way in which a marketing plan is developed is explained and strategic and operational marketing planning is described in detail. The topics of branding and the opportunities represented by press and public relations work for architects and planners round out the “marketing” module.

Literature

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 4: Financial Management

Key terms: Cost accounting, budgeting and controlling

The aim is to become able to analyse one's own company's financial resources in detail, interpret key parameters for the current situation and test them.

Content

Financial management means achieving the target company output with costs that are as low as possible, and in the longer term to create secure asset and capital structures. The tasks involved in financial management in a planning office include establishing a well-structured accounting department, careful cost accounting, sound budgeting and an effective controlling system. On the basis of a practical financial structure for architecture and engineering offices, the “financial management” module presents the information needed to carry these tasks out in a professional and responsible way.

Literature

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

Module 5: Digitalisation

Key terms: Strategy, potentials and digital planning

The aim is to become familiar with the current practical work involved in IT in planning companies and be able both to analyze the specific challenges it implies and also to infer one’s own prospects for development in this context. In addition, thought needs to be given to the way in which the value creation provided by digitalisation influences one’s own company.

Content

IT refers on the one hand to information and data processing in a company, and on the other to the hardware and software components needed for the purpose. This “information technology” module focuses on potential strategies for company management in the IT field. The focus is not on the use of any individual programme, but on taking conscious decisions for or against IT components in one’s own company in order to obtain helpful support in one’s everyday work. The strengths, weaknesses, opportunities and risk of this strategy suggest possible potentials.

The participants will present their own theses on entrepreneurship and open them up for discussion in the plenary session.

Literature

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch

<td>Autumn Course: Geothermal Usage of the Subsurface</td>
<td>W</td>
<td>2 credits</td>
<td>2G</td>
<td>M. O. Saar</td>
</tr>
</tbody>
</table>

Abstract
The block course focuses on shallow groundwater wells and ground heat exchangers, but also expands the spectrum to include geothermal energy and geostorage potential in Switzerland. The contributions address, among other things, the question of how, with increased use of geothermal resources, conflicts of use due to the growing number of uses can be dealt with.

Objective
The aim of the course is for participants to be able to describe the basic processes of geothermal use and to understand the regulatory framework. They will be able to assess the mutual influence of the uses and know possibilities to take these into account in strategic planning.

Modules Geo-Constructions

The Module Geo-Constructions runs over two semesters (FS and HS) and is offered every three years.

Takes place in FS23 + HS23

<table>
<thead>
<tr>

<td>2 credits</td>
<td>2G</td>
<td>J. Aaron</td>
</tr>
</tbody>
</table>

Abstract
The course focuses on the characterization of rock as a basis for describing rock mass behaviour with the help of hazard scenarios that are used in the planning and construction of underground excavations.

Objective
Participants learn the geological, geomechanical and hydrogeological factors necessary for the assessment and are able to estimate the influence of geological conditions on underground excavations.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

</tbody>
</table>

Abstract
The autumn course provides current and new knowledge needed for classification, determination of the relevant processes and estimation of the temporal behaviour of geological mass movements.

Objective
The participants learn which investigations and measurements can be used to improve the hazard analysis in a targeted manner, especially for more complex slope instabilities.

Competencies

### Literature

### Further Courses

- **Nonparametric Regression**
  - **Number**: 447-6221-00L
  - **Title**: Nonparametric Regression
  - **Type**: W
  - **ECTS**: 1
  - **Hours**: 1G
  - **Lecturers**: M. Mächler
  - **Abstract**: This course focuses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.
  - **Competencies**: Subject-specific Competencies: Concepts and Theories. Method-specific Competencies: Analytical Competencies. Personal Competencies: Creative Thinking

- **Repeated Measures**
  - **Number**: 447-6257-00L
  - **Title**: Repeated Measures
  - **Type**: W
  - **ECTS**: 1
  - **Hours**: 1G
  - **Lecturers**: M. L. Spohn
  - **Competencies**: Subject-specific Competencies: Concepts and Theories. Method-specific Competencies: Analytical Competencies. Personal Competencies: Creative Thinking

---

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 444 of 2653
The elements of a sample survey are explained. The most important classical sample designs (simple random sampling and stratified random sampling) with their estimation procedures and the use of auxiliary information including the Horvitz-Thompson estimator are introduced. Data preparation, non-response and its treatment, variance estimation and analysis of survey data is discussed.

Knowledge of the Elements and the process of a sample survey. Understanding of the paradigm of random samples. Knowledge of simple random sampling and stratified random sampling and capability to apply the corresponding methods. Knowledge of further methods of sampling and estimation as well as data preparation and analysis.

Introduction to the statistical methods of survey research.

Nonparametric and Resampling Methods

- understanding basics of Bayesian inference
- use R packages to run MCMC algorithms
- fit and understand Bayesian linear models
- introduction to hierarchical Bayesian models

We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions. We will learn how to build, fit and validate Bayesian models of increasing complexity. There will be examples of applications from various fields: insurance, meteorology, marketing, etc.

Applied Bayesian Statistics

Introduction to Bayesian statistics: basics of inference, computation with MCMC, linear regression, Bayesian hierarchical models. Focus on applications and hands-on programming.

Statistical Analysis of Financial Data

Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.
Analysis of High-Dimensional Data

Abstract
Block course on analysis of high-dimensional data with a focus on prediction and feature assessment.

Objective
The goal of this course is to gain a good understanding of the concepts discussed during the lecture and to apply the new methods on real data examples using the software "R". The topics covered in the lecture are:

Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

Content
Course on Analysis of High-Dimensional Data with focus on Prediction and Feature Assessment.

Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

Lecture notes
The block course is based on lecture notes (https://bookdown.org/staedler_n/highdimstats/).

Literature

Prerequisites / notice
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving assessed
Project Management fostered

Social Competencies
Communication fostered
Cooperation and Teamwork fostered
Customer Orientation fostered
Leadership and Responsibility fostered
Self-presentation and Social Influence fostered
Sensitivity to Diversity fostered
Negotiation fostered

Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking fostered
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

Spatial Statistics

Abstract
In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective
The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content
After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes
Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

Literature
### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: fostered

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

**Personal Competencies**
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

<tr>
<td>Abstract</td>
<td>The inner working of the R&amp;D organization by exploring roles and processes is investigated.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim of this course is to develop the participants’ ability to articulate a coherent plan for R&amp;D activities linked to the business needs of a corporation, and to set the environment to enable an efficient R&amp;D organization.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>In most organizations, the R&amp;D organization is the one that delivers the innovation to be brought to the market. In this module, we investigate the inner working of the R&amp;D organization by exploring roles and processes. Since R&amp;D almost always starts with significant uncertainties and unsolved technical problems, governing R&amp;D has to account for these unknowns. As R&amp;D processes take time in which the market environment may change in ways other than predicted at the beginning of a project, external influences have to be continuously monitored as well to enable market success.</td>
<td></td>

**Abstract**
In this course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

**Objective**
Graduates of the course know the technical foundations of information security and understand the difficulty and complexity involved when trying to build secure systems.

**Content**
In this new course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

**Abstract**
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

**Objective**
Participants have understood and presented a publication or report on a present topic in information security. By attending other participants presentations students get further introduced to additional current information security related topics/incidents.

**Content**
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

**Abstract**
This course is composed of various sub-modules related to Cyber Security taught by experts on the relevant fields.

**Objective**
Students are expected to see behind the curtain of current research and engineering activities related to Cyber Security. At the same time students are introduced to contemporary challenges in cyber security by renowned experts.

**Content**
The lectures cover contemporary aspects and challenges in Cyber Security. The goal is to present current fields of research/engineering and the latest results. By way of example, Cyber Security Policy is one of sub-modules presented by researchers of the Center for Security Studies at ETH. Besides faculty members of the computer science department, there will be guest lecturers from industry presenting Cyber Security related challenges in their field of activity.

**Literature**
Will be announced during the course.

<td>3 credits</td>
<td>5A</td>
<td>L. E. Fässler</td>
</tr>
</tbody>
</table>

**Abstract**

This module offers a practical introduction to some basic concepts and techniques for information processing and their practical applications. The programming languages are Python and SQL.

**Objective**

- how to encode a problem into a program, test the program, and correct errors.
- to understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- to implement mathematical models as a simulation.

**Content**

The following programming concepts are introduced during this module:

1. Variables, data types
2. Condition check, loops, logics
3. Sequential data types
4. Functions and Modules
5. Data management (SQL)

In the practical part of the course, students work on small programming projects with a context from natural sciences. Electronic tutorials are available as preparation.

**Prerequisites / notice**

No prior knowledge is required for this course. It is based on application-oriented learning. The students spend most of their time working through programming projects and discussing their results with teaching assistants. To learn the programming basics there are electronic tutorials available.

**Competencies**

### Subject-specific Competencies

- Concepts and Theories assessed
- Techniques and Technologies assessed

### Method-specific Competencies

- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

### Social Competencies

Communication assessed

### Personal Competencies

- Adaptability and Flexibility fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

**Abstract**

This course provides a fundamental training in the areas of data science and machine learning. It is intended for managers and leaders who want to understand the typical workflow, fundamental techniques and key challenges of data science and machine learning to drive successful implementations.

**Objective**

- have a good understanding of the basic methods of data science and machine learning
- know the typical data science workflow and can understand and assess the role and importance of each individual step
- understand the importance of quantifying and communicating uncertainty in the data
- know the importance and basic techniques of cleaning and organizing data and can perform simple data cleaning tasks in pandas.
- can identify suitable algorithms and select the best-suited one for a given task
- can apply machine learning methods as implemented in scikit-learn on tabular data
- understand the basic ideas behind modern deep learning methods and can implement simple deep learning models in tensorflow
- understand some key applications such as natural language processing or computer vision.
- are able to apply the learned methods to practical problems in data science.

**Content**

We will cover the following topics:

- The typical data science workflow
- Cleaning, organizing and preparing data for further analysis
- Exploratory data analysis: Gaining an understanding through visualizing and summarizing data
- Basics of statistical inference and uncertainty quantification
- Correlations and regression.
- Basics of Machine learning, including supervised and unsupervised learning, model evaluation and model selection
- Standard algorithms such as linear regression, decision trees, k-nearest neighbors, k-means, principal component analysis
- Identification of the best-suited algorithm and models for a given dataset and machine learning task
- Foundations of Deep Learning
- Challenges & Considerations: Potential pitfalls, threats, and ethical considerations.

The theoretical parts will be complemented by practical exercises using python, pandas, numpy, matplotlib, scikit-learn, and tensorflow.
Participants learn how new information technologies such as machine learning and AI change different aspects of a business, and learn how to evaluate specific risks, costs, and benefits of new technologies. It addresses success factors and pitfalls for technology initiatives, and equips participants to contribute to technology-related decisions.

Participants understand how technology impacts business strategy. They are able to assess benefits, costs, and risks of new technology use, and to contribute to decisions balancing these aspects. They understand the long-term impact of today's technology decisions and can use it to help companies make better technology investment decisions.

Participants are able to confidently participate in discussions with technical experts and to ensure technology is evaluated from the perspective of the commissioning business.

Participants understand how AI projects differ from traditional IT projects. They are able to shape respective projects in their companies and to help make them successful.

This integration module links the newly acquired understanding of technology with technology's impact on business strategy. Participants will explore how new information technologies such as machine learning and AI change different aspects of a business, and learn how to evaluate specific risks, costs, and benefits of new technologies. The module will shed light on success factors and common pitfalls when implementing new technologies and respective business changes, and it will specifically address the communication between technical experts and business management. The module provides insights into how participants can contribute to technology-related decisions and help shape the use of IT for business benefit. It teaches concepts regarding IT cost, IT risk, IT complexity, and IT lifecycle management, software architecture and project methodologies, including how machine-learning projects differ from traditional IT projects, and applies them to a number of current business/IT topics such as cloud computing, use of AI for software development, and Internet of Things.

ECTS: European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The widespread use of mobile technologies (e.g., wearable sensors, mobile applications, social media, and location-tracking technologies) can meet the health monitoring needs of the world's aging population and the ever-growing number of chronic patients. However, this premise is based on applying information and communication technologies that allow us to monitor patient data in many different ways. In this course, we will analyze systematic ways to collect data, review the most appropriate methods and applications in healthcare, discuss the main challenges, and apply the newly gained knowledge in a project.

The course has four learning objectives, i.e., to

1. understand the concept of digital biomarkers in general
2. understand the various application areas of digital biomarkers
3. to critically reflect and assess existing digital biomarkers
4. to understand how to design a digital biomarker

The course will cover the following topics:

1. Introduction to digital biomarkers
2. Design of digital biomarker studies
3. Exploration and assessment of digital biomarker candidates
4. Digital biomarker project and critical reflection

Prerequisites / notice

This module is assessed based on the participant’s pass/fail status of the group project (including a presentation). The group project is ungraded.

Abstract

Today, we face the challenge of chronic conditions. Personal coaching approaches are neither scalable nor financially sustainable. The question arises therefore to which degree Digital Health Interventions (DHIs) are appropriate to address this challenge. In this CAS module, students will design, implement and evaluate a DHI, esp. a just-in-time adaptive intervention.
After this module, participants will be able to…

1. understand the importance of just-in-time adaptive interventions (JITAIs), esp. for the prevention of NCDs
2. understand the design, implementation and evaluation of smartphone-based and chatbot-delivered JITAIs
3. discuss opportunities and challenges of JITAIs

What are the implications and rationale behind the recent developments in the field of digital health?

Digital Health is the use of information and communication technology for the prevention and treatment of diseases in the everyday life of individuals. It is thus linked to topics such as digital health interventions, digital biomarkers, digital coaches and healthcare chatbots, telemedicine, mobile and wearable computing, self-tracking, personalized medicine, connected health, smart homes, or smart cars.

In the 20th century, healthcare systems specialized in acute care. In the 21st century, we now face the challenge of dealing with the specific characteristics of non-communicable diseases (NCDs). NCDs are now responsible for around 70% of all deaths worldwide and 85% of all deaths in Europe and are associated with an estimated economic loss of $7 trillion between 2011 and 2025. NCDs are characterized in particular by the fact that they require an intervention paradigm that focuses on prevention and lifestyle change. Lifestyle (e.g., diet, physical activity, tobacco, or alcohol consumption) can reduce the risk of suffering from a chronic condition or, if already present, can reduce its burden. A corresponding change in lifestyle is, however, only implemented by a fraction of those affected, partly because of missing or inadequate interventions or health literacy, partly due to socio-cultural influences. Individual personal coaching of these individuals is neither scalable nor financially sustainable.

To this end, the question arises on how to develop evidence-based digital health interventions (DHIs) that allow medical doctors and other caregivers to scale and tailor long-term treatments to individuals in need at sustainable costs. At the intersection of health economics, behavioral medicine, information systems research, and computer science, this CAS module has the objective to help participants interested in the multi-disciplinary field of digital health to better understand the need, design, implementation, and assessment of DHIs, esp. just-in-time adaptive interventions (JITAIs).

After this module, participants will be able to…

1. understand the importance of JITAIs, esp. for the prevention of NCDs
2. understand the design, implementation and evaluation of smartphone-based and chatbot-delivered JITAIs
3. discuss opportunities and challenges of JITAIs

The CAS module is structured in two parts and follows the concept of a blended treatment consisting of live sessions and complementary online material. In the live sessions, participants will learn relevant topics. Complementary learning material (e.g., video clips), multiple-choice questions, and exercises are provided via the online learning platform.

In the second part, participants work in teams and will use their knowledge from the first part of the module to develop a smartphone-based and chatbot-delivered JITAI with MobileCoach (www.mobile-coach.eu), an open-source software platform for the development of digital biomarker and digital health interventions. Each team will then present and discuss the resulting JITAI and evaluation results with their colleagues who will provide peer reviews. Additional live coaching sessions are offered to support the teams with the design and evaluation of their JITAI, and with the preparation of the final group project presentations.

**Abstract**

Precision Medicine is a new approach in health care aiming to deliver personalized prevention and treatment for human diseases, by taking into account individual differences in lifestyle, environment, and biology.

**Objective**

After taking this course, participants will be able
- to describe the goal of precision medicine;
- to explain different next-generation sequencing technologies;
- to illustrate how to make good use of public biological/clinical repositories;
- to demonstrate basic concepts of big data and machine learning;
- to explain how to genotype biological samples for a genetic disease;
- to describe examples of complicated ethical or clinical situations in personalized medicine.

**Abstract**

Participants will learn all necessary steps to establish new digital measures for their own clinical research. They will get a comprehensive understanding of this new emerging field, will discuss the newest guidelines with authors from international societies, will have a chance to interact with digital pioneers, and will be enabled to develop a concept for their individual digital measure.

**Objective**

The course enables participants to...

1. describe why new methods are needed to generate evidence.
2. describe how new (digital) methods for generating evidence are established.
3. explain how the concept of patient-centredness is applied in the development of new methods for evidence generation.
4. analyse sources of bias in basic research.
5. analyse the conditions for the development and validation of new evidence generation tools.
6. understand the framework for the development of new methods for evidence generation and to analyse the advantages and disadvantages of different approaches.
7. develop their own concept for a new digital measure.

European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches and mentors will interact regularly with participants, offer guidance on how to strategize and implement business cases. They will give feedback on challenges and activities and help participants strengthen their abilities to garner needed resources for their undertakings.

Objective
This module enables participants:
- To identify key unknowns and important progress measures for their respective business case and implement effective means and tools to further develop their business case
- To understand the view of potential customers and implement their feedback to improve the business case
- To effectively communicate and enroll other important venture constituents (mentors, advisors, employees, investors, etc.) in the venture.

Content
This module focuses on the development needs of participants' business skills and competencies. In this module, experienced business coaches and startup mentors will interact regularly with the participants, offer guidance on how to strategize and implement compelling business cases, feedback on specific challenges, and participants' activities with the goal to strengthen the ability of the participant to garner needed resources for their undertakings.

Prerequisites / notice
This module is only for CAS ELTV participants.
Abstract
This module focuses on the development needs for participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach along a personal development plan, and feedback on specific challenges and participants' activities with the goal to strengthen the participants' leader capability and people skills.

Objective
This module enables participants:
- To identify current gaps in the personal management skills and competencies and develop meaningful goals and plans to fill those gaps
- To implement effective exercises and practices to improve the participants' leadership capacity
- To effectively communicate and manage key constituents, notably employees and key advisors in a venture project.

Content
This module focuses on the development needs of participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach them along a personal development plan, and feedback participants on specific challenges and activities with the goal to strengthen the participants' leadership capability and people skills.

This course draws out good practices in promoting sustainability development at the city and local level. Participants gain insights on designing urban-focused development interventions.

### Abstract

Historically, cities have been hubs of innovation, economic activity and rising prosperity. However, the unprecedented speed and scale at which cities are growing today is a huge challenge. As epicenters of migration, environmental degradation, health hazards and unemployment, urban areas are especially vulnerable to disasters, social conflict and inequality. Despite this, some of the most promising initiatives to achieve the SDGs have been implemented by cities. What strategies and processes do successful city-based initiatives pursue? How can development organisations support mainstreaming the SDGs at the local level? What can be learnt from experiences so far? This course draws out good practices in promoting sustainability and equity at the city and local level. Participants gain insights on designing urban-focused development interventions.

- **Migration and Development**
  - Does not take place this semester.
  - Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.
24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

ETH MA/MSc students apply with a letter of motivation to the NADEL administration office.

Registration only through the NADEL administration office.

Abstract
Globally, over 280 million people live outside their countries of origin. While the concept of migration has negative connotations for some, migration can bring significant benefits — to both countries of origin and destination, if the right policies and initiatives are in place. The course explores the role that international cooperation can play in promoting the positive aspects of migration.

Objective
Course participants have improved understanding of the following issues:
- Definition of migration concepts and terms
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of "migration and development"
- International cooperation organisations and their strategies and activities in terms of migration and development.

Content
Globally, over 280 million people are currently living outside their countries of origin, voluntarily and involuntarily; and a further 60 million people live in internal displacement settings within their countries of origin. Migration is multifaceted, and driven by various, often interlinked factors including conflict and violence, economic, social and political factors, as well as environmental and climate related events. While the concept of migration has negative connotations for some, migration can bring significant benefits — to both countries of origin and destination, if the right policies and initiatives are in place.

The course explores the role that international cooperation can play in promoting the positive aspects of migration and in reducing the potential negative consequences.

This course covers:
- Important terms and concepts related to migration;
- International legal frameworks related to migration;
- The geography of migration flows;
- Major drivers of migration;
- The evolving concept of migration and development;
- Actions, strategies and initiatives of international cooperation actors when it comes to migration and development.

865-0020-00L Social Entrepreneurship – Driving Sustainability in Business

Does not take place this semester.

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

Abstract
This course introduces the concept of social entrepreneurship, understanding in which situations and under which conditions the concept can be applied, and the basics of developing a business strategy for a social enterprise.

Objective
This course introduces the concept of social entrepreneurship over three different blocks. The first part is dedicated to the definition, history, context and the successes and blockers of social entrepreneurship, including some real-world examples. In the second part the participants will learn to transform a social business idea into a concrete social business plan. The last block of the course is dedicated to the power of storytelling, where participants learn how to pitch their business ideas convincingly.

Content
- Definitions of "social entrepreneurship" and the difference with "entrepreneurship"
- Get inspired by concrete examples of successful social ventures
- Formulate a social business plan using the business canvas methodology
- Learning to think and act like a social entrepreneur
- The art and power of storytelling in an entrepreneurial context

865-0059-00L Storytelling for Systems Change

Only for CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.
Abstract

This course provides a foundation in the principles, techniques, and strategies for storytelling in the context of systems change. Key topics include:

- Psychology of Stories
- Key Elements and Techniques of Storytelling
- Ethics & Authenticity
- Using Stories in Project Cycle Management

Objective

By the end of this course, participants will be able to apply and adapt the fundamentals of storytelling to support their work as development practitioners and as proponents of systems change. They will be able to integrate storytelling techniques into activities such as reporting, fundraising, and context analysis. They will be better equipped to construct stories that are engaging and illustrative of the complexity of systems change.

865-0049-00L AI for Global Development Organisations

Only for CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

865-0012-00L Gender and Economics

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

ETH MA/MSc students apply with a letter of motivation to the NADEL administration office.

Abstract

This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies. The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course conveys basic knowledge about gender aspects in economics. Key elements are:

- Feminist approaches to macroeconomics, microeconomics and international economics
- Critical analysis of global and regional economic trends, including those related to economic crises
- Gender-responsive economic policy for program implementation, policymaking, and advocacy

Content

Economic inequalities between men and women persist in many countries. For example, in many countries, men earn more money and are more likely to own land and control productive assets than women. This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies. The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course is taught in cooperation with SDC and UN women.

Adaptability and Flexibility

The past two decades witnessed significant advances in the areas of computational design and digital fabrication in architecture. These developments have fostered a new type of architectural thinking, which is characterized by flexibility, adaptability, and the ability to respond to changing conditions and user needs. Through various exercises, participants will learn to critically question current approaches to existing buildings, which are all too often characterized by rigid and inflexible designs.

The students of this seminar will gain insight into different evaluation criteria and value systems within the larger field of preservation. The past two decades have seen a shift in the way we think about historic buildings and sites. While buildings protected as monuments are widely recognized as cultural heritage, the large building stock of the second half of the 20th century is often considered unattractive and its maintenance or upgrading a costly imposition. However, it is precisely this stock that holds great potential, as it generally allows more possibilities for use and change than protected objects. In case of demolition, individual components of these buildings can possibly be reused.

The discussion about values, protection and preservation of the existing building stock is complex and must be conducted on different levels. In addition to classic protection criteria, ecological and economic considerations, too, must be taken into account.

Digital Heritage

This course focuses on recent constructions built using innovative computational design and fabrication technologies, and the challenges associated with their repair, maintenance, and preservation.

With the help of input lectures and excursions in and around Zurich, participants will explore new types of materials, structural designs, construction processes and methods associated with recently completed buildings built using computational methods. They will learn to critically observe existing theories and methods of preservation and discuss in groups the relationship between today’s digitally fabricated objects and future challenges in the discipline of preservation.

Preservation in Switzerland

Historic buildings and sites are not per se significant parts of cultural heritage. They only become so when certain values are associated with them. Monument values are as dynamic as the society that produces them. The lecture traces the historical development of monument recognition and preservation in Switzerland since 1798.

Objective

Students will be able to name the most important actors in Swiss heritage conservation and describe developments in the field. They know methodological approaches and can place them in their historical context. They can identify the necessary principles and instruments in different situations and use them in their professional environment.

Content

In the 20th century, the most important impulses for the theory and practice of restoration came from the Federal Commission for the Preservation of Monuments, whose theoretical discourse and work are traced in detail. However, the activities of the cantons, private-law organisations and universities are also examined within the course. The institutionalisation of monument preservation is analysed in the context of social developments, whereby the evolution of its self-image from a patriotic civic duty in the age of industrialisation to monument preservation as environmental protection in the sustainability discourse of the 21st century is also examined. In the second half of the semester, the theoretical foundations, actors and instruments that are relevant in Switzerland today will be presented and their interaction explained.

Central questions will be examined in greater depth using concrete case studies. Among others, the following will be discussed: the restoration of Chillon Castle from 1897; the mountain village restoration of Vrin in 1944; the restoration of the Augustinian Church in Zurich in 1958; the controversy surrounding the reconstruction of the Predigerchor in Zurich in 1987; the extension of the Stadtcasino Basel (2016-2020); the struggle for the preservation of medieval wooden buildings in the canton of Schwyz (2000-2021).

Competencies

Subject-specific Competencies

Concepts and Theories

Development of the Existing Building Stock

079-0252-00L Does not take place this semester.

Abstract

The course deals with the densification strategy of the city of Zurich and the resulting handling of existing building stock (mostly demolition and new construction). Insights into real estate evaluation and specific examples are used to show possible alternatives.

Objective

The course discusses the topic of densification and the future of the existing building stock. By dealing with the qualities of existing buildings within the areas to be densified, students are invited to discuss whether these objects are to be preserved, transformed, and supplemented or whether they have to be demolished.

Content

The city of Zurich introduced the densification strategy in the revised spatial planning law, focusing on the existing building stock. As a rule, densification is achieved today through demolitions and replacement. This includes buildings which are still in a good condition. The course thus aims to explore possible alternatives.

Brief general introduction to the real estate market and real estate valuation; introduction to the topic of "densification", well and badly realised examples; discussion of current densification projects and alternative solutions within the framework of two to three workshops.

**Abstract**
A Geographic Information System (GIS) is a system for collecting, managing, analyzing and visualizing spatial data (geodata). This module teaches the fundamental concepts and principles necessary for a comprehensive understanding and effective application of GIS technologies.

**Objective**
After completion of this module, students will be able to understand the fundamentals of Geographic Information Systems (GIS) and be able to retrieve and apply them appropriately in practice. They will be able to describe and apply the essential components and principles of GIS.

**Abstract**
GIS methods and processes represent the basic strategies and processing steps used within a GIS workflow to model, capture, manage, analyze, and visualize geodata. The GIS workflow is a systematic approach that ensures that geospatial data is used effectively to solve problems in various application domains.

**Objective**
The aim of this module is to provide students with a comprehensive understanding and diverse skills in the use of GIS methods and processes. The entire sequence of geodata processing from acquisition to application is to be covered. The goal is to provide students with a structured and systematic approach to effectively process and use geospatial data in a meaningful way.

Wireless Networking and Mobile Computing

252-0237-00L

Concepts of Object-Oriented Programming

- **Type**: W
- **ECTS**: 8 credits
- **Hours**: 3V+2U+2A
- **Lecturers**: P. Müller

**Abstract**

A course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object, and class initialization, program correctness, reflection, and the state of art for Wi-Fi 802.11, Cellular 5G, and Internet-of-Things.

**Objective**

After this course, students will:

- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

**Content**

The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:

- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

**Literature**

Will be announced in the lecture.

**Prerequisites / notice**

Prerequisites:

- Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

252-0293-00L

Wireless Networking and Mobile Computing

- **Type**: W
- **ECTS**: 4 credits
- **Hours**: 2V+1U
- **Lecturers**: S. Mangold

**Abstract**

This course gives an overview about wireless standards and summarizes the state of art for Wi-Fi 802.11, Cellular 5G, and Internet-of-Things, contact tracing with Bluetooth, audio communication, visible light communications, medical technology. The course combines lectures with a set of assignments in which students are asked to work with a JAVA simulation tool, and Arduino boards.

**Objective**

The objective of the course is to learn about the general principles of wireless communications, including physics, frequency spectrum regulation, and standards. Further, the most up-to-date standards and protocols used for wireless LAN IEEE 802.11, Wi-Fi, Internet-of-Things, sensor networks, cellular networks, visible light communication, and cognitive radios, are analyzed and evaluated. Students develop their own add-on mobile computing algorithms to improve the behavior of the systems, using a Java-based event-driven simulator. We also hand out embedded systems that can be used for experiments for optical communication. Throughout the course, insights from telecommunications, toy industry, and medical technology industry are shared.

**Content**

Wireless Communication, Wi-Fi, Contact Tracing, Bluetooth, Internet-of-Things, 5G, Standards, Regulation, Algorithms, Radio Spectrum, Cognitive Radio, Mesh Networks, Optical Communication, Visible Light Communication. We will address contact tracing, radio link budget, location distance measurements, and Bluetooth in more depth. MedTech basics are also provided.

Chapters:

1. Introduction
2. Wireless Communication Basics
3. IEEE 802.11 Wireless LAN (Wi-Fi)
4. IEEE 802.15 Wireless PAN (ZigBee & Bluetooth)
5. Mobile Computing Algorithm Basics: Control and Game Theory
6. Visible Light Communication
7. Audio Communication
9. Mobile Computing for Automated Medicine Delivery

**Lecture notes / Literature**

The course material will be made available by the lecturer.

1. The course webpage (look for Stefan Mangold's site)
2. The Java 802 protocol emulator "JEmula802" from https://bitbucket.org/lfield/jemula802

**Prerequisites / notice**

Students should have interest in wireless communication, and should be familiar with Java programming. Experience with GNU Octave or Matlab will help too (not required).

252-0463-00L Security Engineering W 7 credits 2V+2U+2A D. Basin, S. Krstic

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements&risk analysis, system modeling&model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems.
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature

- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice

Prerequisite: Class on Information Security
Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

Fundamentals:
what is data?
Bayesian Learning
Computational learning theory

Supervised learning:
Ensembles: Bagging and Boosting
Max Margin methods
Neural networks

Unsupervised learning:
Dimensionality reduction techniques
Clustering
Mixture Models
Non-parametric density estimation
Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
252-0546-00L Physically-Based Simulation in Computer Graphics W 5 credits 2V+1U+1A S. Coros, B. Thomaszewski

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

252-1411-00L Security of Wireless Networks W 6 credits 2V+1U+2A S. Capkun, K. Kostiainen

Abstract
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

Objective
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

Content
- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resistant communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Social Competencies
- Cooperation and Teamwork

Personal Competencies
- Critical Thinking

252-1414-00L System Security W 7 credits 2V+2U+2A S. Capkun, S. Shinde

Abstract
The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content
The first part of the course covers general security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking

252-1425-00L Geometry: Combinatorics and Algorithms W 8 credits 3V+2U+2A B. Gärtner, M. Hoffmann, P. Schnider

Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?) of triangulations. We study combinatorial and algorithmic geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction). Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
Yes

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook
Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

252-3005-00L Natural Language Processing W 7 credits 3V+3U+1A R. Cotterell

Abstract
This lecture provides an introduction to natural language processing and computational linguistics. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to natural language processing and computational linguistics. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

**227-2210-00L**

**Computer Architecture**

W 8 credits 6G+1A S. Sadrosadati, O. Mutlu

**Abstract**

Computer architecture is the science & art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

**Objective**

We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), new paradigms like processing-in-memory, parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, interconnection networks, specialized systems for major data-intensive workloads (e.g. graph analytics, bioinformatics, machine learning), etc. We will focus on fundamentals as well as cutting-edge research. Significant attention will be given to real-life examples and tradeoffs, as well as critical analysis of modern computing systems.

**Content**

The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

See the course website for detailed and complete content of past incarnations of the course: https://safari.ethz.ch/architecture

**Lecture notes**

All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

The video recordings of the lectures are expected to be made available after lectures.

See https://safari.ethz.ch/architecture for past examples.

**Literature**

We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

See https://safari.ethz.ch/architecture for past examples.

**Prerequisites / notice**

**Competencies**

Subject-specific Competencies

- Concepts and Theories  assessed
- Techniques and Technologies  assessed

Method-specific Competencies

- Analytical Competencies  assessed
- Problem-solving  assessed

Social Competencies

- Communication  assessed
- Leadership and Responsibility  assessed

Personal Competencies

- Adaptability and Flexibility  assessed
- Critical Thinking  assessed
- Self-direction and Self-management  assessed

263-2400-00L

**Reliable and Trustworthy Artificial Intelligence**

W 6 credits 2V+2U+1A M. Vechev

**Abstract**

Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

**Objective**

Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.
The course is split into 4 parts:

1. **Robustness of Machine Learning**
   - Adversarial attacks and defenses on deep learning models.
   - Certified training of deep neural networks (combining symbolic and continuous methods).

2. **Privacy of Machine Learning**
   - Threat models (e.g., stealing data, poisoning, membership inference, etc.).
   - Attacking federated machine learning (across vision, natural language and tabular data).
   - Differential privacy for defending machine learning.
   - AI Regulations and checking model compliance.

3. **Fairness of Machine Learning**
   - Introduction to fairness (motivation, definitions).
   - Enforcing individual fairness (for both vision and tabular data).
   - Enforcing group fairness (e.g., demographic parity, equalized odds).

4. **Robustness, Privacy and Fairness of Foundation Models**
   - We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

263-2520-00L Formal Foundations of Programming Languages

Abstract

The course covers topics in the theory of programming languages, types, and program verification, and how to construct and validate that theory with machine-checked proofs in the Coq proof assistant.

Objective

Students will learn how to develop machine-checked proofs, how to rigorously define the semantics of a programming language and its type system, and how to analyze and formally establish the guarantees of well-typed programs.

Content

The course will proceed in two parallel tracks:

- The theory track (2V) will introduce operational semantics, type systems, and type soundness proofs, starting with the simply-typed lambda calculus and then continuing with increasingly expressive languages.

- The Coq track (2G) will begin with an introduction to machine-checked proofs and the Coq proof assistant. Afterwards we will mechanize the theory developed in the first track. This is the hands-on part of the course; students will carry out these proofs in Coq themselves with instructions from the lecturer.

263-2800-00L Design of Parallel and High-Performance Computing

Abstract

Advanced topics in parallel and high-performance computing.

Objective

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content

We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice

This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

263-3010-00L Big Data

Abstract

This course will provide an introduction to big data processing and analytics, focusing on the Apache Hadoop ecosystem. Students will learn about the core components of Hadoop, such as the Hadoop Distributed File System (HDFS) and the MapReduce framework. They will also gain hands-on experience with tools like Pig and Hive for data processing, and Spark for real-time analytics.

Objective

1. Understand the architecture and key components of Hadoop.
2. Master the basics of data processing using Hadoop and Pig/Hive.
3. Gain proficiency in real-time data processing with Apache Spark.

Content

- Data Storage and Processing with HDFS and Hadoop.
- Data Processing with Pig and Hive: SQL-like language for data processing.
- Real-time Data Processing with Apache Spark.
- Integration with Other Tools: Explore integration with other big data tools and ecosystems.

Prerequisites / notice

Students should have a basic understanding of programming concepts, experience with programming in one or more languages, and familiarity with data processing concepts. Knowledge of the Python language is beneficial but not mandatory.

Assessment

The course evaluation will include:

1. Homework assignments to reinforce concepts learned in class.
2. Project work: Students will work on a real-world big data project, applying the skills and knowledge gained in the course.
3. Midterm exam: Comprehensive assessment of the material covered in the first half of the course.
4. Final exam: Comprehensive assessment of the material covered in the entire course.

Credit Distribution

- Homework: 10 credits
- Project: 10 credits
- Midterm Exam: 10 credits
- Final Exam: 10 credits

Total: 40 credits

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 474 of 2653
Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

“Big Data” refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the “fourth paradigm”.

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Prerequisites / notice
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departmentes interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Literature
Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations. In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology. The participation in the course is subject to the following condition: - Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning
https://ml2.inf.ethz.ch/courses/aml/

Computational Intelligence Lab
http://da.inf.ethz.ch/teaching/2019/CIL/

Introduction to Machine Learning
https://las.inf.ethz.ch/teaching/introml-S19

Statistical Learning Theory
http://ml2.inf.ethz.ch/courses/slt/

Computational Statistics
https://stat.ethz.ch/lectures/ss19/comp-stats.php

Probabilistic Artificial Intelligence
https://las.inf.ethz.ch/teaching/pai-f18

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud. The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

The course will cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. This list of papers will be provided at the beginning of the course.

This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it may also be accessible to last-year bachelor students.

This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design. The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms. This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you’re ready for this class or not, please consult the instructor.
Privacy is a fundamental human right! And yet, technological advances (in particular in computer science) can often undermine privacy. In this course, we will see how to formalize various notions of privacy and how to build systems that preserve privacy, by combining techniques from cryptography and statistics.

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. Network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. Network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. Analysis and inference topics such as traffic monitoring and network forensics; and

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

This course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

Basic knowledge in cryptography, probability and machine learning is recommended but not required.

References to relevant research papers will be provided.

Literature
Boneh & Shoup - A Graduate Course in Applied Cryptography

Prerequisites
Basic knowledge in cryptography, probability and machine learning is recommended but not required.
Lecture slides will be made available at the course Web site.

No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

**263-5056-00L Applications of Deep Learning on Graphs**

W 4 credits 2G+1A G. Rätzsch

*Abstract*

Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

*Objective*

Many established deep learning methods require dense input data with a well-defined structure (e.g. an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

*Content*

Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning, 2) Graph Neural Networks: convolutional, attentional, message passing, overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling), 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs. Temporal GNNs, Geometric GNNs, Deep Generative Models for Graphs.

*Prerequisites / notice*

263-3210-00 Depp Learning or 263-0008-00 Computational Intelligence Lab; 252-0220-00 Introduction to Machine Learning; Statistics/Probability; Programming in Python; Unix Command Line.

**263-5210-00L Probabilistic Artificial Intelligence**

W 8 credits 3V+2U+2A A. Krause

*Abstract*

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

*Objective*

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

*Content*

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

*Prerequisites / notice*

Solid basic knowledge in statistics, algorithms and programming.

*Competencies*

The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.

**263-5351-00L Machine Learning for Genomics**

W 6 credits 2V+2U+1A V. Boeva

*Abstract*

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

*Objective*

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

*Content*

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

*Prerequisites / notice*

*Competencies*

The course covers major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways

**263-5902-00L Computer Vision**

W 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

*Abstract*

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human interaction, as well as gaming technology.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/VR research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Computer Graphics“ which takes place in Basel before the start of the semester.

Lecture slides will be available on moodle.

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/VR research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Computer Graphics“ which takes place in Basel before the start of the semester.

Lecture slides will be available on moodle.

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
Content
Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

Lecture notes
Methodologies to analyze the cases and create final presentations. Short overview of each case.

Prerequisites / notice
Successful completion of Lecture "Information Technology in Practice".

252-4601-00L Current Topics in Information Security
The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Content
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

Literature
The reading list will be published on the course web site.

252-5051-00L Advanced Topics in Machine Learning
The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Literature
The papers will be presented in the first session of the seminar.

252-5701-00L Seminar in Advanced Topics in Vision
The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
This seminar covers advanced topics in computer vision, such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction, and other related topics. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective
The goal is to get an in-depth understanding of actual problems and research topics in the field of computer vision as well as improve presentations and critical analysis skills.
The goal of this course is for students to gain a comprehensive understanding of state-of-the-art HCI research on user-centered programming interfaces.

All students read the papers and participate in the discussion.

Research Topics in Software Engineering

**Objective**
Each student will be assessed on their understanding of the course material through participation in discussions and completing assignments.

**Content**
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

**Prerequisites / notice**
Students taking this seminar should have the necessary background in systems and low level programming.

Hardware Acceleration for Data Processing

**Objective**
Each student will be assessed on their understanding of the course material through participation in discussions and completing assignments.

**Content**
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

**Prerequisites / notice**
Students taking this seminar should have the necessary background in systems and low level programming.

Advanced Topics in Human-Centric Computer Vision

**Objective**
Each student will be assessed on their understanding of the course material through participation in discussions and completing assignments.

**Content**
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

**Prerequisites / notice**
Students taking this seminar should have the necessary background in systems and low level programming.

Seminar on User-Centered Programming Interfaces

**Objective**
Each student will be assessed on their understanding of the course material through participation in discussions and completing assignments.

**Content**
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

**Prerequisites / notice**
Students taking this seminar should have the necessary background in systems and low level programming.
### 263-5100-00L  Topics in Medical Machine Learning

**Abstract**
This seminar discusses recent relevant contributions to the fields of medical machine learning and related areas. Each participant will hold a presentation and lead the subsequent discussion.

**Objective**
Preparing and holding a scientific presentation in front of peers is a central part of working in the scientific domain. In this seminar, the participants will learn how to efficiently summarize the relevant parts of a scientific publication, critically reflect its contents, and summarize it for presentation to an audience. The necessary skills to successfully present the key points of existing research work are the same as those needed to communicate own research ideas. In addition to holding a presentation, each student will contribute to and lead the discussion session on the topics presented in the class.

**Content**
The topics covered in the seminar are related to recent computational challenges that arise in the medical field, including but not limited to clinical data analysis, interpretable machine learning, privacy considerations, statistical frameworks, etc. Both recently published works contributing novel ideas to the areas mentioned above as well as seminal contributions from the past are on the list of selected papers.

**Prerequisites / notice**
Knowledge of machine learning and interest in applications in medicine. ML4H is beneficial as a prior course.

### 263-5702-00L  Seminar on Digital Humans

**Abstract**
This seminar covers advanced topics in digital humans with a focus on the latest research results. Topics include estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. A collection of research papers is selected.

**Objective**
The goal is to get an overview of actual research topics in the field of digital humans and to improve presentation and critical analysis skills.

**Content**
This seminar covers advanced topics in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

166-0301-00L New Business Models for Future Transport Systems ■ O 3 credits 2G

Does not take place this semester.

Abstract

This module addresses the implementation of (digital) strategies and innovative business models of the future and elucidates the drivers, inhibitors and challenges of business model innovation. Using suitable methods and procedures, participants in the module develop, evaluate and refine prototypes of sustainable future business models.

Objective

Participants

• are able to understand and explain the core issues, concepts and strategies of business model innovation;
• are able to describe the relevance and the process of business model development;
• are able to translate a personally developed business case into a sustainable business model;
• are able to apply suitable design strategies to optimise a personally developed business model;
• are able to appropriately embed new business models into a corporate or business segment strategy;
• are able to assess the strengths, weaknesses, opportunities and risks of a business model;
• are able to convincingly present their own business case / business model in a structured manner to relevant stakeholder groups (investors, board members, clients, partners);
• are able to engage with and develop various points of view to assess business models;
• are able to shape a modelling process for themselves and reflect on it.

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 484 of 2653
Content

Business model innovation:
• Conceptual foundations of business model innovation
• Drivers, inhibitors and challenges of business model innovation
• Business model innovation in established organisations and structures
• Case study and mini cases in the context of transport system / mobility business model innovation

Business modelling (essentials):
• Business model thinking and modelling
• The Business Model Canvas as a conceptual and methodological tool
  o Customer benefits / value propositions
  o Demand side
  o Supply side
• Business model patterns

Business modelling (application)
• Creation of a real business case for business modelling
• Business model prototyping (basis: Business Model Canvas)
• Evaluation and review/re-prototyping of participants' own business cases / business models

Incorporating new business models into corporate / business segment strategies
• Fit with strategic analysis
• Compliance with corporate or business segment strategy
• Contribution to strategy implementation

Presenting business models convincingly (basics/application)
• Basics of business model presentation
• Development of participants' own storylines and presentation structure (business value concept)
• Pitching of own business case / business model

Lecture notes
Distributed at start of module.

Literature
Distributed at start of module.

Prerequisites / notice
Announced to students of the of the MAS | CAS at the beginning of the term.

166-0302-00L Implementing New Strategies and Business Models for Future Transport Systems  O  3 credits  2G
Does not take place this semester.

Abstract
In order to be successful, new strategies / innovative business models have to be implemented in the market as well as in the company itself. This requires proactively managed transition processes. This module deals with such transition processes on three levels: change management theory – best-practice examples – one's own practice.

Objective
Participants...
• know and understand selected classic and current theories regarding change (management) in systems
• know how to design and initiate participative transition processes
• are familiar with / know how to apply selected tools of change management
• have discussed best-practice cases with responsible managers within the mobility/transportation sector
• have reflected theory and best-practice cases in regard to their own practice
• have developed management options and approaches for their own practice

Content
• Classic and current change management approaches
• Communication in transition processes
• Participation: integration of stakeholders
• Dealing with resistances
• Discussions with guests from practice regarding the management of transition processes related to the implementation of new strategies / business models

Methods
• Selected change management methods and tools

Case studies
• Various good/best practice cases within the mobility sector
• Change cases of students

Lecture notes
Distributed at start of module.

Literature
Distributed at start of module.

Prerequisites / notice
Announced to students of the of the MAS | CAS at the beginning of the term.
Abstract
For companies it is essential to realise products quickly, economically and in a customer-oriented way. In this context approaches to agile and user-centred product development such as Scrum and Design Thinking are increasing in importance. Compared to traditional product development methods, agile methods promise higher quality and customer satisfaction coupled with reduced expenditure.

Objective
Design and realisation of product development projects for future transport systems: Participants are familiar with the methods and procedures of agile and user-centred product development and are able to apply them profitably in their enterprises.

Content
Participants define an innovation theme themselves in groups, and a selection of topics is then drawn from this theme for module group work. The module takes participants through the whole process, from the analysis of target groups and their requirements through project conception and planning to implementation in example form. The course is practical and uses concrete examples. At the end of the module participants will have deployed the methods of agile and user-centred product development to work very practically through a theme they have developed themselves, and will have become familiar with the typical application scenarios, advantages and hurdles associated with these methods.

Abstract
The participants, in heterogeneous teams, deal with a current problem from the topics of the CAS New Business Models. They must be able to work interdisciplinarily and across sectors, where appropriate together with relevant other parties. The participants communicate the results appropriately.

Objective
- Deal with a specific problem from the CAS New Business Models subject area.
- Be able to work interdisciplinarily and across sectors, where appropriate together with relevant other parties.
- Communicate the results appropriately.

Lecture notes
Distributed at start of module.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 488 of 2653
In this module, innovation, change and transitions in transportation systems on different levels are discussed from different complementary perspectives. Both economic and social science approaches to the analysis, anticipation and governance of innovation processes are presented, discussed and applied to current issues. Topics are:

- Respective theories and methods;
- Innovation as an economic discovery process, measuring innovation;
- Emerging trends as new opportunities for innovation;
- Innovation today in the transportation/mobility system: theoretical basis and concrete examples;
- Transition of socio-technical systems, co-evolution of technical and societal dynamics;
- The relevance of social acceptance and ethical aspects for innovations in mobility.

166-0103-00L System Aspects of Air and Shipping Traffic ❘ O 3 credits 2G to be announced

Abstract
Air and shipping traffic cover a substantial part of human mobility, air traffic in passenger as well as freight transport, shipping mainly in freight transport. Students gain an overview, limit modes of mobility and learn to classify air and shipping traffic in the overall system of mobility.

Objective
Participants
• know the fundamental differences between air, shipping traffic compared to motorized individual transport and public transport.
• are able to deduce differences between air and shipping traffic.
• know the possibilities and limits as well as pros and cons of different valuation methods used for air and shipping transport.
• develop ideas for suitable indicators to evaluate scenarios in air and shipping traffic.

Content
• Key figures, development and trends in air and shipping traffic.
• Potentials for holistic improvement in air and shipping traffic.
• Life Cycle Assessment (LCA) for questions in air and shipping traffic.
• Overview on technologies and their potentials to improve sustainability in air and shipping transport.
• Berechnung und Interpretation von Kennzahlen.

Abstract
The participants deal with a current problem from the topics of CAS System Aspects.

Objective
- Deal with a specific problem from the CAS System Aspects subject area.
- Deepen selected content from module independently
- Be able to work interdisciplinary and across sectors, where appropriate together with relevant other parties.
- Communicate the results appropriately.

Content
In der CAS-Arbeit zeigen die Studierenden, dass sie in der Lage sind, eine fundiert aufbereitete Auseinandersetzung mit technischen und nicht-technischen Entwicklungen im Mobilitätssystem und deren mögliche Auswirkungen auf das Schweizer Verkehrssystem oder auf Teilbereiche desselben anzufertigen.

Die Teilnehmenden setzen sich dabei aktiv mit aktuellen und/oder zukünftig erwarteten Entwicklungen im Mobilitätsektor auseinander, übersetzen mögliche Entwicklungen in verkehrliche Parameter (=Zukunft der Mobilität); greifen auf Lerninhalte des Studiums zurück; entwickeln ausgewählte Themen selbständig weiter (bzw. im Rahmen einer Arbeitsgruppe) und setzen sich mit der Relevanz für die Praxis auseinander (Relevanz für Stakeholdergruppen wie z.B. politische Entscheidungsträger, Verkehrsunternehmen, Industrie, Umweltverbände, Energieversorger sowie auch andere gesellschaftliche Gruppen, z.B. für Menschen im Rentenalter).

</tbody>
</table>
Abstract
The module includes the supply of the road mobility of the future with renewable energy. The generation, transport, processing, transfer of energy to the vehicles (refueling, charging) and the energetic evaluation are presented. Electricity, hydrogen, biogenic and synthetic fuels are considered.

Objective
The aim of the module is a detailed energetic and technical understanding of the supply of road vehicles with renewable energy. Graduates know the primary energy production as well as the end energy processing of the different energy carrier concepts. In addition, they know the legal CO₂ requirements for vehicle registration and are able to qualitatively assess the impact on the Swiss energy system.

Content
- The energy system of the future; biogenic and electric renewable primary energy
- End energy processing
- Transfer from the energy system to mobility and influences on the overall energy system

**Abstract**
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Lecture notes**
There is no script. Powerpoint presentations will be made available on-line to students.

**Prerequisites / notice**
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

<table>

</tr>
</tbody>
</table>

**Abstract**
The course introduces basic concepts of the interaction between nutrition and exercise performance.

**Objective**
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

**Content**
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

**Lecture notes**
Lecture slides and required handouts will be available on the ETH website (moodle).

**Literature**
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

**Prerequisites / notice**
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

**Abstract**
Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

**Objective**
Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

**Lecture notes**
Handouts for each lecture will be uploaded to Moodle every week.

395-0301-00L Digital Nutrition Monitoring O 2 credits 1G

Abstract This module introduces the basic concepts of classic dietary assessment and of dietary reference values. In addition, novel, digital methods for food monitoring as well as health in general will be introduced. Biomarkers for nutritional assessment will build the last part of this module.

Objective Students can apply classic dietary assessment methods and interpret generated results Students can describe the general concept of digital health Students know how to apply methods for digital nutrition monitoring and understand their benefits and limitations

Competencies Subject-specific Competencies Concepts and Theories assessed Techniques and Technologies fostered Method-specific Competencies Media and Digital Technologies fostered Social Competencies Cooperation and Teamwork fostered

395-0302-00L Nutrition in Metabolic Disease O 3 credits 2G F. von Meyenn

Abstract The module Nutrition in metabolic disease will cover aspects of endocrinology and physiology in relation to nutrition, as well as specifically focus on nutritional aspects of obesity (including childhood obesity), type 2 diabetes including its therapy as well as muscle and exercise. In addition, different diet forms and their effects will be discussed.

Objective Students understand how nutrition is closely linked to endocrinology. Students can develop nutritional strategies to improve health of obese patients. Students can apply nutritional concepts in the support of treatment and prevention of type 2 diabetes. Students can judge different diet forms in terms of their effect health/specific health aspects.

Competencies Subject-specific Competencies Concepts and Theories assessed Techniques and Technologies fostered Method-specific Competencies Analytical Competencies assessed Social Competencies Communication fostered Cooperation and Teamwork fostered

### Module 2: Pharma Project Management and Health Communication

**Type:** W  
**ECTS:** 2.5 credits  
**Hours:** 3G  
**Lecturers:** R. Furegati Hafner, R. Schibli

The enrolment is done by the CAS in Pharmaceuticals study administration.

**Abstract**

In this module, students learn to plan, execute, and manage pharma industry projects effectively, emphasizing clear objectives and timelines. They develop skills in team collaboration, conflict resolution, and stakeholder communication to ensure project success. Students also enhance their ability to convey ideas clearly and persuasively to diverse audiences through role-playing exercises.

**Objective**

- About projects, project management and the project environment
- How to define and plan my project, how to deal with stakeholders and how to manage project risks
- How to manage a project team, develop the project plan and launch the project
- How to monitor and report, project close-out and project leadership
- How to evaluate a project and portfolio management
- How to handle a budget and resource management

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Method-specific Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

### Module 7: Clinical Development

**Type:** W  
**ECTS:** 2.5 credits  
**Hours:** 3G  
**Lecturers:** R. Schibli

The enrolment is done by the CAS in Pharmaceuticals study administration.

**Abstract**

Module 7 gives an overview about the several steps that have to be followed during the process of clinical development.

**Objective**

- Preclinical bridge to clinical development
- Strategy for clinical development
- Regulatory aspects of clinical development
- Good clinical practice (GCP) and quality assurance
- First in human studies (Phase I), Proof of concept studies (Phase II), Registration studies (Phase III), Post-registration studies (Phase IV)
- Monitoring
- Organizational and financial aspects of clinical development
- Portfolio and life cycle management
- Data management and simulation of a clinical study
- Personalized medicine

Only for CAS in Pharmaceuticals.

The enrolment is done by the CAS in Pharmaceuticals study administration.

Abstract
The essay is an essential part of the CAS program „Pharmaceuticals – From Research to Market“ (CAS Pharm) and serves as final performance assessment.

Objective
The essay documents the student’s competence development during the program as well as the transfer of acquired knowledge to professional practice/activities.

### Abstract
The seminar provides an introduction to the basics of working with heritage theory on a scientific basis. It imparts methodological knowledge, introduces participants to archive-based research, and enables them to critically evaluate the sources consulted. The subsequent communication of the results in the form of an expert's report is also part of the course.

### Objective
The aim of the seminar is to qualify participants to apply methods of architectural and cultural studies in the evaluation of objects of the built environment. Participants are enabled to assess a selected building in the form of a heritage conservation expert's report.

### Content
An essential basis for the responsible handling of the built heritage is the ability to recognize its characteristics and special features from an architectural-historical perspective and to objectively work out its historical testimonial value. This requires knowledge of scientific methods as well as the ability to undertake targeted research and critically evaluate source material in order to productively incorporate it into the analysis. The first part of the seminar is devoted to an introduction to academic work in the field of architecture and cultural studies. This lays the foundation for the second part which deals with the independent academic appraisal of an individual building.

### Competencies

</table>

### Abstract
In the seminar, selected texts on architectural theory and monument preservation are read together and discussed in plenary. The focus is on selected writings from John Ruskin, Gottfried Semper and Friedrich Nietzsche to Alois Riegsl and Adolf Loos to Walter Benjamin, Aleida Assmann and Peter Zumthor.

### Objective
Skills in reading complex theoretical and literary writings on architecture and monument preservation are taught. With increasing practice, these enable participants to undertake an independent appropriation of architectural theory and monument preservation content.

### Content
The writings on architectural theory and historic preservation discussed in the seminar provide an overview of the most important theories and concepts of historic preservation. Ruskin’s narrative of architectural historicity, Semper’s conception of “Bekleidung” and Nietzsche's transformation of mythology are covered, as are Riegsl's notions of “Erinnerungswert” and “Gegenwartswert”, Loos’ writings on architecture, Benjamin’s notion of aura and Aleida Assmann’s memory space as well as Peter Zumthor’s atmosphere. Each text is discussed in terms of textual structure, conceptual history, visual language, relationship to poetry and literature, strategies of theory, etc. Identifying the levels and intersections that link a theory with other theories characterizes one of the main tasks of our seminar.

### Literature

### Abstract
Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

### Objective
In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensively justify their own positions within the context of preservation. Our goal here is to foster students' communication skills and the culture of discussion.

### Content
The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. The core course of spring semester 2024 conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures.

The first part is devoted to substantive preservation law: legal foundations and qualification of an object as a "monument", structural-legal
aspects of protection and various protection instruments. It is planned to involve the participants by means of practical examples.

The aim of the course is to familiarise students with the essential subject areas, the most important protagonists and lines of argumentation
in the history of monument conservation. The focus is on European history and German-language sources. In order to get to know the formation of theory, its paths and detours, the most important terms and persons in the history of monument conservation are introduced. Based on various texts, the history of the protection of architectural monuments since antiquity is illuminated. Further focal points in the history of monument preservation were during the Enlightenment, the French Revolution and in the process of the formation of nation states. The discourse on the concept and practice of monument conservation as we understand it today was led by a number of conservators in the German-speaking world around 1900. War-related destruction and the incipient building boom in Europe
led to modern debates on the theory of monuments, which are still relevant today. Dealing with monument values is not an end in itself; it can be essential for the preservation of the monument or for historical mediation. Critical positions on the tasks, goals or practices of heritage preservation can only be developed against the background of a knowledge of its historical approaches.

To follow
Abstract
In addition to theory, heritage conservation also plays an important practical role in the current building revolution. In order to make the diverse possibilities in architecture visible, this course develops new strategies for communicating the discipline of monument preservation for an exhibition on this topic at S AM in 2025.

Objective
The aim of the seminar is to develop concepts for communicating and exhibiting heritage-related content and debates that go beyond specialist discourse and address a broader public. As part of the course, participants will acquire in-depth knowledge of various exhibition strategies in the field of architecture and will have the opportunity to develop exhibits for an exhibition organised by the S AM Swiss Architecture Museum (Basel) in collaboration with the Chair of Construction Heritage and Monument Preservation at ETH Zurich and ICOMOS Suisse in spring 2025.

Content
At a time when the maintenance of existing buildings is seen as an essential element of the building revolution, the theory and practice of heritage conservation is taking on an integral role. Nevertheless, heritage conservation still has to contend with image problems: people often misunderstand exactly what its aim is and, unaware of its mission, principles and (still highly topical) theories, the discipline is often assumed to have a purely conservative attitude. 50 years after the European Year of Monument Conservation in 1975, when the whole of Europe was dominated by the question of how to preserve the built heritage, there is no need for a fundamental repositioning, but there is certainly a need for an “update” on issues of monument conservation and its attitude in the face of current challenges. The joint exhibition at the S AM Swiss Architecture Museum in spring 2025 is dedicated to this topic. The course offers the opportunity to deal with architectural exhibition strategies and to participate in the development of various concepts for communicating the theory and practice of heritage conservation. New guiding principles for the future practice of heritage conservation will be jointly derived on the basis of best practice examples. In group work, current examples of successful cooperation between heritage conservation and architecture will be analyzed and documented for presentation in the exhibition in the form of drawings, texts and models. Depending on the number of participants, other parts of the exhibition can also be the subject of the work.

Prerequisites / notice
The course addresses primarily students of the MAS ETH in Denkmalpflege und Konstruktionsgeschichte and the CAS ETH in Future Heritage.

**Abstract**
The programme equips the next generation of leaders in the public sector and other sectors dealing with governance matters with the necessary competencies to tackle complex governance challenges.

**Objective**
Participants learn to:
- Understand key governance frameworks and international blueprints; comprehend underlying drivers & challenges affecting governance;
- dissect multi-dimensional policy issues; lead effectively across the spectrum of technical, human and conceptual challenges.

**Content**
The program encompasses a sequence of one or half-day modules, which are organized into three interdisciplinary learning blocks:

**I. Contemporary Governance**
In this block, participants examine the broad frameworks within which public sector work takes place. Students will explore what governance in the 21st Century means as well as the theoretical and practical nature of organizational, legal, regulatory and financial dimensions of public institutions and processes. With input from multiple disciplines, students gain the ability to contextualize and critically assess the local, national as well as international context of their individual work.

**II. Public Management**
In this block, students are challenged to expand their management toolbox through lectures providing them with theoretical context and practical insights into various aspects of public management. The goal is for participants to enhance their ability to lead and motivate teams, to negotiate effectively and to communicate with a variety of stakeholders.

**III. Policy Domains**
This block covers relevant and rapidly changing policy domains. Special attention is paid to interlinkages between specific policy areas. Students gain the big picture knowledge necessary to make informed managerial decisions within complex processes and initiatives.

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 501 of 2653
Objective
Students know about:
- Pharmacokinetik and kinetic-modelling
- Statistics and practical session
- Radiotracers in biochemistry and molecular pharmacology
- Selective modification of peptides and proteins to target GPCRs
- Demonstration of experimental set up: Peptide and protein modification, radioactive assays in biochemistry
- Visit ABX Radeberg
- Nuclear medicine: basics and therapy
- Immunology
- Drug interventions/interactions/adverse reactions
- Pharmacology basics, special aspects, clinical studies
- Toxicology
- Teatystems in toxicology and targeted therapeutics and nucleic acids
- Nuclear medicine: clinical diagnostic applications in neurology
- Nuclear medicine: visit to SPECT facility and radiopharmaceutical GMP lag (Tc, Ga, therapy)
- Radiological imaging modalities- technology and applications
- Nuclear medicine: clinical diagnostic applications in oncology
- Radiopharmaceutical monographs in the European pharmacopoeia
- Practical session, visit: cyclotron, GMP PET production and quality control, PET and PET/CT, therapy unit
- Radioligand-binding-assays/autoradiography
- In house tours in groups: radioligand-binding-assays, autoradiography, metabolite analytics with LC-MS, cyclotron and radiochemistry, highlights in Leipzig
- Biological effects of radiation
- Radiotracer transport and blood brain barrier
- Radiotracers for neuromaging

Competencies
Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

<tr>
<td>Abstract</td>
<td>Regenerative Materials can be used to build high- quality envelopes and high- comfort environments. The course presents the basics of hygrothermal building physics and the state of the art in this field. It gives an overview of the type of earth- and bio-based materials that can be used and their hygrothermal properties.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Objective  | - Learn the diversity of regenerative materials used for high- quality envelopes and high- comfort environments  
- Learn how to distinguish earth- and bio-based materials based on their hygrothermal properties  
- Ensure an efficient and durable impact on participants' professional development |
| Content    | The course presents which Regenerative Materials can be used to build high- quality envelopes and high- comfort environments. It details the basics of hygrothermal building physics: Evolution of standards and models; Strength and weaknesses of Regenerative Materials; State of the art and market evolution. It also gives an overview of the diversity of earth-based materials (plasters, blocs, monolith walls); bio-based materials with fibers (straw bales, wool and rigid panels, bulk fibers) and low-impact composites (light mixes combining mineral binder to bio- sourced materials) from resource to implementation, with a synthesis of their hygrothermal properties and their impact on comfort and energy savings. |

| 136-0202-00L | Constructive Details & Implementation of Regenerative Envelops | O    | 2    | 3G    | G. Habert |
|             | Does not take place this semester.                      |      |      |       |           |
| Abstract    | The course is focused on constructive details for regenerative materials used to build high-quality envelopes and high-comfort environments. The participant are mainly learning through a hands-on workshop during which they will produce different prototypes in small groups. |
| Objective   | - Apply knowledge from previous course on high-quality envelopes built with regenerative materials  
- Learn how to compare different constructive systems built with regenerative materials to conventional building techniques considering thermal insulation, thermal mass, moisture regulation and air tightness  
- Ensure an efficient and durable impact on participants' professional development |
| Content     | Small groups producing different prototypes during a hands-on workshop. Each group design and realize a prototype to explore a specific constructive technique using Regenerative Materials and considering thermal insulation, thermal mass, moisture regulation and air tightness. Monitoring devices will be installed in each prototype. These prototypes are compared to reference prototypes built with conventional building techniques. |

| Abstract     | This course offers advanced knowledge on HAM (Heat Air and Moisture) modeling. The most up-to-date simulation models will be presented and used by the participants on real-case projects during simulation workshops. |
| Objective    | - Learn how to use the most up-to-date HAM simulation models  
- Learn how to analyse the transient hygrothermal behaviour of an envelope  
- Ensure an efficient and durable impact on participants' professional development |
| Content      | Advanced knowledge on HAM modeling is presented during simulation workshops:  
- Transient hygrothermal behaviour:  
Presentation of relevant software by experts users or developers  
Presentation of a case study by the HVAC engineers in charge of the calculation  
Calculation exercises based on this case study  
- Digital parametric iteration:  
Presentation of relevant software by experts users or developers  
Presentation of a case study by the HVAC engineers in charge of the calculation  
Calculation exercises based on this case study |

### Project

#### Number 136-0250-00L

**Title**: Project Work on Hygrothermal Validation  
**Type**: O  
**ECTS**: 6 credits  
**Hours**: 3G  
**Lecturers**: G. Habert

**Abstract**: Based on the content of previous courses, the participants are asked to simulate to analyze the hygrothermal behaviour of a building built with the same constructive technique as their prototype. In addition, they have to reproduce the monitoring conditions of their prototypes and compare measurements to simulation results. The result and discussion are presented in front of a jury.

**Objective** - Apply knowledge from previous courses on a case study  
- Learn how to compare measurements to simulation results  
- Enhance communication skills concerning high-quality envelopes built with regenerative materials

<tr>
<td>131-0001-00L</td>
</tr>
</tbody>
</table>

**Abstract**

This learning module navigates the journey from global crises to local interventions by first emphasizing the significance of resilience in DRRS. It then explores global crises through diverse perspectives in the "Framing nested crises" submodule. The subsequent submodules focus on practical skills at the community level and the societal and individual root causes of crises.

**Objective**

The "From global crises to local interventions" module is designed to achieve several key learning objectives within the Designing Resilient Regenerative Systems (DRRS) context. Participants will gain a comprehensive understanding of resilience, appreciating its richness and diversity to maximize practical applications within DRRS. The module encourages a multiperspective analysis of global crises, exploring diverse viewpoints influenced by angles, interests, training, geographies, institutions, and worldviews.

Emphasis is placed on developing practical skills at the community level, equipping participants to enhance local resilience and response capabilities within the framework of DRRS. This includes identifying and applying skills crucial for mitigating the impact of disasters and promoting community well-being.

Furthermore, the module delves into the societal and individual root causes contributing to global crises within the paradigm of DRRS. Participants will learn from experts about strategies to understand and address these root causes, fostering effective intervention at both the societal and individual levels.

Through all modules, the course integrates three domains of learning competencies—cognitive, behavioral, and social—interconnected through the individual Quests of the learners.

**Content**

Centered on the pivotal concept of resilience, the module facilitates a nuanced understanding of its richness and diversity for optimal application in addressing crises. Participants are guided through a multiperspective analysis of global crises, considering various viewpoints influenced by angles, interests, training, geographies, institutions, and worldviews.

A significant focus is placed on practical skills development at the community level within the DRRS paradigm. Participants acquire the necessary tools to enhance local resilience and response capabilities, emphasizing mitigating the impact of disasters and fostering community well-being.

The module delves into the root causes of global crises at both societal and individual levels, aligning with the principles of DRRS. Experts share insights on strategies to understand and address these root causes, fostering effective interventions that resonate with the DRRS approach.

**Lecture notes**

See Module 1.1 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

**Literature**

See Module 1.1 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

**Prerequisites / notice**

MOOC#1 Worldviews - From Sustainability to Regeneration is a pathway to CAS#1 Sustainability to Regeneration. To be accepted into the CAS, applicants must have completed the respective MOOC by the time the CAS starts. The content from the MOOC will be supplemented in the CAS by live virtual events with experts from all over the world. In addition, after the first virtual introductory introductory week, a real design excursion to the MonViso Institute in Italy. This trip is obligatory.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

**Abstract**

This learning module focuses on exploring sustainability at a deep and critical level, encouraging participants to delve into the fundamental principles of sustainability, reflect on their mental models, and critically examine the Sustainable Development Goals. The module also aims to expand participants’ thinking towards regeneration.
Objective

In this module, participants will explore sustainability comprehensively, delving into core learning objectives. The journey begins with a profound understanding of sustainability fundamentals, prompting reflection on personal mental models. Participants will critically scrutinize the Sustainable Development Goals (SDGs) and navigate sustainability science theories, explicitly focusing on concepts like Planetary Boundaries. The intersection of artificial intelligence (AI) and sustainability will be examined, fostering critical perspectives.

Practical knowledge takes center stage, focusing on soil regeneration and providing tangible insights into sustainable practices. Participants can engage with the content through flexible mediums, including videos, audio files, or transcripts, tailoring the learning experience to personal preferences.

The application of systems thinking is encouraged, prompting participants to analyze and summarize critical arguments and worldviews presented in the content.

Participants are invited to develop their Quests further, facilitating a holistic exploration of sustainability concepts. Sharing written or graphical reflections with learning partners and the DRRS network promotes collaboration, creating a dynamic community of learners committed to advancing sustainability knowledge.

Content

The learning content of this module is rich and multifaceted, offering a deep exploration of sustainability from various perspectives. Participants engage in a thoughtful journey that begins by understanding the fundamental principles of sustainability and reflecting on personal mental models. Critical examination of the Sustainable Development Goals (SDGs) and exploring sustainability science theories, including concepts like Planetary Boundaries, provide a robust theoretical foundation.

The module goes beyond theory to address the practical aspect of sustainability, focusing on soil regeneration. Participants can choose their preferred learning medium, videos, audio files, or transcripts, enhancing accessibility.

Including artificial intelligence (AI) in the sustainability discourse adds a contemporary dimension, prompting participants to develop critical perspectives on the evolving relationship between technology and sustainability.

Lecture notes

Literature

See Module 1.2 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

Prerequisites / notice

MOOC#1 Worldviews - From Sustainability to Regeneration is a pathway to CAS#1 Sustainability to Regeneration. To be accepted into the CAS, applicants must have completed the respective MOOC by the time the CAS starts. The content from the MOOC will be supplemented in the CAS by live virtual events with experts from all over the world. In addition, after the first virtual introductory introductory week, a real design excursion to the MonViso Institute in Italy. This trip is obligatory.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

Competencies

Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: assessed

Social Competencies

- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

Abstract

This learning module titled "Worldviews" delves into the exploration of how individuals perceive the world and construct their understanding of reality. It emphasizes the significance of worldviews, defined as fundamental beliefs and modes of participation in the broader context.

In this module, participants will embark on a journey to explore the rich tapestry of worldviews, understanding how different cultures and individuals perceive and reason about the world. The learners delve into the intersection of scientific discourse and practical application (praxis), examining the profound impact of scientific perspectives on shaping our collective understanding. A key focus is introducing "warm data," a concept that adds depth to our comprehension of complex systems, demonstrated through real-world examples such as fast fashion dumps and agroforest systems.

The module highlights the role of design, emphasizing both design processes and meta-design—viewing mental maps as dynamic tools that can foster collaborative transformations toward resilient and regenerative systems. Furthermore, the participants explore the potential of artificial intelligence (AI) as a catalyst for regeneration, investigating its role in sustainable practices and contemplating ethical considerations for its responsible integration. Participants are encouraged to engage actively, broaden their perspectives, and contribute to collectively shaping a more sustainable and regenerative future through these objectives.

Data: 15.06.2024 12:39   Autumn Semester 2024   Page 509 of 2653

**Content**

The module starts by delving into the fundamental concept of worldviews, emphasizing their role as foundational beliefs and modes of participation in the broader context. The inclusion of perspectives from Daniel Wahl and Jeremy Lent, as well as an exploration of indigenous and Eastern philosophies, provides a well-rounded approach to understanding diverse ways of knowing and reasoning.

Incorporating practical examples, such as fast fashion dumps in Chile and agroforestry systems in African countries, adds a tangible dimension to the theoretical discussions. This approach helps participants connect abstract concepts to real-world scenarios, fostering a deeper understanding of the implications of different worldviews on environmental and societal issues.

The emphasis on "warm data" introduces a holistic perspective, encouraging participants to consider interconnected systems and view challenges comprehensively. Including meta-design as a tool for collaborative transition promotes active engagement in shaping resilient and regenerative systems.

Furthermore, the module's exploration of the role of artificial intelligence (AI) in regeneration adds a forward-looking dimension, addressing the potential for technological innovation to contribute to sustainable practices.

**Module 4: Reframing Complexity**

*Does not take place this semester.*

**Abstract**

The module "Reframing complexity" invites participants to explore various access points for dealing with uncertainty, fostering a holistic perspective on complexity and encouraging a more nuanced and informed approach to navigating complex living systems.

**Objective**

The "Reframing complexity" module aims to empower participants to understand the intricacies of living systems deeply. Key learning goals include distinguishing between complexity and simplicity, challenging traditional views by fostering a mindset that embraces complexity, and exploring how to design resilient strategies within complex systems. The module emphasizes the role of big data and visualization tools in intervention strategies. Participants will also grasp the interconnectedness of science, praxis, data types, warm data, and AI in complex systems. The overarching objective is to enable individuals to navigate uncertainty by identifying various access points and weaving diverse perspectives into a holistic understanding of complexity.

**Content**

Beginning with Eric Berlow's perspective on "The Other Side of Complexity," the module challenges conventional views and introduces alternative ways of understanding intricate systems.

Fritjof Capra, a renowned figure in systems thinking, contributes to the module focusing on "Complexity Science and Systems Thinking." Participants can anticipate a deep dive into the foundations of complexity science and the principles of systems thinking.

The Hinnen Brothers bring a practical dimension to the module with "Reframe It!" where participants are guided in adopting a reframed mindset towards complexity, offering tangible tools for navigating complex systems.

Michael Stauffacher from ETH Zurich sheds light on the intersection of "Science and Praxis," providing valuable insights into how scientific knowledge translates into practical applications, particularly within the realm of complex systems.

Nora Bateson contributes to the module focusing on "Warm Data," emphasizing the significance of contextual and relational information in understanding complexity. Participants explore how such insights contribute to a more holistic understanding of complex systems.

The module further investigates the role of artificial intelligence in "When is AI Regenerative?"—examining scenarios where AI positively influences the resilience and regeneration of complex systems.

Finally, the module addresses the intricate challenges involved in "Complexities of Decarbonization," providing participants with a nuanced understanding of the hurdles and considerations in transitioning to sustainable and low-carbon practices.

**Lecture notes**

See Module 1.4 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

**Literature**

See Module 1.4 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration
The critical learning goals center around biodiversity, deep ecology, and our intrinsic connection to nature. The module emphasizes the need to relearn and cultivate a deeper understanding of nature, its design language, and patterns. The critical learning goals center around biodiversity, deep ecology, and our intrinsic connection to nature. The module emphasizes the need to relearn and cultivate a deeper understanding of nature, its design language, and patterns. The "Design as Nature" module unfolds through several key subchapters, each addressing crucial aspects of the relationship between humanity and the natural world. A pivotal aspect of the learning experience involves embracing the notion that humans are not separate from nature but an integral part of it. This realization forms a foundational understanding that guides the exploration of sustainable practices.

The learning module on "Design as Nature" explores the disconnect between Western cultures and nature. The module emphasizes the need to relearn and cultivate a deeper understanding of nature, its design language, and patterns. By doing so, they gain insights into creating sustainable solutions that align with the regenerative patterns observed in the natural world.

Bio-infused communication emerges as a significant aspect, urging participants to explore ways of interacting with the environment inspired by nature. This approach fosters a harmonious relationship with the ecosystems we inhabit. Finally, the module delves into the realm of nature finance, where economic mechanisms are derived from nature's principles. The goal is to inspire a redesign of financial systems, aligning them with regenerative and sustainable practices. Combining these learning goals, the "Design as Nature" module provides a comprehensive framework for reconnecting with nature, understanding its design language, and actively contributing to a more sustainable and harmonious coexistence.

Beginning with a focus on biodiversity, the module underscores the vital role of diverse life forms in maintaining ecosystem health. It encourages participants to appreciate the intricate interdependence within natural environments.

"Design for Biodiversity" delves into the impact of human designs on biodiversity, urging the development of solutions that actively support and enhance the richness of life rather than compromise it.

The concept of Deep Ecology - connecting with nature is introduced to cultivate a heightened sense of connection and reverence for the environment. Participants are prompted to reflect on their relationship with nature, fostering a holistic perspective.

Moving into the realm of nature-based design, the module explores the principles of biomimicry. Participants are inspired to learn from nature's design to create sustainable and regenerative solutions, with real-world examples highlighting the positive impact of such approaches.

Bio-infused relation building shifts the focus to communication and interaction with the environment. Participants are encouraged to build relationships with nature that are respectful and sustainable and contribute to overall ecological harmony.

Lastly, the module investigates regenerative economics, exploring economic mechanisms derived from nature. The goal is to redesign financial systems in a way that aligns with sustainable practices and contributes positively to the regeneration of ecosystems.

Does not take place this semester.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

### Module 6: Mind and Movement

**Does not take place this semester.**

**Abstract**

This learning module on mind and movement focuses on facilitating cultural changes by guiding participants through their own unlearning journeys. The module emphasizes the importance of enduring challenging processes to design for regeneration, build personal resilience, and lead collective co-creation.

**Objective**

The learning objectives revolve around actively cultivating a profound relationship with one's surroundings through movement, fostering a deep connection to place. The module strongly emphasizes immersive experiences, encouraging participants to fully engage and be present, providing a richer understanding of self, others, and the more-than-human world.

Self-discovery takes center stage as participants are prompted to question and challenge their perceived physical and psychological boundaries. The module equips individuals with the tools to build resilience in their engagements with place, self, and others, navigating challenges with adaptability and strength.

Exploring the transformative power of movement, participants learn to mediate their relationships with self through action, understanding, and expressing emotions physically. The curriculum also guides individuals to develop ecologically attuned and reciprocal conversations, fostering a deeper connection with human and non-human entities in their environment.

Redefining adventure becomes a key theme, encouraging participants to move beyond conventional notions and embody their practices. Participants transform routine experiences into meaningful and adventurous engagements by integrating movement and mindfulness into daily activities.

Philosophically grounded in contemporary neuroscience, the module challenges traditional views that separated the mind and body. It underscores the interconnectedness of these elements, recognizing the profound significance of emotions and bodily experiences in the pursuit of self-realization and holistic growth. Through this multifaceted approach, participants are empowered to reframe their relationship with the world, themselves, and the more-than-human aspects of their environment.

**Content**

This learning module on mind and movement stands out for its holistic approach to personal and collective development. By seamlessly integrating physical movement, mindfulness practices, and ecological awareness, participants are offered a multifaceted exploration of their experiences.

A notable strength lies in the practical application of concepts, focusing on immersive experiences such as cultivating relationships through movement and redefining adventure. This hands-on approach adds a tangible and applicable dimension to the learning journey.

The module emphasizes building resilience in engagements with place, self, and others, recognizing the importance of adaptability and strength in navigating challenges. Additionally, the ecological awareness component, encouraging participants to develop attuned and reciprocal conversations with human and non-human entities, aligns with a contemporary understanding of our interconnectedness with the environment.

</tbody>
</table>

**Abstract**
Participants will be introduced into regulations and landscape including all stake holders. The different types of medicinal products are introduced including subsequent regulations. Participants apply the knowledge in different starting scenarios.

**Objective**
- Understand the complexity of the regulatory landscape
- Know the main characteristics of different medicinal products and subsequent regulatory pathways
- Identify the different stakeholders and players in this landscape
- Analyze different regulatory strategies using real-world cases

**Content**
- The regulatory landscape – a challenge for all players
- Different types of medicinal products - different regulatory pathways
- Health authorities – friend or foe?
- Different countries – different regulations
- Successful regulatory strategy – make or break for a medicinal product
- From idea to product – do it yourself

<table>
<thead>

</thead>
</table>

**Abstract**
Students gain an overview of how to transform a research idea into a finished healthtech product by confidently navigating different regulatory landscapes and developing compelling certification strategies for various healthtech products. Students learn how to use Regulatory Thinking to turn Regulatory Affairs into a business planning tool.

**Objective**
- Applying regulatory thinking and translation of this method into practice.
- Getting an overview of applicable laws, different regulations, directives and guidelines in the healthtech sector: MD, IVD, SaMD, medicine, biotech, ATMP.
- Understanding the different roles and responsibilities of Certification Bodies (CB), Notified Bodies (NB), and other Regulators and/or Reimbursement Agencies, hereafter: Competent Authorities (CAs).
- Knowing how to address CAs, including communication and interaction
- Awareness of the importance of a quality management system (QMS) and knowing different systems, including, but not limited to ISO 13485:2016, GMP, GLP, GCP

**Content**
The journey of regulatory thinking - from medical devices (MDs), to in vitro diagnostics (IVDs), to software as a medical device (SaMD), to medicines and advanced therapeutic medicinal products (ATMPs): Commonalities, differences and the search for the lowest common denominator in terms of:
- Regulations/Directives/Laws/Guidelines
- Interaction with the regulatory authorities
- The principles of safety/efficacy/performance/transparency
- The requirements for the implementation of a QMS

<table>

<th>D. Schaffarczyk, R. Abächerli, further lecturers</th>
</tr>
</thead>
</table>

**Abstract**
From software as a medical device to medicinal products: The intended use of a healthtech product serves as strategic pivotal point from conception to reimbursement strategies: Understanding its importance defines advertising claims and ensures that the product meets the needs of patients.

**Objective**
- Know and understand different definitions: medical need / public health assessment; personalized medicine, pharmacogenomics/ customized device.
- Understand the importance of medical and stakeholder needs assessments in medicine / medtech / in-vitro diagnostics / software as medical device / artificial intelligence and among different stakeholders.
- Understand the relationship between indication / intended use / intended purpose and development, including risk assessment.
- Define the intended use / intended purpose for a healthtech product and derive user groups, patient groups, indications and contraindications.
- Understand and derive an overview of the different stakeholders of a healthtech product and their different interests.

**Design and Development Plan, Clinical Development Plan:** Plan development correctly.

**Overview**
- Overview of different development models, starting with requirements engineering, the classical waterfall model and V-model up to agile methods for software as medical device or AI concepts.
- ISO 14971: Understanding and applying principles of risk man-agement.
- IEC 62366: Understanding and applying the principles of usability engineering.

**Artificial Intelligence:** Know the challenges of artificial intelligence in healthtech products, define an AI policy and develop a verification process.
Content

The intended use is the “linchpin” in the development, approval and reimbursement of medicinal products or medical devices: Whether software as a medical device, artificial intelligence in medical devices, but also in pharmaceuticals or biotechnology, the intended use is the first and last touchstone - alpha and omega - of all healthtech concepts.

- Intended use, user and patient groups I/III: How the intended use of a healthtech product influences its development, safety, performance, marketing strategy and reimbursement possibilities.

- Intended use, user and patient groups II/III: How the intended use of a healthtech product determines the patient population and thus defines indications and contraindications.

- Intended use, user and patient groups III/III: How the intended use of a healthtech product determines the requirements for different user groups.

- Software as a medical device or drug: What is the market missing - what does the patient want? Derive product re-requirements by understanding market requirements and patient needs. (development planning).

- Software as a medical device or drug: Who is interested in the product, who benefits from it, who works with it? Derive concepts for usability and risk management by understand-ing the different user groups and their interests (verification and validation).

- Software as a medical device or drug: Who is interested in the product, who benefits from it, who works with it? Derive concepts for usability and risk management by understand-ing the different user groups and their interests (verification and validation).

Abstract

An overview of the preclinical development of drugs as well as medical devices and in vitro diagnostics is given. The relevant regulations are conveyed in a practice-oriented manner.

Objective

- Understanding the principles and limitations of the preclinical efficacy and safety disciplines in product development - pharmacodynamics, pharmacokinetics and toxicology
- Understanding and apply regulations for drug development, development of medical devices and in vitro diagnostics
- Understanding for which purposes GLP (Good Laboratory Practice) is applied
- Understanding and apply the do's and dont's of animal experiments in product development
- Understanding the different possibilities and the importance of communication with the regulatory authority in early product development

Content

The Module 4 "Development Process: Preclinical" includes an overview of preclinical efficacy and safety in drug development as well as in the development of medical devices and in vitro diagnostics. Emphasis will be placed on the applicable regulations and potential interactions with regulatory authorities in early product development. When a preclinical development plan becomes necessary and what is needed to start with will be explained in a practical way. An overview is also given of which preclinical studies and documents are required in order to be able to conduct an early clinical study in humans for the first time.

### Abstract

In the CAS Robotics participants are offered a RobotX professor as a mentor together with whom they design their study plan along an individually-specified focus area in the area of Robotics and AI. Based on the individual expertise and interests of the participants, the customised Robotics and AI module consists of a combination of (i) research project, (ii) lectures, (iii) knowledge transfer.

### Objective

The CAS Robotics and AI module offers experienced industry individuals the opportunity to undergo research-related training in Robotics and AI, to update their knowledge and to expand their area of expertise in a targeted manner and aims at:

- training skills at the frontiers of the current state of research in Robotics and AI,
- deepening technical know-how with state-of-the-art knowledge in the specified focus area, and
- advancing practical competencies in the impart of expertise and knowledge transfer across disciplines and educational levels.

| 139-0102-00L    | Module 2: Finite Element Modelling and Identification of the Seismic Behavior of Structures | O    | 2 credits | 3G    | B. Stojadinovic         |
| **Objective**   | This module enables participants:                                       |
|                 | - To use the state-of-the-art FEM software and implement the optimal FE modelling techniques for the simulation of the seismic response of existing buildings (concrete, masonry, mixed concrete-masonry) located in Switzerland |
|                 | - To obtain knowledge of the FEM software and the modelling techniques for the simulation of soil-structure interaction |
|                 | - To understand the current methodologies for the identification and monitoring of the vibration and the seismic behavior of structures located in Switzerland. |

| 139-0103-00L    | Module 3: Analysis Methods and Case Study Examples of Seismic Evaluation and Retrofitting | O    | 2 credits | 3G    | B. Stojadinovic         |
| **Abstract**    | The scope of this Module is to present Analysis Methods and Case Study Examples that illustrate established procedures and practical engineering solutions that are applied in the seismic evaluation and retrofitting of existing structures by Civil Engineers working in Switzerland. |
| **Objective**   | This module enables participants:                                       |
|                 | - To acquire practical knowledge of the seismic retrofitting techniques commonly used in Switzerland, their implementation and their cost |
|                 | - To select the appropriate analysis method for the seismic evaluation of structures located in Switzerland and understanding of the governing factors |

| 139-0104-00L    | Module 4: Individual Project Exercise | O    | 4 credits | 2P    | B. Stojadinovic         |
| **Objective**   | This module enables participants:                                       |
|                 | - To conduct independently a seismic evaluation of an existing structure located in Switzerland considering the boundary conditions that influence the seismic behavior of the structure |

### CAS in Seismic Evaluation and Retrofitting - Key for Type

- **O**: Compulsory
- **W+**: Eligible for credits and recommended
- **W**: Eligible for credits

**Key for Hours**

- **V**: lecture
- **G**: lecture with exercise
- **U**: exercise
- **S**: seminar
- **K**: colloquium

- **P**: practical/laboratory course
- **A**: independent project
- **D**: diploma thesis
- **R**: revision course / private study

**ECTS**: European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.

Introduction to Computer Science

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

Lecture notes
The lecture follows the book "Physics" by Paul A. Tipler.

Literature
Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

Competencies
- Subject-specific Competencies: Concepts and Theories fostered
- Method-specific Competencies: Problem-solving fostered
- Personal Competencies: Critical Thinking fostered

Mathematical Foundations I: Analysis A

Abstract
Introduction to calculus in one dimension. Building simple models and analysing them mathematically. Functions of one variable: the notion of a function, the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Objective
Introduction to calculus in one dimension. Building simple models and analysing them mathematically.

Content
Functions of one variable: the notion of a function, the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Literature
G. B. Thomas, M. D. Weir, J. Hass: Analysis 1, Lehr- und Übungsbuch, Pearson-Verlag
R. Sperb/M. Akveld: Analysis I (vdf)
L. Papula: Mathematik für Ingenieure und Naturwissenschaftler (3 Bände), Vieweg

Competencies
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Personal Competencies: Creative Thinking fostered

Introduction to Computer Science

Abstract
Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.

Objective
Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content
Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation; Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.

Lecture notes
Script booklet (copies of powerpoint slides, in English), distributed at first or second lecture.

Literature
See: www.csms.ethz.ch/education/Info

Prerequisites
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam (compulsory performance component, 12% of the exam mark; in case of repetition of the exam, the exercise marks from a previous semester can be kept).

For more information about the lecture: www.csms.ethz.ch/education/Infol

Information about the practical course will be given on the first day.

Abstract
The general chemistry practical course aims at preparing the students for the work in modern chemistry laboratory. The students are trained to behave safely in the laboratory and use chemicals, chemistry glassware, and related equipment to perform and analyze the equilibrium in basic chemical reactions.

Objective
The students are expected to gain practical experience with as well as establish understanding of the following concepts and phenomena:

- Safe behavior and safety regulations in chemistry laboratory;
- Best practices in common techniques (purification, recrystallization, distillation, etc.);
- Analysis of measured values (measuring error, average value, error analysis);
- Acid-base-equilibria (stresses of acids and bases, pH- and pKa-values, titrations, buffer systems);
- Precipitation equilibria (gravimetry, potentiometry, conductivity measurements);
- Oxidation state and redox reactions (redox-titrations, galvanic elements);
- Metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration);
- Qualitative analysis (cation and anion separation, determination of cations and anions).
In the general chemistry practical course students are introduced to the work in chemistry laboratory. During the course they become familiar with common chemistry glassware and related equipment as well as learn basic experimental procedures, such as distillation, recrystallization, purification, digestion etc. Upon the measurements of pH, conductivity, and potential in the course of reactions, students establish the understanding of the chemical equilibrium concept.

Students work with various classes of inorganic compounds and types of chemical reactions, e.g. acid-base, redox, precipitation. They also obtain first experience with the synthesis of metal complexes as well as learn basics of qualitative analysis of an unknown substance.

Inorganic Chemistry I

This course consists of the following parts, which introduce the students to the chemistry of transition metals as well as lanthanides and actinides. In this context, students will master the basics of group theory and its application.

Physical Chemistry II: Chemical Reaction Kinetics

401-0373-00L  Mathematics III: Partial Differential Equations  O  4 credits  2V+1U  N. Moshayedi

Abstract

Objective
Classical tools to solve the most common linear partial differential equations.

Content
1) Examples of partial differential equations
- Classification of PDEs
- Superposition principle

2) One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

3) Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

4) Separation of variables
- Solution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions
- Dirichlet and Neumann boundary conditions

5) Laplace equation
- Solution of Laplace's equation on the rectangle, disk and annulus
- Poisson formula
- Mean value theorem and maximum principle

6) Fourier transform
- Derivation and definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Solution of the heat equation

7) Laplace transform (if time allows)
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

Lecture notes
See the course web site (linked under Lernmaterialien)

Literature

Additional books:

4) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (chapters 1,2,11,12,8)

For additional sources, see the course web site (linked under Lernmaterialien)

Prerequisites / notice
Required background:
1) Multivariate functions: partial derivatives, differentiability, Jacobian matrix, Jacobian determinant

2) Multiple integrals: Riemann integrals in two or three variables, change of variables

3) Basic knowledge of ordinary differential equations

Autumn Semester 2024
Subject-specific Competencies
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds.

A manual is distributed in the teaching laboratory.

Analytical Competencies
Table of contents:
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995;

Communication
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods.

Abstract
Introduction to the experimental methods of Inorganic Chemistry

Objective
The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc. The synthesis, characterization and analysis of inorganic compound are a main topic. Special emphasis on experimental techniques of synthetic inorganic chemistry, in particular the safe handling of reactive and pyrophoric chemical and solvent purification and drying techniques.

Content
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

Lecture notes
A manual is distributed in the teaching laboratory.

Prerequisites / notice
- Passed Basisprüfung
- Passed Practical Course General Chemistry (1. Semester, 529-0011-04)
- Passed Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230) or Practical Course BCB III: Organic Chemistry (3. Sem. BSc BCB, 529-0016-00)
- Continuous Attendance of Course Inorg. Chemistry 1 (3. Sem. BSc BCB, 529-0121) and Analytical Chemistry 1 (3. Sem., 529-0051)

This class has a limited number of positions available. If necessary, access priority will be settled according to the results of the first-year examinations. Students that are not accepted following that rule will be given priority for the coming year registration.

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

Homogeneous Catalysis

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Organic Chemistry III: Introduction to Asymmetric Synthesis

529-0231-00L

Abstract
Methods of Asymmetric Synthesis

Objective
Understanding of the basic principles of diastereoselective synthesis

Content
Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbyl addition reactions; Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and crotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydroboration, dihydroxylation, epoxidation.

Literature

Evans' Problems in Organic Chemistry App

529-0432-00L

Physical Chemistry IV: Magnetic Resonance

Abstract
Theoretical foundations of magnetic resonance (NMR, EPR) and selected applications. Introduction to magnetic resonance in isotropic and anisotropic phase.

Objective
The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple ‘pulse trickery’ is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

Abstract
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Objective
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Content
Laboratory experiments: UV/VIS spectroscopy, luminescence spectroscopy, FT infrared spectroscopy, light diffraction and refraction, thermal lenses, Raman spectroscopy, reflection spectroscopy, optical polarization phenomena, laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS), FT nuclear magnetic resonance spectroscopy (NMR), electron paramagnetic resonance spectroscopy (EPR), atomic force microscopy (AFM), Fourier transform methods.

Lecture notes
Detailed documentation to each experiment will be handed out.

Prerequisites / notice
Praktikum Physikalische Chemie, 3. Auflage, vdf Hochschulverlag an der ETH, Zürich 2022.
Praktikum Physikalische Chemie (529-0054-00) or Praktikum Physikalische Chemie (529-0054-01).

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

Abstract
Introduction into the important methods for structural analysis (solid state NMR), crystal structure analysis and surface analysis techniques and their applications.

Objective
Knowledge in solid state NMR, crystal structure analysis and surface analytical techniques relevant for inorganic materials.

Content
This lecture course consists of three parts: 1) Solid-state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications.

Physical Chemistry

### Biological Chemistry

**529-0240-00L Chemical Biology - Peptides**

- **Number**: 529-0240-00L
- **Title**: Chemical Biology - Peptides
- **Type**: W
- **ECTS**: 6 credits
- **Hours**: 3G
- **Lecturers**: H. Wennemers

**Abstract**: An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

**Objective**: Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

**Content**: Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.

**Lecture notes**: Citations from the original literature relevant to the individual lectures will be assigned weekly.

### Chemical Aspects of Energy

**529-0659-00L Electrochemistry: Fundamentals, Cells & Applications**

- **Number**: 529-0659-00L
- **Title**: Electrochemistry: Fundamentals, Cells & Applications
- **Type**: W
- **ECTS**: 6 credits
- **Hours**: 3G
- **Lecturers**: L. Gubler

**Abstract**: Introduction to electrochemistry from a physical chemistry point of view, focusing on thermodynamics & kinetics of electrochemical reactions, and engineering aspects of electrochemical cells. The topics are of generic nature yet also discussed in the context of specific applications in industrial electrochemistry, energy storage and conversion, electroanalytical techniques, sensors and corrosion.

**Objective**: The course establishes the fundamentals to understand and describe electrochemical reactions and phenomena related to these. The students are familiarized with key concepts and approaches in electrochemistry and selected aspects of materials science and engineering and how they are put to use in selected applications.
Content

- Introduction: important quantities & units, terminology;
- Chapter I - Redox reactions, Faraday's laws;
- Chapter II - Equilibrium electrochemistry: cells, galvanic and electrolytic cells, thermodynamic state functions, theoretical cell voltage, half-cell / electrode potential, hydrogen electrode, the electrochemical series, Nernst equation;
- Chapter III - Electrodes & interfaces: electrochemical potential, phase potentials, work function, Fermi level, the electrified interface, the electrochemical double layer, reference electrodes and laboratory cells;
- Chapter IV - Electrolytes: conductivity, aqueous electrolytes, transference effects, liquid junctions, polymer electrolytes, ion-exchange membranes, Donnan exclusion, solid state ion conductors;
- Chapter V - Dynamic electrochemistry: overpotentials, description of charge-transfer reaction, Butler-Volmer and Tafel equation, exchange current density, mass transport limitations;
- Chapter VI - Industrial electrochemistry: electrochemical engineering, process and reactor types, current density distribution, porous electrodes, chlor-alkali and HCl electrolysis, oxygen depolarized cathode;
- Chapter VII - Energy storage & conversion: important primary and secondary battery chemistries, fuel cells, polymer electrolyte fuel cells, low temperature H2 and O2 electrochemistry, electrocatalysis, triple-phase boundary, solid oxide fuel cell, conversion efficiency;
- Chapter VIII - Electroanalytical methods & sensors: potentiometry, amperometry, cyclic and stripping voltammetry, rotating disc electrode studies, electrochemical sensors;
- Chapter IX - Corrosion: corrosion reactions, Pourbaix diagram, corrosion potential, passivation, corrosion protection

Lecture notes

Abstract

An introduction to the principles of X-ray diffraction and crystal structure determination as it relates to Chemistry

Objective

To gain an understanding of the principles of crystal structure determination by X-ray diffraction.

Content

Basic crystallographic concepts: Unit cells, Bravais lattices, Laue symmetry, crystal classes (point groups), space groups, crystal growth, instrumentation, diffraction of X-rays by crystals: physical and geometric basics, powder and single crystal methods, structure solution and modelling, interpretation of crystal structure data; internal coordinates for structure description: atom spacing, co-ordination polyhedra, bond angles, torsion angles; intermolecular interactions, absolute configuration determination. Overview of inorganic, organic and macromolecular databases.

Lecture notes

The script and exercises will be distributed weekly in loose form
What happens to chemicals in the environment? How do we determine whether they degrade over decades and accumulate in the food chain?

Introduction to algorithms (special focus on chemistry):

S. Riniker, J. Hollender

Algorithms and Programming for Chemistry

A. Anastasaki

- The students will be able to recognize different polymer types and associate them with their chemical structure and properties (i.e. rubber elasticity, glass transition temperature, etc.)
- The students will become familiar with various synthetic methods to produce polymers of different architectures and topologies
- The students will be exposed to different characterization methods (e.g. size exclusion chromatography, mass-spectrometry, nuclear magnetic resonance) that are necessary to confirm the successful synthesis and structure of a polymer
- The students will understand the mechanism of selected polymerization methodologies
- The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed

C++ programming:

Materials Science

Offered during Spring Semester.

Environmental Chemistry

What happens to chemicals in the environment? How do we determine whether they degrade over decades and accumulate in the food chain? Answers to these questions are provided in this lecture, which covers basic knowledge about distribution behavior, environmental analysis, abiotic and biotic degradation reactions, and toxic effects of chemicals as part of environmental chemical risk analysis.
Objective
Students will develop a basic understanding for fate and effects of chemicals in the environment and learn how to use simple quantitative tools for the assessment of chemical behaviour and toxic effects.

Content
Part 1: Partitioning and reactivity
* Physico-chemical description of partitioning behaviour of organic compounds
* Partitioning in environmental media including soil/sediment, air, water
* Chemical and biological transformations

Part 2: Effects
* Test systems for the assessment of ecotoxicological effects of chemicals
* Bioavailability and bioaccumulation
* Metabolisms of organic compounds
* Molecular mechanisms of toxic action

Part 3: Analyses
* Analytical methods for quantification of substances in water, soil, and air
* Sampling, sample preparation and quantification of organic compounds in environmental media

Lecture notes
Handouts/lecture slides will be made available electronically

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

**Abstract**

This focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

**see Educational Science Teaching Diploma**

## Subject Didactics in Chemistry

**Important Notice: Enrolment in the courses of this category is only possible if no more than 12 CP of potential additional requirements have to be acquired.**

**Autumn Semester 2024**

**Page 534 of 2653**
Die Studierenden sammeln zu Beginn ihrer Ausbildung erste Erfahrungen mit der Beobachtung, Konzeption und Durchführung von

The students have basic subject didactic knowledge for teaching chemistry at a secondary school.

They are able to design lessons that are effective for learning, actively involve students in lessons, explain challenging concepts simply, use experiments for theory and reflect on teaching.

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnasiusspezifischer Lerninhalte
- Didaktische Vereinfachung
- Modelle und chemischen Formeln zur Beschreibung von Aufbau und Umwandlung der Substanzen
- Wechselspiel zwischen Beobachtung in der realen Welt und Deutung auf Modell-Ebene
- Skizzen entwerfen und zur Erklärung von Reaktionen nutzen
- Chemie im 8. Schuljahr: Das Teilchenmodell erklärt viele Phänomene im Anfangsunterricht
- Atommuster und chemische Bindung
- Radioaktivität und Kernspaltung
- Struktur und Eigenschaft
- Auswahl, Konzeption, Vorbereitung, Durchführung, Einbettung und Auswertung von Demonstrationsexperimenten

Literature

- E. Rossa: Chemie-Didaktik, Cornelsen Verlag, 2015
- H.-J. Bader et al: Konkrete Fachdidaktik Chemie, Oldenbourg Verlag, 2002

Prerequisites / notice

Das Einführungspraktikum findet an einem Gymnasium der Deutschschweiz statt.

Das Chemieunterricht am Gymnasium soll einerseits grundlegende chemische Kenntnisse für den Alltag vermitteln und andererseits auf ein naturwissenschaftlich orientiertes Hochschulstudium vorbereiten. Diese beiden Ziele sind im Unterricht gleichermassen zu berücksichtigen.

Anhand der Diskussion bewährter Beispiele und dem Entwurf eigener Unterrichtsbausteine soll die zukünftige Lehrperson befähigt werden, einen den spezifischen Rahmenbedingungen angepassten Unterricht zu entwickeln, der diesem hohen Qualitätsanspruch genügt.

### Professional Training in Chemistry

</table>

**Abstract**

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

**Objective**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.
This course unit introduces students to the technique of conducting experiments in chemistry lessons. It covers didactic, technical, safety-related and presentation aspects.

Students can:
- demonstrate experiments safely and convincingly
- explain observations in a level-appropriate manner
- use experiments to support theory
- know why experiments need to be tested before demonstration
- know some standard experiments
- develop own experiments

Schwerpunkte bilden die folgenden Themen:
- Theoretische Einführung
- Merkmale für ein sicheres Experimentieren
- Die Studierenden erproben und demonstrieren bereitstehende Experimente
- Experimente mit einer Skizze festhalten
- Auf Basis der Literatur ein Experiment selbständig ausarbeiten, dokumentieren und vorführen
- Experimente in den Unterricht einbetten
- Aufgaben zur Auswertung entwerfen

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen.

Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Nach Abschluss der übrigen Ausbildung.

Will mark the conclusion of the teacher training program in Chemistry.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen.

Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Nach Abschluss der übrigen Ausbildung.

Will mark the conclusion of the teacher training program in Chemistry.
Internship Chemistry Didactics

**Abstract**
During the Internship Chemistry Didactics students teach 8 lessons at a high school. Students try out and evaluate activating forms of instruction presented in the subject didactics.

**Objective**
- Students will be able to use different didactic methods in the classroom and recognize the details necessary for successful implementation.
- To try out different options for specialist further training in their profession.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge specialist competence in this way.

**Content**
In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a larger extent, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

**Learning format**: Lecture.

**Thematic focus of FV I**:
- The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
- Stereochemistry: The Coupe du Roi and its chemical meaning, Cyclostereoisomerism, Origin of biomolecular homochirality
- Chemistry and sustainability. The link between chemical products and energy consumption, life cycle assessments and chemical energy storage

**Lecture notes**
Slides and selected literature will be provided.

**Literature**
Selected articles from the primary literature are presented, commented on and recommended reading.

**Prerequisites / notice**
Das Fachdidaktikpraktikum kann erst nach dem Besuch von Fachdidaktik 1 und frühestens mit Fachdidaktik 2 durchgeführt werden (eine gleichzeitige Belegung von Fachdidaktik 2 und Fachdidaktikpraktikum ist möglich).

**Competencies**
- **Subject-specific Competencies**: Concepts and Theories - assessed
- **Method-specific Competencies**: Analytical Competencies - assessed
- **Social Competencies**: Communication - fostered
- **Leadership and Responsibility**: fostered
- **Sensitivity to Diversity**: fostered
- **Personal Competencies**: Creative Thinking - fostered
- **Critical Thinking**: fostered
- **Self-awareness and Self-reflection**: fostered

---

Mentored Work Specialised Courses in the Respective Subject with an Educational Focus I

**Abstract**
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**
The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Content**
Thematikliche Schwerpunkte:

**Lecture notes**
Eine Anleitung zur mentorierten Arbeit in FV wird zur Verfügung gestellt.

**Literature**
Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

**Prerequisites / notice**
Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

## Organic Chemistry

### 529-0233-01L Organic Synthesis: Methods and Strategies
- **Type:** W+
- **ECTS:** 6
- **Hours:** 3G
- **Lecturers:** E. M. Carreira

**Abstract**
The complex relation between structural analysis, methods leading to desired transformations, and insight into reaction mechanisms is exemplified. Relations between retrosynthetic analysis of target structures, synthetic methods and their combination in a synthetic strategy.

**Objective**

**Content**
- Extension and deepening of the knowledge in organic synthesis and the principles of structure and reactivity.

**Literature**

**Prerequisites / notice**
OC I-IV

  - Self-direction and Self-management: fostered

### 529-0241-10L Selectivity in Organic Synthesis
- **Type:** W+
- **ECTS:** 6
- **Hours:** 3G
- **Lecturers:** J. W. Bode

**Abstract**
Fundamentals of selective organic reactions, including current and historical examples of enantioselectivity, regioselectivity, chemoselectivity. Further aspects include recent developments in catalysis, strategies and tools for selective organic synthesis.

**Objective**
Understanding and explaining the origin of selectivity in organic synthesis and the application of selective organic reactions to the construction of complex organic and biological molecules.

**Content**
- Fundamental concepts and recent advances for the selective synthesis of complex organic molecules, including natural products, pharmaceuticals, and biological molecules. Key concepts include the development of enantioselective and regioselective catalysts, the identification of new reaction mechanisms and pathways, and technological advances for facilitating the synthesis of organic molecules.
- Analysis of key primarily literature including identification of trends, key precendents, and emerging topics will be emphasized.

**Lecture notes**
Will be provided in class and online

<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course conducts and supports experiments for a specifically designed genuine research project. We will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The relevant technologies will be taught to the students, such as the preparation of competent cells, production and isolation of DNA fragments, transformation of gene libraries, and DNA sequencing. The course participants will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The students will present the results obtained from their individual evolution experiments at the end of the semester. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>The necessary documents and protocols will be distributed to the participants during the course. General literature to “Directed Evolution” and chorismate mutases, e.g.:</td>
<td></td>
<td></td>

### Abstract

An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

### Objective

Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

### Content

- Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.
- Lectures notes: Citations from the original literature relevant to the individual lectures will be assigned weekly.

### Literature

## 529-0731-00L Nucleic Acids and Carbohydrates

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

### Abstract

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

### Objective

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

<td></td>
<td>The basic principles of NMR in solids will be introduced. After the discussion of basic tools to describe NMR experiments, basic methods and experiments will be discussed, e.g., magic-angle spinning, cross polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information.</td>

<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>The course aims at enabling students to understand the key theoretical points of DNP and to design DNP experiments. Students will be familiarized with the structure of the state-of-the-art DNP instrumentation. Students will be also informed about the technological challenges towards the development of advanced instrumentation for the future DNP experiments. A special focus will be given in the technology of microwave source. Furthermore, students will become familiar with pulse sequences used in biomolecular applications and understand how they are constructed. Students will be able to identify the strengths and weaknesses of biomolecular DNP and how to design DNP experiments for biological applications including sample preparation and choice of NMR experiment and related parameters.</td>

</tbody>
</table>

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 543 of 2653
The course is separated in three well separated parts.

The first part will cover DNP concept and mechanisms, while a special focus will be given in DNP instrumentation, such as MAS technology, and the NMR probe. Several details will be also presented on the development high field NMR magnet.

The second part of the course is dedicated to the microwave theory and technology. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isotope labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP including membrane proteins, in-cell DNP and viruses.

Lecture notes
A script which covers the topics will be accessible through the course Moodle

529-0026-00L Advanced Magnetic Resonance - Biological Magnetic Resonance

Abstract
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. It is concerned with inference of structure and dynamics of proteins and their complexes from data obtained by EPR and liquid-state NMR experiments. The special focus is on multi-state and ensemble modelling.

Objective
This course enables students to design experimental strategies for characterization of structure and dynamics of proteins whose flexibility is relevant for their function. Students understand the spin dynamics that encodes sidechain and backbone motion as well as distance information into signals measured by magnetic resonance experiments. They learn to solve the inverse problem of inferring dynamics parameters and distances from the experimental results. They acquire skills in modelling protein ensemble structure from constraints derived by analyzing magnetic resonance data. Students are aware of the complications introduced by the use of spin labels in such experiments and learn how to include such labels in modelling.

Content
• Nitroxide spin labels, their interaction with the environment, and influence of their dynamics on EPR line shapes
• Contributions to electron spin decoherence and ways to improve resolution in pulsed EPR
• Measurement of electron-electron dipole-dipole interaction and conversion of the primary data to distance distributions
• Modelling of spin labels by rotamer libraries
• Ensemble modelling with exact NOE constraints
• Ensemble modelling with distance distributions
• Liquid-state NMR experiments for assessing protein structure and dynamics
• Assignment of NMR signals for proteins
• Theory of the nuclear Overhauser effect (NOE)
• Ensemble modelling with exact NOE constraints
• Multistate structure calculation and analysis
• Further constraints on protein structure and dynamics from NMR experiments

Lecture notes
A script, which covers the topics, will be accessible through the course Moodle

Prerequisites / notice
A basic knowledge of magnetic resonance, e.g. as covered in the Lecture Physical Chemistry IV, or the book "Spin Dynamics" by Malcolm Levitt.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies fostered

Method-specific Competencies
Analytical Competencies assessed
Decision-making fostered
Problem-solving assessed

ECTS
529-0043-01L Analytical Strategy W 6 credits 3G R. Zenobi, S. Giannoukos, D. Günther

Abstract
Problem-oriented development of analytical strategies and solutions.

Objective
Ability to create solutions for particular analytical problems.

Content
Individual development of strategies for the optimal application of chemical, biochemical, and physico-chemical methods in analytical chemistry solving predefined problems. Experts from industry and administration present particular problems in their field of activity. Principles of sampling.

Lecture notes
Copies of problem sets and solutions will be distributed free of charge

#### Abstract
The first part of the course covers the engineering aspects of the prominent renewable energy technologies: solar (PV and thermal), wind, hydro, geothermal and bioenergy. We further discuss energy storage, renewable transport and renewable heating & cooling. Finally, we introduce the key concepts of the economics of renewable energy and its integration in the energy system.

#### Objective
Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.

#### Lecture notes
Lecture Notes containing copies of the presented slides.

#### Prerequisites / notice
Prerequisite: strong background on the fundamentals of engineering thermodynamics, equivalent to the material taught in the courses Thermodynamics I, II, and III of D-MAVT.

Abstract
Advanced X-ray crystal structure analysis

Objective
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results. Review of principles of diffraction and instrumentation, unit cells, lattices, and symmetry. Inorganic structural chemistry: sphere packings, ionic crystals, covalent networks, intermetallic compounds. Overview of powder diffraction and application of crystal chemistry for structure analysis of polycrystalline phases. Working safely with X-rays, crystal growth, selection and mounting, data collection strategies, data reduction, corrections for absorption, extinction and Lp, advanced structure solution theory and techniques: Patterson function, heavy atom technique, Fourier methods, direct methods. Structure modeling and refinement, disorder, twinning, false symmetry, interpretation of anisotropic shift parameters. Determination of absolute configuration, interpretation of results and scope of chemically useful information, validation and publication of results, critical evaluation of published crystal structures.

Content
Information and exercise sheets will be distributed in loose form.

Literature
(2) J.D. Dunitz, "X-ray Analysis and the Structure of Organic Molecules", 1995, Verlag HCA.

Additional literature

Prerequisites / notice
Students will conduct the computational exercises and examples of structure solution and refinement on personal computers.

Prerequisite: Principles of Crystal Structure Determination (529-0039-00L).

The course aims to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

## Content

1. Introductory lecture: basics of quantum mechanics and quantum chemistry
2. Einstein’s special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3. Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4. Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5. Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6. Relativistic effects in chemistry and the emergence of spin
7. Spin in density functional theory
8. New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group

## Literature

2. F. Schwabl: Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997 (english version available: F. Schwabl, Advanced Quantum Mechanics)

Note also the standard textbooks:

A) A. Szabo, N.S. Ostlund. Verlag, Dover Publications
B) I. N. Levine, Quantum Chemistry, Pearson

## Prerequisites / notice

Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

## Competencies

### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: fostered

### Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered

### Personal Competencies
- Creative Thinking: fostered
- Critical Thinking: fostered
- Self-awareness and Self-reflection: fostered

## 529-0004-01L

**Classical Simulation of (Bio)Molecular Systems**

- 6 credits
- 4G
- P. H. Hünlenberger, J. Dolenc, S. Riniker

### Abstract

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

### Objective

Introduction to classical (atomic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

### Content

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

### Literature

See: www.csms.ethz.ch/education/CSBMS

### Prerequisites / notice

Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS

## Competencies

### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

### Method-specific Competencies
- Analytical Competencies: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

### Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 548 of 2653
Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination, ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

Students should be able to:

1. Identify important polymerization procedures and types of polymerization.
2. Predict activities of monomers based on the chemical structures.
3. Devise synthetic pathways to produce a given polymer structure.
4. Evaluate properties of macromolecules based on structure and synthesis method.
5. Develop synthesis schemes for target structures and discuss potential applications of polymers.

Polymerization is a series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:

- Modern step-growth polymerization
- Living anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metallocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

They will be uploaded on Moodle.

They will be handed out as the lectures progress.

They will be uploaded on Moodle.

They will be uploaded on Moodle.

They will be uploaded on Moodle.

They will be uploaded on Moodle.
Objective

This course intends to enable all students to:

- Acquire and understand the basic jargon, concepts and methods necessary to discuss, in a precise and concise manner, innovation processes and their outcomes at different levels of analysis

- Analyze the differences between individual and organizational decision processes and their innovative outcomes

- Evaluate critically the potential of different (digital) technologies to impact business organizations.

Content

Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

Lecture notes

Slides will be available on the Moodle page

363-0565-00L Principles of Macroeconomics

Abstract

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

Content

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes

The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

Compensatory courses

Inorganic Chemistry
Advanced Magnetic Resonance - Solid State NMR

**Abstract**
The aim of the course is to familiarize the students with the basic concepts of modern high-resolution solid-state NMR. Starting from the mathematical description of spin dynamics, important building blocks for multi-dimensional experiments are discussed to allow students a better understanding of modern solid-state NMR experiments. Particular emphasis is given to achieving high spectral resolution.

**Objective**
The basic principles of NMR in solids will be introduced. After the discussion of basic tools to describe NMR experiments, basic methods and experiments will be discussed, e.g., magic-angle spinning, cross polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information.

**Content**
This lecture course consists of three parts 1) Solid-state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications

**Lecture notes**
Will be given during the lectures

Data: 15.06.2024 12:39   Autumn Semester 2024   Page 551 of 2653
The underlying lecture (529-0051-00L) is offered in autumn semester but only in German.

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications.

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure eludication methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes
Script will be provided for the production price

Literature
- D. A. Skoog and J. D. Leary, Instrumentelle Analytik, Springer, Heidelberg, 1996;
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 “Instrumental analysis of organic compounds” (4th semester) is recommended.

529-0058-AAL
Analytical Chemistry II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Enhanced knowledge about the elemental analysis and spectrocopical techniques with close relation to practical applications. This course is based on the knowledge from analytical chemistry I. Separation methods are included.

Objective
Use and applications of the elemental analysis and spectrocopical knowledge to solve relevant analytical problems.

Content
Combined application of spectroscopic methods for structure determination, and practical application of element analysis. More complex NMR methods: recording techniques, application of exchange phenomena, double resonance, spin-lattice relaxation, nuclear Overhauser effect, applications of experimental 2d and multipulse NMR spectroscopy, shift reagents. Application of chromatographic and electrophoretic separation methods: basics, working technique, quality assessment of a separation method, van-Deemter equation, gas chromatography, liquid chromatography (HPLC, ion chromatography, gel permeation, packing materials, gradient elution, retention index), field desorption, field flow fractionation, enhanced knowledge in atomic absorption spectroscopy, atomic emission spectroscopy, X-ray fluorescence spectroscopy, ICP-OES, ICP-MS.

Literature
K. Robards, P. R. Haddad, and P. E. Jackson, Principle and Practice of Modern Chromatographic Methods, Academic Press, London, 1994,

Prerequisites / notice
None.

529-0132-AAL
Inorganic Chemistry III: Organometallic Chemistry and Homogeneous Catalysis
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.
Physical Chemistry III: Molecular Quantum Mechanics  
E- 4 credits  
F. Merkt  

Abstract  
Postulates of quantum mechanics, operator algebra, Schrödinger’s equation, state functions and expectation values, matrix representation 
of operators, particle in a box, tunneling, harmonic oscillator, molecular vibrations, angular momentum and spin, generalised Pauli principle, 
perturbation theory, electronic structure of atoms and molecules, Born-Oppenheimer approximation.

Objective  
This is an introductory course in quantum mechanics. The course starts with an overview of the fundamental concepts of quantum 
mechanics and introduces the mathematical formalism. The postulates and theorems of quantum mechanics are discussed in the context 
of experimental and numerical determination of physical quantities. The course develops the tools necessary for the understanding and 
calculation of elementary quantum phenomena in atoms and molecules.

Content  
Postulates and theorems of quantum mechanics: operator algebra, Schrödinger’s equation, state functions and expectation values. Linear 
motions: free particles, particle in a box, quantum mechanical tunneling, the harmonic oscillator and molecular vibrations. Angular 
momentum: electronic spin and orbital motion, molecular rotations. Electronic structure of atoms and molecules: the Pauli principle, angular 
momentum coupling, the Born-Oppenheimer approximation. Variational principle and perturbation theory. Discussion of bigger systems 
(solids, nano-structures).

Literature  

Enrolment ONLY for MSc students with a degree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, 
doctoral students) CANNOT enrol for this course unit.

Physical Chemistry IV: Magnetic Resonance  
E- 4 credits  
G. Jeschke, M. Ernst  

Abstract  
Theoretical foundations of magnetic resonance (NMR,EPR) and selected applications.

Objective  
Introduction to magnetic resonance in isotropic and anisotropic phase.

Content  
The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It 
starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and 
two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple 
pulse trickery’ is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian 
is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is 
introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. 
determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging 
(MRI) are presented.

Enrolment ONLY for MSc students with a degree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, 
doctoral students) CANNOT enrol for this course unit.

Inorganic and Organic Chemistry II  
E- 11 credits  
V. Mougel  

Abstract  
Introduction to the experimental methods of Inorganic Chemistry

Objective  
The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic 
chemistry, kinetics, etc.. The synthesis, characterization and analysis of inorganic compound are a main topic. Emphasis is given to 
scientific writing (experiment reports).

Content  
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. 
Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and 
collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible 
projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, 
synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

Enrolment ONLY for MSc students with a degree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, 
doctoral students) CANNOT enrol for this course unit.

Note: A manual is distributed in the teaching laboratory.

Prerequisites / notice  
- Practical Course General Chemistry (1. Semester, 529-0011-04)  
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)  
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)  

If necessary, access priority will be settled according to the results of the first-year examinations.

**Abstract**

Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic devices enable physical and chemical processes to be controlled with exquisite precision and in an fast and efficient manner. This course introduces the underlying concepts, features and applications of microfluidic systems in the chemical and life sciences.

**Objective**

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

**Content**

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   - Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   - Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   - Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   - Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Pécel number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   - Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   - Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   - Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   - Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   - Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    - Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    - Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

**Lecture notes**

- Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

**Literature**

- There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

**Abstract**

**Objective**

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes, Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes
Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html
Additional handout of slides will be provided during the lectures.

#### Abstract
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics,...).

#### Objective
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials, personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ('how do we make something?') to the question of 'what should we make?'

#### Content
Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific compound provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course during the exercise sessions. Contributions will be made in small groups, where a larger topic is studied. The progress of each group will be followed by reports and short presentations during the semester, and one final presentation at the end of the semester. Active participation in the group projects is mandatory for the admission to the oral exam.

#### Literature

#### Prerequisites / notice
Prerequisites: Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).

#### Abstract
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stages of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

#### Objective
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

#### Content

#### Lecture notes
no script
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization.

Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students should be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.
- Process optimization: the students will learn how to formulate optimization problems in mathematical terms, the main type of optimization problems that exist (i.e., LP, NLP, MILP and MINLP) and the fundamentals of the optimization algorithms implemented in commercial solvers.

Prerequisites
Prerequisite: Basic knowledge on unit operations, mainly reaction engineering and distillation. It is recommended that the student takes the module "Process Simulation and Flowsheeting" before "Process Design and Development", but it is not mandatory.

Literature
Main books

Other references

Prerequisites / notice
A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.
Objective

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content

The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

Abstract

Heterogeneous catalysis, an enabling foundation of the chemical industry, spearheads innovation toward key sustainability targets in clean energy, carbon neutrality, and zero waste. The Catalysis Engineering course provides students with concepts bridging from the molecular-level design of catalytic materials to their technical application.

Objective

To accelerate the discovery and implementation of sustainable technologies, this vibrant discipline is constantly refining its design principles, particularly at the nanoscale, a shift facilitated by the availability of increasingly powerful tools that permit the continued development of fundamental knowledge over different time and length scales. During this course, you will learn current concepts for the defossilization of the chemical industry and strategies for achieving this goal from idea to implementation. By introducing topical case studies both in lectures and through a semester project, you will see aspects of catalyst synthesis and characterization, kinetics, mass and heat transport, deactivation and process design, sustainability metrics, and the potential of digital tools to guide catalyst design. Since this area is rapidly advancing and no textbooks are available, the lectures follow slides and journal articles.

Content

The aspects described above will be demonstrated through industrially-relevant examples such as:
- Natural gas valorization
- CO2 conversion to energy vectors
- Plastics upcycling
- Concept for a glycerol biorefinery
- Halogen chemistry on catalytic surfaces
- Ensemble design for selective hydrogenations
- Single-atom catalysis
- Hierarchical zeolite catalysts

Lecture notes

The course material is based on slides and journal articles.

Prerequisites / notice

It is assumed that students selecting this course are familiar with basic concepts of chemistry and catalysis (chemistry or chemical engineering background). Other students are welcome to contact us to discuss the requirement for prior knowledge.

Case Study

Number  Title  Type  ECTS  Hours  Lecturers

Abstract

The learning objective is to design, simulate and optimize a real (bio-)chemical process from a process systems perspective. Specifically, a commercial process simulation software (Aspen) will be used for the process simulation and optimization. Students have to integrate knowledge and develop engineering thinking and skills acquired in the other courses of the curriculum.

Objective

The students are supposed to design, simulate, and optimize a real (bio-)chemical process from a process systems perspective using a commercial process simulation software.
Create a model describing the production process
- Students will apply a commercial process simulator systematically for process creation and analysis.
- Students will create a process simulation flowsheet for steady-state simulation.

Evaluate the performance of the production process
- Students will analyse and understand the degrees of freedom in modelling process units and flowsheets.
- Students will understand the role of process simulators in process creation.
- Students will make design specifications and follow the iterations implemented to satisfy them.
- Students will judge the role of process simulators in equipment sizing and costing and profitability analysis.
- Students will assess the economic performance of the process, including operating costs (OPEX), and capital investment (CAPEX), based on the outcome of the simulation model.
- Students will assess the environmental impact of the production process following the Life Cycle Assessment (LCA) methodology.

Optimize the design and operating conditions of the production process
- Students will carry out sensitivity analyses and optimizations considering technical and economic criteria.
- Students will generate process integration alternatives to improve the initial design.
- Students will optimize the production process considering economic and environmental criteria.

Before the case study week, students are encouraged to participate in the exercises of the course "Process Simulation and Flowsheeting" in order to get familiar with the Aspen Plus simulation software (this is highly recommended, but not mandatory).

The problem statement and detailed instructions are provided in the project brief made available at the beginning of the case study week.

During the case study week:
- Students work in teams of 4-6 people.
- Students have to pose and solve process equipment and system design related problems.
- Students have to coordinate the activities, the preparation of the written report and the oral presentation.
- Students get support from project assistants and the course supervisor.

The groups deliver the written report on a predefined date.

The students receive the feedback and are asked to implement some changes in their reports.

A final presentation takes place summarizing the main findings of the project.

<td>Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.</td>

<tr>
<td></td>
<td>Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label &quot;Systems Biology&quot;, focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stochiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.</td>

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 560 of 2653
Objective

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

Content

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, ‘soft’ lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrophorotics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
   Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
   Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Lecture Notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature

There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed

- Techniques and Technologies: assessed
- Communication: assessed
- Cooperation and Teamwork: assessed

Social Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed

Personal Competencies

551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similiary to emulsions.

This interdisciplinairy course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinairy audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinairy understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinairy audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant querions and actively participate in class discussions, further enhancing their scientific skills.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selecting a topic for the final presentation and supporting literature.

</tbody>
</table>
Objective
The course establishes the fundamentals to understand and describe electrochemical reactions and phenomena related to these. The students are familiarized with key concepts and approaches in electrochemistry and selected aspects of materials science and engineering and how they are put to use in selected applications.

Content
- Introduction: important quantities & units, terminology;
- Chapter I - Redox reactions, Faraday’s laws;
- Chapter II - Equilibrium electrosynthesis: cells, galvanic and electrolytic cells, thermodynamic state functions, theoretical cell voltage, half-cell / electrode potential, hydrogen electrode, the electrochemical series, Nernst equation;
- Chapter III - Electrodes & interfaces: electrochemical potential, phase potentials, work function, Fermi level, the electrified interface, the electrochemical double layer, reference electrodes and laboratory cells;
- Chapter IV - Electrolytes: conductivity, aqueous electrolytes, transference effects, liquid junctions, polymer electrolytes, ion-exchange membranes, Donnan exclusion, solid state ion conductors;
- Chapter V - Dynamic electrochemistry: overpotentials, description of charge-transfer reaction, Butler-Volmer and Tafel equation, exchange current density, mass transport limitations;
- Chapter VI - Industrial electrosynthesis: electrochemical engineering, process and reactor types, current density distribution, porous electrodes, chlor-alkali and HCl electrolysis, oxygen depolarized cathode;
- Chapter VII - Energy storage & conversion: important primary and secondary battery chemistries, fuel cells, polymer electrolyte fuel cells, low temperature H2 and O2 electrochemistry, electrocatalysis, triple-phase boundary, solid oxide fuel cell, conversion efficiency;
- Chapter VIII - Electroanalytical methods & sensors: potentiometry, amperometry, cyclic and stripping voltammetry, rotating disc electrode studies, electrochemical sensors;
- Chapter IX - Corrosion: corrosion reactions, Pourbaix diagram, corrosion potential, passivation, corrosion protection

lecture notes, lecture slides, exercise & solutions (PDF files)

Literature

Prerequisites / notice
Students should be familiar with the fundamentals of physical chemistry.
Molecular Aspects of Catalysts and Surfaces

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatics are assessed.

Analytical Competencies

1) Safety and Health and their importance for sustainability
2) Green metrics: real-life tools
3) The proper choice of technology and their impact
4) Case Study from fragrance industry
5) Case Study from agrochemical industry
6) Case Study from pharmaceutical industry
7) Case Study from the bulk chemical industry

Molecular Aspects of Catalysts and Surfaces

Basic elements of surface science important for materials and catalysis research. Physical and chemical methods important for research in surface science, material science and catalysis. Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.

Modeling and Simulations

Classical Simulation of (Bio)Molecular Systems

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Economics and Technology Management

Technology and Innovation Management

This course focuses on the sources of innovation (with a specific focus on digital technologies), the tools and techniques that organizations deploy to innovate routinely, and the strategic implications of technical change at different levels of analysis: individuals, firms and whole ecosystems.

Evaluating the potential of different (digital) technologies to impact business organizations.
Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high-risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

**Prerequisites / notice**
The course content and methods are designed for students with some background in management and/or economics.

**363-0565-00L Principles of Macroeconomics**

**Abstract**
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

**Objective**
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

**Content**
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

**Lecture notes**
The course Moodle page contains announcements, course information and lecture slides.

**Literature**

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

**Abstract**
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ...).
Objective

This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials, personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ("how do we make something?") to the question of 'what should we make?'

Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service? We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

327-2145-00L Advanced Polymer Synthesis

Abstract

Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination, ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

Objective

Students should be able to: Identify important polymerization procedures and types of polymerization. Predict reactivities of monomers based on the chemical structures Devise synthetic pathways to produce a given polymer structure. Evaluate properties of macromolecules based on structure and synthesis method. Develop synthesis schemes for target structures and discuss potential applications of polymers.

Content

Polymerization is series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:

- Morden Step-growth polymerization
- Living Anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metallicocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

Lecture notes

They will be uploaded on Moodle

Literature

Lecture notes will be given

Prerequisites / notice

Strong basic knowledge of Organic Chemistry.Any course on Introductory Polymer Chemistry such as *Advanced Building Blocks for Soft Materials* or "Introduction to Macromolecular Chemistry" or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

Process Design

Number  Title                  Type   ECTS   Hours   Lecturers
529-0643-01L Process Design and Development W 6 credits 3G G. Guillen Gosaibez

Abstract

The course is focused on the design of Chemical Processes, with emphasis on the preliminary stages of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

Objective

The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.
Content
Process creation: heuristics vs. mathematical programming.
Heuristics for reaction and separation operations, heat transfer and pressure change.
Introduction to optimization in process engineering and the modeling software GAMS.
Process economic evaluation: equipment sizing and costing, time value of money, cash flow calculations.
Process integration: sequencing of distillation columns using mixed-integer linear programming (MILP), and synthesis of heat exchanger networks using mixed-integer nonlinear programming (MINLP).
Batch processes: scheduling, sizing, and inventories.
Principles of molecular design using mixed-integer programming.

Prerequisites / notice
Prerequisite: Basic knowledge on unit operations, mainly reaction engineering and distillation. It is recommended that the student takes the module "Process Simulation and Flowsheeting" before "Process Design and Development", but it is not mandatory.

529-0613-01L Process Simulation and Flowsheeting W 6 credits 3G G. Guillén Gosálbez

Abstract
This course encompasses the theoretical principles of chemical process simulation and optimization, as well as its practical application in process analysis. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages (Aspen) are introduced for solving process flowsheeting and optimization problems.

Objective
This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students should be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.
- Process optimization: the students will learn how to formulate optimization problems in mathematical terms, the main type of optimization problems that exist (i.e., LP, NLP, MILP and MINLP) and the fundamentals of the optimization algorithms implemented in commercial solvers.

Content
Overview of process simulation and flowsheeting:
- Definition and fundamentals
- Fields of application
- Case studies
Process simulation:
- Modeling strategies of process systems
- Mass and energy balances and degrees of freedom of process units and process systems
Process flowsheeting:
- Flowsheet partitioning and tearing
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
Process optimization and analysis:
- Classification of optimization problems
- Linear programming, LP
- Non-linear programming, NLP
- Mixed-integer linear programming, MILP
- Mixed-integer nonlinear programming, MINLP
Commercial software for simulation (Aspen Plus):
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence, optimisation & debugging

**Abstract**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Objective**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Content**
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

**Lecture notes**
Handouts during the class

**Literature**
Recommendations for text books will be covered in the class

**Prerequisites / notice**
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

**Abstract**
Heterogeneous catalysis, an enabling foundation of the chemical industry, spearheads innovation toward key sustainability targets in clean energy, carbon neutrality, and zero waste. The Catalysis Engineering course provides students with concepts bridging from the molecular-level design of catalytic materials to their technical application.

**Objective**
To accelerate the discovery and implementation of sustainable technologies, this vibrant discipline is constantly refining its design principles, particularly at the nanoscale, a shift facilitated by the availability of increasingly powerful tools that permit the continued development of fundamental knowledge over different time and length scales. During this course, you will learn current concepts for the defossilization of the chemical industry and strategies for achieving this goal from idea to implementation. By introducing topical case studies both in lectures and through a semester project, you will see aspects of catalyst synthesis and characterization, kinetics, mass and heat transport, deactivation and process design, sustainability metrics, and the potential of digital tools to guide catalyst design. Since this area is rapidly advancing and no textbooks are available, the lectures follow slides and journal articles.

**Content**
The aspects described above will be demonstrated through industrially-relevant examples such as:
- Natural gas valorization
- CO2 conversion to energy vectors
- Plastics upcycling
- Concept for a glycerol biorefinery
- Halogen chemistry on catalytic surfaces
- Ensemble design for selective hydrogenations
- Single-atom catalysis
- Hierarchical zeolite catalysts

A supervised semester project conducted in small groups provides a taster of catalysis research on a timely topic. Students will learn basic skills including critical literature analysis, problem definition and solving, methods of catalyst synthesis, characterization, and testing, and data evaluation and communication through a short talk.

**Lecture notes**
The course material is based on slides and journal articles.

**Prerequisites / notice**
It is assumed that students selecting this course are familiar with basic concepts of chemistry and catalysis (chemistry or chemical engineering background). Other students are welcome to contact us to discuss the requirement for prior knowledge.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

The underlying lecture (529-0051-00L) is offered in autumn semester but only in German.

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications.

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra;
- Raman spectroscopy.

Lecture notes
Script will be provided for the production price.

Literature

**Abstract**

The lecture provides an introduction to some of the physical fundamentals of chemistry, in particular radioactivity, quantum mechanics, the structure of matter and an atom, the periodic table of elements, and chemical bonding.

**Objective**

After the lecture, students will be able to,

- to calculate physical quantities and their units which are important for chemistry,
- name some properties of chemically relevant particles and propose experimental methods to determine these properties,
- name applications and hazards of radioactivity,
- categorize radioactive decay processes and mathematically represent the time course of simple decay reactions and qualitatively predict and represent them,
- describe wave and particle properties of electromagnetic radiation and matter and propose experimental methods for their detection,
- to explain the basics of quantum mechanics (meaning of the wave function, Heisenberg's uncertainty principle, operators, commutators) and to perform simple calculations with them,
- analyze and calculate absorption and emission spectra of single-electron atoms,
- to set up the Schrödinger equation for a molecular multi-particle system.

**Content**

Atomic orbitals and energy levels: ionisation energies, atomic spectroscopy, term values and symbols. Quantum mechanical atom model: wave-particle duality, the uncertainty principle, Schrödinger's equation, the hydrogen atom, construction of the periodic table of the elements. Chemical bonding: ionic bonding, covalent bonding, molecular orbitals.

Introduction to calculus in one dimension. Building simple models and analysing them mathematically.

Content
Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

Lab courses

Practical Course General Chemistry

- The general chemistry practical course aims at preparing the students for the work in modern chemistry laboratory. The students are trained to behave safely in the laboratory and use chemicals, chemistry glassware, and related equipment to perform and analyze the equilibrium in basic chemical reactions.

- The students are expected to gain practical experience with as well as establish understanding of the following concepts and phenomena:
  - Safe behavior and safety regulations in chemistry laboratory;
  - Best practices in common techniques (purification, recrystallization, distillation, etc.);
  - Analysis of measured values (measuring error, average value, error analysis);
  - Acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems);
  - Precipitation equilibria (gravimetry, potentiometry, conductivity measurements);
  - Oxidation state and redox reactions (redox-titrations, galvanic elements);
  - Metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)
  - Qualitative analysis (cation and anion separation, determination of cations and anions).
Content
In the general chemistry practical course students are introduced to the work in chemistry laboratory. During the course they become familiar with common chemistry glassware and related equipment as well as learn basic experimental procedures, such as distillation, recrystallization, purification, digestion etc. Upon the measurements of pH, conductivity, and potential in the course of reactions, students establish the understanding of the chemical equilibrium concept.

Students work with various classes of inorganic compounds and types of chemical reactions, e.g. acid-base, redox, precipitation. They also obtain first experience with the synthesis of metal complexes as well as learn basics of qualitative analysis of an unknown substance.

Literature
Moodle Lernplattform

Prerequisites / notice
Compulsory: online enrolment latest one week after start of the semester

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

529-0422-00L  Physical Chemistry II: Chemical Reaction Kinetics  O  4  3V+1U  R. Signorell

Abstract

Objective
Introduction to Chemical Reaction Kinetics

Content

Lecture notes
Will be provided
Mathematics III: Partial Differential Equations

Abstract

Objective

Classical tools to solve the most common linear partial differential equations.

Content

1) Examples of partial differential equations
   - Classification of PDEs
   - Superposition principle

2) One-dimensional wave equation
   - D'Alembert's formula
   - Duhamel's principle

3) Fourier series
   - Representation of piecewise continuous functions via Fourier series
   - Examples and applications

4) Separation of variables
   - Solution of wave and heat equation
   - Homogeneous and inhomogeneous boundary conditions
   - Dirichlet and Neumann boundary conditions

5) Laplace equation
   - Solution of Laplace's equation on the rectangle, disk and annulus
   - Poisson formula
   - Mean value theorem and maximum principle

6) Fourier transform
   - Derivation and definition
   - Inverse Fourier transformation and inversion formula
   - Interpretation and properties of the Fourier transform
   - Solution of the heat equation

7) Laplace transform (if time allows)
   - Definition, motivation and properties
   - Inverse Laplace transform of rational functions
   - Application to ordinary differential equations

Lecture notes

See the course web site (linked under Lernmaterialien)

Literature

Additional books:

4) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (chapters 1,2,11,12,6)

For additional sources, see the course web site (linked under Lernmaterialien)

Prerequisites / notice

Required background:

1) Multivariate functions: partial derivatives, differentiability, Jacobian matrix, Jacobian determinant

2) Multiple integrals: Riemann integrals in two or three variables, change of variables

3) Basic knowledge of ordinary differential equations
The lecture slides, problem sets, and additional documents are provided online. Link: https://wennemers.ethz.ch/education.html

Abstract

Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

Lecture notes

Script will be for the production price

Literature

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites

- Passed Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230) or Practical Course BCB III: Organic Chemistry (3. Sem. BSc BCB, 529-0016-00)

Lecture notes

- Passed Basisprüfung
- Passed Practical Course General Chemistry (1. Semester, 529-0011-04)
- Passed Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230) or Practical Course BCB III: Organic Chemistry (3. Sem. BSc BCB, 529-0016-00)
- Continuous Attendance of Course Inorg. Chemistry 1 (3. Sem. BSc BCB, 529-0121) and Analytical Chemistry 1 (3. Sem., 529-0051)

This class has a limited number of positions available. If necessary, access priority will be settled according to the results of the first-year examinations. Students who are not accepted following that rule will be given priority for the coming year registration.

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

**Abstract**
This course introduces the basic principles and concepts of chemical engineering thermodynamics. Whilst providing insights into the meaning and properties of fundamental thermodynamic quantities, the course also has a primary focus on the application of thermodynamic concepts to real chemical engineering problems.

**Objective**
A primary objective of the course is to present a rigorous treatment of classical thermodynamics, whilst retaining a strong engineering perspective. Accordingly, real-world engineering examples will be used to highlight how thermodynamics is applied in engineering practice. The core ideas presented and developed within the course will provide a foundation for subsequent studies in such fields as fluid mechanics, heat transfer and statistical thermodynamics.

**Content**
The first part of the course introduces the basic concepts and language of chemical engineering thermodynamics. This is followed by an analysis of energy and energy transfer, with a specific focus on the concept of work and the first law of thermodynamics. Next, the notion of a pure substance is introduced, with a discussion of the physics of phase-changes being presented. The description of pure substances is further developed through an analysis of the PVT behavior of fluids, equation of states, ideal and non-ideal gas behaviour and compressibility factors.

The second part of the course begins with a discussion of the use of the energy balance relation in closed systems that involve pure substances and then develops relations for the internal energy and enthalpy of ideal gases. Next, the second law of thermodynamics is introduced, with a discussion of why processes occur in certain directions and why energy has quality as well as quantity. Applications to cyclic devices such as thermal energy reservoirs, heat engines and refrigerators are provided. Entropy changes that take place during processes for pure substances, incompressible substances and ideal gases are described.

The third part of the course establishes thermodynamic formulations for the calculation of enthalpy, internal energy and entropy as function of pressure and temperature, Gibbs energy, fugacity and chemical potential. Two-phase systems are introduced as well as the use of equations of state to construct the complete phase diagrams of pure fluid.

The final part of the course focuses on the properties of mixtures and the phase behavior of multicomponent systems. The fundamental equations of phase equilibria in terms of the chemical potential and fugacity are also discussed. The concept of an ideal solution is introduced and developed. This is followed by an assessment of non-ideal behavior and the use of activity coefficients for describing phase diagrams. Particular focus is given to phase equilibria. Finally, concepts relating to chemical equilibria are introduced with the general concepts developed being applied to reacting species. Examples here include the calculation of the Gibbs free energy and the equilibrium constant of a reaction.

**Lecture notes**
Lecture handouts, background literature, problem sheets and notes will be made accessible to enrolled students through the lecture Moodle site.

**Literature**
Although there is not set text for the course, the following three texts will be used in part and are excellent introductions to Chemical Engineering thermodynamics:

**Prerequisites / notice**
A basic knowledge of chemical thermodynamics is required.

**Prerequisites / notice**
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.
This course covers common numerical algorithms and statistical methods used by chemical engineers to solve typical problems arising in physico-chemical processes. Lecture notes will be handed out. 

Topics covered:

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Sensitivity to Diversity
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

529-0636-00L Heat Transport and Fluid Dynamics

Abstract: This course teaches the basis and the methods for the description and for the quantitative treatment of heat transfer and fluid flow with emphasis on physico-chemical processes.

Objective: At the end of this course students should be familiar with the basics of heat transfer and fluid dynamics, and have acquired the ability to describe these phenomena in practical processes and to perform corresponding calculations.

Content: Mechanisms of heat and momentum transfer; analogy between mass, heat and momentum transfer; dimensional analysis; kinematics and continuum mechanics; steady and non-steady; laminar and turbulent flow; incompressible flows; Bernoulli equation; Navier-Stokes equations; boundary layer theory; steady and non-steady heat conduction; convective heat transfer; heat transfer correlations; radiative heat transfer.

Lecture notes: Lecture notes will be handed out.

529-0632-00L Homogeneous Reaction Engineering

Objective: Provide to the students a complete methodology for the analysis and design of homogeneous reactors.

Lecture notes: Scripts are available online on the website page of the Arosio group.

752-4001-00L Microbiology

Abstract: Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective: Teaching of basic knowledge in microbiology.

Discovering Management

Does not take place this semester.

Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Excercises) 351-0778-01.

Abstract

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:

1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content

The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

Technology Entrepreneurship for Chemical Engineers

Only for students in BSc Chemical Engineering.

Abstract

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding. This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Objective

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases. The project work links technology entrepreneurship with challenges in the chemical industry.

Content

Weekly sessions - recorded.

10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …)

Typical lecture format (2h):
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

Special workshops will complement the course.

Laboratory Courses and Case Studies

<table>

Abstract

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. Based on this compilation and selected quantitative as well as qualitative measures, a process assessment and comparison is conducted. A basic flow sheet is then generated, and mass and energy balances are performed to carry out a preliminary economic and environmental assessment.

Objective

- to obtain knowledge about different databases and sources of information
- application of the knowledge obtained in lectures to a real problem
- problem-oriented problem solving (application of different methods to the same subject)
- team work
- report writing and presentation techniques
The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. For this purpose, relevant substance data (i.e. physico-chemical, toxicological, safety, and environmental data), as well as information about synthesis routes and technical implementations (i.e. on reaction kinetics; possible separation operations; economic, safety, and environmental aspects), are collected from the literature. Based on this compilation and selected quantitative as well as qualitative measures, a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation. For this alternative, a basic flowsheet and mass and energy balances are generated.

529-0639-01L  Chemical Engineering Laboratory  O  6 credits  8P  N. Kobert, R. Grass

Abstract
The internship is exclusively for chemical engineering BSc 05 semester students. For justified exceptions, please contact the teaching staff before the start of the semester.

Objective
Introduction to various tools of chemical engineering techniques with reference to the running lectures.

Content
In groups of two, students will conduct experiments in the following areas: thermodynamics and phase equilibria including electrochemistry, transport phenomena, kinetics and selectivity of complex reactions, characterisation of ideal and real reactors.

Prerequisites / notice
Registration for the course unit is only possible for the primary target group (Chemical Engineering Bachelor 05 semester students).

</tr>
</tbody>
</table>

**Abstract**
The seminar covers basic issues of research design, small-n research, and data collection. It deals with issues of causality, conceptualization, case study design and QCA. Data collection includes interviews, surveys, text analysis, and experimental research.

**Objective**
This MACIS core seminar covers basic issues of research design, small-n research, and data collection. It familiarizes students with general research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students should be able to use the principal methods of data collection used by political scientists, have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
- Method-specific Competencies: Analytical Competencies, Project Management
- Social Competencies: Communication
- Personal Competencies: Creative Thinking, Critical Thinking

**Abstract**
The seminar focuses on seminal books and articles as well as brand new analyses on topical issues of democratic theory and practice. After reviewing theoretical models and different types of democracy, the seminar deals with core problems of democratic governance and with challenges to democracy stemming from globalization and international institutions.

**Objective**
At the end of the seminar, students are familiar with the relevant theoretical and empirical literature on democracy and democratization in national and international contexts. They are able to reflect on contemporary challenges to democracy, in particular those stemming from the internationalization of politics.

</tr>
</tbody>
</table>

**Abstract**
This course addresses the role of policy change and its underlying politics in the transformation of the energy and other climate and sustainability-related sectors. It focuses on political perspectives (while also touching on historical and socio-economic perspectives) and applies various theoretical concepts to understand specific aspects of transition governance.

**Objective**
- To gain an overview of the history of the transition of large socio-technical systems
- To recognize challenges for transformative policy change and to understand the theoretical frameworks and concepts for studying transitions
- To develop own research question and address it in research paper that demonstrates knowledge of the role of policy and politics in transitions

**Content**
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of socio-technical systems necessary. This course introduces the social and environmental challenges involved in the energy sector as a key sector in need of transition. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then focuses on the role of public policy and policy change in governing complex socio-technical transitions, considering the role of political actors, institutions and policy feedback.

**Lecture notes**
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

**Literature**
A reading list will be provided via moodle.ethz.ch at the beginning of the semester.
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a fostered perspective; (2) develop collaborative research including project management, spanning the entire project cycle from ideation, study design and pre-analysis planning, field phase and data collection, statistical analysis and paper writing.

Literature
The reading materials consist of a series of academic papers (see detailed syllabus)

Prerequisites / notice

**857-0052-00L** Comparative and International Political Economy ■ W 8 credits 2S V. Koubi, E. K. Smith
MacIS students are given priority.
Registration required to koubi@ir.gess.ethz.ch

Abstract
This research seminar complements the MACIS core seminar in Political Economy. It covers topics such as international trade, environmental policy, international finance and foreign direct investment, and welfare state policy. Students will, based on reading assignments and discussions in class, develop a research question, present a research design, and write a paper.

Objective
Students will acquire an advanced understanding of some of the key issues and arguments in comparative and international political economy. They will also prepare the ground for a high-quality MA thesis in political economy.

Content
Because the number of students will be very small, the Political Economy core course runs in parallel, and research interests will be heterogeneous, the general approach will be informal and decentralized. Before the seminar starts we will identify what research topics - within the broader field of Comparative and International Political Economy - the participating students are most interested in. In the first two weeks of the semester, we will meet twice for two hours each as a group to discuss how to write a good research seminar paper, and to identify more closely what each student will be working on. Each student will then receive a reading list, so that she/he can get familiar with the state-of-the-art in her/his area of interests and develop a research design in close consultation with Profs. Bernauer and Koubi as well as postdocs and doctoral students in her/his research group.

Prerequisites / notice
This seminar is restricted to students enrolled in the MACIS program.

**857-0108-00L** Introduction to Security Studies ■ W 8 credits 2S T. Bernauer

Abstract
This seminar introduces students to international security studies research by covering a substantive topic in the field each week (such as war, nuclear weapons, etc.). Students will study the discipline’s fundamental questions and will engage with how scholars generate knowledge as well as the various research designs, inferential strategies, and analytical methods they have used.

Objective
Students will study the discipline’s fundamental questions, such as why wars occur, if there are ways to make the outbreak of war less likely, and what the advent of nuclear weapons and emergent technologies means for international affairs. The course will also expose students to recent debates and research in the field. It will cover how scholars have generated knowledge as well as the various research designs, inferential strategies, and analytical methods they have used. After completing the course, students should have increased familiarity with essential readings in international security studies and the skills to conduct meaningful independent research.

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.
| Lecture notes | Reading materials and slides will be available via Moodle. |
| Literature | Reading materials and slides will be available via Moodle. |
| Prerequisites / notice | Access / Prerequisites |

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) subject to the same conditions. Registration for the course in the mystudies system at ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

**Migration and Development**

**W**

1 credit

2G

Does not take place this semester.

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

ETH MA/MSc students apply with a letter of motivation to the NADEL administration office.

Registration only through the NADEL administration office.

**Abstract**

Globally, over 280 million people live outside their countries of origin. While the concept of migration has negative connotations for some, migration can bring significant benefits – to both countries of origin and destination, if the right policies and initiatives are in place. The course explores the role that international cooperation can play in promoting the positive aspects of migration.

**Objective**

Course participants have improved understanding of the following issues:

- Definition of migration concepts and terms
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of "migration and development"
- International cooperation organisations and their strategies and activities in terms of migration and development.

**Content**

Globally, over 280 million people are currently living outside their countries of origin, voluntarily and involuntarily, and a further 60 million people live in internal displacement settings within their countries of origin. Migration is multifaceted, and driven by various, often interlinked factors including conflict and violence, economic, social and political factors, as well as environmental and climate related events. While the concept of migration has negative connotations for some, migration can bring significant benefits – to both countries of origin and destination, if the right policies and initiatives are in place. The course explores the role that international cooperation can play in promoting the positive aspects of migration and in reducing the potential negative consequences.

This course covers:
- Important terms and concepts related to migration;
- International legal frameworks related to migration;
- The geography of migration flows;
- Major drivers of migration;
- The evolving concept of migration and development;
- Actions, strategies and initiatives of international cooperation actors when it comes to migration and development.

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Cooperation and Teamwork
- Personal Competencies: Critical Thinking

**Engaging with Policy Processes: Strategies and Tools**

**W**

1 credit

2G

Does not take place this semester.

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

**Abstract**

The course enables participants to understand the significance of the engagement of civil society organisations in policy processes in order to overcome exclusion and foster voice. The course acquaints participants with concepts and practice of civil society participation in shaping policies at micro and macro level and provides practical tools for influencing political processes.

**Objective**

Recognizing that development is inherently political, this course covers political processes and how they intertwine with the goals and strategies of various agents in international cooperation. It discusses the significance and implications of civil society’s efforts to foster voice and inclusion. The course provides a nuanced understanding of different strategic options and approaches to contribute to policy processes and offers tools that have proven to be effective in practical development cooperation work. It provides an opportunity for participants to apply concepts related to the strengthening of civil society to their projects and case studies.

**Content**

- Understanding policy processes: Institutions and actors at the macro, meso and micro level
- Political settlements, power distribution and inequalities of access to rights and resources
- Exclusive and fragile institutions, and the influence of dominant coalitions
- Policy in terms of rules and norms emerging from a negotiation process between interdependent actors
- Actor-oriented approaches, methods and tools to analyse, engage with and contribute to policy processes

**Prerequisites**

Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with the NADEL secretariat.
This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies.

Objective

The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course conveys basic knowledge about genders aspects in economics. Key elements are:

- Feminist approaches to macroeconomics, microeconomics and international economics
- Critical analysis of global and regional economic trends, including those related to economic crises
- Gender-responsive economic policy for program implementation, policymaking, and advocacy

Content

Economic inequalities between men and women persist in many countries. For example, in many countries, men earn more money and are more likely to own land and control productive assets than women. This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies. The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course is taught in cooperation with SDC and UN women.

865-0069-00L Health and Development

MAS ETH in Global Cooperation and Sustainable Development

| Credit | W | 2 | 2G | K. Hartgen |

Abstract

The following topics will be discussed: Basic principles of epidemiology and global burden of disease distribution, Health systems and health system strengthening including economic aspects and health insurance, communicable diseases such as HIV/AIDS, Malaria, tuberculosis and neglected tropical diseases, mother and child health, non-communicable diseases and transition in health in LAMICs.

Competencies

Subject-specific Competencies: Concepts and Theories

- fostered
This course will introduce students to a variety of foundational economic models of politics and policy making. This includes—but is not limited to—models of electoral competition, political agency, legislative bargaining, and the interaction between political and market outcomes (e.g., via market and business regulations).

The course material will mainly be theoretical and mathematical (primarily using game theory). Real-world examples and empirical research will be discussed to help motivate and evaluate the theoretical material. Most of the content will focus on the United States, for which rich theoretical and empirical literatures exist. However, the key tools, ideas, and insights can be applied more generally and beyond the United States.

The course assumes basic mathematical competencies (e.g., familiarity with algebra, multi-variable calculus, and probability). We will not assume prior knowledge of game theory—the course will introduce game theoretic concept as they are required. However, having previously taken an introductory course in game theory will be an advantage (e.g., D-MTEC courses such as: 363-0558-00L "Introduction to Game Theory: Strategic and Cooperative Thinking" or the recent edition of 363-0515-00L “Decisions, Markets, and Games”).

The course material primarily draws from the following textbook:

Other useful resources:

There are no formal admission requirements. It is expected that students have a basic level of mathematical competence. It will be beneficial if students have taken an ungraded level course in microeconomics or game theory.

### Master's Thesis

<td>J. Spirig</td>
</tr>
</tbody>
</table>

**Abstract**
In this colloquium, students enrolled in the MACIS program first present and discuss research design and methods issues concerning their prospective MA theses. Towards the end of the semester they present preliminary findings from their MA thesis work.

**Objective**
It is the goal of the colloquium to help students with the initial steps of writing their master theses. During the colloquium, they will develop a relevant research question and hypotheses and select appropriate methods and data.

</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.</td>

<td></td>
<td>* macroevolution of species</td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation &amp; extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, Influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.</td>

Abstract

Evolutionary genetics covers three important areas of modern evolutionary genetics: bioinformatics, molecular evolution and population genetics. Treating these three areas together in a single course provides an integrated education in evolutionary genetics. A solid understanding of these areas is also central to other fields such as conservation biology or behavioural and evolutionary ecology.

262-6110-00L Bioinformatics Algorithms (University of Basel)  
W  4 credits  3G  external organisers

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract

The course must be registered for directly at Uni Basel. 
Uni Basel course number: 45401-01

Objective

Students can understand the main algorithmic design principles for problems like sequence alignment, motif finding and phylogenetic inference. Further, students get an overview of modern machine learning methods and their applications to bio-medical problems.

401-6282-00L Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)  
W  5 credits  3G  H. Rehrauer

Mind the enrolment deadlines at UZH:  

Abstract

A range of topics will be covered, including basic molecular biology, genomics technologies and in particular, a wide range of statistical and computational methods that have been used in the analysis of DNA microarray and high throughput sequencing experiments.

Content

Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Lecture notes

Lecture notes, published manuscripts

Prerequisites / notice

Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics

The course must be registered for directly at Uni Basel. 
Uni Basel course number: 25661-01

Abstract

This course reviews how ideas and concepts from physics have helped understanding biological systems by discussing landmark papers in the field.

636-0104-00L Biophysical Methods  
W  4 credits  3G  D. J. Müller

Abstract

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:

- **Light microscopy**: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- **Super resolution optical microscopy**: STED, PALM, STORM, other variations
- **Electron microscopy**: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- **X-ray, electron and neutron diffraction**
- **MRI imaging**
- **Scanning tunneling microscopy and atomic force microscopy**
- **Patch clamp technologies**: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- **Surface plasmon resonance-based biosensors**
- **Molecular pore-based sensors and sequencing devices**
- **Mechanical molecular and cellular assembly devices**
- **Optical and magnetic tweezers**
- **CD spectroscopy**
- **Optogenetics**
- **Molecular dynamics simulations**

**Objective**

Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

**Content**

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Media and Digital Technologies
  - Problem-solving
- **Personal Competencies**
  - Adaptability and Flexibility
  - Creative Thinking

**Lecture notes**

The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

**Literature**

- See: www.csms.ethz.ch/education/CSBMS
- Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

**Prerequisites / notice**

The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

All lecture material will be made available online via Moodle.

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

Murray, Mathematical Biology, Springer
Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
Keener and Sneyd, Mathematical Physiology, Springer
Fall et al, Computational Cell Biology, Springer
Szallasi et al, System Modeling in Cellular Biology, MIT Press
Wolkenhauer, Systems Biology
Kreyszig, Engineering Mathematics, Wiley

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.
Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

Fundamentals:
- What is data?
- Bayesian Learning
- Computational learning theory

Supervised learning:
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

Unsupervised learning:
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

636-0101-00L Systems Genomics W 4 credits 3G B. Treutlein, C. Beisel, Z. He

Abstract
This course is an introduction to the wide field of Genomics. It addresses how fundamental questions in biological systems are studied using methods in genomics and how the resulting data is analysed to make quantitative interpretations of biological phenomena.

Objective
The goal of this course is to get detailed insights in how state-of-the-art DNA sequencing technologies can be applied for a qualitative and quantitative description of molecular and cellular processes and function. Students will learn how to analyse RNA-seq / transcriptomics data and make biological interpretations in a quantitative manner.

Content
This course will be a mix of lecture sessions, hands-on computational data analysis using public datasets and seminars discussing own results in the context of the published studies. In the lectures we will introduce current Next-Generation Sequencing technologies and their application to address basically all facets of modern biology and biomedical research. We will cover the major sample processing methods used for investigating functional genomic aspects like transcriptome and chromatin profiling, review recent advances in (cancer) genome sequencing and give an overview of public big data sequencing projects (ENCODE, GTEx, TCGA, ...).

For the computational data analysis we will focus on differential gene expression profiling (RNA-seq) experiments that have been selected from fascinating published biological studies. Data analysis based on R will follow a detailed tutorial describing all required steps of sequence read processing and will be conducted in small groups to enable every student hands-on experience.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

636-0704-00L Computational Biology and Bioinformatics Seminar O 2 credits 2S N. Beerenwinkel, D. Iber, T. Stadler

Number of participants limited to 30.
The seminar is addressed primarily at students enrolled in

Seminar
The CBB seminar is mandatory.

Number Title Type ECTS Hours Lecturers
636-0704-00L Computational Biology and Bioinformatics Seminar O 2 credits 2S N. Beerenwinkel, D. Iber, T. Stadler

The seminar is addressed primarily at students enrolled in

The course language is English.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 590 of 2653
the MSc CBB programme. Students of other ETH study programmes interested in this course need to ask the lecturer for permission to enrol in the course.

The Seminar will be offered in autumn semester in Basel (involving professors and lecturers from the University of Basel) and in spring semester in Zurich (involving professors and lecturers from the University of Zurich). Professors and lecturers from ETH Zurich are involved in both semesters.

Uni Basel lecturers: Richard Neher, Attila Becskei, Mihaela Zavolan, Erik van Nimwegen

Abstract
Computational biology and bioinformatics aim at an understanding of living systems through computation. The seminar combines student presentations and current research project presentations to review the rapidly developing field from a computer science perspective. Areas: DNA sequence analysis, proteomics, optimization and bio-inspired computing, and systems modeling, simulation and analysis.

Objective
Studying and presenting fundamental papers of Computational Biology and Bioinformatics. Learning how to make a scientific presentation and how classical methods are used or further developed in current research.

Content
Computational biology and bioinformatics aim at advancing the understanding of living systems through computation. The complexity of these systems, however, provides challenges for software and algorithms, and often requires entirely novel approaches in computer science. The aim of the seminar is to give an overview of this rapidly developing field from a computer science perspective. In particular, it will focus on the areas of (i) DNA sequence analysis, sequence comparison and reconstruction of phylogenetic trees, (ii) protein identification from experimental data, (iii) optimization and bio-inspired computing, and (iv) systems analysis of complex biological networks.

The seminar combines the discussion of selected research papers with a major impact in their domain by the students with the presentation of current active research projects / open challenges in computational biology and bioinformatics by the lecturers. Each week, the seminar will focus on a different topic related to ongoing research projects at ETHZ, University of Basel and University of Zurich, thus giving the students the opportunity of obtaining knowledge about the basic research approaches and problems as well as of gaining insight into (and getting excited about) the latest developments in the field.

Literature
Original papers to be presented by the students will be provided in the first week of the seminar.

Advanced Courses
A total of 30 ECTS needs to be acquired in the Advanced Courses category. Thereof at least 16 ECTS in the Theory and at least 10 ECTS in the Biology category.

Theory
At least 16 ECTS need to be acquired in this category.

Abstract
The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods.

The exercises involve actual implementation of numerical methods in C++.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently
Content
First two weeks: A gentle introduction to C++

1. Computing with Matrices and Vectors
   1.1 Fundamentals
   1.2 Software and Libraries
   1.4 Computational Effort
   1.5 Machine Arithmetic and Consequences

2. Direct Methods for (Square) Linear Systems of Equations
   2.1 Introduction: Linear Systems of Equations
   2.3 Gaussian Elimination
   2.6 Exploiting Structure when Solving Linear Systems
   2.7 Sparse Linear Systems

3. Direct Methods for Linear Least Squares Problems
   3.1 Least Squares Solution Concepts
   3.2 Normal Equation Methods
   3.3 Orthogonal Transformation Methods
     3.3.1 Transformation Idea
     3.3.2 Orthogonal/Unitary Matrices
     3.3.3 QR-Decomposition
     3.3.4 QR-Based Solver for Linear Least Squares Problems
   3.4 Singular Value Decomposition

4. Filtering Algorithms
   4.1 Filters and Convolutions
   4.2 Discrete Fourier Transform (DFT)
   4.3 Fast Fourier Transform (FFT)

5. Machine Learning of One-Dimensional Data
   (Data Interpolation and Data Fitting in 1D)
   5.1 Abstract Interpolation (AI)
   5.2 Global Polynomial Interpolation

8. Iterative Methods for Non-Linear Systems of Equations
   8.1 Introduction
   8.2 Iterative Methods
   8.3 Fixed-Point Iterations
   8.4 Finding Zeros of Scalar Functions
   8.5 Newton’s Method in Rn
   8.6. Quasi-Newton Method

Lecture notes
Lecture materials (PDF documents and codes) will be made available to the participants through the course web page and online repositories. Access information will be communicated in the beginning of the course.

Literature
M. Hanke-Bourgeois “Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens”, BG Teubner, 2002

Prerequisites / notice
The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves, in case they do not know it already.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making fostered
Problem-solving assessed
Project Management fostered

263-5210-00L Probabilistic Artificial Intelligence
W 8 credits 3V+2U+2A A. Krause

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

401-0647-00L Introduction to Mathematical Optimization

**Objective**
The course aims to convey a deep understanding of the key concepts of sequential object-oriented programming and their applications to a variety of problems in engineering.

**Content**
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

**Literature**
Information about relevant literature will be given in the lecture.

**Prerequisites / notice**
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

227-0225-00L Linear System Theory

**Objective**
Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

**Content**
- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

**Literature**
Available on the course Moodle platform.

**Prerequisites / notice**
Sufficient mathematical maturity, in particular in linear algebra, analysis.

151-0575-01L Signals and Systems

**Objective**
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercises.

**Content**

**Prerequisites / notice**
Lecture notes available on course website.

252-0237-00L Introduction to Mathematical Optimization

**Objective**
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection.

**Content**
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing).
- The key problems of single and multiple inheritance and how different languages address them.
- Generic type systems, in particular, Java generics, C# generics, and C++ templates.
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them.
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing.

How to maintain the consistency of data structures
The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected for students in the life sciences. The course aims to train the students into the proficient use of programming in analyzing data derived from projects in life sciences. The Basics of the theory of stochastic processes and an overview of selected applications will be announced in the lecture.

Abstract

Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the students with a theoretical foundation for developing such stochastic models and analyzing reaction networks.

Objective

By the end of the course, students should be comfortable with accessing and analyzing a wide variety of biological data. Concepts such as reproducibility, modularity, interoperability, and scalability will be emphasized.

Content

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Literature

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

Prerequisites / notice

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

Abstract

The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts.

“Big Data” refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the “fourth paradigm”.

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBLR, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (? , *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Literature

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Algorithms and Data Structures for Population Scale Genomics

Abstract
Research in Biology and Medicine have been transformed into disciplines of applied data science over the past years. Not only size and inherent complexity of the data but also requirements on data privacy and complexity of search and access pose a wealth of new research questions.

Objective
This interactive course will explore the latest research on algorithms and data structures for population scale genomics applications and give insights into both the technical basis as well as the domain questions motivating it.

Content
Over the duration of the semester, the course will cover three main topics. Each of the topics will consist of 70% lecture content and 30% practical content. Thereby, the practical implementation of the concepts presented in the lecture forms an integral part of the course.

1) Algorithms and data structures for the efficient compression of and search in texts and graphs. Motivated through applications in compressive genomics, the course will cover succinct indexing schemes for strings, trees and general graphs, compression schemes for binary matrices as well as the efficient representation of haplotypes and genomic variants.

2) Stochastic data structures and algorithms for approximate representation of strings and graphs as well as sets in general. This includes winnowing schemes and minimizers, sketching techniques, (minimal perfect) hashing, approximate membership query data structures, and approximate counting.

3) Data structures supporting encryption and data privacy. As an extension to data structures discussed in the earlier topics, this will include secure indexing using homomorphic encryption as well as design for secure storage and distribution of data.

Information Systems for Engineers

Abstract
This course provides the basics of relational databases from the perspective of the user. We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.
Using a relational database

Applied Bioinformatics: Microbiomes W 5 credits 2V+2U N. Bokulich, M. Ziemski

Abstract
Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.

Objective
Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content
1. Introduction to microbiomes and microbial bioinformatics toolkit. Python, Pandas, Jupyter, GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology, diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice
No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (Python), bioinformatics, and statistics.

Students will bring and work on their own laptop computers.

All software used in the course is free and open-source.

752-5500-00L Modelling and Simulation in Drug Development W 2 credits 3V H.-M. Kaltenbach

Autumn Semester 2024
Abstract

This course introduces how Modelling and Simulation (=mathematical modelling) is applied today for the development of novel drugs in the pharmaceutical industry. Background lectures are combined with hands-on exercises on real-world examples.

Objective

The goal of this course is to provide students with a general understanding of drug development and pharmacology and how Modelling and Simulation is used to develop new drugs. Together with the application, the course will provide the background in the statistical methodologies used to model multivariate and time-dependent data with several levels of statistical variability.

Content

Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data is at the core to gain this understanding. Focusing on the application using real world examples, this course will introduce the statistical methodologies that have been developed to describe complex biological and pharmaceutical data with several levels of statistical variability.

The course will cover the basics of drug development and pharmacology with a focus on the principles of drug absorption, distribution, metabolism and excretion (ADME) and drug pharmacokinetics and pharmacodynamics (PK/PD). The different drug formats (small molecules, biologics, cell-based therapies, gene therapies and oligonucleotide formats) and their pharmacological properties will be introduced. The translation from animal to human to inform first-in human dose selections will be discussed.

The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equation (ODEs) and the theory on non-linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. Practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam’s Razor.

The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures.

The course is organized jointly by D-BSSE and LYO-X, a Quantitative Systems Pharmacology consulting company situated in Basel.

Prerequisites / notice

Basics of dynamics systems (e.g., BSSE courses by Iber or Kammash, or CSB course by Stelling).

263-5351-00L Machine Learning for Genomics W 6 credits 2V+2U+1A V. Boeva

Abstract

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

Objective

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

Content

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

Prerequisites / notice

Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

From Publication to the Doctor’s Office

The deadline for deregistering expires at the end of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract

This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

Objective

Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the
discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where
students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main
findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to „bedside“ – has been approved by European Medicines Agency
  / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to
design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab.
This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including
DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of
personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics
has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract
quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and
prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information
extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning
healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient
outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized,
efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course.
The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide
insightful and constructive feedback.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a
related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions
or ability and interest to learn them outside of the class.

*Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ETHZ.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html*

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse
 genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair
and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of
eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of
developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.
Microbiology (Part I)  W 3 credits  2V  W.-D. Hardt, L. Eberl, B. Nguyen, J. Piel, M. Pilhofer, A. Vagstad

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Literature
Updated handouts will be provided during the class.

Immunology I  W 3 credits  2V  M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Developmental Neuroscience (University of Basel)  W 2 credits  2V  external organisers

Does not take place this semester.
The course must be registered for directly at Uni Basel.

Frontiers in RNA Biology (University of Basel)  W  2 credits  2V  external organisers

Stem Cells: Biology and Therapeutic Manipulation  W  4 credits  3G  T. Schroeder
Abstract

Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective

Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

Content

We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:

- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

Lecture notes

Handout during the course.

262-5120-00L  Principles of Evolution: Theory (University of Zurich)  6 credits  3V  University lecturers

Abstract

"Nothing in Biology Makes Sense Except in the Light of Evolution". Evolutionary theory and methods are essential in all branches of modern biology.

Objective

Subject specific skills:

- By the end of the course, students will be able to:
  - describe basic evolutionary theory and its applications
  - discuss ongoing debates in evolutionary biology
  - critically assess the presentation of evolutionary research in the popular media

Key skills:

- By the end of the course, students will be able to:
  - approach biological questions from an evolutionary perspective

Content

This course will provide a broad overview of current evolutionary thought, including the mechanisms of evolutionary change, adaptation and the history of life and will involve practical field and lab work as well as lecture material.

551-0307-00L  Molecular and Structural Biology I: Protein Structure and Function  3 credits  2V  R. Glockshuber, K. Locher, E. Weber-Ban

Abstract

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
Literature
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

262-6107-00L Applied Mathematics and Informatics in Drug Discovery (University of Basel) W 2 credits 2G external organisers

Mind the enrolment deadlines at Uni Basel: https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
This introductory course will offer a practitioner’s review of mathematical concepts, informatics tools, and industrial approaches in relevant fields, especially bioinformatics, molecular modelling, cheminformatics, mathematical modelling, experiment design and statistical inference, and machine learning.

Objective
We explore the drug-discovery process and study applications of mathematics and informatics with case studies. We examine how mathematics concepts and informatics tools are used to model complex systems at multiple levels - molecular level, cellular and omics level, organ- and system-level, and population level - and how the multiscale modelling approach contributes to drug discovery.

529-0733-02L Chemical Biology and Synthetic Biochemistry W 6 credits 3G K. Lang, M. Fottner

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
directed evolution and protein engineering
chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

This course is about fundamental algorithm design paradigms (such as induction, divide-and-conquer, backtracking, dynamic programming), classic algorithmic problems (such as sorting and searching), and data structures (such as lists, hashing, search trees). Moreover, an introduction to parallel programming is provided. The programming model of C++ will be discussed in some depth.

An understanding of the design and analysis of fundamental algorithms and data structures. Knowledge regarding chances, problems and limits of parallel and concurrent programming. Deeper insight into a modern programming model by means of the programming language C++.

Data structures and algorithms: mathematical tools for the analysis of algorithms (asymptotic function growth, recurrence equations, recurrence trees), informal proofs of algorithm correctness (invariants and code transformation), design paradigms for the development of algorithms (induction, divide-and-conquer, sweep-line method, backtracking and dynamic programming), classical algorithmic problems (searching, selection and sorting), data structures for different purposes (linked lists, hash tables, balanced search trees, quad trees, heaps, union-find), further tools for runtime analysis (e.g. amortized analysis). The relationship and tight coupling between algorithms and data structures is illustrated with geometric problems (convex hull, line intersections, closest point pairs) graph algorithms (traversals, topological sort, transitive closure, shortest paths, minimum spanning trees, max flow).

Programming model of C++: correct and efficient memory handling, generic programming with templates, functional approaches with functors and lambda expressions.

Parallel programming: concepts of parallel programming (Amdahl's and Gustavson's laws, task/data parallelism, scheduling), problems of concurrency (data races, bad interleavings, memory reordering), process synchronisation and communication in a shared memory system (mutual exclusion, semaphores, monitors, condition variables), progress conditions (freedom from deadlock, starvation).

The concepts provided in the course are motivated and illustrated with practically relevant algorithms and applications.

All required mathematical tools above high school level are covered, including a basic introduction to graph theory.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture slides and all other material will be made available for download on the course web page.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

262-0945-AAL  Cell and Molecular Biology for Engineers I and II E- 6 credits 13R B. Treutlein

Does not take place this semester.
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content
Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

Abstract

Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unites two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security,
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

252-1414-00L System Security  W  7 credits  2V+2U+2A  S. Capkun, S. Shinde

Abstract
The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

### Content
- **Objective**: Students are familiar with fundamental network-security concepts.
- **Method-specific Competencies**: Students can implement network-security protocols based on cryptographic libraries.
- **Method-specific Competencies**: Students can identify and assess vulnerabilities in software systems and network protocols.
- **Method-specific Competencies**: Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- **Method-specific Competencies**: Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- **Method-specific Competencies**: Students can implement network-security protocols based on cryptographic libraries.

### Prerequisites / notice

This course is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will cover topics spanning four broad themes with a focus on the first two themes:
- **Objective**: Students are familiar with fundamental network-security concepts.
- **Objective**: Students can implement network-security protocols based on cryptographic libraries.
- **Objective**: Students can identify and assess vulnerabilities in software systems and network protocols.
- **Objective**: Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- **Objective**: Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

### Content

- **Content**: The later parts of the course will focus on applications to machine learning.
- **Content**: The first half of the course will cover topics from cryptography such as secure multiparty computation, zero-knowledge proofs, PIR, ORAM, anonymous communication, etc.
- **Content**: The second part will cover statistical notions of privacy, in particular differential privacy, and selected topics in machine learning privacy.
- **Content**: Students are familiar with fundamental network-security concepts.
- **Content**: Students can implement network-security protocols based on cryptographic libraries.
- **Content**: Students can identify and assess vulnerabilities in software systems and network protocols.
- **Content**: Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- **Content**: Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.

### Lecture notes

Lecture notes will be posted on Moodle.

### Literature

Boneh & Shoup - A Graduate Course in Applied Cryptography

References to relevant research papers will be provided.
Prerequisites / notice

Basic knowledge in cryptography, probability and machine learning is recommended but not required.

| Abstract      | This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks. |
| Objective     | By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about: - security problems of commodity hardware that we use everyday and how you can defend against them. - relevant computer architecture and operating system aspects of these issues. - hands-on techniques for performing hardware attacks. |
| Literature    | Slides, relevant literature and manuals will be made available during the course. |

| 252-0811-00L  | Applied Security Laboratory                  | W    | 8     | 7P             | D. Basin    |
| Abstract      | Hands-on course on applied aspects of information security. Applied information security, operating system security, OS hardening, computer forensics, web application security, project work, design, implementation, and configuration of security mechanisms, risk analysis, system review. |
| Objective     | The Applied Security Laboratory addresses four major topics: operating system security (hardening, vulnerability scanning, access control, logging), application security with an emphasis on web applications (web server setup, common web exploits, authentication, session handling, code security), computer forensics, and risk analysis and risk management. |
This course emphasizes applied aspects of Information Security. The students will study a number of topics in a hands-on fashion and carry out experiments in order to better understand the need for secure implementation and configuration of IT systems and to assess the effectiveness and impact of security measures. This part is based on a book and virtual machines that include example applications, questions, and answers.

The students will also complete an independent project: based on a set of functional requirements, they will design and implement a prototypical IT system. In addition, they will conduct a thorough security analysis and devise appropriate security measures for their systems. Finally, they will carry out a technical and conceptual review of another system. All project work will be performed in teams and must be properly documented.

### Lecture notes

### Literature

Recommended reading includes:

- Various: OWASP Guide to Building Secure Web Applications, available online
- Frisch: Essential System Administration, O'Reilly & Associates.
- NIST: Risk Management Guide for Information Technology Systems, available online as PDF
- BSI: IT-Grundschutzhandbuch, available online

### Prerequisites / notice

- The lab allows flexible working since there are only few mandatory meetings during the semester.
- The lab covers a variety of different techniques. Thus, participating students should have a solid foundation in the following areas: information security, operating system administration (especially Unix/Linux), and networking. Students are also expected to have a basic understanding of HTML, PHP, JavaScript, and MySQL because several examples are implemented in these languages.
- Students must be prepared to spend more than three hours per week to complete the lab assignments and the project. This applies particularly to students who do not meet the recommended requirements given above. Successful participants of the course receive 8 credits as compensation for their effort.
- All participants must sign the lab's charter and usage policy during the introduction lecture.

### 252-1411-00L Security of Wireless Networks

#### Abstract

This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

#### Objective

After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

#### Content

- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resistant communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

### 263-4657-00L Advanced Encryption Schemes

This course focuses on the practical aspects of encryption schemes and their applications in real-world scenarios. The course emphasizes the relationship between theoretical cryptography and practical implementation.

#### Abstract

Public-Key Encryption has had a significant impact by enabling remote parties to communicate securely via an insecure channel. Latest schemes go further by providing a fine-grained access to the encrypted data.

#### Objective

The student is comfortable with formal security definitions and proof techniques used to analyze the security of the latest encryption schemes with advanced features. This prepares the student to start reading research papers on the field.

#### Content

We will start by presenting the notion of Public-Key Encryption with its various security guarantees and some constructions. Then we will look into encryption schemes with fine-grained access control to the encrypted data, such as identity-based encryption or attribute-based encryption and present different methodologies to prove their security.

#### Literature

Links to relevant research papers will be given in the course materials.

#### Prerequisites / notice

It is recommended for students to have prior exposure to cryptography, e.g. the D-INFK course "Digital Signatures" or "Applied Cryptography".

### 263-4665-00L Zero-Knowledge Proofs

This course focuses on the theoretical foundations of zero-knowledge proof systems and their practical applications in computer security.

#### Abstract

Zero-knowledge proofs are protocols which allow a prover to convince a verifier that a statement is true without leaking any information beyond that fact. This course is a detailed introduction to zero-knowledge proof protocols.

#### Objective

- To understand what it means for a zero-knowledge proof to be secure
- To construct and analyse various types of zero-knowledge proofs
- To understand some applications of zero-knowledge proofs

#### Content

The course will discuss interactive zero-knowledge proofs based on various cryptographic assumptions, and their applications in cryptography and the real world. The course may also describe some more advanced constructions of non-interactive proofs.

#### Lecture notes

The course notes will be written in English.

#### Prerequisites / notice

Students should have taken a first course in Cryptography (as taught in the Information Security course at Bachelor’s level), Experience with algebra (groups and finite fields) and probability is highly recommended.

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 612 of 2653
Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Content
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

Literature
The reading list will be published on the course web site.

Semester Project
The Semester Project provides students with the opportunity to apply acquired knowledge and skills.

Objective
The students can gain hand-on experience by solving independently a technical-scientific problem.

Data Management Systems
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts. "Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, …)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

## Elective Courses

### Number 252-0535-00L
#### Title Advanced Machine Learning

**Type:** W  
**ECTS:** 10 credits  
**Hours:** 3V+2U+4A  
**Lecturers:** C. Cotrini Jimenez

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

**Topics covered in the lecture include:**

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

### Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution. PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

### Number 252-1414-00L
#### Title System Security

**Type:** W  
**ECTS:** 7 credits  
**Hours:** 2V+2U+2A  
**Lecturers:** S. Capkun, S. Shinde

**Abstract**

The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems.

**Objective**

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

**Content**

The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language- supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories: assessed

**Method-specific Competencies**

- Analytical Competencies: fostered
  - Decision-making: fostered
  - Problem-solving: fostered

**Social Competencies**

- Communication: fostered

**Personal Competencies**

- Adaptability and Flexibility: fostered
  - Critical Thinking: fostered

---

### Number 263-2800-00L
#### Title Design of Parallel and High-Performance Computing

**Type:** W  
**ECTS:** 9 credits  
**Hours:** 2V+2U+4A  
**Lecturers:** T. Hoefler

**Abstract**

Advanced topics in parallel and high-performance computing.
Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann
Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below.

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

### Probabilistic Artificial Intelligence

**Abstract**
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

**Objective**
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bands and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**
Solid basic knowledge in statistics, algorithms and programming.

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 617 of 2653
Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content
The course is split into 4 parts:

Robustness of Machine Learning
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning
- Threat models (e.g., data poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language, and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

263-5005-00L Artificial Intelligence in Education

Abstract
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical and neural networks. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-5056-00L Applications of Deep Learning on Graphs

Abstract
Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

- Enforcing group fairness (for both vision and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

- Threat models (e.g., data poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language, and tabular data).
- Differential privacy for defending machine learning.

263-5056-00L Applications of Deep Learning on Graphs

Abstract
Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

Objective

Many established deep learning methods require dense input data with a well-defined structure (e.g. an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over such structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

Content

Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNNs. Geometric GNNs, Deep Generative Models for Graphs.

Prerequisites / notice

263-3210-00 Depp Learning or 263-0008-00 Computational Intelligence Lab; 252-0220-00 Introduction to Machine Learning; Statistics-Probability; Programming in Python; Unix Command Line.

263-5300-00L Guarantees for Machine Learning

Does not take place this semester.

W 7 credits 3V+1U+2A F. Yang

Abstract

This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective

By the end of the semester students should be able to

- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work

- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions

- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project

- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

Content

This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics

- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to

- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites / notice

Students should have very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/ “Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Competencies

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

263-5351-00L Machine Learning for Genomics

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

W 6 credits 2V+2U+1A V. Boeva

Abstract

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

Content

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (MMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

Prerequisites / notice

### 252-0535-00L Advanced Machine Learning

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:** What is data?
- **Bayesian Learning**
- **Computational learning theory**
- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
- **Learning Dynamical Systems**

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

### 252-1425-00L Geometry: Combinatorics and Algorithms

**Abstract**

Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

**Objective**

The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

**Content**

Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

**Lecture notes**

yes
Prerequisites / notice

Each student is expected to collaborate in an international working group with students from the partner universities. Each group works on Projects in Topological Data Analysis. Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you're ready for this course or not, please consult the instructor.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Analytical Competencies
  - Decision-making
  - Problem-solving

- **Method-specific Competencies**
  - fostered
  - fostered

**Literature**

**Prerequisites / notice**

Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Seminar-, Bachelor- and Master Thesis projects in the area.

**Abstract**

- **Information Theory I**
  - This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

- **Structural Graph Theory**
  - Structural graph theory forms, besides extremal graph theory, one of the two main pillars of modern graph theory. While the latter is concerned with maximizing the number of edges or the density of graphs, structural graph theory focuses on understanding the structural nature of all members of a class of graphs. This course will cover several cornerstone results of structural graph theory.

- **Projects in Topological Data Analysis**
  - This seminar complements the course "Introduction to Topological Data Analysis". Students of the seminar will collaborate with students from international universities on concrete projects in topological data analysis, both theoretical and applied. Each student is expected to collaborate in an international working group with students from the partner universities. Each group works on one of the projects suggested by the lecturers, and is assigned a mentor. At the end of the semester, each working group presents their findings in a written report and an oral presentation.

**Objective**

- **Information Theory I**
  - The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

- **Structural Graph Theory**
  - The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the source-channel coding theorem, feedback capacity

- **Projects in Topological Data Analysis**
  - Each student is expected to collaborate in an international working group with students from the partner universities. Each group works on one of the projects suggested by the lecturers, and is assigned a mentor. At the end of the semester, each working group presents their findings in a written report and an oral presentation.

**Content**

- **Information Theory I**
  - The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

- **Structural Graph Theory**
  - Graph minors: Connectivity and versions of Menger's theorem, Planar graphs, Wagner's theorem, Tree-width, algorithmic applications of tree-width and Courcelle's theorem, balanced separators and Alon-Seymour-Thomas theorem, Grid Minor Theorem, Erdős–Pósa property and algorithmic applications, Graph Minor Structure Theorem, Membership complexity, Wagner's conjecture

- **Projects in Topological Data Analysis**
  - Successful participation in the course "Introduction to Topological Data Analysis" or equivalent background in topological data analysis is required.

**Overview**

**Literature**

**Prerequisites / notice**

Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.
Companions | Subject-specific Competencies | Concepts and Theories | fostered
Method-specific Competencies | Analytical Competencies | fostered
Social Competencies | Communication | assessed

263-5300-00L | Guarantees for Machine Learning | W | 7 credits | 3V+1U+2A | F. Yang

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in individual exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

Content
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics
- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites
Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

401-3055-64L | Algebraic Methods in Combinatorics | W | 5 credits | 2V+1U | not available

Abstract
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Objective
The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Content
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):
- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Abstract**

This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

**Objective**

At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.
Content

We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping. Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects.

Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures. The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

Computer Vision

W

8 credits

3V+1U+3A

M. Pollefeys, S. Tang, F. Yu

Objective

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Elective Courses

227-0560-00L

Computer Vision and Artificial Intelligence for Autonomous Cars

Up until FS2022 offered as Deep Learning for Autonomous Driving

Type

W

ECTS

6 credits

3V+2P

C. Sakaridis

Abstract

This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Objective

Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:

1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception
The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:

1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

262-0546-00L Physically-Based Simulation in Computer Graphics

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and object animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

263-5905-00L Mixed Reality

Abstract
The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective
After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content
The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:
- Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision(graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D, other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice
Prerequisites include:
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

Abstract Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

Objective The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them using C/C++, STL, CGAL, and BGL.

263-0009-00L Information Security Lab W 8 credits 2V+1U+3P+1A S. Shinde, D. Basin, S. Capkun, K. Paterson

Abstract This InterFocus Course will provide a broad, hands-on introduction to Information Security, introducing adversarial thinking and security by design as key approaches to building secure systems.

Objective This course will introduce key concepts from Information Security, both from attack and defence perspectives. Students will gain an appreciation of the complexity and challenge of building secure systems.

Content The course is organised in three-week segments. In each segment, a new concept from Information Security will be introduced. The overall scope will be broad, including cryptography, protocol design, system security, and privacy.

Lecture notes Will be made available during the semester.

Literature Paul C. van Oorschot, Computer Security and the Internet: Tools and Jewels.
Dan Boneh and Victor Shoup, A Graduate Course in Applied Cryptography.

Prerequisites / notice Ideally, students will have taken the D-INFK Bachelors course “Information Security” or an equivalent course at Bachelors level.

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

This course focusses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

For classical parametric models there exist optimal statistical estimators and test statistics whose distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics.

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

In the workshop each participant gives a short talk about a recent statistical problem encountered in their daily work.

Presentation of a statistical problem, getting to know different applications of statistical methodology.

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

Understanding of the choice of weight function and of the smoothing parameter, also done automatically.

Understanding of the choice of weight function and of the smoothing parameter, also done automatically.

In the workshop each participant gives a short talk about a recent statistical problem encountered in their daily work.

Practical application on data sets at the computer.

Practical application on data sets at the computer.

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

For classical parametric models there exist optimal statistical estimators and test statistics whose distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics.

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

In the workshop each participant gives a short talk about a recent statistical problem encountered in their daily work.

Presentation of a statistical problem, getting to know different applications of statistical methodology.
We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use assessed generation and structure of repeated measures. Planning and realization of corresponding studies. Within- and between-subjects factors.

This course introduces probabilistic deep learning (DL). DL is used for data with complex features like images. We treat DL as probabilistic assessed.

Participants will gain the ability of recognizing repeated measures and to analyze them adequately. They will know how to deal with pseudoreplicates. Generation and structure of repeated measures. Planning and realization of corresponding studies. Within- and between-subjects factors. Common covariance structures. Statistical analyses: graphical methods, summary statistics approach, univariate and multivariate ANOVA, linear mixed effects models.

You will get practical experiences in setting up probabilistic DL models, learn how to tune them, and learn how to control the training procedure. You will learn to model different outcome distributions such as Gaussians, Poissonians, or Multinomial for the task at hand. You will learn about different neural network architectures (e.g. fully connected and convolutional neural networks) and how to choose the appropriate NN architecture for your task at hand.

You will learn to model different outcome distributions such as Gaussians, Poissonians, or Multinomial for the task at hand.

You will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions. There will be examples of applications from various fields: insurance, meteorology, marketing, etc.

**447-6191-00L Statistical Analysis of Financial Data**

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

**Abstract**

**Objective**
Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.

---

**447-6255-00L Analysis of High-Dimensional Data**

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

**Abstract**
Block course on analysis of high-dimensional data with a focus on prediction and feature assessment.

**Objective**
The goal of this course is to gain a good understanding of the concepts discussed during the lecture and to apply the new methods on real data examples using the software "R". The topics covered in the lecture are:

1. **Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization**
2. **Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage**

**Content**
Course on Analysis of High-Dimensional Data with focus on Prediction and Feature Assessment.

1. **Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization**
2. **Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage**

**Lecture notes**
The block course is based on lecture notes (https://bookdown.org/staedler_n/highdimstats/).

**Literature**

**Prerequisites / notice**
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

---

**447-6233-00L Spatial Statistics**

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

**Abstract**

**Objective**

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 629 of 2653
Abstract
In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective
The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content
After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes
Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

Abstract
The diploma thesis typically consists of a data analysis of data from a participant's own field of work. The thesis requires a time expenditure of about one or two weeks. Thesis work should prove the participants' capability to apply useful and modern statistical methods to address appropriate questions properly and effectively.

Objective
Thesis work should prove the participants' capability to apply useful and modern statistical methods to address appropriate questions properly and effectively.

263-4640-00L Network Security O 8 credits 2V+2U+3A P. De Vaere, S. Frei, K. Paterson, A. Perrig

Abstract Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

Objective Students are familiar with fundamental network-security concepts.

- Students can implement network-security protocols based on cryptographic libraries.

Content The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

Prerequisites / notice This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

268-0101-00L Introduction to Information Security O 5 credits 4G P. Schaller, S. Matetic

Abstract In this course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

Objective Graduates of the course know the technical foundations of information security and understand the difficulty and complexity involved when trying to build secure systems.
In this new course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**

**Abstract**
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

**Objective**
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include:
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems.
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

252-1411-00L Security of Wireless Networks

W 6 credits 2V+1U+2A S. Capkun, K. Kostiainen

Abstract
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

Objective
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

**Abstract**
Registration in this class requires the permission of the instructors. Preference is given to students in the MSc EEIT.

Machine Learning (ML) and artificial intelligence are pervading the digital society. Today, even low power embedded systems are incorporating ML, becoming increasingly "smart". This lecture gives an overview of ML methods and algorithms to process and extract useful near-sensor information in end-nodes of the "internet-of-things", using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V).

**Objective**
Learn how to Process data from sensors and how to extract useful information with low power microprocessors using ML techniques. We will analyze data coming from real low-power sensors (accelerometers, microphones, ExG bio-signals, cameras…). The main objective is to study in details how Machine Learning algorithms can be adapted to the performance constraints and limited resources of low-power microcontrollers.

**Content**
The final goal of the course is a deep understanding of machine learning and its practical implementation on single- and multi-core microcontrollers, coupled with performance and energy efficiency analysis and optimization. The main topics of the course include:

- Sensors and sensor data acquisition with low power embedded systems
- Machine Learning: Overview of supervised and unsupervised learning and in particular supervised learning (Bayes Decision Theory, Decision Trees, Random Forests, kNN-Methods, Support Vector Machines, Convolutional Networks and Deep Learning)
- Low-power embedded systems and their architecture. Low Power microcontrollers (ARM-Cortex M) and RISC-V-based Parallel Ultra Low Power (PULP) systems-on-chip.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

The laboratory exercised will show how to address concrete design problems, like motion, gesture recognition, emotion detection, image and sound classification, using real sensors data and real MCU boards.

**Lecture notes**
Script and exercise sheets. Books will be suggested during the course.

**Prerequisites / notice**
Prerequisites: C language programming. Basics of Digital Signal Processing. Basics of processor and computer architecture. Some exposure to machine learning concepts is also desirable

**Image Analysis & Computer Vision**

**Abstract**
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**
The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalized problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g., recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

The participation in the course is subject to the following conditions:
1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

Neuromorphic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module IN1404 at UZH. Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

The course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Understanding of the characteristics of neuromorphic circuit elements.

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audio, and real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS TRANSISTOR, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

401-0649-00L Applied Statistical Regression

Abstract This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Prerequisites / notice The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

401-3612-00L Stochastic Simulation

Abstract This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

Objective Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

Lecture notes A script will be available in English.
The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today’s highly complex models.

**401-4632-10L Causality**

In statistics, we are used to search for the best predictors of some random variable. In many situations, however, we are interested in predicting a system’s behavior under manipulations. For such an analysis, we require knowledge about the underlying causal structure of the system. In this course, we study concepts and theory behind causal inference.
Objective

After this course, you should be able to
- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

Content

The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

Literature

Parts of this course will be based on the book “Elements of Causal Inference” (MIT Press, open access). More details will follow.

Prerequisites / notice

Prerequisites: basic knowledge of probability theory and regression

Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-2400-00L Reliable and Trustworthy Artificial Intelligence W 6 credits 2V+2U+1A M. Vechev
Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content
The course is split into 4 parts:
Robustness of Machine Learning
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning
- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Competencies
Subject-specific Competencies
Concepts and Theories assessed

Method-specific Competencies
Techniques and Technologies assessed
Analytical Competencies assessed
Problem-solving assessed

Personal Competencies
Creative Thinking assessed
Critical Thinking assessed

263-3240-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann
Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is to provide an understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
Prerequisites / notice

This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

  Advanced Machine Learning
  https://ml2.inf.ethz.ch/courses/aml/

  Probabilistic Artificial Intelligence
  https://las.inf.ethz.ch/teaching/pai-f18

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed
Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies assessed
- Problem-solving assessed
- Project Management assessed
Social Competencies
- Communication fostered
Personal Competencies
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics fostered

263-5300-00L Guarantees for Machine Learning W 7 credits 3V+1U+2A F. Yang

Does not take place this semester.

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics:
- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomized initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.
Students should have followed at least “Introduction to Machine Learning” or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-0834-00L Information Systems for Engineers W 4 credits 2V+1U G. Fourny

Abstract
This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor’s thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
- Book: "Database Systems: The Complete Book", H. Garcia-Molina, J.D. Ullman, J. Widom (It is not required to buy the book, as the library has it)

Prerequisites / notice

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logic
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

<tr>
<td>Objective</td>
<td>Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become familiar with important technical concepts and with concurrency folklore.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses &quot;Parallele Programmierung (parallel programming)&quot; and &quot;Algorithmen und Datenstrukturen (algorithm and data structures)&quot; or equivalent courses.</td>
<td></td>
<td></td>

</thead>
<tbody>
<tr>
<td>Abstract</td>
<td>The key challenge of the information society is to turn data into information, knowledge into knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>&quot;Big Data&quot; refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the &quot;fourth paradigm&quot;.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Large scale analytics and machine learning are outside of the scope of this course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Papers from scientific conferences and journals. References will be given as part of the course material during the semester.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to foster the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

**Prerequisites / notice**
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departaments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

### Competencies

**Abstract**

This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**

- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

**Content**

The block course covers the following topics:

- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

The lecture will be given in two parts on two afternoons. Some exercises will be built into the lecture.

**Literature**

Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

**Prerequisites / notice**

You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

**Competencies**

Subject-specific Competencies

Method-specific Competencies

Social Competencies

Personal Competencies

- Concepts and Theories assessed
- Media and Digital Technologies fostered
- Communication fostered
- Critical Thinking assessed
- Self-awareness and Self-reflection fostered

**227-3001-00L Diploma Thesis**

Registration for the diploma thesis requires the successful completion of 18 credits ECTS from subjects of specialization.

**Abstract**

The Diploma of Advanced Studies finishes with a 3-months diploma thesis which is directed by a professor of the department ITET. Students prove their ability to conduct independent scientific research on a specific research problem, using skills and knowledge acquired during the program. The thesis includes a written report and an oral presentation.

**Objective**

### 136-0250-00L Project Work on Hygrothermal Validation

**W** 6 credits 3G

G. Habert

**Abstract**

Based on the content of previous courses, the participant are asked to simulate to analyze the hygrothermal behaviour of a building built with the same constructive technique as their prototype. In addition, they have to reproduce the monitoring conditions of their prototypes and compare measurements to simulation results. The result and discussion is presented in front of a jury.

**Objective**

- Apply knowledge from previous courses on a case study
- Learn how to compare measurements to simulation results
- Enhance communication skills concerning high-quality envelopes built with regenerative materials

Abstract
The course gives a description and summary of the field of gene technology and its pharmaceutical applications. The course focuses on important methods and technologies and their application for genomic, transcriptomic and proteomic analyses in human biology.

Objective
The course gives an overview of current state-of-the-art and advancement in the fields of gene technology. Herein, the course focuses on genomic, transcriptomic and proteomic analysis and their uses in drug discovery and biomedical applications. The course is structured into lectures and practical examples drawn from the research field. Upon completion, the students are familiar and know current state-of-the art of methods and applications, but are also able to classify, contrast and apply different strategies and methods within the field of gene technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

Content
I) Genomics and transcriptomics
Methods and Techniques:
- Recombinant DNA technology
- Next generation sequencing methods, sequencing of genomes
- CRISPR technology
Application to human biology:
- Functional genomics/transcriptomics
- Principles of cancer, genetic diseases
- Therapies: cell-based therapies/gene therapies/DNA and RNA vaccination

II) Proteomics
Methods and Techniques:
- Protein cloning and expression
- The antibody molecule
- Measurement and determination of biomolecular interactions
- Protein characterization and engineering
- Modifications and radioactive labelling
Application to human biology:
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

III) Drug discovery: Protein-based libraries
Methods and Techniques:
- Immune repertoire mining
- Display and selection technologies
  1. antibody phage display
  2. other polypeptide display technologies
  3. small-molecules display: DNA-encoded chemical libraries

Lecture notes
The lecture series follows the above-described content, and the students are provided with the lecture slides and additional notes. The additional notes are needed for the in-depth study of the individual topics, and to set the frame and content of the in-class group work of the chosen examples.

Abstract
Principles and technologies for the manufacturing of dosage forms and drug delivery systems. Knowledge of pharm. excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dosage forms.

Objective
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, of their production, function, quality, stability and application. Comprehension of the molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dispense dosage forms.

Content
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, sterilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid ophthalmics. Surfactants, micelle formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.
Abstract
The course places the basic pharmaceutical knowledge acquired to date, particularly in pharmacology, in an applied therapeutic context and encourages interdisciplinary thinking in pharmacy. Weekly practical sessions present and discuss common pharmaceutical case studies that may arise in a pharmacist's daily work.

Objective
Students
• are able to independently analyze, present, explain, and discuss simple case studies from pharmacy practice based on their basic knowledge of pharmacy, particularly pharmacology.
• deepen their knowledge of therapeutic classes, drugs, and treatment guidelines.
• are able to analyze the pharmacological profiles of selected drugs in a therapeutic context (e.g., with regard to adverse drug reactions and interactions).
• are able to compare different drugs and derive therapy-relevant characteristics.

Content
Pharmaceutical case studies from different therapeutic fields comprehend following subject areas:
• Indication
• Dosage Form
• Adverse Drug Reactions
• Interactions
• Contraindications

Lecture notes
Is made available via Moodle.

Literature
As stated in the cases.

Prerequisites / notice
The lecture Pharmacology and Toxicology I (535-0521-00L) must be attended in parallel to or prior to this course.

The course takes place weekly. For each lesson, group work is prepared and submitted in advance, presented by one group at a time, and discussed in plenary.

535-0525-00L Pharmaceutical Cases

O 1 credit 1G
D. Stämpfli, S. Erni, E. Kunt Bacs, P. Obrist

Abstract
This two-semester lecture course provides a detailed understanding of the fundamentals of drug action and the therapeutic use of important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

Objective
The lectures provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

Content
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicology, contraindications and dosage of relevant drugs. Basic principles of clinical pharmacology and pharmacotherapy will be covered.
Lecture notes

A script is provided for each lecture. Scripts define important course contents but do not replace the lectures.

Abstract

This course provides basic clinical and pharmaceutical knowledge and skills for triage, diagnostics and therapy support of the most common diseases.

Objective

Students

- know and understand the pathomechanisms and clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed below.
- can use this knowledge to triage patients: i.e. analyse simple symptoms and diseases, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
- know the therapeutic guidelines, classes of active ingredients and selected, practice-relevant drugs (including indications and the most frequent and important adverse drug reactions, interactions and contraindications).

Content

"Pharmaceutical Care" und "Health Care";
Häufigste Erkrankungen und Therapien der
- Allergologie
- Angiologie und Hämatologie
- Dermatologie
- Endokrinologie und Diabetologie
- Gastroenterologie
- Infektiologie

- Urologie

Lecture notes

Provided via moodle.

Literature

As stated in the lecture notes.
The course is divided into three parts. The first part provides an overview of drugs used for the pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. The second part is focused on pharmacogonomics of drug metabolism and basic concepts of toxicology. The third part addresses advanced knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases, osteoporosis, autoimmune diseases and cancer. The course also provides an overview of the fields of medical virology, toxicology, and pharmacogonomics with a special focus on the role of genetic polymorphisms in drug response and adverse effects.

Topics include the pharmacology and pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. Medical virology covers important viral infections and their pharmacotherapy with different classes of antiviral drugs. In the field of pharmacogonomics, the course is focused on examples of genetic variability of drug metabolism and drug responses, and the relevance of pharmacogonomics and toxicogenomics for clinical drug development. Finally, basic concepts of toxicology are introduced.

A script is provided for each lecture. The scripts define important and exam-relevant contents of the lectures. Scripts do not replace the handouts to the lectures. 

Please note that the assessment of this course must be passed (not compensable). The performance assessment of the course takes place in two written on campus online partial examinations. The overall grade results from the average of the grades of both partial examinations. If the overall grade is unsatisfactory, both partial examinations must be repeated.

**Clinical Chemistry II**

**Abstract**

Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

**Objective**

Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interprete selected tests.

**Content**

Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

535-5522-00L Therapeutic Skills II

Abstract
This course provides basic clinical and pharmaceutical knowledge and its application for triage, diagnostics and therapy support for the most common diseases in geriatrics, women's health, oncology, paediatrics and neurology (epilepsy). In addition, the role of nutrition in special life situations and in selected health disorders is taught.

Objective
- know and understand the pathomechanisms and the clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed.
- can triage patients by applying this knowledge: i.e. analyse simple symptoms and disease patterns, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
- know the therapeutic guidelines, drug classes and selected, practice-relevant drugs (including indications and the most frequent and important dosages, adverse drug reactions, interactions and contraindications).

(for detailed learning objectives, see the guideline)

Abstract
Pharmaceutical Manufacturing relevant for the community pharmacy considering the "GMP-Regeln in kleinen Mengen" of the Pharmacopoeia: The preparation of extemporaneous products covering the most common forms under consideration of their Risks and Quality Assurance.

Objective
The students are able to produce pharmaceutical relevant drug Systems without further assistance, lege arts, applying the right techniques and material. The production and packaging has to follow GMP rules and tailored for the patients need. The quality control and correct documentation have to be followed. The students know the most relevant specifications, concentration and dosing ranges of common APIs and excipients. The students are familiar with the relevant literature (Pharmaceutical and legal basis) regarding the Pharmaceutical manufacturing relevant for the community pharmacies.

Content
Vermittlung der wichtigsten Kenntnisse, Arbeitsschritte und -techniken im Bereich der Arzneimittelherstellung in kleinen Mengen (Formula) mit Fokus auf der Herstellung, Qualitätssicherung und Risikobeurteilung einschliesslich der patientenspezifischen Abgabepraxis.

In den Praktika: Anhand praxis-relevanter Beispiele wird die Aufgabenplanung, die Fertigung einschliesslich die korrekte Verwendung der Gerätschaften, die Inprozesskontrolle, die Verpackung und die Qualitätssicherung diverser Rezepte und Arzneiformen geübt. Unter Einbezug risikoadaptierter Massnahmen erfolgt die Qualitätssicherung, -kontrolle und Einhaltung von Hygienerichtlinien genümt der geltenden Arzneibüchern. Die Studierenden vertiefen damit ihre GMP-relevanten Kenntnisse und Fertigkeiten.

535-5526-00L Injection Techniques and Vaccinations

Does not take place this semester.

Abstract
Die Studierenden erlernen die praktische Durchführung von subkutanen (s.c.) und intramuskulären (i.m.) Injektionen. Sie wissen, wie in Notfallsituationen vorzugehen ist.

Die Besonderheiten von häufig eingesetzten parenteral zu verabreichenden Medikamenten, insbesondere von Impfungen, sind bekannt.

Objective
Die Studierenden erwerben das theoretische Wissen und die praktischen Fähigkeiten, welche für die s.c. und i.m. Verabreichung von Medikamenten erforderlich sind. Sie sind fähig, Risikopatienten zu identifizieren und sind geschult, bei Notfällen (z.B. Anaphylaxie) korrekt zu handeln.

Die Studierenden kennen die in der Schweiz zur Verfügung stehenden Impfungen, den schweizerischen Impfplan und sind vertraut mit der Anwendung von elektronischen Hilfsmitteln bei Fragestellungen rund um das Impfen.

Die Studierenden kennen die rechtlichen Grundlagen und regulatorischen Aspekte bezüglich der Verabreichung von Impfungen. Sie fördern den Einsatz von elektronischen Hilfsmitteln zur Verwaltung und Überwachung der Impfungen.

Die Studierenden kennen das konzeptionelle und praktische Vorgehen bei der Durchführung von subkutanen Injektionen und intramuskulären Injektionen.

Die Studierenden können verschiedene Verbandmaterialien und können diese anwenden, um akute Wunden zu versorgen.

Content
Die Lernziele und Inhalte entsprechen dem Fähigkeitsprogramm FPh Impfen und Blutentnahme von PharmaSuisse (ausser venöse Blutentnahmen)

- BLS-AED-SRC Komplettkurs (siehe https://www.slrg.ch)
- Vorgehen bei Notfällen (z.B. Herzinkarst, Schlaganfall, Anaphylaxie u.a.) in der Apotheke
- Vorgehen bei der Versorgung akuter Wunden
- Injektionstechniken: Materialkunde, Hygienevorschriften und Desinfektion, Kommunikation mit Patienten, Vor- und Nachbereitung einer Injektion, praktische Durchführung von subkutanen Injektionen und intramuskulären Injektionen
- Theorie und praktische Aspekte der Durchführung von subkutanen Blutentnahmen
- Impfungen (z.B. Lesen von Impfausweisen, Erstellen eines individuellen Impfschemas, Impfdebate)

Lecture notes
Wird auf mystudies veröffentlicht.

Literature
Wird im Skript angegeben.

Prerequisites / notice
Die Impfungen werden an Mittelstuderenden durchgeführt.

Deshalb müssen sich alle Studierenden gegen Hepatitis B impfen und eine Titerbestimmung nach der 3. Impfung durchführen lassen. (Ziel: Titer über 100 UI/).

Der Nachweis über den ausreichenden Titer muss am ersten Kurstag mitgebracht werden.

Die praktischen Übungen werden in Kleingruppen durchgeführt. Die Zuteilung muss eingehalten werden. Unterschiedliche Anfangszeiten beachten!

Film und Tonaufnahmen während der Lehrveranstaltung sind strikt untersagt.

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

---

**Abstract**

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

**Objective**

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**

Topics covered:

- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

Data: 15.06.2024 12:39   Autumn Semester 2024   Page 660 of 2653
Abstract
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Objective
Introduction to various mathematical aspects of Data Science.

Content
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

Lecture notes

Prerequisites / notice
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity--including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

Data Management

Number Title Type ECTS Hours Lecturers
263-3010-00L Big Data W 10 3V+2U+4A G. Fourny

Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

"Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.
Content

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)

Large scale analytics and machine learning are outside of the scope of this course.

Literature

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Prerequisites / notice

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departements interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Competencies

Subject-specific Competencies

- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies

- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies fostered
- Problem-solving fostered

Social Competencies

- Communication fostered
- Sensitivity to Diversity fostered
- Negotiation fostered

Personal Competencies

- Creative Thinking fostered
- Critical Thinking assessed

263-3845-00L Data Management Systems

Abstract

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understating these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

263-4500-00L Advanced Algorithms
W 9 credits
3V+2U+3A J. Lengler, B. Häupler, M. Probst

This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

Objective
This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

Content
The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms.

Lecture notes
https://people.inf.ethz.ch/~aroeyskoe/AA23

Prerequisites / notice
This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.

252-3005-00L Natural Language Processing
W 7 credits
3V+3U+1A R. Cotterell

This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-2400-00L Reliable and Trustworthy Artificial Intelligence
W 6 credits
2V+2U+1A M. Vechev

Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.
Content

The course is split into 4 parts:

Robustness of Machine Learning

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attack federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

Competencies

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

- Analytical Competencies: assessed
- Problem-solving: assessed

Personal Competencies

- Creative Thinking: assessed
- Critical Thinking: assessed

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann

Abstract

Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective

In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice

This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning
https://ml2.inf.ethz.ch/courses/aml/

Computational Intelligence Lab
http://da.inf.ethz.ch/teaching/2019/CIL/

Introduction to Machine Learning
https://las.inf.ethz.ch/teaching/introml-S19

Statistical Learning Theory
http://mil2.inf.ethz.ch/courses/slt/

Computational Statistics

263-5005-00L Artificial Intelligence in Education W 3 credits 1V+0.5U M. Sachan

Abstract

Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

Objective

The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class and asynchronous discussion, and b) work on problem-sets exemplifying the use of educational data mining techniques.
Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of assessed 6 credits

2G+1A

The course will start with an introduction to data mining techniques (e.g., prediction, structured discovery, visualization, and relationship mining) relevant to analyzing educational data. We will then continue with topics on personalization in AI in educational technologies (e.g., learner modeling and knowledge tracing, self-improving AIED systems) while showcasing exemplary applications in areas such as content curation and dialog-based tutoring. Finally, we will cover ethical challenges associated with using AI in student-facing settings. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, working on problems, preparing seminar presentations).

Lecture notes
Lecture slides will be made available at the course Web site.

Prerequisites / Literature
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

Content
Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

Objective
Many established deep learning methods require dense input data with a well-defined structure (e.g., an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

Content
Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNNs, Geometric GNNs, Deep Generative Models for Graphs.

Prerequisites / notice
There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

263-5056-00L Applications of Deep Learning on Graphs

Abstract
Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

Objective
Many established deep learning methods require dense input data with a well-defined structure (e.g., an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

Content
Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNNs, Geometric GNNs, Deep Generative Models for Graphs.

Prerequisites / notice
263-3210-00 Depp Learning or 263-0008-00 Computational Intelligence Lab; 252-0220-00 Introduction to Machine Learning; Statistics/Probability; Programming in Python; Unix Command Line.

263-5300-00L Guarantees for Machine Learning

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be practiced in final presentations and report as well as during peer-grading of peer talks.

Content
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics
- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

Prerequisites / notice
The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

263-5351-00L Machine Learning for Genomics

Abstract
The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed
Social Competencies
Communication assessed
Cooperation and Teamwork assessed
Personal Competencies

Machine Learning on Microcontrollers

Abstract
Machine Learning (ML) and artificial intelligence are pervading the digital society. Today, even low power embedded systems are incorporating ML, becoming increasingly “smart”. This lecture gives an overview of ML methods and algorithms to process and extract useful near-sensor information in end-nodes of the “internet-of-things”, using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V).

Objective
Learn how to Process data from sensors and how to extract useful information with low power microprocessors using ML techniques. We will analyze data coming from real low-power sensors (accelerometers, microphones, ExG bio-signals, cameras,…). The main objective is to study in details how Machine Learning algorithms can be adapted to the performance constraints and limited resources of low-power microcontrollers.

Content
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

Lecture notes
Script and exercise sheets. Books will be suggested during the course.

Prerequisites / notice

Computer Vision

Abstract
The laboratory exercises will show how to address concrete design problems, like motion, gesture recognition, emotion detection, image evaluation of ML in battery-operated embedded systems.

Objective
- Sensors and sensor data acquisition with low power embedded systems
- Machine Learning: Overview of supervised and unsupervised learning and in particular supervised learning (Bayes Decision Theory, Decision Trees, Random Forests, kNN-Methods, Support Vector Machines, Convolutional Networks and Deep Learning)
- Low-power embedded systems and their architecture. Low Power microcontrollers (ARM-Cortex M) and RISC-V-based Parallel Ultra Low Power (PULP) systems-on-chip.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

Content
The final goal of the course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Information Theory I

Abstract
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon’s source coding and channel coding theorems

Content
- The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Computer Vision and Artificial Intelligence for Autonomous Cars

Abstract
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Objective
- Computer Vision: Invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition
- Social Competencies
- Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

Content
- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

Prerequisites / notice
Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Communication

Social Competencies

227-0560-00L

Abstract
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.
Objective

Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content

The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Critical Thinking assessed

227-0689-00L System Identification W 4 credits 2V+1U R. Smith

Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Literature
Additional papers will be available via the course Moodle.

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

401-0625-01L Applied Analysis of Variance and Experimental Design W 5 credits 2V+1U L. Meier
Subject-specific Competencies

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by assessing

Literature

Analytical Competencies

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has not available

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the

Critical Thinking

Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorial designs and fractional designs, power.

Prerequisites

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

Probabilistic Methods in Combinatorics

W 5 credits 2V+1U B. Sudakov

Abstract

This course provides a gentle introduction to the Probabilistic Method, with an emphasis on methodology. We will try to illustrate the main ideas by showing the application of probabilistic reasoning to various combinatorial problems.

Content

The topics covered in the class will include (but are not limited to): linearity of expectation, the second moment method, the local lemma, correlation inequalities, martingales, large deviation inequalities, Janson and Talagrand inequalities and pseudo-randomness.

Literature

- Graph Coloring and the Probabilistic Method, by M. Molloy and B. Reed, Springer, 2002.

401-3055-64L

Algebraic Methods in Combinatorics

W 5 credits 2V+1U not available

Abstract

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Content

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lecture notes

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites

Students are expected to have a mathematical background and should be able to write rigorous proofs.

401-3601-00L

Probability Theory

W 9 credits 4V+1U V. Tassion

Abstract

Basics of probability theory and the theory of stochastic processes in discrete time

Objective

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- measure theory formalism and probability theory,
- Dynkin's lemma and independence,
- convergence of series of independent random variables,
- law of large numbers,
- conditional expectation,
- martingale convergence theorems,
- uniform integrability,
- optional stopping theorem for martingales,
- the Bienaymé–Galton-Watson process and its R-number,
- convergence in distribution and the central limit theorem.

The course will be available in electronic form.

**Lecture notes**

**Prerequisites / notice**

- Basic notions in probability theory (probability space, conditional probability, Borel Cantelli, Dynkin Lemma, random variables, expectation, variance, law of large numbers).
- Measure Theory

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Techniques and Technologies
- Personal Competencies: Creative Thinking

**401-3612-00L Stochastic Simulation**

**Abstract**

This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

**Objective**

Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

**Content**

Examples of simulations in different fields (computer science, statistics, statistical mechanics, operations research, financial mathematics).

**Literature**

**Prerequisites / notice**

- Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

**401-3622-00L Statistical Modelling**

**Abstract**

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

**Objective**

Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

**Content**

**Prerequisites / notice**

- This is the course unit with former course title "Regression".
- Credits cannot be recognised for both courses 401-3622-00L Statistical Modelling and 401-0649-00L Applied Statistical Regression in the Mathematics Bachelor and Master programmes (to be precise: one course in the Bachelor and the other course in the Master is also forbidden).

**401-3621-00L Fundamentals of Mathematical Statistics**

**Abstract**

In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

**Objective**

The aim of this course is to gain insight into the main statistical ideas and concepts.

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Personal Competencies: Creative Thinking

**401-4623-00L Time Series Analysis**

**Abstract**

The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

**Objective**

The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting

ARIMA, ARIMA, Introduction into GARCH models

The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

- 151-0563-01L Dynamic Programming and Optimal Control
- 261-5112-00L Algorithms and Data Structures for Population Scale Genomics
- 263-5351-00L Machine Learning for Genomics

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

**Abstract**
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

**Objective**
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- epidemiology
- pathogen evolution
- macromutation of species

**Content**
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS.

Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylogenetics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**
Lecture slides will be available on moodle.

**Literature**
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

**Prerequisites / notice**

**Computationally continuous performance assessments.** In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

**Abstract**
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

**Objective**
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

**Content**
- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resistant communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

**Computationally continuous performance assessments.** In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

**Data:** 15.06.2024 12:39

**Autumn Semester 2024**

**Page 671 of 2653**
In 2023, the course will cover advanced topics in communication networks such as:

- Advanced Internet routing (convergence, optimality, scalability, flexibility);
- Network programmability (OpenFlow, P4);
- Traffic engineering / Load Balancing;
- Network verification and synthesis;
- Network measurements;
- Network security;
- Upcoming transport protocols and technologies;
- Adaptive video streaming; and
- Network sustainability.

The course will be composed of lectures and practical exercises (some of which including labs).

<table>
<thead>
<tr>
<th>Competencies</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Students are familiar with fundamental network-security concepts.</td>

<tr>
<td>- Students have an in-depth understanding of a range of important state-of-the-art security technologies.</td>
<td></td>
</tr>
<tr>
<td>- Students can implement network-security protocols based on cryptographic libraries.</td>
<td></td>
</tr>
</tbody>
</table>

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

Topics to be covered include:

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô’s formula, Girsanov transformation, Itô’s representation theorem
- Black-Scholes formula

Lecture notes

See information on course homepage

Prerequisites:

Prerequisites: Results and facts from probability theory as in the book “Probability Essentials” by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course “Wahrscheinlichkeitsrechnung”.)

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

401-3922-00L Life Insurance Mathematics

Abstract

The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

401-3925-00L Non-Life Insurance: Mathematics and Statistics

Abstract

Does not take place this semester.

Objective

The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content

The following topics are treated:

- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tarification
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Lecture notes

M.V. Wüthrich, Non-Life Insurance: Mathematics & Statistics
http://ssrn.com/abstract=2319328

Literature

M.V. Wüthrich, M. Merz. Statistical Foundations of Actuarial Learning and its Applications

Prerequisites:

The exams ONLY take place during the official ETH examination period (no semester end exams), and only in person exams (i.e. no remote exams).

This course will be held in English and counts towards the diploma of “Aktuar SAV”. For the latter, see details under www.actuaries.ch.

261-5111-00L Asset Management: Advanced Investments (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: MFOEC207

Mind the enrolment deadlines at UZH:

Abstract

Comprehension and application of advanced portfolio theory

Objective

Comprehension and application of advanced portfolio theory
The theoretical part of the lecture consists of the topics listed below.

- Standard Markowitz Model and Extensions MV Optimization, MV with Liabilities and CAPM.
- The Crux with MV
- Resampling, regression, Black-Litterman, Bayesian, shrinkage, constrained and robust optimization.
- Downside and Coherent Risk Measures
- Definition of risk measures, MV optimization under VaR and ES constraints.
- Risk Budgeting
- Equal risk contribution, most diversified portfolio and other concentration indices
- Regime Switching and Asset Allocation

An introduction to regime switching models and its intuition.

- Strategic Asset Allocation
Introducing a continuous-time framework, solving the HJB equation and the classical Merton problem.

401-4889-00L Mathematical Finance W 10 credits 4V+2U B. Acciaio

Abstract
Advanced course on mathematical finance:
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- additional topics

Objective
Advanced course on mathematical finance, presupposing good knowledge in probability theory and stochastic calculus (for continuous processes).

Content
This is an advanced course on mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this mostly in continuous-time models.

Topics include
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- and probably others

Lecture notes
The course is based on different parts from different books as well as on original research literature.

Literature
While there are many textbooks on mathematical finance, none of them is ideal to cover the contents of this course. References include the following books:

Prerequisites / notice
Prerequisites are the standard courses
- Probability Theory (for which lecture notes are available)
- Brownian Motion and Stochastic Calculus (for which lecture notes are available)
Those students who already attended "Introduction to Mathematical Finance" will have an advantage in terms of ideas and concepts.

This course is the second of a sequence of two courses on mathematical finance. The first course "Introduction to Mathematical Finance" (MF I), 401-3888-00, focuses on models in finite discrete time. It is advisable that the course MF I is taken prior to the present course, MF II.

For an overview of courses offered in the area of mathematical finance, see https://www.math.ethz.ch/imsf/education/education-in-stochastic-finance/overview-of-courses.html.

103-0227-00L Application Development in Cartography W 6 credits 4G A. Neumann

Abstract
This course introduces concepts and techniques in 3D cartography and web application development. Practical experience will be gained in a map project.

Objective
Students acquire general knowledge about the foundations and best practices in 3D cartography and modern web application development. They learn to plan, design and implement an interactive and animated 3D web map.
Content
- 3D cartography
- Web mapping
- Data processing
- Animations and interactions
- Map and UI design
- Web application development
- Programming (JavaScript).

Lecture notes
Handouts of the lectures and exercise documents are available on Moodle.

Prerequisites / notice
Cartography II or Introduction to Web Cartography Part 1+2 (MOOC) or similar knowledge in mapping with JavaScript.

Abstract
Independent study project with novel geoinformation technologies. Information on past projects: http://gis-lab.ethz.ch/

Objective
This lab focuses on presenting spatial, temporal, and open data in tangible ways. Students will learn how to work with novel geoinformation technologies such as virtual/mixed reality or mobile applications. They will engage in teamwork, application design, programming and presenting their results.

Abstract
Building a Robot Judge: Data Science for Decision-Making

Does not take place this semester.
Deep-Learning (DL) is a brain-inspired weak form of AI that allows training of large artificial neuronal networks (ANNs), similar to those found in the human brain. ANNs are trained using algorithms that are inspired by the way the brain learns, which involves adjusting the strength of connections between neurons based on experience. This allows them to learn from data and improve their performance over time. However, ANNs are not without limitations. They require large amounts of training data, and their performance can be limited in certain domains without sufficient data.

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods ranging from single synapses to entire networks. To achieve this, the lectures and exercises will merge ideas, concepts, and methods from machine learning and neuroscience. Personal Competencies will be developed through presentation skills, professional behavior, and the ability to work in teams. Social Competencies will be developed through presentation skills, professional behavior, and the ability to work in teams. Also, participants will develop a diverse skill set that is required to understand learning in large, hierarchical neuronal networks. This includes the ability to simulate spiking neuronal networks that learn simple (e.g., digit classification) tasks in a supervised manner.

Objective

After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy, and technology policy research. They should also have an overview of current topics of international research in these areas.

Content

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods ranging from single synapses to entire networks. To achieve this, the lectures and exercises will merge ideas, concepts, and methods from machine learning and neuroscience. Personal Competencies will be developed through presentation skills, professional behavior, and the ability to work in teams. Social Competencies will be developed through presentation skills, professional behavior, and the ability to work in teams. Also, participants will develop a diverse skill set that is required to understand learning in large, hierarchical neuronal networks. This includes the ability to simulate spiking neuronal networks that learn simple (e.g., digit classification) tasks in a supervised manner.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is it that the defendant will commit another crime? How much additional revenue will this new tax law collect? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.
Prerequisites / notice
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).

2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

227-1033-00L  Neuroromophic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this course as part of their major.

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module INI404 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding of the characteristics of neuromorphic circuit elements.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice
Particular: This course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L  Introduction to Neuroinformatics

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Abstract
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

227-1051-00L  Systems Neuroscience (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: INI415

Mind the enrolment deadlines at UZH:

Abstract
This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

Objective
To understand the basic concepts underlying perceptual, motor and cognitive functions.

Content
Main emphasis sensory systems, with complements on motor and cognitive functions.

None

Literature

Prerequisites / notice
none
Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Abstract
Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective
Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts.

In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content
The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Literature

Network Modeling

Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Abstract
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective
The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.
The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models

- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)
  * Models for relational event data: dynamic network actor models (DyNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.
This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.

**Objective**
At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

**Content**
This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1. Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2. MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3. Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained.
4. Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

**Literature**
Agent-based modeling in general

MATSim

**Prerequisites / notice**
There are no strict preconditions regarding which lectures the students should have previously attended. However, experience with at least one high-level programming language (Java, R, Python, or other) is recommended.

For those without object-oriented programming experience, a crash course 101-0491-10 Basics of Java and Best Practices for Scientific Computing before the start of HS is recommended.

**701-0023-00L Atmosphere**

**Abstract**
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Objective**
Students are able
- to explain the physical structure and chemical composition of the atmosphere
- to quantitatively describe and understand the fundamental physical and chemical process in the atmosphere
- to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

In the course "Atmosphere", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined.

**Content**
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds.

**Lecture notes**
Written information will be supplied.

**701-0473-00L Weather Systems**

**Abstract**
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water isotope

**Objective**
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales

- basic understanding of stable water isotopes as tracers for moist adiabatic processes in weather systems

**Content**
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotope

**Lecture notes**
Lecture notes and slides
The students will learn how to design and implement state-of-the-art algorithms for planning the motion of robots executing challenging tasks in complex environments. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues. Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combining discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will foster the development of tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

**Prerequisites / notice**

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

**Competencies**

- **Analytical Competencies**
  - Conceptual Thinking
  - Creative Thinking
- **Social Competencies**
  - Cooperation and Teamwork
- **Personal Competencies**
  - Critical Thinking

**Literature**

Prerequisites / notice

Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Decision-making
- Problem-solving

151-0563-01L Dynamic Programming and Optimal Control

Introduction to Dynamic Programming and Optimal Control.

Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Prerequisites / notice

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: DINF2039

Mind the enrolment deadlines at UZH:

Abstract

For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, and visual-inertial odometry. The course will cover computer vision using a combination of theoretical lectures and practical exercises.

Objective

Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry. The course will cover the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers.

Content

Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Literature

Lecture notes

Lecture slides will be made available on the course official website: http://rpg.ifi.uzh.ch/teaching.html

Prerequisites / notice

Fundamentals of algebra, geometry, matrix calculus, and Matlab programming.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitively excluded or banned from the relevant program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/launch.html)

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your **“UZH email account”** to receive the related information from the lecturer.

151-0851-00L Robot Dynamics

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

Prerequisites / notice

151-0703-00L Control Systems

Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Objective

Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

Abstract
In this class, we bring together data science applications provided by ETH researchers outside computer science and teams of computer science master’s students. Two to three students will form a team working on data science/machine learning-related research topics provided by scientists in a diverse range of domains such as astronomy, biology, social sciences etc.

Objective
The goal of this class if for students to gain experience of dealing with data science and machine learning applications “in the wild”. Students are expected to go through the full process starting from data cleaning, modeling, execution, debugging, error analysis, and quality/performance refinement.

Prerequisites / notice
Prerequisites: At least 8 KP must have been obtained under Data Analysis and at least 8 KP must have been obtained under Data Management and Processing.

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
- Computational learning theory
  - Supervised learning:
    - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
  - Unsupervised learning:
    - Dimensionality reduction techniques
    - Clustering
    - Mixture Models
    - Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.
Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

“Big Data” refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departements interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases); this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

**263-3845-00L Data Management Systems**

**W 8 credits 3V+1U+3A G. Alonso**

**Abstract**

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

**Objective**

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

**Content**

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place a special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

**Literature**

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

**Prerequisites / notice**

The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

**Competencies**

- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
- Fostered Competencies: Information Theory I, Dynamic Programming and Optimal Control

**227-0417-00L Information Theory I**

**W 6 credits 4G A. Lapidoth**

**Abstract**

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

**Objective**

The fundamentals of Information Theory including Shannon’s source coding and channel coding theorems

**Content**

The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

**Literature**

T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

**227-0560-00L Computer Vision and Artificial Intelligence for Autonomous Cars**

**W 6 credits 3V+2P C. Sakaridis**

Up until FS2022 offered as Deep Learning for Autonomous Driving
Abstract
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Objective
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Competencies
Subject-specific Competencies

Critical Thinking assessed

227-0689-00L System Identification W 4 credits 2V+1U R. Smith
Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Literature

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

227-2210-00L Computer Architecture W 8 credits 6G+1A S. Sadrosadati, O. Mutlu

Abstract
Autumn Semester 2024
Abstract
Computer architecture is the science & art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

Objective
We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), new paradigms like processing-in-memory, parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, interconnection networks, specialized systems for major data-intensive workloads (e.g. graph analytics, bioinformatics, machine learning), etc. We will focus on fundamentals as well as cutting-edge research. Significant attention will be given to real-life examples and tradeoffs, as well as critical analysis of modern computing systems.

Content
The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

See the course website for detailed and complete content of past incarnations of the course: https://safari.ethz.ch/architecture

Lecture notes
All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

The video recordings of the lectures are expected to be made available after lectures.

See https://safari.ethz.ch/architecture for past examples.

Literature
We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

See https://safari.ethz.ch/architecture for past examples.

252-1414-00L System Security W 7 credits 2V+2U+2A S. Capkun, S. Shinde

252-3005-00L Natural Language Processing W 7 credits 3V+3U+1A R. Cotterell

261-5130-00L Research in Data Science W 6 credits 13A Professors
Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them (using C/C++, STL, CGAL, and BGL).

This InterFocus Course will provide a broad, hands-on introduction to Information Security, introducing adversarial thinking and security by design as key approaches to building secure systems.

This course will introduce key concepts from Information Security, both from attack and defense perspectives. Students will gain an appreciation of the complexity and challenge of building secure systems.
The course is organised in three-week segments. In each segment, a new concept from Information Security will be introduced. The overall scope will be broad, including cryptography, protocol design, system security, and privacy.

Will be made available during the semester.

Paul C. van Oorschot, Computer Security and the Internet: Tools and Jewels.
Dan Boneh and Victor Shoup, A Graduate Course in Applied Cryptography.

Ideally, students will have taken the D-INFK Bachelors course “Information Security” or an equivalent course at Bachelors level.

Subject-specific Competencies
Methods-specific Competencies
Personal Competencies

Robustness of Machine Learning
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning
- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Assessment
The course will start with an introduction to data mining techniques (e.g., prediction, structured discovery, visualization, and relationship mining) relevant to analyzing educational data. We will then continue with topics on personalization in AI in educational technologies (e.g., learner modeling and knowledge tracing, self-improving AIED systems) while showcasing exemplary applications in areas such as content curation and dialog-based tutoring. Finally, we will cover ethical challenges associated with using AI in student-facing settings. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, working on problems, preparing seminar presentations).

### 263-5005-00L Artificial Intelligence in Education

**Objective**
The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class and asynchronous discussion, and b) work on problem-sets exemplifying the use of educational data mining techniques.

**Content**
The course will start with an introduction to data mining techniques (e.g., prediction, structured discovery, visualization, and relationship mining) relevant to analyzing educational data. We will then continue with topics on personalization in AI in educational technologies (e.g., learner modeling and knowledge tracing, self-improving AIED systems) while showcasing exemplary applications in areas such as content curation and dialog-based tutoring. Finally, we will cover ethical challenges associated with using AI in student-facing settings. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, working on problems, preparing seminar presentations).

**Lecture notes**
Lecture slides will be made available at the course Web site.

**Literature**
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

**Prerequisites / notice**
There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

### 263-5210-00L Probabilistic Artificial Intelligence

**Objective**
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**
Solid basic knowledge in statistics, algorithms and programming. The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.
The objectives of this course are:

- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve these.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.
**Content**

Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

**Literature**

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
  - assessed

- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - assessed

- Personal Competencies
  - Critical Thinking
  - assessed

---

**401-3601-00L Probability Theory**

**W**

- 9 credits
- 4V+1U
- V. Tassion

**Objective**

At most one of the three course units (Bachelor Core Courses)

401-3461-00L Functional Analysis I

401-3531-00L Differential Geometry I

401-3601-00L Probability Theory

401-3602-00L Applied Stochastic Processes

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- Measure theory formalism and probability theory, Dynkin’s lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

**Content**

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- Measure theory formalism and probability theory, Dynkin’s lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

- Personal Competencies
  - Creative Thinking
  - assessed

---

**401-3612-00L Stochastic Simulation**

**W**

- 5 credits
- 2V+1U
- F. Sigrist

**Objective**

This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

**Content**

Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

**Lecture notes**

A script will be available in English.

**Literature**

**Prerequisites / notice**

Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

---

**401-3627-00L High-Dimensional Statistics**

**W**

- 4 credits
- 2V
- not available

**Abstract**

"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference.
### 401-3622-00L Statistical Modelling

**Abstract**
In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models, and generalized linear models, robust methods, and nonparametric models. Several numerical examples will illustrate the theory.

**Objective**
Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

**Content**
- Basics of Regression Approaches
- Linear and Generalized Linear Models
- Nonparametric Regression
- Robust Regression Methods
- Model Selection

**Literature**

**Prerequisites / notice**
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: assessed
  - Project Management: fostered
- Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: fostered
  - Sensitivity to Diversity: fostered
- Personal Competencies
  - Adaptability and Flexibility: fostered
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: fostered

**Credits**
7 credits

https://people.math.ethz.ch/~abandeira/BandeiraSingerStrohmer-MDS-draft.pdf (see for some Open Problems)

**401-3901-00L Linear & Combinatorial Optimization**

**Abstract**
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Objective**
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Content**
- Linear programming and polyhedra
- Flows and cuts
- Combinatorial optimization problems and polyhedral techniques
- Equivalence between optimization and separation

**Literature**

**Prerequisites / notice**
Solid background in linear algebra.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: assessed
  - Project Management: fostered
- Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: fostered
  - Sensitivity to Diversity: fostered
- Personal Competencies
  - Adaptability and Flexibility: fostered
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: fostered

**Credits**
10 credits

**Lecture notes**

**401-4944-20L Mathematics of Data Science**

**Abstract**
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

**Objective**
Introduction to various mathematical aspects of Data Science.

**Content**
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

**Lecture notes**

**Prerequisites / notice**
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: assessed
  - Project Management: fostered
- Social Competencies
  - Communication: assessed
  - Cooperation and Teamwork: fostered
  - Sensitivity to Diversity: fostered
- Personal Competencies
  - Adaptability and Flexibility: fostered
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: fostered

**Credits**
8 credits

**Lecture notes**

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei
### Probabilistic Methods in Combinatorics

**W 5 credits 2V+1U**  
**B. Sudakov**

**Abstract**  
This course provides a gentle introduction to the Probabilistic Method, with an emphasis on methodology. We will try to illustrate the main ideas by showing the application of probabilistic reasoning to various combinatorial problems.

**Content**  
The topics covered in the class will include (but are not limited to): linearity of expectation, the second moment method, the local lemma, correlation inequalities, martingales, large deviation inequalities, Janson and Talagrand inequalities and pseudo-randomness.

**Literature**
- Graph Coloring and the Probabilistic Method, by M. Molloy and B. Reed, Springer, 2002.

**Lecture notes**
https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Prerequisites / notice**
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

### Algebraic Methods in Combinatorics

**W 5 credits 2V+1U**  
**Does not take place this semester.**

**Abstract**  
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**  
The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**  
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Prerequisites / notice**
Students are expected to have a mathematical background and should be able to write rigorous proofs.

### Time Series Analysis

**W 4 credits 2G**  
**F. Balabdaoui**

**Abstract**  
The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARIMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

**Objective**  
The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.

**Content**  
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARIMA, ARIMA Introduction to GARCH models

**Literature**
The main reference for this course is the book “Introduction to Time Series and Forecasting”, by P. J. Brockwell and R. A. Davis

**Prerequisites / notice**
Basic knowledge in probability and statistics

### Causality

**W 5 credits 3G**  
**J. Peters**

**Abstract**  
In statistics, we are used to search for the best predictors of some random variable. In many situations, however, we are interested in predicting a system's behavior under manipulations. For such an analysis, we require knowledge about the underlying causal structure of the system. In this course, we study concepts and theory behind causal inference.
Objective

After this course, you should be able to:

- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

Content

The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

Literature

Parts of this course will be based on the book “Elements of Causal Inference” (MIT Press, open access). More details will follow.

Prerequisites / notice

Prerequisites: basic knowledge of probability theory and regression

Competencies

Subject-specific Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

402-0448-01L Quantum Information Processing I: Concepts
This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Abstract

The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Objective

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

Content

The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,...), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes

Will be provided.

Literature

Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice

A good understanding of finite dimensional linear algebra is recommended.

Competencies

Subject-specific Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies

Analytical Competencies assessed
Decision-making fostered
Problem-solving fostered

Personal Competencies

Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking fostered

Data Science Lab

Interdisciplinary Electives

Number Title Type ECTS Hours Lecturers

263-3300-00L Data Science Lab O 14 credits 9P A. Illc, V. Boeva, R. Cotterell, J. Vogt, F. Yang

Abstract

In this class, we bring together data science applications provided by ETH researchers outside computer science and teams of computer science master's students. Two to three students will form a team working on data science/machine learning-related research topics provided by scientists in a diverse range of domains such as astronomy, biology, social sciences etc.

Objective

The goal of this class if for students to gain experience of dealing with data science and machine learning applications "in the wild". Students are expected to go through the full process starting from data cleaning, modeling, execution, debugging, error analysis, and quality/performance refinement.

Prerequisites / notice

Prerequisites: At least 8 KP must have been obtained under Data Analysis and at least 8 KP must have been obtained under Data Management and Processing.

Seminar

Number Title Type ECTS Hours Lecturers

252-5051-00L Advanced Topics in Machine Learning W 2 credits 2S R. Cotterell, M. El-Assady, N. He, F. Yang

Abstract

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.
Objective
The seminar "Advanced Topics in Human-Centric Computer Vision" familiarizes students with recent developments in pattern recognition and machine learning. Students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar is to summarize the essential ideas of the paper in sufficient detail while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Literature
The papers will be presented in the first session of the seminar.

Abstract

263-3504-00L
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Objective
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

263-3713-00L
In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modeling of detailed human activities.

Objective
The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

Content
The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

Presenter: Give a presentation about the paper that you read in depth.
Reviewer: Perform a critical review of the paper.

Prerequisites / notice
All other students: read the paper and submit questions they have about the paper before the presentation. Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

Competencies
Method-specific Competencies: Analytical Competencies
Social Competencies: Communication
Personal Competencies: Critical Thinking

263-5100-00L
This seminar discusses recent relevant contributions to the fields of medical machine learning and related areas. Each participant will hold a presentation and lead the subsequent discussion.

Objective
Preparing and holding a scientific presentation in front of peers is a central part of working in the scientific domain. In this seminar, the participants will learn how to efficiently summarize the relevant parts of a scientific publication, critically reflect its contents, and summarize it for presentation to an audience. The necessary skills to successfully present the key points of existing research work are the same as those needed to communicate own research ideas. In addition to holding a presentation, each student will both contribute to as well as lead a discussion section on the topics presented in the class.

Content
The topics covered in the seminar are related to recent computational challenges that arise in the medical field, including but not limited to clinical data analysis, interpretable machine learning, privacy considerations, statistical frameworks, etc. Both recently published works contributing novel ideas to the areas mentioned above as well as seminal contributions from the past are on the list of selected papers.

Prerequisites / notice
Knowledge of machine learning and interest in applications in medicine. ML4H is beneficial as a prior course.

401-3620-74L
The Autumn Semester 2024 registration for this course has ended.

 Objective
Number of participants limited to 24.
Mainly for students from the Mathematics Bachelor and Master Programmes who, in addition to the introductory course unit 401-2604-00L Probability and Statistics, have heard at least one core or elective course in statistics. Also offered in the Master Programmes Statistics resp. Data Science.

401-5680-00L
This Autumn Semester 2024 registration has ended.

 Objective
Research colloquium

Science in Perspective
The minimal prerequisites for the Master's thesis registration are:

- Completed Bachelor's program
- All additional requirements completed (additional requirements, if any, are listed in the admission decree)
- Minimum degree requirements fulfilled of the course categories Data Analysis and Data Management and overall 50 credits obtained in the course category Core Courses
- Data Science Lab (14 credits) completed

Abstract
The Master's thesis concludes the study program and demonstrates the students' ability to use the knowledge and skills acquired during Master's studies to solve a complex data science problem.

Objective
To work independently and to produce a scientifically structured work.

**Abstract**

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

**Objective**

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**

The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

**Literature**

Literature will be made available to the participants.

Further, this collection of tools will be used:

**Abstract**

This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

**Objective**

This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:

1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

**Content**

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:

2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a “hands-on” feel for the course topics.

**Literature**

Suggested Reading:

Marc Peter Deisenroth, A Aldo Faisal, and Cheng Soon Ong Mathematics for Machine Learning
O. Martin: Bayesian analysis with python. Packt Publishing Ltd, 2016

**Prerequisites / notice**

Familiarity with Python is advised.
Discovering Management (Pitch) 351-0778-01L

**Does not take place this semester.**

**Abstract**
This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers an additional exercise.

**Objective**
The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

**Content**
The exercise consists of delivering and submitting a "pitch" with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

**Literature**
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, "Discovering Management".

---

**Discovering Management 351-0778-00L**

*Does not take place this semester.*

**Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Exercises) 351-0778-01.**

**Abstract**
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

**Objective**
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

**Content**
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a “lecture-style” approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

**Lecture notes**
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

### Prerequisites / notice
To benefit from this course, you should have a practical affinity to technics, as well as an abstract interest in information technology in its comprehensive cultural context.

---

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 700 of 2653
The methodology of humanistic research grows more complex with every academic generation: it presents a thicket of epistemological frameworks rather than a straightforward array of tools. In the omnivorous field of architectural history and theory, the scholar faces yet further possibilities. This course considers the variety of available strategies for the creation of architectural histor(ies) and theor(ies) as an intellectual opportunity distinctive to our discipline. Through close study of a range of historically significant or innovative texts, we will deepen our understanding of how other scholars have structured their work and refine our own research methodologies.

The course, held over two semesters, combines a traditional doctoral theory seminar with a practical writing workshop. We will alternate reading-based discussions with working sessions directed towards the development of the doctoral plan to be submitted at the end of the first year.

The course schedule will be available at the beginning of the semester on the course moodle page.

Please note gta doctoral program courses begin the third week of the semester (the first week of October).

Lecture notes
PDfs of texts for discussion will be provided on the course moodle page (registered students only).

Prerequisites / notice
Required for first-year gta doctoral students; gta MAS and external doctoral students accepted by application, space permitting. Due to the intensive nature of the course, auditors and passive participants are not allowed. Please contact instructor for more information.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

Max. number of participants 15 students.

The course “360 – Reality to Virtuality” is interconnected with “3D Scanning and Freeform Modeling”.

You must register for both courses: “360 – Reality to Virtuality” and “3D-Modeling” (2x 2 ETCS).

Classroom teaching + 4h block + self-teaching and research at home.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

If you already have an Oculus Quest 2, you do not need to pay any deposit and can work on your own device.

Please note gta doctoral program courses begin the third week of the semester (the first week of October).

W 2 credits 2U A. Kiryk

Enrolment in agreement with the lecturer only
kiryk@arch.ethz.ch

This course explores the concept of “Hybrid Reality,” blending digital and physical spaces using VR technologies. Students will learn to digitize spaces, create immersive environments, and design interactive exhibitions.

The goal is to digitize an existing space and use it in virtual reality as a context for further design. During the course, AI tools will be utilized to enhance the photogrammetry 3D scanning process. In the first part of the course, we learn the tools; then we work on architectural VR projects, either in groups or individually. Throughout the course, we will examine VR workflows to create immersive and interactive architectural spaces. At the end of the course, we will present the works in a VR exhibition. Each student receives an Oculus Quest VR headset to work with at home throughout the semester.

Fusions of digital-analog relationships have accompanied us since the very beginning of the digitalization era. The rapidly growing impact of digital technologies on our life necessitates constant adaptation. The course introduces the term “Hybrid Reality,” which represents the coexistence of physical and digital spaces. Using state-of-the-art VR technologies, the methodology focuses on immersive, real-time, 1:1 scale space creation, exploring corporeal design, and reinventing conventional methods. Students will learn to digitize physical spaces, create hybrid reality environments, and design interactive exhibitions.

The course, held over two semesters, combines a traditional doctoral theory seminar with a practical writing workshop. We will alternate reading-based discussions with working sessions directed towards the development of the doctoral plan to be submitted at the end of the first year.

The course schedule will be available at the beginning of the semester on the course moodle page.

Please note gta doctoral program courses begin the third week of the semester (the first week of October).

Lecture notes
PDfs of texts for discussion will be provided on the course moodle page (registered students only).

Prerequisites / notice
Required for first-year gta doctoral students; gta MAS and external doctoral students accepted by application, space permitting. Due to the intensive nature of the course, auditors and passive participants are not allowed. Please contact instructor for more information.

<td>101-0191-00L</td>
<td>Seismic and Vibration Isolation</td>
<td>W</td>
<td>2</td>
<td>1G</td>
<td>M. Vassiliou</td>
</tr>
</tbody>
</table>

Abstract
This course will cover the analysis and design of isolation systems to mitigate earthquakes and other forms of vibrations. The course will cover:

1. Conceptual basis of seismic isolation, seismic isolation types, mechanical characteristics of isolators.
3. Design approaches and code requirements

Objective
After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.

Content
1. Introduction: Overview of seismic isolation; review of structural dynamics and earthquake engineering principles. Viscoelastic behavior.
2. Linear theory of seismic isolation
3. Types of seismic isolation devices - Modelling of seismic isolation devices – Nonlinear response analysis of seismically isolated structures in Matlab
4. Behavior of rubber isolators under shear and compression
5. Behavior of rubber isolators under bending
6. Buckling and stability of rubber isolators
7. Code provisions for seismically isolated buildings

Lecture notes
The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes:
- Reading material, and (optional) exercise problems and solutions.

Literature
- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017
- Design of seismic isolated structures: from theory to practice, Farzad Naeim and James M. Kelly, John Wiley & Sons, 1999

Prerequisites / notice
- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011

101-0522-10L Doctoral Seminar Data Science and Machine Learning in Civil, Env. and Geospatial Engineering  ● Does not take place this semester.

Abstract
Current research in machine learning and data science within the research fields of the department. The goal is to learn about current research projects at our department, to strengthen our expertise and collaboration with respect to data-driven models and methods, to provide a platform where research challenges can be discussed, and also to practice scientific presentations.

Objective
- learn about discipline-specific methods and applications of data science in neighbouring fields
- network people and methodological expertise across disciplines
- establish links and discuss connections, common challenges and discipline-specific differences
- practice presentation and discussion of technical content to a broader, less specialised scientific audience

Content
Current research at D-BAUG will be presented and discussed.

Prerequisites / notice
This doctoral seminar is intended for doctoral students affiliated with the Department of Civil, Environmental and Geomatic Engineering. Other students who work on related topics need approval by at least one of the organisers to register for the seminar.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

101-0139-00L Scientific Machine and Deep Learning for Design and Construction

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:

1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/laboratory exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.
**Literature**

Suggested Reading:

**Prerequisites / notice**

Familiarity with Python is advised.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: fostered
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: assessed

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered

**Personal Competencies**
- Creative Thinking: fostered
- Critical Thinking: fostered
- Self-direction and Self-management: fostered

**Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement**

*The lecture takes place if a minimum of 12 students register for it.*

**Abstract**

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

**Objective**

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**

The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

**Literature**

Literature will be made available to the participants.

The following open access article builds a core element of the course:

available at (open access): http://www.ingentaconnect.com/content/one/oekom/gaia/2017/00000026/00000001/art00011

Further, this collection of tools will be used:
- https://naturalsciences.ch/topics/co-producing_knowledge
- https://www.shapeidtoolkit.eu

**Prerequisites / notice**

Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00)

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories: fostered
- Analytical Competencies: fostered
- Problem-solving: fostered

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered

**Personal Competencies**
- Critical Thinking: fostered
- Self-awareness and Self-reflection: fostered

**101-0523-15L**

**Frontiers in Machine Learning Applied to Civil, Env. and Geospatial Engineering**

*Does not take place this semester.*

**Abstract**

This doctoral seminar organised by the D-BAUG platform on data science and machine learning aims at discussing recent research papers in the field of machine learning and analyzing the transferability/ adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

**Objective**

Students will
- Critically read scientific papers on the recent developments in machine learning
- Put the research in context
- Present the contributions
- Discuss the validity of the scientific approach
- Evaluate the underlying assumptions
- Evaluate the transferability/ adaptability of the proposed approaches to own research
- (Optionally) implement the proposed approaches.

**Literature**

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 708 of 2653
Content

With the increasing amount of data collected in various domains, the importance of data science in many disciplines, such as infrastructure monitoring and management, transportation, spatial planning, structural and environmental engineering, has been increasing. The field is constantly developing further with numerous advances, extensions and modifications. The course aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Each student will select a paper that is relevant for his/her research and present its content in the seminar, putting it into context, analyzing the assumptions, the transferability and generalizability of the proposed approaches. The students will also link the research content of the selected paper to the own research, evaluating the potential of transferring or adapting it. If possible and applicable, the students will also implement the adapted algorithms. The students will work in groups of three students, where each of the three students will be reading each other’s selected papers and providing feedback to each other.

Notice

This doctoral seminar is intended for doctoral students affiliated with the Department of Civil, Environmental, and Geomatic Engineering. Other students who work on related topics need approval by at least one of the organizers to register for the seminar.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

</table>
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

**Prerequisites / notice**

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

**Note**

This is not a course, but a consulting service. There are no exams nor credits. We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, which is important for understanding how genes are turned on and off. The students should obtain an understanding of these processes, which are at work during gene expression.

Concepts and Theories
- Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; miRNA-based interactions between the participating research groups.

Analytical Competencies
- Communication assessed
- Leadership and Responsibility fostered
- Self-presentation and Social Influence fostered
- Critical Thinking fostered
- Self-awareness and Self-reflection fostered

Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion. The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

The students will actively participate in the course which is held in the form of a seminar. Individual students will prepare particular topics of the course based on literature references and present the material in form of a seminar to their fellow students. In short, the students learn to actively participate in discussions and to prepare a presentation of a scientific topic which was mostly unknown to them before.
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similarly to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter. Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant questions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selecting a topic for the final presentation and supporting literature.
The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer’s and Parkinson’s, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecture notes
Lecture slides and some scripts will be provided.

Literature
No compulsory textbooks. Literature will be provided during the course

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

**900-0105-DRL** Transferrable Skills Course III (1-3 days, with Poster or Talk)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

**900-0106-DRL** Transferrable Skills Course I (1 week)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**900-0107-DRL** Transferrable Skills Course II (1 week)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**900-0108-DRL** Transferrable Skills Course III (1 week)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**900-0109-DRL** Transferrable Skills Course I (1 week, with Poster or Talk)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**900-0110-DRL** Transferrable Skills Course II (1 week, with Poster or Talk)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**900-0111-DRL** Transferrable Skills Course III (1 week, with Poster or Talk)  
*Only for doctoral students.*

*Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.*

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.
Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

### 900-0112-DRL Participation in Commission I (min 1 year)

**W** 1 credit 2P Lecturers

Only for doctoral students.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

### 900-0113-DRL Participation in Commission II (min 1 year)

**W** 1 credit 2P Lecturers

Only for doctoral students.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

### 900-0114-DRL Member of Executive Board (min 1 year)

**W** 2 credits 4P Lecturers

Only for doctoral students.

Abstract
Active participation in the presidium or executive board of a university group for at least 1 year.

Objective
Active participation in the presidium or executive board of a university group for at least 1 year.

### 701-0703-00L Environmental Ethics (University of Zurich)

**W** 3 credits 2V University lecturers

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 07SMEEE266

Please register at: https://www.uzh.ch/cmsssl/de/studies/application/chmobilit yin.html

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

### 851-0745-00L Ethics Workshop: The Impact of Digital Life on Society

**W** 2 credits 2S E. Vayena, A. Blasimme, J. Sleigh, to be announced

Open to all Master level / PhD students.

Abstract
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

Objective
- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

#### 376-1651-00L Ethics of Life Sciences and Biotechnology

**Abstract**

This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

**Objective**

This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

**Content**

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

#### 851-0178-00L Ethics and Scientific Integrity for Doctoral Students

**Abstract**

This course is interdisciplinary. If your department offers this course, please register there if possible.

**Objective**

This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

**Competencies**

Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.
Content

Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice
For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

**ECTS**

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

Students will learn basic and advanced biophysical methods applied to problems in molecular biotechnology. The course provides an introduction to key concepts in developmental biology.

The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

The biophysical methods to be taught will include:

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patchclamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

The students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as research in biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

**Abstract**
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

**Objective**
The course enables students to formulate, analyse, and simulate mathematical models of biochemical networks. To this end, the course covers basic mathematical concepts necessary to build mathematical models of biochemical reaction dynamics as well as basic concepts from dynamical systems theory. The exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

**Content**
Biochemical Reaction Modelling

- Basic Concepts from Linear Algebra & Differential Equations
- Mathematical Methods: Linear Stability Analysis, Phase Plane Analysis, Bifurcation Analysis
- Dynamical Systems: Switches, Oscillators, Adaptation Signal Propagation in Signalling Networks
- Parameter Estimation

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies

- Method-specific Competencies
  - Analytical Competencies
  - Problem-solving

- Personal Competencies
  - Creative Thinking
  - Critical Thinking

**Prerequisites / notice**
The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

**Abstract**
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

**Objective**
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

**Content**
Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectronic processing and fabrication sequence
- Optical: Packaging

**Lecture notes**
Handouts in English

**Literature**

**Prerequisites / notice**
Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitiorium of fundamental physics and quantum theory at the semester beginning can be offered.

The information on the web can be updated until the beginning of the semester.
Biotechnology of Enzymes

Abstract
This course covers the role of enzymes in biotechnology, from discovery via engineering to applications in a variety of fields from food to the pharmaceutical industry.

Objective
Students will learn to identify opportunities for utilizing enzymes in biotechnology and develop basic and advanced enzyme engineering skills, informed by the latest research and techniques.

Content
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

Literature
The course will use selected parts of textbooks, original scientific publications, and reviews, which will be shared during the lecture.

Biological Engineering and Biotechnology

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Stem Cells: Biology and Therapeutic Manipulation

Abstract
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

636-0118-00L Introduction to Dynamical Systems with Applications to Biology

W 4 credits 3G+2A M. H. Khammash

Abstract
Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and qualitative features of this change is the topic of dynamical systems theory. Dynamical systems arise naturally in virtually all scientific disciplines including physics, biology, chemistry and engineering. This course is a broad introduction to the topic dynamical systems.

Objective
The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using mat lab will be used to demonstrate various concepts.

Content
A dynamical view of the world; the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; linear stability analysis; classifications of linear systems; Liapunov functions and nonlinear stability; cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts.

Lecture notes
Will be provided as needed.

Literature

Prerequisites / notice
Prerequisites: Calculus; a first course in differential equations; basic linear algebra (eigenvectors and eigenvalues). Matlab programming.

636-0119-00L Introduction to Statistics and R

W 6 credits 3G+2A J. Kuipers

Abstract
This course offers a practical introduction to the fundamentals of data analysis and R.

Objective
To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

Content
Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

Lecture notes
Lecture slides will be available.

Prerequisites / notice
Access to Rstudio with some markdown and tidyverse packages installed.

636-0017-00L Computational Biology

W 6 credits 3G+2A T. Vaughan, C. Magnus, T. Stadler

Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamics inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.
This course is an introduction to the wide field of Genomics. It addresses how fundamental questions in biological systems are studied.

Objectives

- To introduce students to the fundamental concepts of systems biology.
- To provide an overview of the methodologies used in systems biology.
- To develop skills in applying computational methods to analyze biological data.
- To understand the importance of computational tools in exploring and interpreting biological systems.

Competencies

- Analytical Competencies: Evaluate and interpret data from computational analysis.
- Creative Thinking: Apply creative solutions to complex biological problems.
- Problem-solving: Identify and solve problems related to biological systems.

Prerequisites

- Basic knowledge in linear algebra, analysis, and statistics will be helpful.
- Programming in R for project work.

Literature

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Software

- R for data analysis.
- BEAST for phylogenetic analysis.

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

The course is organized jointly by D-BSSE and LYO-X, a Quantitative Systems Pharmacology consulting company situated in Basel.

The technical components of this course are to be evaluated weekly.

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  - Advanced Machine Learning
    https://ml2.inf.ethz.ch/courses/aml/
  - Computational Intelligence Lab
    http://da.inf.ethz.ch/teaching/2019/CIL/
  - Introduction to Machine Learning

263-5053-00L Technology Investing W 2 credits 3S A. Ilac, C. Jurzyk

Abstract
Venture Capital is important to fund big transformational ideas and is often misunderstood by tech or research entrepreneurs. This lecture immerses participants in the role of a Venture Capitalist (VC) to learn from experienced entrepreneurs and investors. In small teams, you work on a case of a real start-up and defend the case in a simulated investment committee consisting of experienced VCs.
Objective
After attending this course, students will be able to:
- Explain the differences between VC and founder thinking
- Evaluate if a start-up is suited for venture capital ("VC readiness")
- Evaluate founder friendliness of term sheets
- Determine funding needs & strategy for a start-up from research to first round
- Write and evaluate an investment memo

Content
The course is practically oriented and features guest speakers from leading venture capital firms and start-ups. The course embraces a unique perspective combining technology and investor thinking. The seminar is structured around five days with the following themes.

The detailed program is listed here: https://bit.ly/techinvesting23

The macro picture. Why does venture capital exist? What are major tech breakthrough areas and their disruptive potential? We also review the differences in the US and European perspective as well as developments towards more impact and diversity conscious funds.

A peek into the mind of a VC. How to build a successful VC? Learn what key factors & processes required to build a successful venture capital company. This includes strategic decisions for investment thesis, structure of a fund, portfolio economics, valuation & ownership targets, cap table. In addition, we introduce the fundamentals of the investment process (including due diligence, term sheets, and deal memo) as well as portfolio management.

The founder’s perspective. Why should you raise venture capital and how? Learn to evaluate the founder friendliness of terms, company approach, strategic decisions, negotiation and valuation.

Fundraising types. Learn about different types of funding and their implications. This includes an overview of the Swiss ecosystem and a discussion of the different types (grants, equity, loans, SAFE, crowd, …). We also include a practical session on crypto technology for modern fund-raising using launchpads and tokenized shares.

Tying it all together. The last day is focused on simulating an investment committee meeting where the groups present their deal memos and discuss with the audience.

Competencies
Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Method-specific Competencies
Analytical Competencies
Decision-making
Media and Digital Technologies
Problem-solving
Project Management

Social Competencies
Communication
Cooperation and Teamwork
Customer Orientation
Leadership and Responsibility
Self-presentation and Social Influence
Sensitivity to Diversity
Negotiation

Personal Competencies
Adaptability and Flexibility
Creative Thinking
Critical Thinking
Integrity and Work Ethics
Self-awareness and Self-reflection
Self-direction and Self-management

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Competencies
Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Method-specific Competencies

Self-awareness and Self-reflection
Self-direction and Self-management

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Only for Biotechnologie Master, Programme Regulations 2021 or doctoral students of D-BSSE.
Abstract: This course provides an overview of modern concepts of bioengineering across different levels of complexity, from single molecules to systems, microscaled reactors to production environments, and across different fields of applications.

Objective: Students will be able to recognize major developments in bioengineering across different organisms and levels of complexity and be able to relate it to major technological and conceptual advances in the underlying sciences.

Content: Molecular and cellular engineering; Synthetic biology; Engineering strategies in biology; from single molecules to systems; downscaling bioengineering; Bioengineering in chemistry, pharmaceutical sciences, and diagnostics, personalized medicine.

Lecture notes: Handouts during class

Literature: Will be announced during the course

Competencies: Subject-specific Competencies

**Abstract**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**Objective**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**[Part I on Moodle](#)**

The self-paced e-learning course on Moodle consists of 5 modules:

1. **Module 1: Ethics**
   - Introduction to moral theory (with emphasis on practical guidance regarding decision making)

2. **Module 2: Ethics in scientific research**
   - Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

3. **Module 3: Collecting resources**
   - A variety of tools and resources that help identify ethical issues are presented and explained

4. **Module 4: Setting up a strategy**
   - Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

5. **Module 5: Making decisions**
   - Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

**Part II**

The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
- **Method-specific Competencies**
  - Decision-making: assessed
- **Personal Competencies**
  - Critical Thinking: assessed
  - Integrity and Work Ethics: assessed

**Data:** 15.06.2024 12:39  |  **Autumn Semester 2024**  |  **Page 734 of 2653**
Abstract
This course (e-learning module followed by workshop) equips doctoral students with knowledge and tools to recognize, discuss and address ethical issues of their research.

Objective
Doctoral students learn how to identify, analyze and address ethical issues in their own research. They will also reflect on their professional role as scientists.

Content
This course introduces doctoral students to ethical issues that may occur during their research activities. After an introduction to ethics and good scientific practice, participants are familiarised with resources that can assist them with ethical decision-making (e-learning module on Moodle). In the second, face-to-face part, participants will have the opportunity to critically discuss their knowledge and share their experiences with fellow doctoral students in a discipline specific context.

Subject Specialisation

Doctorate Chemistry and Applied Biosciences

Further information at: https://www.ethz.ch/en/doctorate.html
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant questions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature.

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

**Objective**

**Lecture notes**

Unterlagen in der ersten Stunde verteilt.

**Prerequisites / notice**

Zugang mit Bewilligung des Dozenten

**Literature**

Varriert nach aktuellem Stand der Forschung

**Objective**

The students will understand how to use the tools needed to analyze simple highly resolved spectra. They will become familiar with experimental techniques in high resolution molecular spectroscopy and will understand how molecular spectroscopy can be applied to solve problems with respect to atmospheric pollutants and the detection of molecules in interstellar space.

**Content**

The students will learn how to record rotationally and rovibrationally resolved spectra in the THz and IR frequency range. For that purpose state-of-the-art sources like synchrotrons, FELs and other THz sources will be discussed. In this context, the basics of Fourier transform infrared spectroscopy will also be reviewed. The analysis of such spectra with interactive programs will then be explained. Finally, applications of high resolution molecular spectroscopy in the field of atmospheric and interstellar chemistry will be discussed. The identification and the quantitative determination of atmospheric pollutants will be discussed in detail. In addition, the identification of interstellar molecules in the context of the origin of life will be reviewed. The question of the identification of the interstellar unidentified infrared bands and of the interstellar diffuse bands will also be addressed. Finally, high resolution molecular spectroscopy of chiral molecules in the context of molecular parity violation will be discussed.

**Abstract**

Institut-Seminar covering current research topics in Physical Chemistry.
The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:
1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate...
This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant querions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selectin a topic for the final presentation and supporting literature.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

Data: 15.06.2024 12:39  Autumn Semester 2024  Page 742 of 2653
The lecture series takes place at the ETH Hönggerberg and covers a variety of major activities involved in drug discovery: selecting drug targets, technologies used in drug discovery, small, medium and large drugs, objectives of the medicinal chemist, assessing drug safety, principles of personalized medicine, designing clinical trials, how intellectual property is protected, as well as others.

The objective of the course is to gain a global understanding of most of the important phases in the discovery and development of modern synthetic and biological drugs, from the first activities to clinical trials. The lecture is intended for students that have an interest in the area and/or may consider a career working in drug discovery. This lecture course complements knowledge and experience gained in the research project performed by the Ph.D. student.

Thirteen two hour lectures for life-science PhD students and students of the Pharmaceutical Sciences Master, given by experts from the ETH, UZH, USZ and the pharmaceutical industry.

Introduction to the modern drug discovery process - Principles of drug pharmacokinetics and drug metabolism - Computer sciences in drug discovery - Drug targets - In vitro methods in drug discovery - Natural products in drug discovery - Medicinal chemistry: Chemical lead selection/optimization - Antibodies and therapeutic proteins: Targets and drugs - In vivo molecular imaging in drug discovery - Drug formulation: Key development consideration, Current new APIs challenges and FDA rising standards - Preclinical safety, adverse drug events and drug-drug interactions - Clinical development steps including trial design - Intellectual property in drug discovery and development

To be distributed during the lecture

Formally none, but a basic understanding in biochemistry, physiology and chemistry is highly desirable as it will certainly help to get the most from the lectures.

**Abstract**

Students learn how to effectively retrieve, critically judge, analyze, and manage published scientific information – important skill sets in chemistry and life sciences where scientists need to deal with vast amounts of information. The course, using practical examples, also covers scientific writing, visualizations, science communication and state-of-the-art technologies such as text mining.

**Objective**

Students are made aware about the wide variety of information solutions that exist today for all kinds of research processes, get an independent understanding of how they are derived and learn how to critically judge their quality. They learn how scientific communication works today and on which concepts and principles it is based. They develop the ability to select appropriate, subject-specific databases or tools for a given specific scientific question based on a sound understanding on how a tool or database has been developed and maintained, thus building the personal capacity of doing research effectively and efficiently by integrating scientific information into the research process when needed. Students learn how to evaluate information solutions, to build suitable search strategies and to integrate them in their information workflows. Also, they learn how to effectively communicate their own scientific results using various distribution channels and to measure the impact of their outreach activities. Overall, they gain the ability to perform all steps of the research cycle in a time- and cost-efficient manner, from the research strategy up to writing a first paper and their Ph.D. thesis.

**Content**

The course has been primarily designed for Ph.D. students, also for the Life Science Zurich Graduate School, but is also open to Master students. In a series of 12 units, which always include practical examples (for some lectures a notebook is required), the use of scientific information is taught not in a database-centric view but corresponding to the steps through which scientific research is conducted – including the dissemination of scientific results. This is particularly interesting for students who are about to write-up their first paper or thesis.

Students will learn about the different types of information resources and tools, get an insight into the numerous databases and tools that exists and how those are built and maintained, enabling them to critically judge the value and trustworthiness of an information resource. Additionally, they will learn how to communicate their own scientific results properly, using also additional measures that are reflected by alternative metrics.

The following topics are covered in twelve modules:

1. & 2. The world of scientific publishing: basics, publishing models
2. Searching and retrieving scientific information using search engines and literature databases
3. Searching and retrieving scientific information using subject-specific databases in chemistry and materials science
4. Searching and retrieving scientific information using subject-specific databases in life sciences
5. Tools for analyzing scientific information
6. Tools for managing scientific information and sharing knowledge, including pipelining tools
7. Patents
8. Text (literature) mining
9. Visualizing molecules for lab reports, presentations, posters, and publications
10. Scientific writing, good design & good scientific practice
11. Communicating & analyzing the impact of (your) science

**Lecture notes**

The slide deck and supplementary materials will be made available in the teaching document repository (ILIAS) after each lecture.

**Literature**

Additional literature and reference are provided in the course material.

Transferable Skills Course I (1 week, with Poster or Talk)  
Only for doctoral students.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course II (1 week, with Poster or Talk)  
Only for doctoral students.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course III (1 week, with Poster or Talk)  
Only for doctoral students.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Participation in Commission I (min 1 year)  
Only for doctoral students.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Participation in Commission II (min 1 year)  
Only for doctoral students.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Member of Executive Board (min 1 year)  
Only for doctoral students.

Objective
Active participation in the presidium or executive board of a university group for at least 1 year.

Abstract
Active participation in the presidium or executive board of a university group for at least 1 year.

Ethics and Scientific Integrity for Doctoral Students in Chemistry and Related Fields  
C. Copéret, S. J. Sturla

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.
Content

Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice)

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a Strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part of this course focuses on chemistry-specific aspects. It provides an interactive learning environment. Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Participation in summer or winter schools with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective
Participation in summer or winter schools with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

900-0156-DRL
Summer School I (1 week)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Participation in summer or winter schools with a minimum duration of 1 week.

Objective
Participation in summer or winter schools with a minimum duration of 1 week.

900-0157-DRL
Summer School II (1 week)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Participation in summer or winter schools with a minimum duration of 1 week.

Objective
Participation in summer or winter schools with a minimum duration of 1 week.

900-0158-DRL
Summer School III (1 week)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Participation in summer or winter schools with a minimum duration of 1 week.

Objective
Participation in summer or winter schools with a minimum duration of 1 week.

900-0159-DRL
Summer School I (1 week, with Poster or Talk)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Participation in summer or winter schools with a minimum duration of 1 week.

Objective
Participation in summer or winter schools with a minimum duration of 1 week.
### Abstract

The Role of Intellectual Property in the Engineering and Technical Sector

Abstract
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

| 851-0735-10L | Startups and Law              | W    | 2 credits | 2V    | P. Peyrot |
|              | Particularly suitable for students of D-ITET, D-MAVT. |
| Abstract     | The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions. |
| Objective    | The students shall obtain the following competence: - They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise. - They shall be able to contribute to the legal management of the company and to discuss legal issues. - They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company. |
| Lecture notes | A comprehensive script will be made available online on the moodle platform. |
| Competencies | Subject-specific Competencies: Concepts and Theories assessed |
|              | Method-specific Competencies: Analytical Competencies assessed, Decision-making fostered, Problem-solving assessed |
|              | Social Competencies: Communication fostered, Negotiation fostered |

| 851-0735-09L | Workshop & Lecture Series on the Law & Economics of Innovation | W    | 2 credits | 2S    | S. Bechtold |
|             | This series is a joint project by ETH Zurich and the Universities of St. Gallen and Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust, privacy & technology policy. Scholars from law, economics, management and related fields present their current research. All speakers are internationally well-known experts from Europe, the U.S. & beyond. |
| Abstract    | After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas. |
| Objective   | The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented. |
| Lecture notes | Papers discussed in the workshop and lecture series are posted in advance on the course web page. |

This colloquium offers an opportunity to discuss recent and ongoing research in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral, and social science.

The colloquium features presentations from internal and external researchers as well as presentations of doctoral students close to submitting their dissertation research plan.

The colloquium features invited presentations from internal and external researchers as well as presentations of doctoral students close to submitting their dissertation research plan.

The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to be involved in active research group.

The colloquium offers an opportunity to discuss recent and ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral, and social science.

The colloquium features presentations from internal and external researchers as well as presentations of doctoral students close to submitting their dissertation research plan.

The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to be involved in active research group.
Objective
Graduate student train and improve their presentation skills based on their own project ideas, all participants stay informed on current trends in the field and have the opportunity for networking with invited scholars.

851-0585-41L Computational Social Science

W 3 credits 2S D. Helbing, C. I. Hausladen, J. C.-Y. Yang

Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

851-0609-06L Governing the Energy Transition

W 2 credits 2V T. Schmidt, L. P. Fesenfeld

Primarily suited for Master and PhD level.

Autumn Semester 2024
This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socioeconomic, and political perspectives and applies various theoretical concepts to understand specific aspects of the governance of the energy transition.

**Objective**
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

**Content**
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary. This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions, and policy feedback. The grade will be determined by a final exam.

**Lecture notes**
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

**Prerequisites / notice**
This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

**851-0252-10L**

**Project in Behavioural Finance**

- **W** 3 credits 2S
- **S. Andraszewicz, C. Hölscher, A. C. Roberts**

**Abstract**
In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

**Objective**
This course has four main goals:
1. To learn about the most important topics within Behavioural Finance
2. To learn to effectively select, review and present information using modern telecommunication tools
3. To practice working on group projects in hybrid working conditions (online + in-person)
4. To solve an applied behavioral finance business case stemming from an industry partner

**Content**
The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare a presentation on core topics in behavioral finance. The point of this exercise is to critically select the most relevant information on a given topic and present to non-expert educated colleagues. At the same time, the audience learns about the key topics in behavioral finance. Every session involves a discussion moderated and supported by the lecturers.

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

**Prerequisites / notice**
Students from all domains of ETH and all levels of education are welcome in the course.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies

- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
  - Project Management

- **Social Competencies**
  - Communication
  - Cooperation and Teamwork
  - Customer Orientation

- **Personal Competencies**
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-direction and Self-management

**701-0015-00L**

**Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement**

- **W** 2 credits 1S
- **B. Vienni Baptista, C. E. Pohl, M. Staffacher**

**Abstract**
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

**Objective**
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**
The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.
Literature

Literature will be made available to the participants.
The following open access article builds a core element of the course:
available at (open access): http://www.ingentaconnect.com/contentone/oekom/gaia/2017/00000026/00000001/art00011

Further, this collection of tools will be used:
https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeidtoolkit.eu

Prerequisites / notice

Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00)

851-0252-13L Network Modeling

Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Abstract

Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective

The following topics will be covered:

- Introduction to network models and their applications
  - Stylized models:
    * uniform random graph models
    * small world models
    * preferential attachment models
  - Models for testing hypotheses while controlling for the network structure:
    * Quadratic assignment procedure regression (QAP regression)
  - Models for testing hypotheses on the network structure:
    * Models for one single observation of a network: exponential random graph models (ERGMs)
    * Models for panel network data: stochastic actor-oriented models (SAOMs)
The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content

The following topics will be covered:

- Introduction to network models and their applications
  - Stylized models:
    * uniform random graph models
    * small world models
    * preferential attachment models
  - Models for testing hypotheses while controlling for the network structure:
    * Quadratic assignment procedure regression (QAP regression)
  - Models for testing hypotheses on the network structure:
    * Models for one single observation of a network: exponential random graph models (ERGMs)
    * Models for panel network data: stochastic actor-oriented models (SAOMs)
    * Models for relational event data: dynamic network actor models (DyNAMs)
The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Prerequisites / notice

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

851-0252-15L Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.
**Objective**

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

**Content**

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

**Lecture notes**

Slides and lecture notes are distributed via the associated course moodle.

**Contract Design I**

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual language.

**Number of participants limited to 160. Max 80 ETHZ and 80 UZH Students**

**Abstract**

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we will take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

**Objective**

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

**For ETH students:** Your grade will consist of two parts:

1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project. UZH and UNISG students should check out the description of the class at their respective home institutions.

**Lecture notes**

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.
This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Studies are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

The lecture slides will be presented on the course Moodle after each lecture.
Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

Integrity and Work Ethics assessed
Self-awareness and Self-reflection assessed
Self-direction and Self-management assessed

Evidence-Based Design: Methods and Tools for Evaluating Architectural Design

W 3 credits 2S M. Gath Morad, C. Hölscher, L. Narvaez Zertuche, C. Veddeler

Abstract

Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Objective

The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Applied Network Science: Sports Networks

W 3 credits 2S U. Brandes

Abstract

We study applications of network science methods, this semester in the domain of sports. Topics are selected for diversity in sports, research questions, and techniques with applications such as passing networks, team rankings, or career trajectories. Student teams present results from the recent literature, possibly with replication, in a conference format.

Objective

Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on sports analytics, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.
Doctoral candidates from all ETH departments, whose research is related to global sustainable development issues, are invited to give a presentation about their ongoing work and discuss their doctoral project in a seminar with a diverse group of researchers. The seminar is open to all Master level / PhD students.

### Objective

- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.

### Content

The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

### Objective

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

### Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.
The course aims at providing students with practical knowledge and skill of processing, interpreting and analyzing empirical educational data, including different lenses through which to view the nature of inquiry in the field, research design, and an overview of quantitative, qualitative and mixed methods research.

The course will be centered around exploring methodological perspectives by focusing on conceptual aspects of datasets and experiments in the Learning Sciences. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, creating and justifying research designs, performing data analysis).

The course has the following components: a) Planning design-based research/research designs, b) Overview of quantitative, qualitative, mixed methods in Learning Sciences, c) Ethics of Learning Sciences research

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

By the end of this seminar, students will be able to identify and compare different approaches in (online) social network research. They will systematically review the relevant literature and present their arguments in a structured and coherent way.

Humans and Social Networks in the Digital Age

The digital transformation profoundly impacts humans and how they behave online and offline. Interactions in online social networks offer new opportunities (e.g., political movements, global cultural diffusion) and risks (e.g., fake news). In this seminar, we examine recent sociological and psychological research on how the digital transformation affects individuals and their social behaviors.

The digital transformation has made the “online world” increasingly important for the “offline world”. Hence, interactions in online social networks ultimately affect how people feel, think, behave and interact in offline settings. This course aims to present and structure open debates in online and offline social network research with a focus on social network processes, individual outcomes, and emergent social phenomena. By taking a social networks perspective, we view individuals and their behavior in online and offline settings, ethical challenges in conducting social networks research, the effects of the digital transformation on people’s feelings, thoughts, preferences, and behaviors (e.g., digital mental health), and how online social and cultural phenomena emerge (e.g., the diffusion of culture and the spread of social movements).

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners. Finally, the students will reflect on potential changes that results from the evaluations and their consequences.

Literature

Prerequisites / notice

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy". However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

Psychodelic Science: Psychology Pharmacology
Physiology Psychotherapy Philosophy Religion Politics

Abstract
This lecture series covers psychodelic science mainly psychologically, and additionally pharmaco logically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on from the viewpoint of the humanities and psychology.

Objective
To provide students with a multidisciplinary introduction to psychodelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.
Psychedelic science is a multidisciplinary field of study that involves scholars of the mind and scholars of the natural sciences. In this course, psychedelic science is presented mainly from the point of view of psychology, but will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected on from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants.

Private/illicit use of psychedelics is not a topic of this course.

A psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that is occasioned by classic (serotonergic) psychedelics such as psilocybin, mescaline, N,N-dimethyltryptamine (DMT), and lysergic acid diethylamide (LSD). Psychologically, the psychedelic experience can mainly manifest at the perceptual, cognitive, affective, volitional, and somesthetic level. The nonordinary perceptual spectrum ranges from visions (e.g., patterns or beings) to the subjective experience of an all-encompassing oneness, which also transcends the distinction between the perceiver and the perceived. The nonordinary cognitive spectrum ranges from no longer functioning thinking to very clear thinking, the nonordinary affective spectrum, for example, from deepest sadness to highest bliss, the nonordinary volitional spectrum from the feeling of being able to somewhat influence what is happening to the feeling of having no longer a will of one’s own, and the nonordinary somesthetic spectrum, for example, from feelings of bodily heaviness/compression to feelings of bodily lightness/floating.

Heuristically, as one possibility, a psychological typology of the psychedelic experience can be characterized to fall into three main types religious-like experiences (which may be interpreted religiously/spiritually by the individuals having them, but may also be interpreted materialistically or agnostically), autobiographical experiences, and tripartite-mind (cognition/affection/conation) miscellaneous experiences. Investigating the psychedelic experience is a worthwhile endeavor as, for instance, certain aspects of this experience have been associated with increased subjective well-being both for healthy individuals as well as for patients – for example, persisting positive effects on attitudes, mood, and behavior in healthy individuals and sustained symptom reduction in individuals suffering from depression, anxiety, and addiction.

Psychedelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the mind and scholars of the natural sciences to advance the scientific knowledge of it. In this spirit, this course will – besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist) – also involve further psychedelic-science scholars giving individual lectures in their respective field of expertise psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychiatry/psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. dr. sc. ETH Milan Scheidegger, University of Zurich), and philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter). Overall, this course will provide an informative overview of the research foundations that have made psychedelic science what it is today, and will also provide an identification of the research frontiers that must be addressed to expand the psychedelic science of tomorrow.
The objective is to analyze human-insect interactions by identifying key historical factors (economic, scientific, political). Students will integrate current frameworks in the study of environmental history through the combination of primary sources and interdisciplinary research. They will develop skills rooted in their interest in insects and learn to translate them into feedback to peers. Scholars typically approach Nature-related histories by focusing on environmental change, the commodification of resources, and the legacy of natural history collections. Examples of this approach include studies on deforestation, dam constructions, the rubber boom, and the colonial history of European museums. In contrast to these commonly explored topics, insects are often underrepresented in historical research, both as living creatures and metaphors. Addressing this gap, the seminar explores human-insect interactions from a global historical perspective between 1650 and 2000. This exploration encompasses a critical and relational understanding of the history of the scientific study of insects (entomology) and the processes of imperial expansion and global territorialization. To achieve this, students will learn how human-insect interactions led to radical transformations in diverse environments, reflecting a particular modern conception of nature influenced by control anxieties related to economic profit and tropical diseases. Moreover, students will examine how ways of knowing about insects and the environment were influenced by broader correlated economic and imperial factors. Focusing on insect (hi)stories, the aim of this seminar is to apply new methodologies for non-human agencies and source analysis on both micro and macro scales in global and environmental histories.

Literature in general can be seen as fundamentally concerned with the forms and functions of knowledge and (sometimes scientific) understanding, but the genre of science fiction is unique in that it literalises this approach in a far-reaching fashion as the future of science and technology. We will explore knowledge, and the "science of literature" through a diverse range of science fiction texts.

This course introduces students to the various forms and functions of knowledge and science in literature, particularly within the realm of science fiction, the genre that most directly epitomises this fundamental connection within literary texts. In analysing how it shifts our understanding of ourselves and of supposedly inalterable facts about the reality we inhabit, we will examine how science fiction demonstrates that fiction is neither fundamentally in conflict with scientific knowledge, as previously supposed, nor a mere vehicle for its celebration, as still commonly presumed of science fiction. Instead, the genre, with its radical investigations into other forms of being, fearing and hoping, plays a crucial role in the social formation, order and negation of knowledge. As such, science fiction also represents a vital thought experiment regarding the "science of fiction", i.e. the development of a knowledge of literature and the many fascinating ways in which it helps us to know our own world better, in turn.

In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly concerning its historical and cultural embeddedness, unique aesthetic/narrative tools, and relationship with the critical and technocultural contexts that shape it. Employing contemporary theoretical approaches, we will discuss a variety of themes within primary texts alongside diverse critical sources, all of which ultimately relate to knowledge and knowability. Particular areas of focus may include: other worlds and alien existences; altered temporality and alternate history; utopia and dystopia; climate fiction and the Anthropocene; trans-, posthumanist and cyborg identities; robots and AI; and alternative futurisms. Moreover, the course will thereby also engage with the fundamental (and at times overlooked) role of order and presentation of knowledge, i.e. its aesthetic and narrative forms, within science and literature.

The seminar explores insects as historical actors and their diverse interactions with human societies over time and space. It offers an overview of recent approaches in environmental history and multispecies ethnography while providing an analytical framework to understand global processes of natural resource exploitation, knowledge formation, and imperialism. This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

The seminar aims to inspire a nuanced understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activists’ movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements). 1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists’ movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.
### Content

Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power”.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the spectrum, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or it is suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists movements make up for a rich field of investigation on the dynamics of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist’s texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

### 851-0541-00L

**Truth and Historical Injustice: The Production of Knowledge about Past Mass Atrocities**

**W** 3 credits 2V S. M. Scheuzger

**Abstract**
The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

**Objective**
The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

**Content**
When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a basic prerequisite for living together in a democratic society under constitutional conditions. The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities. The course offers a brief introduction to the discussion about the meaning of truth about past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for the modelling of past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century to the 21st century in Europe, Latin America and Africa.

### 851-0456-00L

**Research in Ethics, Technology and Society**

**W** 2 credits 2S M. Boenig-Liptsin, G. Dörthe

**Abstract**
Through thematic discussions of readings, presentation and workshoping of writing-in-progress, and discussions with invited guests, this course brings together advanced students doing research is in science, technology and society to develop their knowledge and projects in community with peers, postdoctoral fellows, and faculty.

**Objective**
The objective of the course is to provide students doing their own research on topics in science, technology and society with focused peer-feedback and tailored theoretical and methodological discussions to support the development of their projects.

**Content**
The course is focused on content from STS and moral and political theory and develops empirical, qualitative, and interpretive social science methods, such as ethnography/participant observation, historical archival research, discourse and document analysis, and semi-structured interviews. Specific thematic, reading, methodological foci are determined by the group to meet the specific needs of each participant.

### 851-0392-00L

**Privacy Quantification and Usable Protection Mechanisms**

**W** 3 credits 2S N. Zufferer, V. Zimmermann

**Abstract**
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

### Content
First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

### 851-0527-00L Introduction to the History of Technology: Concepts, W 3 credits 2V R. Wichum and Current Debates

#### Abstract
Technology and society cannot be separated: No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

#### Objective
The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

#### Content
History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses derive from the technological and social change that are a product of contemporary orientation and thinking; current historiographical methods provide the tools for answering these questions.

### 851-0193-00L Understanding in Science and Mathematics: A W 2 credits 2S Philosophical Perspective

#### Abstract
Understanding is a central goal of science and mathematics, but what exactly is the nature of scientific and mathematical understanding? This seminar will read and discuss a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. You will also practice your skills in giving clear and engaging oral presentations.

#### Objective
The main objective of this seminar is to gain an in-depth understanding of the recent literature on understanding in the philosophy of science, the philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

#### Content
Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while mathematicians aim to increase our understanding of the mathematical world. But what exactly is the nature of understanding in science and mathematics? This issue has been largely neglected in twentieth century philosophy of science, philosophy of mathematics, and epistemology. Yet, in the past twenty years, there has been a regain of philosophical interest into the notion of understanding, leading to a flourishing literature. The aim of this seminar is to gain an in-depth understanding of these recent philosophical developments.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

### 851-0297-00L Manipulation in Literature and Cultural History W 3 credits 2V S. S. Leuenberger

#### Abstract
This lecture focuses on the manipulation and control of individuals and the masses. The power of manipulation is based on subtle use of persuasive linguistic elements and knowledge of the desires and fears of the intended audience. In addition to a theoretical overview, the lecture concentrates on the literary and discursive texts that dispute the control of protagonists. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

<tr>
<td></td>
<td>Part I on Moodle</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The self-paced e-learning course on Moodle consists of 5 modules:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 1: Ethics</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Introduction to moral theory (with emphasis on practical guidance regarding decision making)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 2: Ethics in scientific research</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 3: Collecting resources</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- A variety of tools and resources that help identify ethical issues are presented and explained</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 4: Setting up a strategy</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 5: Making decisions</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>For doctoral students only.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>

**ECTS**: European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
Module 1: Current topics in translational medicine presented by speakers from academia and industry. The basic course in "Good Clinical Practice" (GCP) contains two full-time training days (Module 1 and Module 2) and addresses:

- Timely and concise presentations of postgraduate students, post-docs, senior scientists, professors, as well as external guests from both ETHeart Joint Scientific Colloquium (Autumn Semester) and ETHeart projects, followed by lectures on chosen topics of cardiovascular medicine and research given by leading international academics and industry.

The course consists of two modules.

Module 1: Movement.
- Acquire knowledge about the latest technological advancements in wearable and unobtrusive technologies for sports and health.
- Objective 2: Acquire skills to design novel non-invasive technologies for sport and health.
- The course consists of two modules.

Module 2: Cardiac.
- This module focuses on the latest technologies for monitoring the cardiac cycle and blood pressure. The module starts by succinctly providing background information on cardiac physiology and then briefly introduces conventional technologies used in daily practice. This module subsequently focuses on the latest technologies and the latest data analysis techniques to monitor the cardiac cycle for assisting individuals in sport activities or monitoring their health conditions.

---

<tr>
<td>Abstract</td>
<td>The basic course in &quot;Good Clinical Practice&quot; (GCP) contains two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities. Students will get familiar with: - Key Ethics documents - (Inter)national Guidelines and Laws (e.g., ICH-GCP, DIN EN ISO 14155, TPA, HRA) - Sequence of research projects and project-involved parties - Planning of research projects (statistics, resources, study design, set-up of the study protocol) - Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH) - Roles and responsibilities of project-involved parties Students will learn how to: - Classify research projects according the risk-based approach of the HRA - Write a study protocol - Inform participating patients/study subjects - Obtain consent by participating patients/study subjects - Classify, document and report Adverse Events - Handle projects with biological material from humans and/or health-related personal data</td>

Artificial Intelligence in Rehabilitation and Healthcare

**Abstract**
Students will delve into AI fundamentals (e.g., regression, classification, and deep neural networks) and their role in patient monitoring & personalized rehab. Collaborative projects offered by MedTech companies provide hands-on experience in developing and evaluating AI-driven solutions. This course will emphasise AI's explainability and ethical dimensions fostering its critical analysis.

**Objective**
1. Evaluate the effectiveness of AI tools and algorithms in the context of rehabilitation and healthcare, and suggest modifications or improvements as needed.
2. Understand the ethical and legal considerations surrounding the use of AI in rehabilitation and healthcare and apply this knowledge to ensure patient privacy and data security.
3. Identify potential limitations and risks of using AI in rehabilitation and healthcare and propose strategies to mitigate these challenges.
4. Collaborate effectively with other students on group projects that involve developing and im-plementing AI-based rehabilitation and healthcare solutions.

**Content**
In the class ‘Artificial Intelligence (AI) in Rehabilitation and Healthcare’, we will explore the integration of advanced technology in the field of rehabilitation. The class consists of both theoretical and practical components. In the theoretical part, students are introduced to the fundamental concepts of artificial intelligence, including regressions and classification in machine learning, deep neural networks, and large language models. They will explore the applications of AI in rehabilitation and healthcare, including patient monitoring, personalized treatment plans, and predictive analytics.

- In the practical component, each student will work with one of the clinics or technology companies to identify real-world problems and gain hands-on experience in developing AI in rehabilitation and healthcare. The practical work will be done in the course room with student assistants and experts from the companies. They will use Python as main language on their own laptops with ready-to-use Jupiter notebooks that could have access to our lab's server if needed for computational resources. They will directly start using programming languages and tools to build models, analyze data, and create algorithms that can be used to improve patient outcomes.
- Throughout the class, students are encouraged to think critically about the ethical implications of using AI in rehabilitation. They examine the potential benefits and risks of using advanced technology in patient care and explore ways to mitigate potential negative outcomes.

**Prerequisites / notice**
- Required classes:
  - 401-0643-00L Statistik I
  - 401-0643-13L Statistik II
  - 376-1983-00L Foundations of Data Science
- Recommended courses:
  - 252-0842-00L Programmieren und Problemlösen

---

**Introductory Course in Neuroscience I (University of Zurich)**

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**UZH Module Code:** SPV0Y005

**Mind the enrolment deadlines at UZH:**
https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

**Objective**
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Content**
1. Human Neuroanatomy I &II
2. Comparative Neuroanatomy
3. Building a central nervous system I &II
4. Synapses I &II
5. Glia and more
6. Excitability
7. Circuits underlying Emotion
8. Visual System
9. Auditory & Vestibular System
10. Somatosensory and Motor Systems
11. Learning in artificial and biological neural networks

**Prerequisites / notice**
For doctoral students of the Neuroscience Center Zurich (ZNZ).

---

**Colloquium in Biomechanics**

**Abstract**
Current topics in biomechanics presented by speakers from academia and industry.

**Objective**
Getting insight into actual areas and problems of biomechanics.

---

**Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement**

**Abstract**
The lecture takes place if a minimum of 12 students register for it.

**Objective**
For doctoral students of the Neuroscience Center Zurich (ZNZ), or
- 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

**Prerequisites / notice**
- Course prerequisites:
  - For D-MAVT Master’s: none
  - For D-MAVT Master’s: none
  - For D-MAVT Master’s and PhD students:
    - • If BSc in electrical/mechanical engineering or computer science: none
    - • If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

---

**Notice**
For D-HEST Master’s and PhD students:
- None

For ITET Master’s:
- None

For Biomedical Engineering Master’s:
- None

For ITET Master’s:
- None

For Biomedical Engineering Master’s and PhD students:
- None
Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content
The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Literature will be made available to the participants.

The following open access article builds a core element of the course:
available at (open access): http://www.ingentaconnect.com/content/one/oekom/gaia/2017/00000026/00000001/art00011

Further, this collection of tools will be used:
https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeidtoolkit.eu

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00)

Content
- Principles of biomedical ethics and how they relate to pharmaceutical innovation
- Introduction to drug development, with a focus on the Swiss regulatory ecosystem
- Current trends and impediments to effective drug development, including the use of AI in drug discovery
- Translational medicine and its ethical implications
- Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips
- Ethical aspects of clinical research
- Special regulatory pathways: expanded access / compassionate use
- Special regulatory pathways: accelerated approval
- Drug development and public health. emergency use of new drugs
- Drug pricing: introduction to its regulatory and ethical aspects

Health Sciences and Technology

Only for doctoral students D-HEST.

Abstract
This course allows D-HEST PhD students to fulfill the requirements of the mandatory training in ethics. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

Objective
The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in relation to human health. The specific learning objectives of this course are:

- Identify ethical issues in in life sciences and biotechnology.
- Analyze and critically discuss ethical issues in life sciences and biotechnology.
- Become aware of relevant legal and public policy frameworks.
- Distinguish different ethical approaches and argumentative strategies in applied ethics.
- Recognize how ethical issues relate to different accounts of technology and innovation.
- Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
- Autonomously anticipate ethical issues.
- Propose and communicate solutions to ethical challenges and dilemmas.

Content
This course allows the students to autonomously decide among a broad list of topics specifically designed to be aligned with the scientific interests of D-HEST doctoral programs.

Competition

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Problem-solving
- Communication
- Sensitivity to Diversity
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication
- Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Ethics Workshop: The Impact of Digital Life on Society

Open to all Master level / PhD students.

Abstract
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

Objective
- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.

Content
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

Competition

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Ethics and Scientific Integrity for Doctoral Students

This course is interdisciplinary. If your department offers this course, please register there if possible.

Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Competition

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Data: 15.06.2024 12:39
Autumn Semester 2024
Page 777 of 2653
Content

Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
Method-specific Competencies
- Decision-making assessed
- Problem-solving assessed
Personal Competencies
- Critical Thinking assessed
- Integrity and Work Ethics assessed

900-0100-DRL Transferable Skills Course I (1-3 days) W 1 credit 2S Lecturers

## Subject Specialisation

### Creative Thinking Seminar

**Number** 227-0811-00L  
**Title** Creative Thinking Seminar  
**Type** W  
**ECTS** 2 credits  
**Hours** 2S  
**Lecturers** A. C. Notz

**Abstract**  
This seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositive we are embedded in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

**Objective**  
The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its contemporary significance, explore how Creative Thinking intersects with modern innovations and technologies. The students will develop a comprehensive understanding of Creative Thinking and its practical application, start to cultivate the ability to generate innovative solutions through creative practices and will analyze the broader implications of creativity in various contexts.

**Content**  
In the business world Creative Thinking is considered to be one of the “top ten skills” or “most In-Demand skill” in 2024. With Creative Thinking innovative solutions to problems are developed and not only a large number of ideas but also a variety and range of them are brainstormed. It seems that in today’s dynamic world, creativity isn’t just an asset – but actually necessity. But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity? And how can we use it. Or not. Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially innovation and maybe even in technological applications themselves. Today, not only because of creative economy, creative cities or innovation, but also because of generative AI creativity has gained new and broad attention. In the seminar we go back in history to the invention of the genius and look at different social subsystems like art, psychology, economy as well as field as fashion, advertisement and arts and crafts, how our understanding of creativity has emerged till today.

### Seminar in Theoretical Computer Science

**Number** 252-4202-00L  
**Title** Seminar in Theoretical Computer Science  
**Type** W  
**ECTS** 2 credits  
**Hours** 2S  
**Lecturers** A. Steger, B. Gärtner, M. Hoffmann, J. Lengler, D. Steurer

**Abstract**  
Presentation of recent publications in theoretical computer science, including results by diploma, masters and doctoral candidates.

**Objective**  
The goal is to introduce students to current research, and to enable them to read, understand, and present scientific papers.

**Prerequisites / notice**  
This seminar takes place as part of the joint research seminar of several theory groups. Intended participation is for students with excellent performance only. Formal restriction is: prior successful participation in a master level seminar in theoretical computer science.

### Big Data

**Number** 263-3010-00L  
**Title** Big Data  
**Type** W  
**ECTS** 10 credits  
**Hours** 3V+2U+4A  
**Lecturers** G. Fourny

**Abstract**  
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

**Objective**  
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts. "Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today’s technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Literature

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departmentes interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Abstract

Venture Capital is important to fund big transformational ideas and is often misunderstood by tech or research entrepreneurs. This lecture immerses participants in the role of a Venture Capitalist (VC) to learn from experienced entrepreneurs and investors. In small teams, you work on a case of a real start-up and defend the case in a simulated investment committee consisting of experienced VCs.

Objective

After attending this course, students will be able to:
- Explain the differences between VC and founder thinking
- Evaluate if a start-up is suited for venture capital ("VC readiness")
- Evaluate founder friendliness of term sheets
- Determine funding needs & strategy for a start-up from research to first round
- Write and evaluate an investment memo

263-5053-00L  Technology Investing  W  2 credits  3S  A. Ilic, C. Jurytiko

Autumn Semester 2024
The course is practically oriented and features guest speakers from leading venture capital firms and start-ups. The course embraces a unique perspective combining technology and investor thinking. The seminar is structured around five days with the following themes.

The detailed program is listed here: https://bit.ly/techinvesting23

The macro picture. Why does venture capital exist? What are major tech break-through areas and their disruptive potential? We also review the differences in the US and European perspective as well as developments towards more impact and diversity conscious funds.

A peek into the mind of a VC. How to build a successful VC? Learn what key factors & processes required to build a successful venture capital company. This includes strategic decisions for investment thesis, structure of a fund, portfolio economics, valuation & ownership targets, cap table. In addition, we introduce the fundamentals of the investment process (including due diligence, term sheets, and deal memo) as well as portfolio management.

The founder’s perspective. Why should you raise venture capital and how? Learn to evaluate the founder friendliness of terms, company approach, strategic decisions, negotiation and valuation.

Fundraising types. Learn about different types of funding and their implications. This includes an overview of the Swiss ecosystem and a discussion of the different types (grants, equity, loans, SAFE, crowd, …). We also include a practical session on crypto technology for modern fund-raising using launchpads and tokenized shares.

Tying it all together. The last day is focused on simulating an investment committee meeting where the groups present their deal memos and discuss with the audience.

263-5054-00L Patenting Digital Innovations

<table>
<thead>
<tr>
<th>Objective</th>
</tr>
</thead>
<tbody>
<tr>
<td>After attending this course, students will be able to:</td>
</tr>
<tr>
<td>- Understand the basics of patenting in the digital space relevant for a global market</td>
</tr>
<tr>
<td>- Evaluate patenting opportunities with a more differentiated view on the topic</td>
</tr>
<tr>
<td>- Effectively use patents as a cost-effective part of a technology startup’s business plan</td>
</tr>
<tr>
<td>- Conduct patent searches, freedom-to-operate analysis and infringement analyses</td>
</tr>
<tr>
<td>- Write their first software/AI-related invention disclosure suitable for patenting</td>
</tr>
</tbody>
</table>

Content

The course is focused on patenting digital innovations. It is designed for students with entrepreneurial interests that like to get a hands-on perspective on the topic of intellectual property strategies and patents.

The seminar includes presentations and practical group exercises to apply the acquired knowledge in practice. Entrepreneurs and leading IP experts are joining the seminar as guest speakers for discussion of real-life examples.

Topics that will be covered include:
- Best practices that any AI/software startups should know about IP and patents
- How investors evaluate a strong IP situation of a start-up
- How to efficiently monitor competitor patent activity and obtain “FTO”
- How to create an effective patent filing strategy that grows with the business
- How to efficiently create AI patents while not getting distracted from the founder’s core business

The course also contains a group work of a “FTO battle” where two teams compete in a freedom-to-operate analysis and individual work to write their first invention disclosure related to an AI or software topic.

263-5057-00L From Publication to the Doctor’s Office

<table>
<thead>
<tr>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.</td>
</tr>
</tbody>
</table>

Objective

Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to “bedside” – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

**Competencies**

- Subject-specific Competencies: fostered
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies: fostered
  - Analytical Competencies
  - Communication
- Social Competencies: assessed
  - Cooperation and Teamwork
  - Leadership and Responsibility
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
- Personal Competencies: fostered
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics

**Prerequisites / notice**

The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

**Abstract**

This course provides theoretical and practical insights into technology entrepreneurship. It focusses on the process of building new ventures from the idea to successfully scaling its business operations.

**Objective**

Students will develop internationally scalable and technology-based ventures using the Startup Navigator and ScaleUp Navigator Framework. They will learn how to structure and communicate these ideas to business angel and venture capital investors.

**Content**

This course provides theoretical and practical insights into technology entrepreneurship. It focusses on the process of building new ventures from the idea to successfully scaling its business operations. All tasks will lead students to give a complete pitch presentation in front of business experts and investors at the end of the seminar. The course structure will broadly follow the four dimensions of the St.Galler Startup NavigatorTM.

- Profiling (Problem-Solution-Fit): Here, students will learn to answer questions such as (1) what is your motivation to start a business? (2) What is the real customer problem? (2) What solution can be identified? (3) Who are the customers? (4) What is the job they need done? etc.
- Prototyping (Product-Market-Fit): After this section, students will be able to answer questions such as (1) What is the product or service that solves a customer need? (2) What is the value proposition? (3) What is the unique selling proposition? (4) What is the go-to market strategy? (5) Who are the competitors? etc.
- Sourcing (Execution-Fit): Here, students will learn to address questions such as (1) What are important team roles? (2) How to leverage network and partners? (3) What are the requirements to execute the business? (4) Are there any IP-related challenges? (5) How may we co-create with others? etc.
- Scaling (Performance-Fit): In this section, students will reflect their concept in terms of scalability. They will learn to answer questions such as (1) How do we create purpose-driven culture for growth? (2) How do we scale-up revenues? (3) How do we optimize our startup’s valuation in Series-X funding? (4) What kind of exit options are there?

As a result, students develop internationally scalable and technology-driven businesses in teams. The special focus lies on the ability to successfully pitch these ventures to business angels or venture capital investors.

**Literature**

- Course slides and case-based literature provided by the instructor.
- Additional material pointed out by the instructor prior to and during the course.
Abstract
In this doctoral seminar, current research at the Institute for Visual Computing will be presented and discussed. The goal is to learn about current research projects at our institute, to strengthen our expertise in the field, to provide a platform where research challenges can be discussed, and also to practice scientific presentations.

Objective
This course is designed to help junior researchers in Computer Science develop the skills needed to write their first research articles and/or their Doctoral Plan. Participants will be expected to produce several short texts as homework assignments, so ideally they will already be working on writing about their research in English when they take the course. Assignment submissions can include sections of the Doctoral Plan as well as sections of research articles and conference papers. Participants will receive individual feedback on these texts during the course, both from the instructor and from their peers.

Content
Participants will be expected to produce several short texts as homework assignments, so ideally they will already be working on writing about their research in English when they take the course. Assignment submissions can include sections of the Doctoral Plan as well as sections of research articles and conference papers. Participants will receive individual feedback on these texts during the course, both from the instructor and from their peers.

Part 1: Part 1 will provide an introduction to the course, and will then focus on using model texts, improving vocabulary and phrasing, and constructing reader-friendly sentences.

Part 2: We will discuss structural decisions about research articles in different journals, review the basics of paragraph structure and organization, and examine how to create better flow in a text.

Part 3: We will work on creating successful introductions, integrating the literature, and writing abstracts.

Part 4: Part 4 will address the main content and grammar concerns of writing about methods and results, and review key grammar concepts for writing complex sentences.

Part 5: We will look at how to construct discussion and conclusion sections and how to strike the right tone of caution/confidence. We will then discuss the editing process, preparing articles for submission, and responding to reviewers' comments.

All sessions will involve group work and peer review of participants' writing.

Content
Current research at the IVC will be presented and discussed.

Prerequisites / notice
This course requires solid knowledge in the area of Computer Graphics and Computer Vision as well as state-of-the-art research.

264-5812-00L
Doctoral and Research Writing in Computer Science A Z

Abstract
This course is designed to help junior researchers in Computer Science develop the skills needed to write their first research articles and/or their Doctoral Plan.

Objective
This short course (5 x 4-lesson workshops) is designed to help doctoral students develop the skills needed to write their first research articles, conference submissions and proposals. The course will help participants to:
- understand the needs of different target readerships,
- manage the writing process efficiently,
- structure texts effectively,
- produce logical flow in sentences and paragraphs,
- edit texts before submission, and
- revise texts in response to colleagues' feedback and reviewers' comments.

Content
Participants will be expected to produce several short texts as homework assignments, so ideally they will already be working on writing about their research in English when they take the course. Assignment submissions can include sections of the Doctoral Plan as well as sections of research articles and conference papers. Geometry for Computational Design and Fabrication

Abstract
The main intention of the course is to present geometric concepts that turned out to simplify the solution of problems in computational design and fabrication and hold promise to provide useful methodology for future research in this area.
We will meet for the mandatory kick-off meeting online in October. You will get detailed information together with the invitation email in the

### Ethics and Scientific Integrity for Doctoral Students

**Number**: 851-0178-00L  
**Title**: Ethics and Scientific Integrity for Doctoral Students  
**Type**: W  
**ECTS**: 1  
**Hours**: 2U  
**Lecturers**: G. Achermann

#### Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

#### Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

#### Content

- **Part I on Moodle**
  - The self-paced e-learning course on Moodle consists of 5 modules:
    - Module 1: Ethics  
      - Introduction to moral theory (with emphasis on practical guidance regarding decision making)
    - Module 2: Ethics in scientific research  
      - Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).
    - Module 3: Collecting resources  
      - A variety of tools and resources that help identify ethical issues are presented and explained
    - Module 4: Setting up a strategy  
      - Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
    - Module 5: Making decisions  
      - Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

- **Part II**
  - The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

#### Prerequisites / notice
For doctoral students only.

- The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).
- Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

### Learning to Teach

**Number**: 851-0373-00L  
**Title**: Learning to Teach  
**Type**: W  
**ECTS**: 2  
**Hours**: 2U  
**Lecturers**: M. Lehner, B. Volk

#### Abstract
This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities.

#### Objective
In this course Doctoral Teaching Assistants will...

- discuss learning science and teaching techniques with peers.
- design the introduction of their course/lecture/exercise class.
- develop learning activities according to learning objectives.
- practice classroom assessment techniques in order to measure student learning.
- engage in peer feedback in order to improve own teaching.

#### Content
We will meet for the mandatory kick-off meeting online in October. You will get detailed information together with the invitation email in the first week of the semester. The online phase, where you work through 6 modules in the Moodle course page will end in November. We will meet also face-to-face for the Consolidation workshop. You will find more information on the course page in Moodle.

#### Prerequisites / notice
This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities (exercises, excursions, supervision of practicals, lectures, etc.) or those who will assume teaching tasks in the semester following the programme. No previous teacher training is required.
Competencies

Subject-specific Competencies
- Concepts and Theories: fostered
- Media and Digital Technologies: fostered

Method-specific Competencies
- Communication: fostered
- Cooperation and Teamwork: assessed
- Adaptable and Flexible: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Self-presentation and Social Influence: fostered
- Negotiation: assessed

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Cooperation and Teamwork: fostered
- Self-presentation and Social Influence: fostered

Competencies

851-0745-00L Ethics Workshop: The Impact of Digital Life on Society

Open to all Master level / PhD students.

Abstract
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

Objective
- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Work in a more ethically reflective way.

Content
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Media and Digital Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Self-presentation and Social Influence: fostered
- Negotiation: assessed

Personal Competencies
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered

Course units in Humanities, Social and Political Sciences
Educational Science for Teaching Diploma and TC
Language Courses ETH/UZH: see Science in Perspective
Course units in Management, Technology and Economics

900-0100-DRL Transferable Skills Course I (1-3 days)

Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

900-0101-DRL Transferable Skills Course II (1-3 days)

Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

900-0102-DRL Transferable Skills Course III (1-3 days)

Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.
Abstract: Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective: Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

<td></td>
<td>This course provides a thorough treatment of integrated data conversion systems from system level specifications and trade-offs, over architecture choice down to circuit implementation.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>Data conversion systems are substantial sub-parts of many electronic systems, e.g. the audio conversion system of a home-cinema systems or the base-band front-end of a wireless modem. Data conversion systems usually determine the performance of the overall system in terms of dynamic range and linearity. Students will learn the underlying principles of data conversion and be introduced to the different methods and circuit architectures to implement such a conversion. The conversion methods such as successive approximation or algorithmic conversion are explained based on their operation principle accompanied with the appropriate mathematical calculations, including effects of non-idealities in some cases. After successful completion of the course students should understand the concept of an ideal ADC, know all major converter architectures, their principle of operation and what governs their performance.</td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
<td>- Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic representation; basic conversion algorithms; data converter application; tradeoffs among key parameters; ADC taxonomy. - Dual-slope &amp; successive approximation register (SAR) converters: dual slope principle &amp; converter; SAR ADC operating principle; SAR implementation with a capacitive array; range extension with segmented array. - Algorithmic &amp; pipelined A/D converters: algorithmic conversion principle; sample &amp; hold stage; pipe-lined converter; multiplying DAC; flash sub-ADC and n-bit MDAC; redundancy for correction of non-idealities, error correction. - Performance metrics and non-linearity: ideal ADC; offset, gain error, differential and integral non-linearities; capacitor mismatch; impact of capacitor mismatch on SAR ADC's performance. - Flash, folding an interpolating analog-to-digital converters: flash ADC principle, thermometer to binary coding, sparkline correction; limitations of flash converters; the folding principle, residue extraction; folding amplifiers; cascaded folding; interpolation for folding converters; cascaded folding and interpolation. - Noise in analog-to-digital converters: types of noise; noise calculation in electronic circuit, kT/C-noise, sampled noise; noise analysis in switched-capacitor circuits; aperture time uncertainty and sampling jitter. - Delta-sigma A/D-converters: linearity and resolution; from delta-modulation to delta-sigma modulation; first-order delta-sigma modulation, circuit level implementation; clock-jitter &amp; SNR in delta-sigma modulators; second-order delta-sigma modulation, higher-order modulation, design procedure for a single-loop modulator. - Digital-to-analog converters: introduction; current scaling D/A converter, current steering DAC, calibration for improved performance, delta-sigma D/A-converters.</td>

Data: 15.06.2024 12:39 | Autumn Semester 2024 | Page 794 of 2653
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

Subject-specific Competencies
- Concepts and Theories
- Technics and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

Sufficient mathematical maturity, in particular in linear algebra, analysis.

Available on the course Moodle platform.

A comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

- Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis: basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

Comprehensive copy of transparencies

Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Experience with Linux, low-level systems programming and computer architecture.

This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks.

By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Experience with Linux, low-level systems programming and computer architecture.

This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

Carbon-based Nanoelectronics

This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.
Objective
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

On the theoretical side, we'll cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We'll also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we'll cover how such devices are fabricated, including how the materials are synthesized. We'll also discuss how to characterize the devices and assess their performance.

Content
The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student on a related scientific publication. This presentation is compulsory and accounts for 50% of the grade.

Lecture notes
Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

In addition to the slides, the following supplementary books can be recommended:

Prerequisites / notice
A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

227-0671-00L Nanodevices and Circuits for the Beyond-Moore Era

Abstract
Big Data, AI and the Internet of Things demand new hardware which overcomes the limitations of von Neumann architectures. The lecture gives an insight how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives. Their increased computational power and energy efficiency are demonstrated through neuromorphic computing applications.

Objective
The students will gain a firm understanding in the theory and pioneering experiments of electronic and heat transport at atomic-to-nanometer length-scales. Advanced device functionalities enabled by recently discovered material systems will be covered. The students will learn how to exploit such phenomena for designing nanodevices and circuits to energy-efficiently implement neuromorphic algorithms for a sustainable future of information technologies.

Lecture notes
The presentation slides and further material will be provided every week.

Prerequisites / notice
Basic knowledge of solid state physics and semiconductors.

227-0689-00L System Identification

Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Literature
Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Additional papers will be available via the course Moodle.

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

227-0955-00L Seminar in Electromagnetics, Photonics and Terahertz

Abstract
Selected topics of the current research activities at the IEF and closely related institutions are discussed.
Objective

Have an overview on the research activities of the IEF institute.

Abstract

Advanced Machine Learning

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

---

Objective

In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes. The main learning objectives are:

- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has fostered the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications. The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

401-3055-64L Algebraic Methods in Combinatorics

Abstract
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

The course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments
- Spaces of polynomials and tensor product methods
- Eigenvalues of graphs and their application
- The Combinatorial Nullstellensatz and the Chevalley-Warning theorem
- Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

401-5680-00L Foundations of Data Science Seminar

Abstract
Research colloquium

The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and to the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications. The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

<td>Ethics in Technology</td>
<td>W</td>
<td>2</td>
<td>2V</td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Should we use this technology or not? What are the ethical opportunities and risks of this technological application? Should we always pursue all that is technically possible? What is ethics? How do ethics and technologies relate to each other? Does ethics hinder technological progress? How can ethics foster innovation? Which ethical theory should we apply in a global research-context? The course in times of fast technological progress and rapid technology-based innovation, being able to distinguish on ethical grounds what is technically feasible from all that is technically possible proves to be essential for a humane and sustainable future for humanity and for the planet. The aim of this introductory course is to introduce the ethics of technology by discovering different ethical theories and models while applying them to concrete technological innovations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course considers the correlation between ethics and technologies. The relationship of ethics and technologies will be explored as reciprocal, with each contributing to the other. Applications of groundbreaking technologies often reshape the ethical environment by creating new solutions to societal challenges and new value. At the same time, scientists and technologists all perform their work within an ethically informed context. Meanwhile, ethics contributes to technology by stimulating technological innovation, by recognizing technological inventions, and by providing ethical guidance. Ethics bears on technology even by setting the parameters in which research, discussions, and studies can be conducted. No one should delude themselves that freedom of research cannot be infringed. New ideas and discoveries have always faced suppression on ethical grounds, because they represent challenges to putative “absolute truths” or undermine the enforcement of economic or political power structures. Even in today’s world, the danger of members of the technology community not being able to conduct their research freely and independently still exists. At the same time, ethics can limit technology as well. For example, health and safety guidelines, patents, intellectual property rights, competition policy, consumer protection, and ethical codes of conduct belong to this category. This impact of ethics can be perceived as blocking and hindering technological innovation. In reality, ethics is only informing the innovation process that not everything that is doable is ethically good and should be done. At this point, different ethical theories and models need to be considered in order to gain ethical guidance.</td>

The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its contemporary significance, explore how Creative Thinking interacts with modern innovations and technologies. Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially in innovation and maybe even in technological applications themselves. Today, not only because of creative economy, creative cities or innovation, but also because of generative AI creativity has gained new and broad attention. In the seminar we go back in history to the invention of the genius and look at different social subsystems like art, psychology, economy as well as field as fashion, advertisement and inventors will be brainstormed. It seems that in today's dynamic world, creativity isn't just an asset – but actually necessity. But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity? And how can we use it. Or not.

Part I

The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II

The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice

For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

227-0811-00L Creative Thinking Seminar

W 2 credits 2S A. C. Notz

Abstract

This seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositive we are embedded in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

Objective

The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its contemporary significance, explore how Creative Thinking interacts with modern innovations and technologies. The students will develop a comprehensive understanding of Creative Thinking and its practical application, start to cultivate the ability to generate innovative solutions through creative practices and will analyze the broader implications of creativity in various contexts.

Content

In the business world Creative Thinking is considered to be one of the “top ten skills” or “most In-Demand skill” in 2024. With Creative Thinking innovative solutions to problems are developed and not only a large number of ideas but also a variety and range of them are brainstormed. It seems that in today's dynamic world, creativity isn't just an asset – but actually necessity. But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity? And how can we use it. Or not.

- Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially in innovation and maybe even in technological applications themselves. Today, not only because of creative economy, creative cities or innovation, but also because of generative AI creativity has gained new and broad attention. In the seminar we go back in history to the invention of the genius and look at different social subsystems like art, psychology, economy as well as field as fashion, advertisement and arts and crafts, how our understanding of creativity has emerged till today.

900-0100-DRL Transferable Skills Course I (1-3 days)

W 1 credit 2S Lecturers

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Hacking for Science is a guide to programming with data. It is tailored to the needs of a field in which scholars’ typical curricula do not foster interdisciplinary collaboration, as source code continues to become an important communication channel.

The course contains three blocks that are mostly based on the three learning objectives presented above. Hacking for Science teaches how to use git version control to collaborate professionally, make your research reproducible and your code base persistent.

- Applied data sourcing and data transformation
- Learn how to communicate with SQL databases. Learn how to consume data from different sources using machine to machine communication interfaces (APIs) such as the OpenStreetMap geocoding API / Routing Engine or the KOF data API for macroeconomic time series.

Non-Goals:
Hacking for Science is not a Statistics, Econometrics or Machine Learning course. Though experience in these fields will help inasmuch that students will have an easier time to motivate investing in programming and to come up with their own application examples, profound methodological knowledge is not a prerequisite.

Content
Hacking for Science is a guide to programming with data. It is tailored to the needs of a field in which scholars’ typical curricula do not contain a strong programming component. Yet this course argues that what the open source community calls a ‘software carpentry’ level is totally within reach for a quantitative social scientist and well worth the investment: being able to code leverages field specific expertise and fosters interdisciplinary collaboration, as source code continues to become an important communication channel.

The course contains three blocks that are mostly based on the three learning objectives presented above. Hacking for Science explicitly plans to spread its three blocks over 1-2 months to give students the ability to work on applied examples in between sessions in order to get most out of the subsequent session.

The first block demonstrates the components of a modern data science tech stack, classifies technologies and gives a big picture overview: from languages such as R and Python to container technology such as docker. The second block focuses on git version control, the de facto industry standard to manage source code. Version control is not only crucial to knowledge management and reproducible research, but it is also the backbone of collaboration in distributed teams. The third and final block focuses on data themselves and teaches how to obtain data through machine to machine communication. Furthermore, the third block discusses data management in a research project.

Lecture notes
A free and open online book (made with quarto) is available from https://rse-book.github.io/. The book/script will be continuously updated during the course to account for questions and participants’ questions.

All course materials including, slides, resources and source code will be made available through the course Website: https://rseed.ch/h4sci.html
Abstract
The purpose of this course is to review and discuss issues in current theory and research relevant to innovation in the digital space.

Objective
Through in-depth analysis of published work, doctoral candidates will identify and appraise theoretical and empirical studies, formulate research questions, and improve the positioning of their own research within the academic debate.

Content
The Internet has a twofold impact on the way individuals and firms innovate. First, firms increasingly draw on digital technology to access and capture innovation-relevant knowledge in their environment. Second, individuals, firms, and other organizations extensively utilize the Internet to create, diffuse, and commercialize new digital products and services. During the past decade, theory and research on innovation in the digital space has flourished and generated extensive insights of relevance to both academia and management practice. This has brought us better understanding of working models, and some fundamental reasons for innovation success or failure. A host of new models and research designs have been created to explore the innovation in the digital space, but these have also brought out many open research questions. We will review some of the existing streams of work, and in the process explore a new research agenda.

Format:
The course is organized in one block of 2 days. The course is a combination of pre-readings, presentations by faculty and students, and discussions. The students prepare presentations of papers in order to facilitate analysis and discussion.
Literature

Open source (OS) as innovation model

Coordination in OS communities

Governance & Leadership

Motivation to collaborate

Methods in Management Research: Methodological Fit
364-1013-06L Marketing Theory ▬ W 2 credits 1G F. von Wangenheim
Abstract
The course is taught Florian Wangenheim (ETHZ)

Objective
The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for understanding and explaining buyer and customer behavior in response to marketing action.

Content
In the first class, current understanding of the marketing literature and marketing thought is discussed. In the following classes, various theories are discussed, particularly in light of their importance for marketing. Economic, psychological, and sociological theory will be related to current marketing thought.

364-1013-05L Organizational Behavior

W 1 credit 1S

Abstract
Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, and leadership. In this PhD course, an overview of major concepts and research insights in organizational behavior is provided. The participants are encouraged to discuss their own work situation as PhD students in relation to the OB insights covered in the course.

Objective
The objectives of the course are:
• to provide an overview of OB research
• to discuss major research streams in OB
• to enable students to reflect their own work situation based on concepts used in OB.

Competencies Subject-specific Competencies

Concepts and Theories addressed
Techniques and Technologies fostered
Method-specific Competencies

Analytical Competencies addressed
Decision-making fostered

Personal Competencies

Creative Thinking addressed
Critical Thinking fostered
Self-direction and Self-management fostered

364-1020-01L Methods in Management Research: Methodological Fit

W 1 credit 1S

Abstract
This course covers available methodologies and research design in management research, measurement and validity issues, and a broad overview of the main quantitative and qualitative methods. Students will reflect on the fit between research question and research design in their own research field.
Objective
The course aims to support students in:
- knowing basic quantitative and qualitative research methods
- understanding what data each method needs and what outcomes it can provide, as well as its advantages and disadvantages
- understanding how to link a research question to an appropriate research design and method
- acquiring a basic understanding of how each method works (e.g., which software to use)
- having an idea of how to apply these methods to one's own research
- having a group of peers to share ideas and feedback with

Content
This course covers basic methodological topics relevant to research in the management field, including available methodologies (inductive, deductive) and research design (e.g., interviews, field survey, lab experiment, secondary data), the definition and measurement of constructs, validity, the choice of data collection and data analysis methods. A broad overview of the main quantitative (ANOVA, regression, path analysis, SEM, multilevel models, growth models) and qualitative methods (thematic analysis, grounded theory) currently used in management research will also be provided, together with a brief analysis of the advantages and disadvantages of each method.

Topics related to research design, including pre-registration, power analysis, and data management, as well as level of analysis and temporal issues (in particular related to data collection) can also be discussed, depending on the interest of the class. Finally, the course will cover fit between research question, research design, and methods of data analysis.

Literature
(Refer to Syllabus and Moodle)

Prerequisites / notice
Students should: (1) Be able to read and understand academic papers, including both empirical papers and method papers, to facilitate and actively participate to the class discussions; (2) Download SPSS and R + R Studio before the course to be able to conduct hands-on exercises in class; (3) complete a short survey that the instructor will share before the course, with he goal of optimising course organisation.

ECTS 3 credits

364-1154-00L Technology Innovations and Sustainability Transitions

W Dr 3 credits 2S J. Markard

Abstract
Intro to sustainability transitions: fundamental socio-technical changes in sectors such as energy or transport with the intention to improve sustainability. We discuss past and contemporary transition examples (e.g. net-zero energy transition), key concepts & frameworks and challenges for research and policy making.

Objective
The course provides a better understanding of innovation, transition and sustainability challenges. After completing this course, students will:
- understand the particularities and complexities of selected empirical examples of sustainability transitions,
- become familiar with key concepts and frameworks of research in sustainability transitions and innovation studies,
- know the relevant literature on transition studies and adjacent fields (corporate sustainability, policy analysis) and
- be able to apply the new knowledge, e.g. to design a research project in the field.

Content
Societies are confronted with major sustainability challenges such as climate change, resource depletion, water pollution, or loss of biodiversity. To address these challenges, we need fundamental changes in how we produce and consume things. We need to transform incumbent organizations vs newcomers, the multi-level perspective, politics of transitions and sustainability transition policies. We will read, present and discuss peer-reviewed literature and we will develop and discuss ideas for potential research projects.

In the course, we will familiarize ourselves with key concepts and topics including ‘classic’ innovation theory, innovation systems, incumbent organizations vs newcomers, the multi-level perspective, politics of transitions and sustainability transition policies. We will read, present and discuss peer-reviewed literature and we will develop and discuss ideas for potential research projects.

Format:
The course will consist of 2*90min sessions on Monday afternoons. There is a combination of preparatory reading, presentations by faculty and students, short papers, and discussions.

Attendance is required in all sessions.

Slides reserve Mondays, 2-5pm. Some Mondays might be free, some meetings will be shorter (also depending on enrolment).

Make sure you don’t miss the first session on February 20. This is when we will discuss and allocate student assignments.

364-1025-00L Advanced Microeconomics

E Econometrics 3 credits 2G A. Bommier

Abstract
The objective of the course is to provide students with advanced knowledge in some areas of micro economic theory. The course will focus on 1) Individual behavior 2) Collective behavior 3) Choice under uncertainty 4) Intertemporal choice.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 806 of 2653
The course is framed around papers that discuss or employ calibration, likely including:

- Calibration in Macroeconomics
- Understanding cutting-edge results of current research in the fields of the CER-ETH Professors.
- Macroeconomic models allow us to perform policy counterfactuals related to inequality, monetary policy, and trade. But to believe our predictions, the models’ parameters must be reasonable. Calibration is the process of choosing parameters (usually related to technology and preferences).
- Calibration in Macroeconomics

**Objective**

The purpose of the course is to show students how calibration is and has been used in quantitative macroeconomics. The predictions and implications of macroeconomic models – the costs of trade barriers, the causes of changes in inequality, the effects of fiscal and monetary policy shocks, and the consequences of sovereign default for example – depend on the underlying parameters. Typical parameters include consumer risk aversion and patience, firm and consumer elasticities of substitution, the variance and persistence of shocks to firms and consumers, and credit constraints. To believe the welfare implications, counterfactuals, or forecasts of our models, the parameters must be set to “reasonable” values. Calibration is the process of choosing reasonable parameters using, for example, previous research, estimates from microeconomic data, or the comparison of model moments with empirical counterparts.

Calibration is an essential tool in macroeconomics. It is employed in a large fraction of the academic literature as well as in many influential policy analyses. The course is directed towards researchers interested in the frontier of macroeconomic theory, but it is also relevant for anyone working on policy-related theoretical models in public finance, trade, and international finance.

The instructor will prepare and present lecture slides, but class discussion is strongly encouraged. Students are expected to read the papers assigned for each week. Assessment is based on a final project: each student must replicate the main result of a paper from the class or another paper approved by the instructor.

**Prerequisites / notice**

- Knowledge of graduate-level economic theory.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed

### 363-1136-00L Dynamic Macroeconomics, Innovation and Growth

**Abstract**
Introducing dynamic models and workhorses in macroeconomics, understanding the role of innovation and institutions for economic development and discussing policies to foster innovation and economic growth.

**Objective**
After the course, students will be familiar with dynamic general equilibrium theory and the basic workhorse models in macroeconomics. Participants will be able to apply the frameworks to interesting issues, such as innovation and growth. Moreover, students will understand how the world has developed over the last centuries and the proximate and fundamental causes of innovation and economic growth. Students will understand and apply the basic models of economic growth and will be able to identify policies to foster innovation and growth and to reduce the large wealth differences in the world. Finally, they will get an idea how digitization and artificial intelligence might drive economic growth.

**Content**
1. Introduction
2. The Solow Model
3. The Neoclassical Growth Model (with Mathematical Background)
4. Technological Progress and how the World has developed
5. Innovations and Growth (New Growth Theory)
6. Growth Policies and Fundamental Causes for Growth
7. Digitization and Artificial Intelligence

**Literature**
14. Current Literature on Digitization and Artificial Intelligence

---

### 364-1168-00L Economics of Inequality

**Abstract**
We discuss research on inequality in different areas of economics. Possible topics include distributional national accounts, heterogeneous returns, inheritances, intergenerational mobility, gender inequality in the labor market (topics will also be decided upon depending on the students’ interests). Students will present a paper and critically comment on it (as if they would referee the paper).

**Objective**
After the course, participants will have a solid understanding of the current state of research on inequality in different fields in economics and, starting from there, will be able to develop their own research ideas. They will further learn how to critically assess and referee a paper, as it is common practice during the referee process, and they will practice their presentation skills and give feedback to each other. The students will therefore also acquire competences for conferences and participation in the scientific discourse.
The target group of this course are PhD students who are interested in writing a paper related to economic inequality. Advanced Master students who are interested in taking the course, especially those who plan to pursue a PhD in Economics, are welcome, too. The topic is intentionally kept broad to leave room for individual research interests and cover different areas. This will allow students to get to know the current state of research in different but related areas, and help them develop their own research question.

By critically examining the literature, students will also learn what makes a well-written paper. By presenting papers, students will further train their presentation skills, and we will take time to give feedback in class on the presentations, too. Oral and written presentation of research are both integral parts of a successful academic career. In the written assignment, finally, students will write a referee report or a research proposal, starting from a paper we discussed in the course.

The course will start with an introduction into the topic and an overview of inequality research in economics. Inequality has become a buzzword in many paper titles and abstracts, but different areas of economics have sometimes very different approaches to this popular topic. The main part of the course will consist of reading and presenting papers that belong to different areas of economics, including Macroeconomics, Public Economics, and Microeconomics / Labour Economics.

Below you find the "suggestive" syllabus for this course. I will provide a list of papers in each of the six blocks at the beginning of the semester, and students will choose a paper to present during the semester (suggestions to present a paper that is not on the list are welcome). Students are required to read all papers discussed in the course and active participation is expected. At the end of the semester, they will write a referee report with possible suggestions for future research or develop a research proposal. The written assignment is due by January 24, 2024.

Topics (suggestive)
- Aggregate trends in income and wealth inequality
- Top income and wealth shares
- Distributional national accounts DINA
- Wealth income ratios

Measurement of top wealth and its difficulties
- Capitalization and heterogeneous returns
- Tax data and tax evasion
- Alternative data and its limitations

Inheritances
- Their role for wealth inequality
- Optimal taxation of inheritances

Intergenerational mobility
- Measurement
- Exogenous variation and causal identification

Gender Inequality in the labour market
- Gender wage gap
- Child penalties

Pandemics and their effects on inequalities
- Covid-19
- 1918 Influenza Pandemic ("Spanish Flu")
- The plague

363-1036-00L  Empirical Innovation Economics  W  3 credits  1G  M. Wörter

Abstract
The course focuses on important factors that drive the innovation performance of firms, like innovation capabilities, the use of digital technologies, environmental and innovation policy and it shows how innovation activities relate to firm performance and to the technological dynamic of industries. We also discuss the implications of the findings for effective economic policy-making.

Objective
The course provides students with the basic skills to understand and assess empirically the technological activities of firms and the technological dynamics of industries. In addition, the aim is to promote the understanding of the essential criteria for innovation policy-making.

Content
The course consists of two parts. Part I provides an introduction into important topics in the field of the economics of innovation. Part II consists of empirical exercises based on various firm-level data sets, e.g., the KOF Innovation data, data about the digitization of firms, data about environmentally friendly innovations, or patent data. In part I, we will learn about ... a) market conditions that encourage firms to invest in R&D (Research and Development) and develop new products and processes. ... b) the role of competition and market structure for the R&D activities of companies. ... c) how digital and environmentally friendly technologies diffuse among firms. ... d) how the R&D activities of firms are affected by economic crises and how firms finance their R&D activities. ... e) how we can measure the returns to R&D activities. ... f) how environmental policies and innovation policies affect the technological activities of a firm. In part II we will use the KOF Innovation Survey data, patent data, data on digitization of firms, or other longitudinal data sources, to investigate empirically the technological activities of firms in relation to the topics introduced in part I.

Lecture notes
Will be provided in the course and in the e-learning environment: https://moodle-app2.let.ethz.ch/course/view.php?id=15120

Literature
### Prerequisites / notice

Course is directed to advanced Master-Students and PhD Students with an interest in empirical studies.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories  
- Techniques and Technologies

#### Method-specific Competencies
- Analytical Competencies

### 364-1015-00L KOF-ETH-UZH International Economic Policy Seminar  
(University of Zurich)

- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
- UZH Module Code: 03SMDOEC1051

#### Abstract

In this seminar series, which is held jointly with Prof. Dr. Woltek and Prof. Dr. Hoffman from the University of Zurich, distinguished international researchers present their current research related to international economic policy. The participating doctoral students are expected to attend the presentations (bi-weekly). Moreover, a critical review has to be prepared for 1 of the papers presented.

#### Objective

On the one hand, participating students are exposed to research at the frontier of international economic policy research. On the other hand, skills such as critical thinking and preparing reviews are learned.

### 364-0581-00L Microeconomics Seminar (ETH/UZH)

- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
- UZH Module Code: 03SMDOEC6089

#### Abstract

Research Seminar  
research papers of leading researchers in Microeconomics are presented and discussed

#### Content

Invited Speakers present current research in Microeconomics

#### Competencies

#### Subject-specific Competencies
- Concepts and Theories  
- Techniques and Technologies

#### Method-specific Competencies
- Analytical Competencies

### 364-0585-01L PhD Course: Applied Econometrics

- W 2 credits  
- 2V

#### Abstract

In this course, we will address three blocs of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models).

#### Objective

The main agenda of this course is to familiarize students with the estimation of econometric problems with three alternative types of problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models). Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.

#### Lecture notes

For panel data analysis, I will rely on the book:  

For sample selection and endogenous treatment effect analysis, I will rely on the book:  

For spatial econometrics:  
I will mostly use papers.

I will prepare a script (based on slides), covering all topics.

### 364-1090-00L Research Seminar in Contract Theory, Banking and Money (University of Zurich)

- W 3 credits  
- 2S

#### Abstract

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

#### Objective

H. Gersbach, University lecturers

---

Data: 15.06.2024 12:39  
Autumn Semester 2024  
Page 810 of 2653
Recent developments in the fields of contract theory, finance, banking, money and macroeconomics.

The purpose of this course is to fostered

Objective

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration

Content

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. Students and other guests are welcome.

Objective

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop novel mathematical models for open problems, to analyze them with computers, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to work scientifically on an internationally competitive level.

Content

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. For details of the program see the webpage of the colloquium. Students and other guests are welcome.

Lecture notes

There is no script, but a short protocol of the sessions will be sent to all participants who have participated in a particular session. Transparencies of the presentations may be put on the course webpage.

Literature

Literature will be provided by the speakers in their respective presentations.

Prerequisites / notice

Participants should have relatively good mathematical skills and some experience of how scientific work is performed.

Additional Courses

Number Title Type ECTS Hours Lecturers

Doctoral Retreat - Inaugural Workshop and Seminar on Ethics and Scientific Integrity

Pre-registration upon invitation required. Once your pre-registration has been confirmed, a registration in myStudies is possible. Information on the online Ethic Moodle course will be passed on to registered doctoral candidates in due time.

Objective

The purpose of this course is to
- introduce doctoral candidates to the world of economics, management and systems research at MTEC
- make doctoral candidates aware of silo-thinking in the specific sub-disciplines and encourage them to go beyond those silos
- discuss current issues with regard to substantive, methodological and theoretical domains of research in the respective fields
- sensitise doctoral candidates to ethical issues that may occur during their doctorate.

Content

This course is geared towards first and second-year doctoral candidates of MTEC. It is held as in a workshop style. Students attending this seminar will benefit from interdisciplinary discussions and insights into current and future work in business and economics research.

Doctoral Retreat - Inaugural Workshop and Seminar on Ethics and Scientific Integrity

Pre-registration upon invitation required. Once your pre-registration has been confirmed, a registration in myStudies is possible. Information on the online Ethic Moodle course will be passed on to registered doctoral candidates in due time.

Objective

The purpose of this course is to
- introduce doctoral candidates to the world of economics, management and systems research at MTEC
- make doctoral candidates aware of silo-thinking in the specific sub-disciplines and encourage them to go beyond those silos
- discuss current issues with regard to substantive, methodological and theoretical domains of research in the respective fields
- sensitise doctoral candidates to ethical issues that may occur during their doctorate.

Content

This course is geared towards first and second-year doctoral candidates of MTEC. It is held as in a workshop style. Doctoral candidates attending this seminar will benefit from interdisciplinary discussions and insights into current and future work in business and economics research.

The second, face-to-face part of the Ethic course focuses on discipline-specific aspects and takes place on the 2nd day of the retreat. It provides an interactive learning environment. Doctoral candidates get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral colleagues.

Transferable Skills

Number Title Type ECTS Hours Lecturers

Transferable Skills Course I (1-3 days)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Transferable Skills Course II (1-3 days)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.
Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

900-0102-DRL Transferable Skills Course III (1-3 days) W 1 credit 2S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

900-0103-DRL Transferable Skills Course I (1-3 days, with Poster or Talk) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

900-0104-DRL Transferable Skills Course II (1-3 days, with Poster or Talk) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

900-0105-DRL Transferable Skills Course III (1-3 days, with Poster or Talk) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

900-0106-DRL Transferable Skills Course I (1 week) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

900-0107-DRL Transferable Skills Course II (1 week) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

900-0108-DRL Transferable Skills Course III (1 week) W 2 credits 4S Lecturers
Only for doctoral students.
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

900-0109-DRL Transferable Skills Course I (1 week, with Poster or Talk) W 3 credits 6S Lecturers
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0110-DRL Transferable Skills Course II (1 week, with Poster or Talk)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0111-DRL Transferable Skills Course III (1 week, with Poster or Talk)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0112-DRL Participation in Commission I (min 1 year)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0113-DRL Participation in Commission II (min 1 year)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0114-DRL Member of Executive Board (min 1 year)
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in the presidium or executive board of a university group for at least 1 year.

Objective
Active participation in the presidium or executive board of a university group for at least 1 year.

Summer School III (1 week, with Poster or Talk)

Only for doctoral students.

Abstract
Participation in summer or winter schools with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Participation in summer or winter schools with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

External Conference I (incl. Poster or Talk)

Only for doctoral students.

Abstract
Participation in conferences outside ETH to foster scientific exchange. Participants need to present either a poster or a talk at this occasion.

Objective
Participation in conferences outside ETH to foster scientific exchange. Participants need to present either a poster or a talk at this occasion.

External Conference II (incl. Poster or Talk)

Only for doctoral students.

Abstract
Participation in conferences outside ETH to foster scientific exchange. Participants need to present either a poster or a talk at this occasion.

Objective
Participation in conferences outside ETH to foster scientific exchange. Participants need to present either a poster or a talk at this occasion.

</table>
## 151-0563-01L Dynamic Programming and Optimal Control

**Abstract**
Introduction to Dynamic Programming and Optimal Control.

**Objective**
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

**Content**
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

**Literature**

**Prerequisites / notice**
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

## 151-0593-00L Embedded Control Systems

**Abstract**
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

**Objective**
Familiarize students with main architectural principles and concepts of embedded control systems.

**Content**
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

**Lecture notes / notice**
Lecture notes will be provided. However, students are encouraged to take their own notes.

## 151-0623-00L ETH Zurich Distinguished Seminar in Robotics, Systems and Controls

**Abstract**
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls.

**Objective**
Obtain an overview of various topics in Robotics, Systems, and Controls from leaders in the field. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0623-0.html for a list of upcoming lectures.

**Content**
Familiarize students with main architectural principles and concepts of embedded control systems.

**Prerequisites / notice**
Prerequisite courses are Control Systems I and Informatics I.

## 151-1053-00L Thermo- and Fluid Dynamics

**Abstract**
Current advanced research activities in the areas of thermo- and fluid dynamics are presented and discussed, mostly by external speakers.

**Objective**
Knowledge of advanced research in the areas of thermo- and fluid dynamics.

## 151-8101-00L International Engineering: from Hubris to Hope

**Abstract**
Since Europe surrendered their colonial assets, engineers from rich countries have returned to the African continent to address the real and perceived ills that they felt technology could solve. And yet, 70 years on, the promise of technology has largely failed to deliver widespread, substantive improvements in the quality of life. Why?

**Objective**
This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: marischm@ethz.ch) After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

---

After completing the course, participants will be able to:

- critique the jargon and terms used by the international community, i.e. "development", "aid", "cooperation", "assistance" “third world”
- developing “global south” “low and middle-income” and justify their own chosen terminology
- recognize the role of racism and white-supremacy in the development of the Aid industry
- understand the political, financial, and cultural reasons why technology and infrastructure have historically failed
- Debate the merits of international engineering in popular culture and media
- Propose improved SDG indicators that address current shortcomings
- Compare the engineering curricula of different countries to identify relative strengths and shortcomings
- Explain the inherent biases of academic publishing and its impact on engineering failure
- Analyze linkages between the rise of philanthropy and strategic priority areas
- Recommend equitable, just funding models to achieve more sustainable outcomes
- Formulate a vision for the international engineer of the future
Content
Role of international engineering during colonialism
Transition of international engineering following colonialism
White saviourism and racism in international engineering
International engineering in popular culture
The missing role of Engineering Education
Biases in academic publishing
The emerging role in Global Philanthropy
The paradox of International funding

151-9901-00L  Scientific Writing for Publication in Engineering  

W 2 credits 1G

Number of participants limited to: 15

For the participation in the course, payment of a course fee is required. To register for the course, you need to obtain from your supervisor the confirmation that s/he is willing to pay for your course fee.

Abstract
Scientific Writing for Publication in Engineering is a short course (7 half-day workshops) designed to help junior researchers develop the skills needed to write their research articles in English.

Objective
The course deals with topics such as:
- Fitting texts to target readerships and journals
- Managing the writing process efficiently
- Structuring each section of the text effectively
- Producing fluent and reader-focused sentences and paragraphs
- Editing the text before submission
- Revising in response to reviewers’ comments.

Content
Participants produce a number of short texts as homework assignments and receive detailed individual feedback as well as peer feedback on these during the course. The course takes place at times and locations chosen to suit MAVT doctoral researchers. Content and materials deal specifically with the demands of writing in engineering research fields. Wherever feasible, elements of participants’ future research articles are developed as assignments within the course, so it is particularly useful for those who have their data and are about to begin the writing process.

151-9905-00L  Applied Category Theory for Engineering I  

W 4 credits 3G  A. Censi, J. Lorand

Abstract
Applied Category Theory is an exciting multidisciplinary field of research which harnesses the mathematical language of category theory for applications across a broad range of disciplines. This course is a gentle introduction focused on applications in engineering and the “compositional approach” to systems analysis, co-design, and computation.

Objective
1) Learn basic concepts from algebra and category theory, together with ways to make use of these concepts for engineering applications.

2) Become familiar with case studies of applied category theory, for instance involving dynamical systems, databases, and complex system co-design (e.g. in the context of autonomous vehicles).

3) Be able to recognize compositional structures in concrete scenarios at different levels of abstraction.

4) Understand the “compositional way of thinking” as an approach to systems analysis, co-design, and computation.
Content
Review of basic algebraic structures [sets, relations, (semi)groups, monoids, actions, order theory]

Gentle introduction to category theory [series and parallel composition, feedback, actions, functors, universal properties]

Many simple applied examples illustrating concepts along the way. Extended examples from dynamical systems, databases, and systems co-design in engineering.

Homework will consist of 1) basic exercises to check one’s understanding of core concepts, and 2) a choice between either A) coding exercises (in python) to learn how to implement concepts in software or B) further theory exercises to deepen mathematical understanding.

Homework will be graded on a schedule that allows some flexibility, and it will constitute 100% of the grade (no exam).

Lecture notes
Slides and a (work-in-progress) textbook for the course will be provided (A. Censi, J. Lorand, G. Zardini, “Applied Compositional Thinking for Engineers”).

Literature

Supplementary references include the following books:
Fong, Spivak, “An invitation to applied category theory: Seven sketches in compositionality”
Spivak, “Category theory for the sciences”

Prerequisites / notice
A knowledge of algebra at the level of a bachelor’s degree in engineering/computer science.

351-0778-00L Discovering Management

W 3 credits 3G B. Clarysse, S. Brusoni, V. Hoffmann, T. Netland

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
(1) broaden understanding of management principles and frameworks
(2) advance insights into the sources of corporate and entrepreneurial success
(3) develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

351-0511-00L Managerial Economics

W 4 credits 3V O. Krebs, P. Egger, M. Köthenbürger

Abstract
"Managerial Economics" provides an introduction to the theories and methods from Economics and Management Science to analyze economic decision-making in the context of markets. The course targets students with no prior knowledge in Economics and Management.
The objective of this course is to provide an introduction to microeconomic thinking. Based on the fundamental principles of economic analysis (optimization and equilibrium), the focus lies on understanding key economic concepts relevant for understanding and analyzing economic behavior of firms and consumers in the context of markets. Market demand and supply are derived from the individual decision-making of economic agents and market outcomes under different assumptions about the market structure and market power (perfect competition, monopoly, oligopoly, game theory) are studied. This introductory course aims at providing essential knowledge from the fields of Economics and Management relevant for economic decision-making in the context of both the private and public sector.

Prerequisites / notice

The course targets both Bachelor and Master students. No prior knowledge in the areas of Economics and Management is required.

Introduction to Marketing

363-0403-00L Introduction to Marketing W 3 credits 2G F. von Wangenheim, P. Bachmann

Abstract

This course provides an overview on essential perspectives of marketing and how marketing adds value to a business. It will teach concepts, frameworks and methods for marketing decision making. The course will also look at issues related to marketing implementation. Thereby, a particular focus will be on how data and data analytics can help to support marketers in their decision making.

Objective

After taking the class, students will be able to

1) Understand how marketing adds value to a business.
2) Provide an overview of key concepts in marketing that are applicable to any business.
3) Understand how consumers behave and how this impacts marketing
4) Learn how analytics and quantitative methods can help to improve decision making in marketing.
5) Get to know the elements that shape a firm’s marketing strategy (segmentation, targeting, positioning) and marketing tactics (product, price, promotion, place).

Content

The class will center on the importance of marketing as an activity that creates long-term value for the benefit of organizations and their customers. It will teach concepts, frameworks and methods for marketing decision making.

Specifically, the course is aimed to provide students with a) an overview on the role of marketing within a business, b) details on strategic marketing management decisions and tools, c) a profound knowledge on the individual elements of the marketing mix (product, price, promotion, place), d) an awareness of specific contexts of marketing, and e) first-hand experience on data-driven techniques to support marketers’ decision making.

Thus, this course will introduce key analytical tools to help solving respective managerial tasks. This is a lecture with integrated exercises. Access to a laptop is required for the exercises. The class might be thought in an in-person, remote or in a hybrid format. Students might also be taught via pre-recorded videos and assigned material for self-study.

Literature

The course might comprise mandatory and supplemental reading material. Other literature may be assigned in class.
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems. After attending the class, you should be able to:

- understand the accounting system, the reporting process, and be able to prepare financial statements
- feel comfortable reading and using the information presented in companies’ annual reports
- understand cost concepts and conduct cost analyses
- become familiar with several classic decisions using managerial accounting information
- comment on the current events related to these topics.

The set-up of the course will closely follow the book of N. Gregory Mankiw and Mark P. Taylor (2023), Economics, Cengage Learning, 6th Edition. This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions. The set-up of the course will closely follow the book of N. Gregory Mankiw and Mark P. Taylor (2023), Economics, Cengage Learning, 6th Edition. This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

This course is a prerequisite for the course Financial Management.

The course Accounting for Managers offers an introduction to financial and managerial accounting, especially for students who aspire for a career in business and management with a science or engineering background. After attending the class, you should be able to:

- feel comfortable reading and using the information presented in companies’ annual reports
- understand cost concepts and conduct cost analyses
- become familiar with several classic decisions using managerial accounting information
- comment on the current events related to these topics.

Accounting plays a critical role in the effective functioning of the financial market as well as the long-term success of a company. This course intends to provide an introduction to accounting for those who wish to pursue a career in business, and need the skills and knowledge to understand, analyze, and interpret accounting information to make informed decisions. The course is divided into two parts. In the first part, we focus on financial reporting and start with the basic accounting concepts and the accounting cycle, to learn how the financial system is set up in a company and how financial statements are prepared. We then delve deeper into each major account, and discuss how revenues and expenses are recognized, and how assets, liabilities, and equities are reported. In the second part, we focus on managerial accounting for internal managerial/operational decisions including fundamental topics such as cost behavior, cost estimation, CVP analyses, and relevant costing. We then cover budgeting and standard costing, which are important parts of accounting system in companies.

This course is a prerequisite for the course Financial Management.
### Technology Entrepreneurship (363-0790-00L)

**Abstract**
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

**Objective**
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**
Weekly sessions - recorded.

10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …). Final session: multiple choice semester assignment (100% of grade).

Typical lecture format (2h):
- 15': Introduction
- 60': Guest testimonial
- 15': Discussion related to topic (in groups)
- 10': Plenary discussion
- 20': Q&A with (guest) lecturer

**Lecture notes**
Lecture slides and case material

### Monetary Policy (363-1021-00L)

**Abstract**
The main aim of this course is to analyse the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.

**Objective**
This lecture will introduce the fundamentals of monetary economics and explain the working and impact of monetary policy. The main aim of this course is to describe and analyze the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy, the effectiveness of monetary policy actions, the differences between monetary policy rules and discretionary policy, as well as in institutional issues concerning central banks, transparency of monetary authorities and monetary policy in a monetary union framework. Moreover, we discuss the implementation of monetary policy in practice and the design of optimal policy.

**Content**
For the functioning of today’s economy, central banks and their policies play an important role. Monetary policy is the policy adopted by the monetary authority of a country, the central bank. The central bank controls either the interest rate payable on very short-term borrowing or the money supply, often targeting inflation or the interest rate to ensure price stability and general trust in the currency. This monetary policy course looks into today’s major questions related to policies of central banks. It provides insights into the monetary policy process using core economic principles and real-world examples.

**Lecture notes**
The course Moodle page contains announcements, course information and lecture slides.

**Literature**
The course will be based on chapters of:

**Prerequisites / notice**
Basic knowledge in international economics and a good background in macroeconomics.

### Applied Analysis of Variance and Experimental Design (401-0625-01L)

**Abstract**
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.
Content
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

- Critical Thinking

Abstract
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmaceutics.

Introduction into intellectual property; prosecution of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmaceutics and medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.

Content
1. Introduction into industrial property (patents, trademarks, industrial designs);
2. Prosecution of patent applications (patentability);
3. Patent information (patent publications, databases, searches);
4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement);
5. Peculiarities in pharmaceutics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication);
6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions);
7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharma-trademarks.

Lecture notes
A script is provided in electronic form during the lecture.

327-2226-00L | Ethics and Scientific Integrity for Doctoral Students (MaP Doctoral School) | W | 1 credit | 2U | M. Trassin, K. M. Berg, A. Lauria, S. Stepanow

Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply their knowledge in a discipline specific context.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.
Content
Part I
The self-paced e-learning course consists of 5 modules:
(1) Ethics: Introduction to moral theory (with emphasis on practical guidance regarding decision making)
(2) Ethics in Scientific Research: Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).
(3) Collecting Resources: A variety of tools and resources that help identify ethical issues are presented and explained
(4) Setting up a Strategy: Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
(5) Making Decisions: Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part of this course focuses on discipline-specific aspects of Materials, Processes and Manufacturing Technologies. It provides an interactive learning environment. Participants get to apply their knowledge, and they are encouraged to reflect on ethical problems and critically discuss them with fellow doctoral students.

Prerequisites / notice
For doctoral students only

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Problem-solving assessed Seminar for PhD students and researchers in condensed-matter physics.

This short course is designed to help junior researchers in Materials Science develop the skills needed to write their first research articles.

E-Materials Colloquium

The Materials Colloquium is a platform for PhD students, postdoctoral researchers, group leaders, senior scientists, and professors to present their own and their group's research to their colleagues. The apero following the colloquium has the purpose to stimulate discussions and to promote networking in a relaxed, more informal environment. The Colloquium is open to all who are interested.

Subject-specific Competencies

Writing for Publication in Materials Science is a short course (5 x 4-lesson workshops) designed to help junior researchers develop the skills needed to write their first research articles. The course deals with topics such as:

- identifying target readerships and selecting outlets,
- managing the writing process efficiently,
- structuring the text effectively,
- producing logical flow in sentences and paragraphs,
- editing the text before submission, and
- revising the text in response to reviewers' comments.

Participants are advised to take this course once they have enough research to begin writing so as to be able to get feedback on work in progress. They will be expected to produce a number of short texts as homework assignments and will receive individual feedback from the instructor and peer feedback on these during the course. Wherever feasible, elements of participants' future research articles can be developed for these assignments, so it is likely to be particularly useful for those who have their data and are about to begin the writing process.

Content

Part 1: Part 1 will provide an introduction to the course, and will then focus on using model texts, improving vocabulary and phrasing, and constructing reader-friendly sentences.

Part 2: We will discuss structural decisions about research articles in different journals, review the basics of paragraph structure and organization, and examine how to create better flow in a text.

Part 3: We will work on creating successful introductions, integrating the literature, and writing abstracts.

Part 4: Part 4 will address the main content and grammar concerns of writing about methods and results, and review key grammar concepts for writing complex sentences.

Part 5: We will look at how to construct discussion and conclusion sections and how to strike the right tone of caution/confidence. We will then discuss the editing process, preparing articles for submission, and responding to reviewers' comments.

Prerequisites / notice

All sessions will involve group work and peer review of participants' writing.

This short course is designed to help junior researchers in Materials Science develop the skills needed to write their first research articles.

Microscopy Training SEM I - Introduction to SEM

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form:
This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Objective
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

Content
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Literature
- P. Zeng, E. J. Barthazy Meier, 3P

No mandatory prerequisites.
Advanced Polymer Synthesis

Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination; ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

Objective

Students should be able to: Identify important polymerization procedures and types of polymerization. Predict activities of monomers based on the chemical structures. Devise synthetic pathways to produce a given polymer structure. Evaluate properties of macromolecules based on structure and synthesis method. Develop synthesis schemes for target structures and discuss potential applications of polymers.

Content

Polymerization is a series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:

- Modern Step-growth polymerization
- Living Anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metallocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

Lecture notes

They will be uploaded on Moodle

Literature

Lecture notes will be given

Prerequisites / notice

Strong basic knowledge of Organic Chemistry. Any course on Introductory Polymer Chemistry such as "Advanced Building Blocks for Soft Materials" or "Introduction to Macromolecular Chemistry" or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

FIRST Introduction Day

The FIRST Introduction Day comprises general and access information, cleanroom basics, infrastructure information, safety training, cleanliness seminar, chemistry seminar and safety test. The introduction day is mandatory for each user who intends to use the FIRST cleanrooms independently of level of experience.

Objective

Access to the FIRST cleanroom.

Content

The FIRST Introduction Day comprises general and access information, cleanroom basics, infrastructure information, safety training, cleanliness seminar, chemistry seminar and safety test. The introduction day is mandatory for each user who intends to use the FIRST cleanrooms independently of level of experience.

Advanced Manufacturing (MaP Doctoral School)
Objective

This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Asses a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

Lecture notes

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

101-0167-01L Fibre Composite Materials in Structural Engineering W 3 credits 2G M. Motavalli

Abstract

1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

Objective

At the end of the course, you shall be able to:
1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessar testing and SHM techniques for FRP structures,
3) Continue your education as a phd student in this field.

Content

Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

102-0357-00L Waste Recycling Technologies W 3 credits 2G M. Haupt, V. Burg

Abstract

Waste Recycling Technology (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Objective

At the core of this course is the separation of mixtures of solids bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 831 of 2653
Introduction
Waste Recycling: Scope and objectives
Waste recycling technologies in Switzerland

Fundamentals
Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
Flow sheet basics: Balancing mass flows
Standard processes: batch vs. continuous
Assessment of separation success: Separation function; grade vs. recovery

Separation Processes
Separation according to size and shape (Classification): Screening, Flow separation
Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation; Electrostatic separation, Sensor technology; Froth flotation

Lecture notes
The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

Literature
A list of recommended books will be provided.

Prerequisites / notice
The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

151-0293-00L
Combustion and Reactive Processes in Energy and Materials Technology

Abstract
This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles synthesis. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

Objective
The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

Visualization, Simulation and Interaction - Virtual Reality II

Abstract
This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

Objective
Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems.

The goal of the lecture is to provide a deeper knowledge of today’s VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

Content
Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes
The handout is available in German and English.

Prerequisites / notice
"Visualization, Simulation and Interaction - Virtual Reality I" is recommended, but not mandatory.

Didactical concept:
The course consists of lectures and exercises.

Competencies
Subject-specific Competencies: Concepts and Theories evaluated
Method-specific Competencies: Techniques and Technologies evaluated
Social Competencies: Communication evaluated
Personal Competencies: Critical Thinking evaluated

151-0353-00L
Mechanics of Composite Materials

Abstract
The courses treats aspects related to elastic behavior of unidirectional and multidirectional laminates, micromechanics, failure and damage analysis, analysis and design of composite structures. The focus is on laminated fiber-reinforced polymer composites.

Objective
The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fibre reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Lamine Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic).
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls. The students learn the correct use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the Concepts and Theories.

A bibliography will be handed out during the lectures.

The students learn the application of the event-based and computer-based simulation for layout and improvement of production facilities by operating simulation in the productions, logistic and scheduling will be shown by means of practical examples.

Further, the lecture gives insights into the methods-time measurement (MTM) for evaluating human work places as basis for the simulation and learn how this is performed using virtual reality.

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Operational Simulation of Production Lines

151-0623-00L

The students learn the correct use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. The simulation is an important basis for creating a digital twin in the context of Industry 4.0.

The students should make their first experiences in the use of computer-based simulation.

Further, the lecture gives insights into the methods-time measurement (MTM) for evaluating human work places as basis for the simulation and learn how this is performed using virtual reality.

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

The students learn the application of the event-based and computer-based simulation for layout and improvement of production facilities by means of practical examples and by using the so-called «Digital Twin» within the context of «Industry 4.0». They learn how virtual and mixed reality tools can be used together with the Digital Twin to plan and support the operation of a production line.

This course focuses on the design, manufacture and testing of components produced using additive manufacturing (AM) technologies.

B. Berisha

The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.

W. Meboldt

In parallel to the lectures, the students design, manufacture and test prototypes in a project at different stages of product development.

K. Shea, D. Mohr

Design for Additive Manufacturing

Please write a short motivation letter to apply for the course. The motivation letter should state why you wish to attend the course. Please also mention any experience you have with relevant topics such as CAD, project work, additive manufacturing (AM), simulation or experimental design. Please also mention in the letter if you already have a proposal for an AM component to be designed as part of the project, or if you have a real-world challenge that you could address using AM. Please send your letter to Julian Farchow (email: farchow@ethz.ch).

M. Meboldt, J. Farchow

This course focuses on the design, manufacture and testing of components produced using additive manufacturing (AM) technologies. The course includes a project based on a real-world challenges where students design, fabricate and iteratively optimize functional AM parts using an appropriate AM technology.

This course provides a basic knowledge of design for additive manufacturing (AM). The course will prepare students to

- Apply basic AM processes (metal and plastic)
- Apply AM design guidelines
- Adopt AM in an industrial environment
- Apply design tools and methods in AM
- Create value from AM
- Work in a project based product development team

In parallel to the lectures, the students design, manufacture and test prototypes in a project at different stages of product development.

The course covers the following topics:

- State-of-the-art AM processes for metals and plastics: PBF (also known as SLM, SLS), BJT, MJF, MEX (FDM)
- Design guidelines in AM
- Industrial adoption of AM
- Value creation and business models for AM
- Design tools and methodologies for AM
- Quality management in AM
- Industrial cases of AM applications
- Problem solving and creativity
- Agile development

Script and handouts are available in PDF-format.
**Abstract**
This core course provides insights into the basic theories, principles, concepts, and techniques used to design, analyze, and improve the operational capabilities of an organization.

**Objective**
This course provides students with a broad theoretical basis for understanding, designing, analyzing, and improving manufacturing operations. After completing this course:

1. Students can apply key concepts of POM to detail an operations strategy.
2. Students can do simple forecasting of demand and plan the needed capacity to meet it.
3. Students can conduct process mapping analysis, use it to design and improve processes and layouts, and elaborate on the limitations of the chosen method.
4. Students can choose IT, OT, and automation technology for manufacturing applications.
5. Students can design information flows, manage master data, and use it to plan and control a factory.
6. Students can design material flows in and beyond factories.
7. Students can design performance management systems.
8. Students can select and use problem-solving tools to improve quality and productivity.
9. Additional skills: Students acquire experience in teamwork.

**Content**
The course covers the most fundamental strategic and tactical concepts in production and operations management (POM).

Production and Operations Management (POM) is at the heart of any business. It is concerned with the business processes that transform input into output and deliver products and services to customers. Factory management is an important part of POM, but it is much more than what takes place inside the production facilities of companies like ABB, Boeing, BMW, LEGO, Nestlé, Roche, TESLA, and Toyota. Did you know that the largest portion of assets and employees in most organizations are engaged in the operations function? Although this course focuses on manufacturing, all types of organizations depend on their operational capabilities. With the ongoing globalization and digitization of manufacturing, POM has won a deserved status for providing a competitive advantage.

This course covers the following topics: Introduction to POM, Manufacturing strategy, Forecasting and capacity, Process design, Layout, Industry 4.0, Information flow, Material flow, Logistics/SCM, Performance management, Performance improvement, Quality management, and Maintenance.

This course is administered via Moodle. The course is designed around five elements:

2. Video lectures. Short video lectures presenting basic POM concepts.
3. Class lectures. Deep-dives with case examples on select topics.
4. FactoryVR group assignment. FactoryVR allows students to visit factories virtually.
5. Quizzes. A few quizzes during the semester help students check their progress and prepare for the written exam.

**Literature**
Suggested literature is provided in the syllabus.
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nanostreamructuring. Several applications which are still in the research state, e.g. non-optical lithographies, will be discussed together with industrial applications, such as microolithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Content
Introduction to lasers. Overview of micro- and nanotechnology, microolithography, photoresists: classical types and new developments, laser cutting and welding, laser cleaning, laser ablation, polymer ablation: designed polymers, lasers and surfaces, laser spectroscopy, laser chemical vapor deposition, pulsed laser deposition (PLD), special materials by PLD, alternative structuring methods.

Literature
FSRM, CD-ROM: An Introduction to the World of Microsystems, Neuchatel.

Prerequisites: Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).

Lecture notes
The script (a copy of the slides) will be handed out during the first lecture.

To the question of ‘what should we make?’ to the question of ‘how do we make something?’ to the question of what we make?
As information technology continues its fast-paced evolution, solid-state devices and systems increase in complexity. Engineers and scientists are thus increasingly facing the need to model and simulate their problems numerically where analytic textbook solution cease to exist. Moreover, boundaries between traditional disciplines are harder to maintain, as a proper description of the system might involve phenomena from several domains. Examples include—but not limited to—mechatronics which relies on mechanical, electrical and electronic engineering, and transducers (sensors and actuators) which are by definition devices that convert signals from one physical domain to another. Simulation platforms such as Comsol Multiphysics have truly opened the way to easy multi-domain numerical simulation, offering tools that cover all operations from geometry definition, to meshing, to physics and boundary conditions setting to simulation and result post-processing and analysis in a unified, domain-independent fashion. However, this high degree of freedom has its price, as inexperienced users may face cryptic error messages, incomprehensible or even incorrect results. It is the mission of this course to teach you how to properly set up a problem by exposing some of the most common misconceptions and pitfalls in multiphysics modeling. Good practices will be taught that should simplify the modeling process and increase the likelihood of correct results. Examples will mainly come from the fields of mechanics (continuum solid mechanics), electromagnetism (electrostatics and conductive media), heat transfer (conductive not convective) and combinations of these domains.

The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microbots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Prerequisites:** Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).
Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

151-0604-00L  Microrobotics  W  4 credits  3G  B. Nelson

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0620-00L  Embedded MEMS Lab  W  5 credits  3P  C. Hierold, A. Güntner, M. Haluska

Abstract
Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report.

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificiary layer etching, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes
A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course.

Literature
The document provides sufficient information for the participants to successfully participate in the course.
**Prerequisites / notice**

Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Prof. Daraio, Dual, Hierold, Kouroutsakos, Nelson, Norris, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

### 151-0621-00L Microsystems I: Process Technology and Integration

**Abstract**

Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and devices by a sequence of defined processing steps (process flow).

**Objective**

Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

**Content**

- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

Application of selected technologies will be demonstrated on case studies.

**Lecture notes**

### 151-0913-00L Introduction to Photonics

**Abstract**

This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

**Objective**

Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.
I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

227-0053-00L High-Frequency Design Techniques W 4 credits 2V+2U C. Bolognesi, T. Popovic

Abstract
Introduction to the basics of high-frequency circuit design techniques used in the realization of high-bandwidth communication systems and devices. Modern society depends on increasingly large data masses that need to be transmitted/processed as rapidly as possible: higher carrier frequencies allow wider bandwidth channels which enable higher data transmission rates.

Objective
Familiarize students with the essential tools and principles exploited in the high-frequency design. Introduction to circuit simulation. Introduction to amplifier design.

Content
Introduction to wireless, radio spectrum. Review of vectors and complex numbers, AC circuit analysis, matching networks, distributed circuit design, transmission lines and transmission line equations, reflection coefficients, the Smith Chart and its software, voltage standing wave ratio (VSWR), skin effect, matrix analysis, scattering parameters, electromagnetic fields and waves, amplifier design. Hands-on experience with measurement equipment.

Lecture notes
A detailed script is provided for each lecture, including the exercises and their solutions.

Literature
The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes

Lectures notes and slides will be handed out during the lectures.

Prerequisites

Method-specific Competencies

Analytical Competencies

Problem-solving

Social Competencies

Communication

Cooperation and Teamwork

Personal Competencies

Critical Thinking

227-0110-00L Electromagnetic Waves: Materials, Effects, and Antennas

W 6 credits 4G

Abstract

This course provides profound knowledge about electromagnetic waves. Various types of materials, nonlinear and resonant effects, and antenna applications are discussed.

Objective

You can describe wave propagation in classical and nonclassical materials and know the fundamental solutions. You know how waves interact with matter and about nonlinear, scattering and resonant effects. You can apply the acquired knowledge in scattering, waveguiding, radiation, and antenna problems.

Content

The lecture covers the following topics:

- Generic time-harmonic electromagnetic fields
- Fundamental solutions of the wave equation
- Wave propagation in various types of materials
- Interaction of waves with matter
- Nonlinear effects
- Resonant effects
- Applications like scattering, waveguiding, radiation
- Radio frequency and optical antennas

Lecture notes

Lecture notes and slides will be handed out during the lectures.

Prerequisites

- Required background: Calculus, Linear Algebra, basic knowledge of vector calculus, knowledge of basic circuit theory.
- Familiarity with the electromagnetic field, photons, and radiation physics is helpful.

227-0157-00L Semiconductor Devices: Physical Bases and Simulation

W 4 credits 3G

Abstract

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics, and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics, and device physics is provided.

Content

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsics properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes

The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/

Prerequisites

227-0311-00L Qubits, Electrons, Photons

W 6 credits 3V+2U

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics. Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

??? I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle ???!

### Literature

Supplementary material will be uploaded in Moodle.

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer
+ (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.

### Prerequisites / notice
The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: assessed

#### Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: assessed
- Negotiation: fostered

#### Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

### 227-0615-00L Simulation of Photovoltaic Devices - From Materials to Modules
**Abstract**
The lecture provides an introduction to the theoretical foundations and numerical approaches for the simulation of photovoltaic power conversion, from the microscopic description of component materials to macroscopic continuum modelling of solar cells and network simulation or effective models for performance prediction of entire solar modules.

**Objective**
Get an overview of the current status of photovoltaic technology. Understand the physics of photovoltaic energy conversion and solar cell device operation. Know how to obtain and assess by simulation the key material properties and device parameters. Be able to use standard device simulation tools to analyze, optimize, and predict the performance of solar cells and modules.

**Content**
Photovoltaic technology: history and overview; The solar spectrum; Thermodynamics of solar energy conversion; Detailed balance models and efficiency limit; Microscopic rates of charge carrier generation and recombination; Optical simulation of solar cells; Models for charge transport in semiconductor devices; High-efficiency wafer-based (silicon) photovoltaics; Thin film photovoltaics based on disordered materials (amorphous silicon, organic PV); High-efficiency thin film photovoltaics (CIGS, CdTe, metal-halide perovskites); PV beyond the single junction detailed balance (Shockley-Queisser) limit; Simulation of photovoltaic modules; Energy yield and performance modelling for PV systems; Quantum simulation of nanostructure-based solar cell devices (bonus lecture)

**Literature**
- M. A. Green, „Solar cells: operating principles, technology, and system applications“, Prentice Hall, 1982.

**Prerequisites / notice**
Undergraduate physics (including basic quantum mechanics), mathematics, semiconductor devices, optics. Knowledge of some scripting language (e.g. python) is of advantage.
This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

Objective

The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

On the theoretical side, we'll cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We'll also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we'll cover how such devices are fabricated, including how the materials are synthesized. We'll also discuss how to characterize the devices and assess their performance.

Content

The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 50% of the grade.

Lecture notes

Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

Literature

In addition to the slides, the following supplementary books can be recommended:

Prerequisites / notice

A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.
Students without a background in Electrical Engineering must take "Electric Circuits" before taking "Introduction to Electric Power Transmission: System & Technology".

Abstract
Introduction to analysis methods and network theorems to describe operation of electric circuits. Theoretical foundations are essential for the analysis of the electric power transmission and distribution grids as well as many modern technological devices – consumer electronics, control systems, computers and communications.

Objective
At the end of this course, the student will be able to: understand variables in electric circuits, evaluate possible approaches and analyze simple electric circuits with RLC elements at steady state and during transients, apply circuit theorems to simple meshed circuits, analyze AC circuits and understand the connection of the explained principles to the modelling of 3-phase electric power systems.

Content
Course will introduce electric circuits variables, circuit elements (resistive, inductive, capacitive), resistive circuits and theorems (Kirchhoff's laws, Norton and Thevenin equivalents), nodal and mesh analysis, superposition principle; it will continue by discussing the complete response of RL, RC and RLC circuits during transients, sinusoidal analysis – AC steady state (complex power, reactive, active power) and conclude with the introduction to 3-phase analysis; Mathematical foundations of the circuit analysis, such as matrix operations and complex numbers will be briefly reviewed. This course is targeting students who have no prior background in electrical engineering.

Lecture notes
Lecture and exercises slides will be distributed after each lecture via Moodle platform; additional materials to be accessed online (wileyplus)

Literature
Richard C. Dorf, James A. Svoboda
Introduction to Electric Circuits, 9th Edition
Online materials: https://www.wileyplus.com/
Lecture slides and exercises slides

Prerequisites / notice
This course is primarily intended for students outside of D-ITET. No prior course in electrical engineering is required.

327-0505-00L Surfaces and Interfaces I: Fundamentals, Analytics and Applications  W 6 credits 3G L. Isa, M. P. Heuberger

Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.

Objective
Students are able to:
- describe the physical and chemical properties of surfaces and interfaces,
- analyze and compare analytical tools for surfaces,
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications,
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content
- Introduction to surfaces and interfaces
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photoelectron Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

Electron Microscopy in Material Science

Abstract
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content
This course provides a general introduction into electron- and ion-microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, focused ion-beam and atom probe microscopes are presented. Throughout the semester, various applications in materials science, solid state physics, structural biology, structural geology, and structural chemistry will be reported.

Competencies

Subject-specific Competencies

---

Scattering Techniques for Material Characterization

Abstract
The lecture presents the currently most efficient experimental techniques for microstructure material characterization: X-ray diffraction (XRD) and transmission electron microscopy (TEM). The theoretical basics, instrumentation, complementarity and exclusivity of both techniques will be taught. The course includes practical elements and examples of current research projects at D-MATL.

Objective
Students are able to do:
- systematically characterise the microstructure and phases of a given material with X-rays and electrons
- select the right tool (source, instrument, measurement strategy) and design a workflow for solving a microstructure or phase analysis problem
- describe possibilities and limitations of a given characterisation method
- comprehensively store experimentally collected data in a repository following modern data management rules such that data can be evaluated by students not involved in the experiment
- qualitatively and quantitatively evaluate and present experimental data and results collected by others

Content
The main objective of this hands-on practical course is to give students a comprehensive insight into the most important aspects of microstructure characterization using electron and X-ray scattering. The focus is on the complementarity and exclusivity of the two techniques. We will introduce the most important material characterization tasks, present the relevant physical and crystallographic fundamentals, and discuss how the tasks can be solved with electron and X-ray scattering. We will discuss intrinsic and extrinsic advantages and limitations of the methods and explain essential instrumentation requirements specific to each setup. Another essential facet of the course is the link to everyday D-MATL project problems presented by the lecturers or researchers from D-MATL. The lecture is accompanied by hands-on experiments on samples of D-MATL projects using state-of-the-art instruments.

Literature

Prerequisites / notice
Crystallography, X-ray diffraction and electron microscopy on the BSc level. All enrolled students are initially placed on the "waiting list" until the registration deadline. In the case of more than 12 applicants, the students will be selected by the lecturers before the start of the lecture according to the priority criteria: master students before doctoral students, Material Science students before students of other departments.

---
Abstract
The aim is an overview of the different ordering phenomena that occur in materials: magnetic, electrical, mechanical, structural. Special emphasis is placed on a comprehensive definition of the term "ferroic". Novel forms of order, such as multiferroicity, are of particular interest. Their exploration and the material functionalities derived from these are a central theme in our Department.

Objective
Ferromagnetism is known to humankind for 2500 years, but there are many other forms of spontaneously ordered states in nature that wait to be explored. One of these is ferroelectricity, the spontaneous electric order of a material, which rapidly gains importance in science and technology. It is the aim of this course to learn what actually defines a state as ferroic, what forms of ordering are known or newly proposed, and what kind of materials and functionalities are related to ferroic materials. We also explore the transition from order to disorder, which is fluent and offers materials properties that are not found in the fully ordered or disordered state.

It is an equally important goal that attendees learn to work critically and creatively with the "unfinished knowledge" of a "hot" research field that is in continuous and rapid development. Realizing that scientific results are not eternally true, but need to be constantly challenged and revised if necessary is very important in becoming a researcher working at the forefront of science.

Content
The power of symmetry analysis, aspects of crystallography and group theory, definition and concept of ferroic order. Forms of ferroic order in nature, domains and domain walls, multiferroics and magnetoelectric correlations, dynamical processes and functionalities in ferroic materials, the transition from order to disorder, thermodynamics of such transitions and associated material properties, tour through the Laboratory for Multifunctional Ferroic Materials.

Lecture notes
There is no actual script because one of the main goals of this lecture is to work critically and creatively with the "unfinished knowledge" of a "hot" research field that is in continuous and rapid development. It is important that attendees of the lecture form their own view of this field rather than following the filtered and biased view presented in a script.

Literature
V. K. Wadhawan, Introduction to Ferroic Materials, (Gordon and Breach 2000)
M. Fiebig, Nonlinear Optics on Ferroic Materials, (Willey 2023)
R. R. Birss, Symmetry and Magnetism, (North Holland 1966)

Prerequisites / notice
Knowledge of the physics of materials, as provided by the ETH Zurich B.S. curriculum in Materials Science. Interdisciplinary or Physics students are also welcome. This lecture is on a "hot" research field that is in continuous and rapid development, so students are encouraged to provide continuous feedback so that the topics covered by the lecture can be constantly adopted. The lecture can only be as good as the constructive/critical feedback that is received.

327-2210-00L Thin Films Technology - From Fundamentals to Oxide Electronics

Students who already took "327-2104-00L Inorganic Thin Films: Processing, Properties and Applications" AND "327-2132-00 Multifunctional Ferroic Materials: Growth and Characterisation" are not allowed to attend this course.

Abstract
Oxide films with a thickness of just a few atoms can now be grown with a precision matching that of semiconductors. This opens up a whole world of functional device concepts and fascinating phenomena that would not occur in the expanded bulk crystal.

We will give an introduction to thin films deposition techniques and applications with a focus on the growth of multifunctional oxide thin films.

Objective
In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes.

The main learning objectives are:
- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

Content
A lab visit will be organized and students will participate to the design of thin films with atomic precision.

General description of the leading deposition routes including physical and chemical vapor deposition techniques (PVD and CVD) as well as so called "wet techniques" (e.g. spin coating and spray pyrolysis).

Growth modes and processes.

Part of the course discusses vacuum technologies.

Fundamental characterization techniques for application-relevant thin films as well as state of the art approaches for in situ and ex-situ determination of the structural, chemical and ferroic (ferromagnetic and ferroelectric) properties of films: (XRD for thin films, RHEED, EDX, scanning probe microscopy techniques, laser-optical characterization and many more)

Epitaxy for the advanced design and characterization of high quality thin films for energy efficient oxide electronics.

Types of ferroic order, multiferroics, multifunctional oxide materials, epitaxial strain related effects, oxide thin film based devices and examples.

Regular discussions on preselected scientific literature and mini-seminars will be organized.
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provide extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injection. This course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

In terms of technical content, the lectures will cover:
- an overview of the microelectronics industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamsers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.
Lecture notes
Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

402-0317-00L Semiconductor Materials: Fundamentals and Fabrication
W 6 credits 2V+1U S. Schön, W. Wegscheider

Abstract
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

Content
1. Fundamentals of Solid State Physics
   1.1 Semiconductor materials
   1.2 Band structures
   1.3 Carrier statistics in intrinsic and doped semiconductors
   1.4 p-n junctions
   1.5 Low-dimensional structures
2. Bulk Material growth of Semiconductors
   2.1 Czochalski method
   2.2 Floating zone method
   2.3 High pressure synthesis
3. Semiconductor Epitaxy
   3.1 Fundamentals of Epitaxy
   3.2 Molecular Beam Epitaxy (MBE)
   3.3 Metal-Organic Chemical Vapor Deposition (MOCVD)
   3.4 Liquid Phase Epitaxy (LPE)
4. In situ characterization
   4.1 Pressure and temperature
   4.2 Reflectometry
   4.3 Ellipsometry and RAS
   4.4 LEED, AES, XPS
   4.5 STM, AFM
5. The invention of the transistor - Christmas lecture

Lecture notes
https://moodle-app2.let.ethz.ch/course/view.php?id=20749

Prerequisites / notice
The “compulsory performance element” of this lecture is a short presentation of a research paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

402-0402-00L Ultrafast Laser Physics
W 10 credits 3V+2U L. P. Gallmann, S. Johnson, U. Keller

Abstract
Introduction to ultrafast laser physics with an outlook into cutting edge research topics such as attosecond science and coherent ultrafast sources from THz to X-rays.

Objective
Understanding of basic physics and technology for pursuing research in ultrafast laser science. How are ultrashort laser pulses generated, how do they interact with matter, how can we measure these shortest man-made events and how can we use them to time-resolve ultrafast processes in nature? Fundamental concepts and techniques will be linked to a selection of hot topics in current research and applications.

Data: 15.06.2024 12:39
Autumn Semester 2024
Page 849 of 2653
This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include the quantum nature of light, semi-classical and quantum mechanical description of light-matter interaction, laser manipulation of atoms and ions, quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade, laser manipulation of atoms and ions: laser cooling and trapping, atom interferometry, further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

Prerequisites: Basic knowledge of quantum electronics (e.g., 402-0275-00L Quantenelektronik).

Lecture notes

Autumn Semester 2024
Throughout the past 20 years, the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors, information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups, and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

The topics covered in the course will include quantum circuits, gate decomposition, and universal sets of gates. Efficiency of quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other information-processing protocols.

The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other information-processing protocols.

A good understanding of finite dimensional linear algebra is recommended.

More information on this class can be found on the web site www.qudev.ethz.ch.
402-0464-00L  Light-Matter Interaction in Semiconductors: Physics and Applications

Abstract
The course presents fundamental aspects of light-matter interaction in semiconductor materials, from basic research topics to opto-electronic devices.

Objective
The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these materials, enabled numerous applications as well as the realization of new physical concepts. In this course, we will learn the principles of light-matter interaction in semiconductors for single and multiple particle excitations, and cover opto-electronic applications based on these principles.

Content
Electronic states in III-V materials and quantum structures, optical transitions, excitons and polaritons, novel two dimensional semiconductors, spin-orbit interaction, magneto-optics and opto-electronic devices.

Prerequisites / notice
Prerequisites: Quantum Mechanics II, Introduction to Solid State Physics, Quantum Electronics

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Social Competencies
- Self-presentation and Social Influence

Personal Competencies
- Creative Thinking

402-0465-58L  Intersubband Optoelectronics

Abstract
Intersubband transitions in quantum wells are transitions between states created by quantum confinement in ultra-thin layers of semiconductors. Because of its inherent taylorability, this system can be seen as the “ultimate quantum designer's material”.

Objective
The goal of this lecture is to explore both the rich physics as well as the application of these system for sources and detectors. In fact, devices based on intersubband transitions are now unlocking large area of the electromagnetic spectrum.

Content
The lecture will treat the following chapters:
- Introduction: intersubband optoelectronics as an example of quantum engineering
- Technological aspects
- Electronic states in semiconductor quantum wells
- Intersubband absorption and scattering processes
- Mid-IR and THz ISB Detectors
- Mid-infrared and THz photonics: waveguides, resonators, metamaterials
- Quantum Cascade lasers:
  - Mid-IR QCLs
  - THZ QCLs (direct and non-linear generation)
- Further electronic confinement: interlevel Qdot transitions and magnetic field effects
- Strong light-matter coupling in Mid-IR and THz range

Lecture notes
The reference book for the lecture is "Quantum Cascade Lasers" by Jerome Faist, published by Oxford University Press.

Literature
Mostly the original articles, other useful reading can be found in:
- E. Rosencher and B. Vinter, Optoelectronics, Cambridge Univ. Press
- G. Bastard, Wave mechanics applied to semiconductor heterostructures, Halsted press

Prerequisites / notice
Requirements: A basic knowledge of solid-state physics and of quantum electronics.

402-0526-00L  Ultrafast Processes in Solids

Abstract
Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

Objective
After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

Content
1. Experimental techniques, an overview
2. Dynamics of the electron gas
   2.1 First experiments on electron dynamics and lattice heating
   2.2 The finite lifetime of excited states
   2.3 Detection of lifetime effects
   2.4 Dynamical properties of reactions and adsorbents
3. Dynamics of the lattice
   3.1 Phonons
   3.2 Non-thermal melting
4. Dynamics of the spin system
   4.1 Laser induced ultrafast demagnetization
   4.2 Ultrafast spin currents generated by lasers
   4.3 Landau-Lifschitz-Dynamics
   4.4 Laser induced switching
5. Correlated materials

Lecture notes
will be distributed

Literature
relevant publications will be cited

Prerequisites / notice
The lecture can also be followed by interested non-physics students as basic concepts will be introduced.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving
- Project Management

Social Competencies
- Communication

Personal Competencies
- Creative Thinking

Autumn Semester 2024
Abstract

This course tackles the fundamental question of why only a few materials exhibit magnetism in Nature. The origin of atomic magnetic moments and the key mechanisms that govern their interactions are justified starting from fundamental principles. In addition, the influence of thermal fluctuations on magnetic ordering is discussed as well as the formalism to describe magnetic resonance phenomena.

Objective

By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

Content

The lecture “Introduction to Magnetism” aims at letting students familiarize themselves with the basic principles of quantum and statistical physics that determine the behavior of real magnets. Understanding why only a few materials are magnetic at finite temperature will be the leitmotiv of the course. We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clear reference systems.

Topics:
- Magnetism in atoms (quantum-mechanical origin of atomic magnetic moments, intra-atomic exchange interaction)
- Magnetism in solids (mechanisms producing inter-atomic exchange interaction in solids, crystal field)
- Magnetic order at finite temperatures (Ising, XY, and Heisenberg models, low-dimensional magnetism)
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

Lecture notes

Learning material will be made available through Moodle and through the ETH JupyterHub.

Prerequisites / notice

Students are assumed to possess a basic background knowledge in quantum mechanics, solid-state and statistical physics as well as classical electromagnetism. Students will have the opportunity to self-assess their understanding through quizzes and interactive tutorials, mostly inspired by topics of current research in nanoscale magnetism.

Competencies

Subject-specific Competencies

402-0595-00L Semiconductor Nanostructures

Abstract

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanoscale phenomena based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

Objective

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:

1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. The Aharonov-Bohm effect
4. Coulomb blockade in quantum dots

Content

1. Introduction and overview
2. Semiconductor crystals: Fabrication and molecular beam epitaxy
3. Band structures of semiconductors
4. k.p-theory, effective mass, envelope functions
5. Heterostructures and band engineering, doping
6. Surfaces and metal-semiconductor contacts, fabrication of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport and scattering mechanisms
9. Single- and bilayer graphene
10. Electron transport in quantum point contacts; Landauer-Büttiker description, ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

Lecture notes

In addition to the lecture notes, the following supplementary books can be recommended:

Prerequisites / notice

The lecture is suitable for all physics students, students of Quantum Engineering, and students of Micro- and Nanosystems beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitious students in the third year of Physics may be able to choose the lecture can be chosen as part of the PhD-program. The course is taught in English.

Advanced Magnetic Resonance - DNP Instrumentation

Abstract
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. The following topics will be covered:
- DNP theory & instrumentation
- Microwave theory & technology
- Biological applications of solid-state DNP

Objective
The course aims at enabling students to understand the key theoretical points of DNP and to design DNP experiments. Students will be familiarized with the structure of the state-of-the-art DNP instrumentation and will be introduced to the technological challenges towards the development of advanced instrumentation for the future DNP experiments. A special focus will be given in the technology of microwave source.
Furthermore, students will become familiar with pulse sequences used in biomolecular applications and understand how they are constructed. Students will be able to identify the strengths and weaknesses of biomolecular DNP and how to design DNP experiments for biological applications including sample preparation and choice of NMR experiment and related parameters.

Content
The course is separated in three well separated parts.

- The first part will cover DNP concept and mechanisms, while a special focus will be given in DNP instrumentation, such as MAS technology, and the NMR probe. Several details will be also presented on the development high field NMR magnet.

- The second part of the course is dedicated to the microwave technology and theory. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

- The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isotope labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP including membrane proteins, in-cell DNP and viruses.

Lecture notes
A script which covers the topics will be accessible through the course Moodle

Prerequisites / notice
Prerequisite: A basic knowledge of Magnetic Resonance, e.g. as covered in the Lecture Physical Chemistry IV, or the book “Spin Dynamics” by Malcolm Levitt.

529-0455-00L Laser for Micro- and Nanostructuring

Abstract
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano-structuring. Several applications which are still in the research state, will be discussed together with industrial applications, such as microlithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Objective
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano structuring. Several applications which are still in the research state, e.g. non-optical lithographies, will be discussed together with industrial applications, such as microlithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Content
Introduction to lasers. Overview of micro- and nanotechnology, microlithography, photolithography, photoresists: classical types and new developments, laser cutting and welding, laser cleaning, laser ablation, polymer ablation: designed polymers, lasers and surfaces, laser spectroscopy, laser chemical vapor deposition, pulsed laser deposition (PLD), special materials by PLD, alternative structuring methods.

Lecture notes
The script (a copy of the slides) will be handed out during the first lecture.

Literature
FSRM, CD-ROM: An Introduction to the World of Microsystems, Neuchatel.

<td>Fluid Dynamics with the Lattice Boltzmann Method</td>
<td>W</td>
<td>4</td>
<td>3G</td>
<td>I. Karlin</td>
</tr>
</tbody>
</table>

**Abstract**
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

**Objective**
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, micromodels, and others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

**Content**
The course builds upon three parts:

1. **Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.**
2. **Theoretical basis of statistical mechanics and kinetic equations.**
3. **Lattice Boltzmann method for real-world applications.**

The central elements of the course include:

1. **Background:** Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. **Basics of the Lattice Boltzmann Method and Simulations:**
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. **Hands on:**
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. **Practical issues of LBM for fluid dynamics simulations:**
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. **Microflow:**
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. **Advanced lattice Boltzmann methods:**
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. **Introduction to LB models beyond hydrodynamics:**
   - Lecture notes on the theoretical parts of the course will be made available.
   - Selected original and review papers are provided for some of the lectures on advanced topics.
   - Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

**Lecture notes**
Relativistic fluid dynamics; flows with phase transitions.

**Prerequisites / notice**
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

**Abstract**
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

**Objective**
After successful completion of the course students are able to

- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

**Content**
- Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Lamine Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

**Lecture notes**
yes
### Competencies

### Bioelectronics and Biosensors

**W** 6 credits 2V+2U  J. Vörös, M. F. Yanik

**Abstract**
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

**Objective**
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

**Content**

1. **Introduction**
   - Sources of bioelectric signals
   - 2. Membrane and Transport
   - 3-4. Action potential and Hodgkin-Huxley

2. **Measuring bioelectronic signals**
   - 5. Detection and Noise
   - 6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
   - 7. Measuring potentials in solution and core conductance model
   - 8. Measuring electronic signals with wearable electronics, ECG, EEG
   - 9. Measuring mechanical signals with bioelectronics

3. **In vivo stimulation and recording**
   - 10. Functional electric stimulation
   - 11. In vivo electrophysiology

**Lecture notes**
A detailed script is provided to each lecture including the exercises and their solutions.

**Literature**
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

**Prerequisites / notice**
The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
Content

- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photoelectron Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

327-1207-00L Soft Materials Engineering and Characterization W 5 credits 4G J. Vermant, L. Isa

Abstract
In this course, we discuss engineering aspects of soft materials. First, we cover different classes of soft matter systems, e.g. suspensions, gels, emulsion and foams, and introduce scaling principles to design their structural, mechanical and functional properties. Second, we cover essential characterisation techniques to interrogate the structure-property relations in soft materials.

Objective
The learning goals of the course are to introduce the students to soft matter and its technological applications, to see how the structure-property relations depend on fundamental formulation properties and processing steps. Students should also be able to select a measurement technique to evaluate the properties.

Lecture notes
slides with text notes accompanying each slide are presented.

Abstract
This course explores the mechanisms that govern the adaptive functions of out-of-equilibrium systems in living organisms at the molecular scale and the microstructural design principles of biological materials at larger length scales. Throughout the course, we will also explore how these design principles can be incorporated into synthetic systems to improve targeted functions.

Objective
Students will gain the ability to analyze and integrate bio-inspired adaptive functions into synthetic material systems, as well as interpret the correlation between function, microstructure, and performance of biological and bio-inspired materials. Through engaging activities, students will also develop strategies to create bio-inspired solutions for typical engineering problems and predict the performance of bio-inspired materials.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 858 of 2653
This course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials.

**Block I: Molecular Adaptations of Living Organisms and Creation of Adaptive Bio-inspired Materials**
- Temporal regulation in biological and bio-inspired molecular systems;
- Autonomous molecular structures and out-of-equilibrium systems;
- Molecular motion and work generation mechanisms in biological and bio-inspired systems;
- Sensing, adaptation, and communication in biological and bio-inspired material systems;

**Block II: Principles of Microstructural Design in Biological Materials and Their Synthetically Engineered Counterparts**
- Fundamentals of engineering in biological and bio-inspired materials;
- Replicating biological design principles in synthetic materials (structural, optical, surface properties, etc.);
- Bio-inspired design and systems (mechanical actuation and bio-inspiration in the built environment).

The course is mainly based on the references listed below. Additional references will be provided during the lectures.

**Lecture notes**
Copies of the slides will be made available for download before each lecture.

3.2145-00L Advanced Polymer Synthesis

**Abstract**
Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination, ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

**Objective**
Students should be able to: Identify important polymerization procedures and types of polymerization. Predict activities of monomers based on the chemical structures. Devise synthetic pathways to produce a given polymer structure. Evaluate properties of macromolecules based on structure and synthesis method. Develop synthesis schemes for target structures and discuss potential applications of polymers.

**Content**
Polymerization is series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:
- Modern Step-growth polymerization
- Living Anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metallocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

**Lecture notes**
They will be uploaded on Moodle

**Literature**
Lecture notes will be given

**Prerequisites / notice**
Strong basic knowledge of Organic Chemistry. Any course on Introductory Polymer Chemistry such as “Advanced Building Blocks for Soft Materials” or “Introduction to Macromolecular Chemistry” or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

Data: 15.06.2024 12:39 Autumn Semester 2024 Page 859 of 2653
376-0021-00L Materials and Mechanics in Medicine

Abstract
Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Objective
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Content
Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

376-1103-00L Frontiers in Nanotechnology

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

Abstract
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Content
Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to cleanroom and micro/nanotechnology instruments and 3D printing will be provided. Last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 12 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 × 45 min will be covered by Yüksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 20$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone
The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

529-0004-01L Classical Simulation of (Bio)Molecular Systems

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Objective
Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Lecture notes
The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

529-0455-00L Laser for Micro- and Nanostructuring

Abstract

Objective
The objective of this course is to provide an overview of laser technology and its applications in micro- and nanofabrication. Students will learn about different laser systems, their properties, and how they interact with materials. The course will cover laser ablation, selective laser melting, and other laser-based micro- and nanofabrication techniques.

Content

Lecture notes
The lecture notes will be made available online (moodle).

Abstract

Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano-structuring. Several applications which are still in the research state, will be discussed together with industrial applications, such as microolithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Objective

Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano-structuring. Several applications which are still in the research state, e.g. non-optical lithographies, will be discussed together with industrial applications, such as microolithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Content

Introduction to lasers, Overview of micro- and nanotechnology, microolithography, photoresists: classical types and new developments, laser cutting and welding, laser cleaning, laser ablation, polymer ablation: designed polymers, lasers and surfaces, laser spectroscopy, laser chemical vapor deposition, pulsed laser deposition (PLD), special materials by PLD, alternative structuring methods.

Lecture notes

The script (a copy of the slides) will be handed out during the first lecture.

529-0615-01L Biochemical and Polymer Reaction Engineering W 6 credits 3G P. Arosio, P. Fleckenstein

Abstract

Objective

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content

We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes

Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html
Additional handout of slides will be provided during the lectures.

529-0837-01L Biomicrofluidic Engineering W 6 credits 3G A. de Mello

Abstract

Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic devices enable physical and chemical processes to be controlled with exquisite precision and in an fast and efficient manner. This course introduces the underlying concepts, features and applications of microfluidic systems in the chemical and life sciences.

Objective

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.
Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Pécel number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates
The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract
This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

551-0357-00L
Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

Autumn Semester 2024
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant queries and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature.

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer’s and Parkinson’s, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecture notes

Lecture slides and some scripts will be provided.

Literature

No compulsory textbooks. Literature will be provided during the course.

752-2000-00L Food Materials Science W 4 credits 3G R. Mezzenga, G. Nyström, M. Radiom

Abstract

Principles of soft condensed matter applied to food polymers, surfactants and colloids

Objective

Students will be able to:

- Describe the fundamental physical principles ruling the self-assembly, aggregation, processing and structure-properties relationship in food systems constituted by polysaccharides (polymers), proteins (colloids) and lipids (surfactants).
- Assess and recommend the best set of parameters controlling structure in foods
- Integrate physical and chemical principles to optimize food properties to meet specific requirements of defined food products

752-2314-00L Physics of Food Colloids W 3 credits 2V P. A. Fischer, R. Mezzenga, M. Radiom

Abstract

In Physics of Food Colloids the principles of colloid science will be applied to the aggregation of food materials based on proteins, polysaccharides, and emulsifiers. Mixtures of such raw material determine the appearance and performance of our daily food. In a number of examples, colloidal laws are linked to food science and the manufacturing and processing of food.

Objective

The aggregation of food material determines the appearance and performance of complex food system as well as nutritional aspects. The underlying colloidal laws reflect the structure of the individual raw material (length scale, time scale, and interacting forces). Once these concepts are appreciated the aggregation of most food systems falls into recognizable patterns that can be used to modify and structure exiting food or to design new products. The application and use of these concepts are discussed in light of common food production.
Content

Lectures include interfacial tension (4h), protein aggregation in bulk and interfaces (4h), Pickering emulsions (2h), gels (2h), aggregation of complex mixtures (4h), and the use of light scattering in investigation complex food structures (8h). Most chapters include some hand-ons examples of the gain knowledge to common food products.

Lecture notes

Notes will be handed out during the lectures.

**Food Rheology**

W 3 credits 2V  P. A. Fischer

**Abstract**

Rheology is the science of flow and deformation of matter such as polymers, dispersions (emulsions, foams, suspensions), and colloidal systems. The fluid dynamical basis, measuring techniques (rheometry), and the flow properties of different fluids (Newtonian, non-Newtonian, viscoelastic) are introduced and discussed.

**Objective**

The course provides an introduction on the link between flow and structural properties of flowing material. Rheometrical techniques and appropriate measuring protocols for the characterization of complex fluids will be discussed. The concept of rheological constitutive equations and the application to different material classes are established.

**Content**

Lectures will be given on general introduction (4h), fluid dynamics (2h), complex flow behavior (4h), influence of temperature (2h), rheometers (4h), rheological tests (6h) and structure and rheology of complex fluids (4h).

**Lecture notes**

Notes will be handed out during the lectures.

**Abstract**

The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

**Objective**

After successful completion of the course, students will be able to:

- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

**Content**

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

**Lectures**

The lectures will cover the following contents:

- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

**Design exercises**

The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

**Design project**

The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

101-0127-00L Advanced Structural Concrete

Abstract
This course supplements the courses Structural Concrete I and II regarding the analysis and dimensioning of reinforced and prestressed concrete structures. It focuses on limit analysis methods for walls, beams, slabs and shells, particularly regarding their applicability to the safety assessment of existing structures and their computer-aided implementation.

Objective
Within this course, the students are able to:
- deepen their understanding of structural concrete models and apply them to general design problems, including the assessment of existing structures.
- enhance their knowledge about the load-deformation response of reinforced and prestressed concrete structures.
- identify and assess the limits of applicability of limit analysis methods.
- recognise the assumptions of models suitable for computer-aided structural design and use in a critical way structural concrete design software.
- evaluate the long-term behaviour and the behaviour under fire conditions of concrete structures.
- assess the behaviour of fibre reinforced concrete structures.

Content
Fundamentals (structural analysis, theorems of limit analysis, applicability of limit analysis methods); walls and beams (stress fields and strut-and-tie models, compatibility and deformation capacity, membrane elements with yield conditions and load-deformation behaviour, computer-aided structural design); slabs (equilibrium solutions, yield conditions, shear and punching shear, sustainability); long term effects; steel fibre reinforced concrete (mechanical behaviour, applications); fire behaviour.

Lecture notes
Lecture notes see: http://www.concrete.ethz.ch

Literature

Prerequisites / notice

Students are assumed to be proficient in the material taught in the following courses offered in the BSc in Civil Engineering at ETH Zurich (or have acquired equivalent knowledge elsewhere):
- Theory of structures I+II
- Structural Concrete I+II (incl. prestressed concrete)

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork

Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

101-0129-00L Non Destructive Evaluation & Rehabilitation of Existing Structures

Abstract
Introduction to non destructive evaluation tools and quantitative structural analyses and verifications for condition assessment of existing structures and subsequent decisions on their rehabilitation.

Objective
The goal is for students to familiarize themselves with the handling of assessment and rehabilitation of existing structures from the perspective of a consulting engineer, following a systematic approach as described in current codes and to further learn how to use new non destructive evaluation technologies.

Content
This course is organized in two main pillars. The first pillar describes the technologies that are available for non destructive evaluation of structures and delves into description of the principle of operation of such methods (e.g. wave propagation, acoustic emission analysis, tomography). The second pillar, overviews the current implementation of condition assessment processes in codes and standards. Complementary to the topic of structural evaluation, the topic of interventions, rehabilitation and retrofitting of existing structures for different construction materials is next addressed.

- SIA-Document D 0239 « Existing Structures – Consolidation and Practice » (in German/French)
In Steel Structures III, students will deepen and expand their theoretical background and practical knowledge of the design and construction of steel and composite structures. Special composite structures, such as thin-walled cold-formed sections, crane girders, masts, tanks & silos, are covered. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as certain special fields of application of steel structures. Students will learn how to solve complex structural engineering tasks in larger building projects, e.g. through the use and correct design of large-span slim-floor girders and ultra-slim-composite columns, or the use of glazing and cable structures as principal load-carrying components. They learn how steel structures behave under fire conditions and how they can be protected and designed accordingly. Finally, students learn about the fundamental aspects governing the design of specialty steel structures, such as thin-walled cold-formed sections, crane girders, masts and storage tanks.

The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about the most current developments and see how these are used to shape the future practice in the structural engineering field.

### Content

Steel Structures III provides an in-depth theoretical background and practical knowledge on advanced design topics in steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as some critical fields of application of steel structures. The course discusses the use and design of large-span slim-floor girders and ultra-slim-composite columns, as well as the use of glazing and cable structures as principal load-carrying components. The course covers the design of steel structures under elevated temperatures (fire conditions) is treated, as well as certain special topics for design of serviceability. In addition, fundamental concepts of the design of cold-formed steel framed structures are discussed. Finally, the course will give an overview on the design of specialty steel structures, such as crane girders, masts and storage tanks.

### Literature

- **Stahlbaukalender (various editions), Ernst + Sohn, Berlin**
- **Nonlinear Finite Elements of Continua and Structures, T. Belytschko, W.K. Liu, and B. Moran.**

### Useful (optional) Reading:

Prerequisites / notice

- **Prerequisites:**
  - 101-0158-01 Method of Finite Elements I (FS)
  - A good knowledge of Python is necessary for attending this course.

Competencies

**Subject-specific Competencies**
- Concepts and Theories

**Method-specific Competencies**
- Analytical Competencies
- Problem-solving

**Social Competencies**
- Cooperation and Teamwork

**Personal Competencies**
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

**Method-specific Competencies**
- Problem-solving

**Social Competencies**
- Cooperation and Teamwork

**Personal Competencies**

- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

101-0167-01L Fibre Composite Materials in Structural Engineering W 3 credits 2G M. Motavalli

**Abstract**

1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

**Objective**

At the end of the course, you shall be able to

1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessary testing and SHM techniques for FRP structures,
3) Continue your education as a PhD student in this field.

**Content**

Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented, analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

**Lecture notes**

Power Point Presentations available online at www.empa.ch/abt303

**Literature**

3) fib bulletin 19, Externally applied FRP reinforcement for concrete structures, technical report, 2019
4) SIA166 (2004) Klebewerbewehrungen (Externally bonded reinforcement), Schweizerischer Ingenieur- und Architektenverein SIA

Prerequisites / notice

1) Laboratory Tours and Demonstrations: Empa Structural Engineering Laboratory including FRP Composites, Shape Memory Alloys, Timber Elements, Large Scale Testing of Structural Components
2) Working with Composite Materials in the Laboratory (application, testing, etc)

101-0527-10L Materials and Constructions W 4 credits 2G G. Habert, M. Posani

**Abstract**

Building materials with a special focus on regenerative materials: earth, bio-based and reuse. Looking at material sourcing, properties and performance, as well as how they are integrated in the buildings (building envelope and detailing).

Choice of material is done out of sustainability concern. Comfort, moisture transfer and building physics with hygroscopic materials.

**Objective**

Special focus on regenerative materials: earth, bio-based and reuse

The students will acquire knowledge in the following fields:

- Fundamentals of material performance
- Introduction to durability problems of building facades

Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, stone, earth, wood and bamboo
- Insulating materials (bio-based vs conventional)

Assessment of materials and components behaviour and performance

Degradation risks connected to insulation and post-insulation

Aspects of sustainability and durability

Special focus on comfort, moisture transfer and building physics with hygroscopic materials will be done.

**Content**

Introduction Sustainable cement and concrete
Earth construction
Stone
Steel
Bamboo
Timber construction
Building physic and conventional insulation
Bio-based insulation and degradation risks with insulation
Hygrothermal properties of building materials and dynamic numerical simulations
Efficiency and sustainability of modern window glazing

Course will have general lectures
+ hands on lab @home experiments
+ group project for implementation of regenerative materials.
Competencies

Abstract
The course on Advances in Building Materials provides an introductive overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

Objective
In this course, the students will gain a broad overview of the use of materials in the building sector, with a particular focus on concrete and wood. Current limitations and in particular sustainability related challenges will be detailed with the objective of laying the grounds to discuss future developments anticipated in this field.

Content
This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course of the specialization on Numerical Mechanics of Materials. The course also addresses master students in Materials Science and other study programs interested in deepening their understanding of application-relevant properties of engineering materials and sustainability related challenges.

The following topics are covered:
1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

Lecture notes
Handouts will be provided for each lecture.

Abstract
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

Objective
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

Content
1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM)
5 Creep and relaxation
6 On the nature of failure - Physics of damage and fracture
7 Cracks and growth in structures (LEFM and beyond)
8 Damage and fracture in heterogeneous materials
9 Mechanics of fatigue
10 Student -Project presentation

Lecture notes
Will be provided during the lecture via moodle.

Literature
Will be provided during the lecture.

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.
Objective
After this course you will have profound understanding about:
- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:
- current engineering approaches for durability design (according to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies

Content
- Socio-economic challenges related to ageing infrastructures
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:
- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Lecture notes
The course is based on the book

Slides of the lectures will be distributed in advance

Literature
The course is based on the book

Slides of the lectures will be distributed in advance

Prerequisites / notice
Special handouts and reprints for particular topics will be distributed

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0677-00L Concrete Technology W 2 credits 2G F. Nägeli, G. Martinola, T. Wangler

Abstract
Opportunities and limitations of concrete technology. Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- the role of sustainability in concrete technology
- new research in digital fabrication with concrete

Lecture notes
Slides provided for download.

151-0353-00L Mechanics of Composite Materials
W 4 credits 2V+1U G. Pappas

Abstract
The courses treats aspects related to elastic behavior of unidirectional and multidirectional laminates, micromechanics, failure and damage analysis, analysis and design of composite structures. The focus is on laminated fiber-reinforced polymer composites.

Objective
The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Laminate Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

Lecture notes
Script, handouts, exercises and additional material are available in PDF-format on the moodle page of the lecture.

Literature
The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

151-0524-00L Continuum Mechanics I
W 4 credits 2V+1U A. E. Ehret

Abstract
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

Content
Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

151-0525-00L Dynamic Behavior of Materials

Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

Objective

Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

Content

Topics include temperature and strain rate dependent elasto-plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation; simulation of dynamic failure of structures;

Lecture notes / Literature

Various books will be recommended pertaining to the topics covered.

Prerequisites

Course in continuum mechanics (mandatory), finite element method (recommended)

151-0529-00L Nonlinear FEA

Does not take place this semester.

Note: The previous course title until HS23 "Computational Mechanics II: Nonlinear FEA"

Abstract

The course provides an introduction to non-linear finite element analysis. The treated sources of non-linearity are related to material properties (hyperelasticity, plasticity), kinematics (large deformations, instability problems) and boundary conditions (contact). It aims to provide the students with the knowledge and skills required to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

Objective

To be able to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

Content

1. Introduction; various sources of non-linearities and implications for FEA.

Prerequisites / notice

Lecture notes / Literature

Lecture notes will be provided. However, students are encouraged to take their own notes.

Prerequisites

Mechanics 1, 2, Dynamics, Continuum Mechanics I and Introduction to FEA. Ideally also Continuum Mechanics II.

151-0544-00L Metal Additive Manufacturing - Mechanical Integrity and Process Simulation

Note: The previous course title until HS22 "Metal Additive Manufacturing - Mechanical Integrity and Numerical Analysis"

Abstract

An introduction to Metal Additive Manufacturing (MAM) (e.g. different techniques, the metallurgy of common alloy-systems, existing challenges) will be given. The focus of the lecture will be on the employment of different simulation approaches to address MAM challenges and to enable exploiting the full advantage of MAM for the manufacture of structures with desired property and functionality.

Objective

The main objectives of this lecture are:
- Acknowledging the possibilities and challenges for MAM (with a particular focus on mechanical integrity aspects),
- Understanding the importance of material science and metallurgical considerations in MAM,
- Appreciating the importance of thermal, fluid, mechanical and microstructural simulations for efficient use of MAM technology,
- Using commercial analysis tools (e.g. ABAQUS) for simulation of the MAM process.

Content

- Introduction to MAM (concept, application examples, pros & cons),
- Powder-bed and powder-blown metal additive manufacturing,
- Thermo-fluid analysis of additive manufacturing,
- Continuum-based thermal modelling and experimental validation techniques,
- Residual stress and distortion simulation and verification methods,
- Microstructural simulation (basics, analytical, kinetic Monte Carlo, cellular automata, phase-field),
- Mechanical property prediction for MAM,
- Microstructure and mechanical response of MAM material (stainless steel, Ti6Al4V, Inconel 718),
- Design for additive manufacturing,
- Artificial intelligence for AM

Exercise sessions use ABAQUS for analysis of MAM process. Detailed video instructions will be provided to enable students to set up their own simulations. Students can install the packages on their own systems.

Prerequisites / notice

Handouts of the presented slides.

No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic).

151-0550-00L Adaptive Materials for Structural Applications W 4 credits 3G A. Bergamini

Abstract
Adaptive materials offer appealing ways to extend the design space of structures by introducing time-variable properties into them. In this course, the physical working principles of selected adaptive materials are analyzed and simple models for describing their behavior are presented. Some applications are illustrated, also with laboratory experiments where possible.

Objective
The study of adaptive materials covers topics that range from chemistry to theoretical mechanics.

Content
This course will provide the students with an insight into the properties and physical phenomena which lead to the features of adaptive materials. Starting from chemomechanical (skeletal muscles), the physical behavior of a wide range of adaptive materials, thermo- and photo-mechanical, electro-mechanical, magneto-mechanical and meta-materials will be thoroughly discussed and analyzed. Up-to-date results on their performance and their implementation in mechanical structures will be detailed and studied in laboratory sessions. Analytical tools and energy based considerations will provide the students with effective instruments for understanding adaptive materials and assess their performance when integrated in structures or when arranged in particular fashions.

Basic concepts: Power conjugated variables, dissipative effects, geometry- and materials-based energy conversion

Thermo-mechanical coupling: Shape memory alloys / polymers

Electromechanical coupling(1): DEA, EBL, electrorheological fluids

Shape control / morphing: Use, requirements, challenges

Morphing applications of variable stiffness structures: Lab work

Electromechanical coupling (2): Piezoelectric, electrostrictive effect

Vibration Reduction: Measurement, passive, semi-active (active) damping methods

Vibration reduction applications of piezoelectric materials: Lab work

Metamaterials: Definition of metamaterials - electromagnetic, acoustical and other metamaterials

Energy harvesting and sensing: Energy harvesting with EAP and piezoelectric materials, transducers as sensors: Piezo, resistive,...

Lecture notes
Lecture notes (manuscript and handouts) will be provided

Literature
All material is provided online via Moodle.

151-8015-00L Moisture Transport in Porous Media W 3 credits 2G J. Carmeliet, A. Kubilay, A. Rubin, D. A. Strebel

Abstract
Moisture transport and related degradation processes in porous materials Theory of moisture transport in porous materials

Experimental determination of moisture transport properties

Exercises on moisture transport properties determination:

Selected topics

Liquid transport in cracked porous media, Drying of porous media, microclimate in urban street canyons.

Objective
- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Application of knowledge to moisture transport in cracked materials, drying of porous materials and microclimate in urban street canyons

Content
1. Introduction

Moisture damage: problem statement, durability

Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application

Description of moisture transport

Determination of moisture transport properties

Exercises on moisture transport properties

3. Special topics

Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

Literature
All material is provided online via Moodle.

227-0377-10L  Physics of Failure and Reliability of Electronic Devices and Systems

W  3 credits  2V  I. Shorubalko, M. Held

Abstract
Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

Objective
Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis; basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

237-2103-00L  Composites and Hybrids: From Design to Application

W  5 credits  3V+1U  F. J. Clemens, B. Weisse, A. Winistörfer

Abstract
Composites/hybrids are heterogeneous materials consisting of two or more bonded components, and it is possible to tailor material properties for certain applications. Typically, The components retain their structure and properties, but the properties of the composite are a combination of the properties of its components.

Objective
In this course you will get an inside to lightweight material with high strength, materials that are resistant against abrasion, ceramics with damage tolerance behavior, composites with bioactive, bioreabsorbable, piezoresistive and -electric properties. Enables materials scientists to design composite/hybrid materials for different applications. The course will comprise a balance of lectures, exercises and laboratory classes.

Content
Introduction and basic concepts on biomedical composites and smart composites/hybrids with sensing and actuation properties; production and properties of composites reinforced with particles, whiskers, short or long fibers; selection criteria, case studies and applications, future perspectives.

1. Structural composites (polymer-, metal- and ceramic matrix composites)
   1.1. Introduction and historical background
   1.2. Components: Matrix and reinforcement materials
   1.3. Types of composites and mechanisms of reinforcement
   1.4. Production processes
   1.5. Physical and chemical properties
   1.6. Applications

2. Biomedical Composites
   2.1. Introduction and historical background
   2.2. Components: metals&alloys, natural/synthetic polymers, bioceramics
   2.3. Types of biocomposites
   2.4. Production processes
   2.5. Properties
   2.6. Applications

3. Functional Composites (Sensors and Actuators)
   3.1. Introduction and historical background
   3.2. Components: Matrix and functional filler material
   3.3. Types of composites
   3.4. Production processes
   3.5. Properties
   3.6. Applications

376-0021-00L Materials and Mechanics in Medicine

Abstract
Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Objective
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Content
Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

Literature

Sustainable & Bioinspired Materials (MaP Doctoral School)

Number Title Type ECTS Hours Lecturers
101-0527-10L Materials and Constructions W 4 credits 2G G. Habert, M. Posani

Abstract
Building materials with a special focus on regenerative materials: earth, bio-based and reuse. Looking at material sourcing, properties and performance, as well as how they are integrated in the buildings (building envelope and detailing).

Objective
Choice of material is done out of sustainability concern.

Special focus on regenerative materials: earth, bio-based and reuse

The students will acquire knowledge in the following fields:
- Fundamentals of material performance
- Introduction to durability problems of building facades
- Materials for the building envelope:
  - Overview of structural materials and systems: concrete, steel, stone, earth, wood and bamboo
  - Insulating materials (bio-based vs conventional)
- Assessment of materials and components behaviour and performance
- Degradation risks connected to insulation and post-insulation
- Aspects of sustainability and durability

Content
Introduction
- Sustainable cement and concrete
- Earth construction
- Stone
- Steel
- Bamboo
- Timber construction
- Building physic and conventional insulation
- Bio-based insulation and degradation risks with insulation
- Hygrothermal properties of building materials and dynamic numerical simulations
- Efficiency and sustainability of modern window glazing

Course will have general lectures
- hands on lab @home experiments
- group project for implementation of regenerative materials.
Wood Structure and Function

Abstract

The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective

Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content

In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro- and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

Advanced Environmental Assessments

Abstract

This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Objective

This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the

- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and models, and the adequacy of life cycle impact assessment models and factors
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

Content

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multitoutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes

No script. Lecture slides and literature will be made available on Moodle.

Literature

Literature will be made available on Moodle.

Prerequisites / notice

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. 2016: Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5.2)).

Acoustics in Fluid Media: From Robotics to Additive Manufacturing

Abstract

The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective

The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content

Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Competencies

Continuum Mechanics I

Abstract
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

Content
Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

Lecture notes
Yes

Bioelectronics and Biosensors

Abstract
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content
Lecture topics:
1. Introduction
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley

Measuring bioelectronic signals
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics

In vivo stimulation and recording
10. Functional electric stimulation
11. In vivo electrophysiology

Optical recording and control of neurons (optogenetics)
12. Measuring neurons optically, fundamentals of optical microscopy
13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy

14. Measuring biochemical signals

Lecture notes
A detailed script is provided to each lecture including the exercises and their solutions.

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
This course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials.

The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.

Copies of the slides will be made available for download before each lecture.

This course explores the mechanisms that govern the adaptive functions of out-of-equilibrium systems in living organisms at the molecular scale and the microstructural design principles of biological materials at larger length scales. Throughout the course, we will also explore how these design principles can be incorporated into synthetic systems to improve targeted functions.

By the end of this course, students will be able to explain how natural selection optimizes biological materials at the molecular and microstructural levels and how this optimization process has resulted in the emergence of biological design principles that fulfill essential functions for species’ survival. Students will gain the ability to analyze and integrate bio-inspired adaptive functions into synthetic material systems, as well as interpret the correlation between function, microstructure, and performance of biological and bio-inspired materials. Through engaging activities, students will also develop strategies to create bio-inspired solutions for typical engineering problems and predict the performance of bio-inspired materials.

This course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials.

Block I: Molecular Adaptations of Living Organisms and Creation of Adaptive Bio-inspired Materials

- Temporal regulation in biological and bio-inspired molecular systems;
- Autonomous molecular structures and out-of-equilibrium systems;
- Molecular motion and work generation mechanisms in biological and bio-inspired systems;
- Sensing, adaptation, and communication in biological and bio-inspired material systems;

Block II: Principles of Microstructural Design in Biological Materials and Their Synthetically Engineered Counterparts

- Fundamentals of engineering in biological and bio-inspired materials;
- Replicating biological design principles in synthetic materials (structural, optical, surface properties, etc.);
- Bio-inspired design and systems (mechanical actuation and bio-inspiration in the built environment).

327-1101-00L Biomineralization W 2 credits 2V K.-H. Ernst

Abstract

The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. Biomineralization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biomineralization (BM) / types of biominerals and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phase / modern experimental methods for studying BM phenomena / inter-, intra, extra- and epicellular BM / organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / silification in diatoms, radiolaria and plants / calcium and iron storage / impact of BM on lithosphere and atmosphere / evolution / taxonomy of organisms.

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biomineralization
4. Control of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. Silica
11. Iron storage and mineralization

Lecture notes Script with more than 600 pages with many illustrations will be distributed free of charge.

Abstract

This course explores the mechanisms that govern the adaptive functions of out-of-equilibrium systems in living organisms at the molecular scale and the microstructural design principles of biological materials at larger length scales. Throughout the course, we will also explore how these design principles can be incorporated into synthetic systems to improve targeted functions.

Objective

By the end of this course, students will be able to explain how natural selection optimizes biological materials at the molecular and microstructural levels and how this optimization process has resulted in the emergence of biological design principles that fulfill essential functions for species’ survival. Students will gain the ability to analyze and integrate bio-inspired adaptive functions into synthetic material systems, as well as interpret the correlation between function, microstructure, and performance of biological and bio-inspired materials. Through engaging activities, students will also develop strategies to create bio-inspired solutions for typical engineering problems and predict the performance of bio-inspired materials.

Content

This course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials.

Block I: Molecular Adaptations of Living Organisms and Creation of Adaptive Bio-inspired Materials

- Temporal regulation in biological and bio-inspired molecular systems;
- Autonomous molecular structures and out-of-equilibrium systems;
- Molecular motion and work generation mechanisms in biological and bio-inspired systems;
- Sensing, adaptation, and communication in biological and bio-inspired material systems;

Block II: Principles of Microstructural Design in Biological Materials and Their Synthetically Engineered Counterparts

- Fundamentals of engineering in biological and bio-inspired materials;
- Replicating biological design principles in synthetic materials (structural, optical, surface properties, etc.);
- Bio-inspired design and systems (mechanical actuation and bio-inspiration in the built environment).

Lecture notes Copies of the slides will be made available for download before each lecture.
The course is mainly based on the references listed below. Additional references will be provided during the lectures.

**Multiscale Bone Biomechanics**

W 6 credits 3S R. Müller, X.-H. Qin

The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allow linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

**Abstract**

The learning objectives include

1. advanced knowledge of the state-of-the-are in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programing skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.

**Objective**

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis. To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2-45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture in the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

**Lecture notes**

Material will be provided on Moodle and eColab.

**Prerequisites / notice**

Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course fosters mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters.
- 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 20$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work, the course will teach skills in data acquisition/analysis.

The course should cover the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.
### Content
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the material surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

### Lecture notes
Handouts are deposited online (moodle).

### Literature

(available online via ETH library)

Handouts and references therin.

### Literature
- B. Helgason, B. de Wildt, S. J. Ferguson, J. Kimenai
- W. R. Taylor, M. Zenobi-Wong
- A. de Mello

### Objective
Getting insight into actual areas and problems of biomechanics.

### Abstract
Current topics in biomechanics presented by speakers from academia and industry.

### Content

### Objective
To understand the current state of research in polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required for different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

### Abstract

### Lecture notes
Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html
Additional handout of slides will be provided during the lectures.

### Literature
- Biocompatible Polymers in Medicine, R. Amici, M. Zenobi-Wong, 2002

### Literature
- W. R. Taylor, M. Zenobi-Wong
- A. de Mello

### Objective
A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.
Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   - Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   - Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   - Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   - Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   - Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   - Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   - Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   - Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   - Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    - Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

Lecture notes
- Handout will be given to students at lecture.

There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

#### Abstract

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

#### Objective

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

#### Content

The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
  - Super resolution optical microscopy: STED, PALM, STORM, other variations
  - Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
  - X-ray, electron and neutron diffraction
  - MRI imaging
  - Scanning tunnelling microscopy and atomic force microscopy
  - Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
  - Surface plasmon resonance-based biosensors
  - Molecular pore-based sensors and sequencing devices
  - Mechanical molecular and cellular assembly devices
  - Optical and magnetic tweezers
  - CD spectroscopy
  - Optogenetics
  - Molecular dynamics simulations
Ethics and Scientific Integrity for Doctoral Students

Objective

The objective of this course is to highlight the link between human physiology, product sensory, nutritional functions, and engineering approaches to facilitate the design of food matrices reflecting the requirements for the beforementioned properties. To identify and manipulate these properties, the pathways that control the interaction of food structures and their physiological action will be introduced. Students are introduced to a skill set that will encompass basic digestion, sensory physiology knowledge, and food structures. Students will be exposed to the interplay along the gastrointestinal tract including taste, aroma, and texture perception, swallowing mechanics, and gastrointestinal digestion with an engineering or physical sciences angle.

Content

Chapter 1: Introduction - The need for physiology guided structure and process design in the context of personalized nutrition (Peter Fischer)
Chapter 2: Food Oral Processing: the impact of food oral breakdown on sensory perception (Marine Devezeaux de Lavergne)
Chapter 3: Chewing and swallowing across the lifespan, from infants to elderly (Marine Devezeaux de Lavergne)
Chapter 4: Perception physiology in humans and other species (Benoit von der Weid)
Chapter 5: Biophysics of food digestion & how it can be exploited in the development of strategies for delivery (Timothy J. Wooster)
Chapter 6: Numerical and experimental modelling of the intestinal system (Peter Fischer)

Lecture notes

Lecture notes are available at Moodle

Competencies

Subject-specific Competencies: Concepts and Theories, assessed
Techniques and Technologies, assessed
Method-specific Competencies: Analytical Competencies, fostered
Decision-making, fostered
Media and Digital Technologies, fostered
Problem-solving, assessed
Project Management, fostered
Social Competencies: Communication, fostered
Personal Competencies: Creative Thinking, fostered
Critical Thinking, fostered
Integrity and Work Ethics, fostered

Abstract

This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply their knowledge in a discipline specific context.

Objective

Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content

Part I

The self-paced e-learning course consists of 5 modules:
(1) Ethics: Introduction to moral theory (with emphasis on practical guidance regarding decision making)
(2) Ethics in Scientific Research: Introduction to ethical issues that occur within research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).
(3) Collecting Resources: A variety of tools and resources that help identify ethical issues are presented and explained
(4) Setting up a Strategy: Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
(5) Making Decisions: Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II

The second, face-to-face part of this course focuses on discipline-specific aspects of Materials, Processes and Manufacturing Technologies. It provides an interactive learning environment. Participants get to apply their knowledge, and they are encouraged to reflect on ethical problems and critically discuss them with fellow doctoral students.

Prerequisites / notice

For doctoral students only

900-0100-DRL | Transferable Skills Course I (1-3 days) | W | 1 credit | 2S | Lecturers |

Only for doctoral students.

Abstract

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Objective

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

900-0101-DRL | Transferable Skills Course II (1-3 days) | W | 1 credit | 2S | Lecturers |

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer

Research colloquium

Regular research talks on various topics in mathematical finance and actuarial mathematics

Presentation of recent publications in theoretical computer science, including results by diploma, masters and doctoral candidates.

The goal is to introduce students to current research, and to enable them to read, understand, and present scientific papers. This seminar takes place as part of the joint research seminar of several theory groups. Intended participation is for students with excellent performance only. Formal restriction is: prior successful participation in a master level seminar in theoretical computer science.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.
900-0112-DRL  Participation in Commission I (min 1 year)  
Only for doctoral students.

Abstract  
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective  
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0113-DRL  Participation in Commission II (min 1 year)  
Only for doctoral students.

Abstract  
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective  
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0114-DRL  Member of Executive Board (min 1 year)  
Only for doctoral students.

Abstract  
Active participation in the presidium or executive board of a university group for at least 1 year.

Objective  
Active participation in the presidium or executive board of a university group for at least 1 year.

401-5010-00L  Ethics and Scientific Integrity for Doctoral Students at D-MATH  
W 1 credit  
1R E. Kowalski, not available

Abstract  
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective  
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content  
Part I on Moodle  
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics  
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research  
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources  
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy  
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions  
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II  
The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice  
For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

Competencies  
Subject-specific Competencies  
- Concepts and Theories  
- Decision-making  
- Problem-solving

Method-specific Competencies  
- Critical Thinking

Personal Competencies  
- Integrity and Work Ethics
